

# EXHIBIT C

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,324,004 based on  
U.S. Patent U.S. Patent Publication No. US2002/004786 to Mault et al. (“Mault”)

#### **Exhibit A-4**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, Mault was filed on September 7, 2001, claiming the priority date of September 7, 2000. Mault published at least as of April 25, 2002, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Mault anticipates asserted claims 1, 6, and 18 of the ’004 Patent. To the extent Mault is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Mault is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s “Preliminary” Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ “Preliminary” Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,324,004 based on  
U.S. Patent No.6,036,086 to Sizer (“Sizer”)

### **Exhibit A-5**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

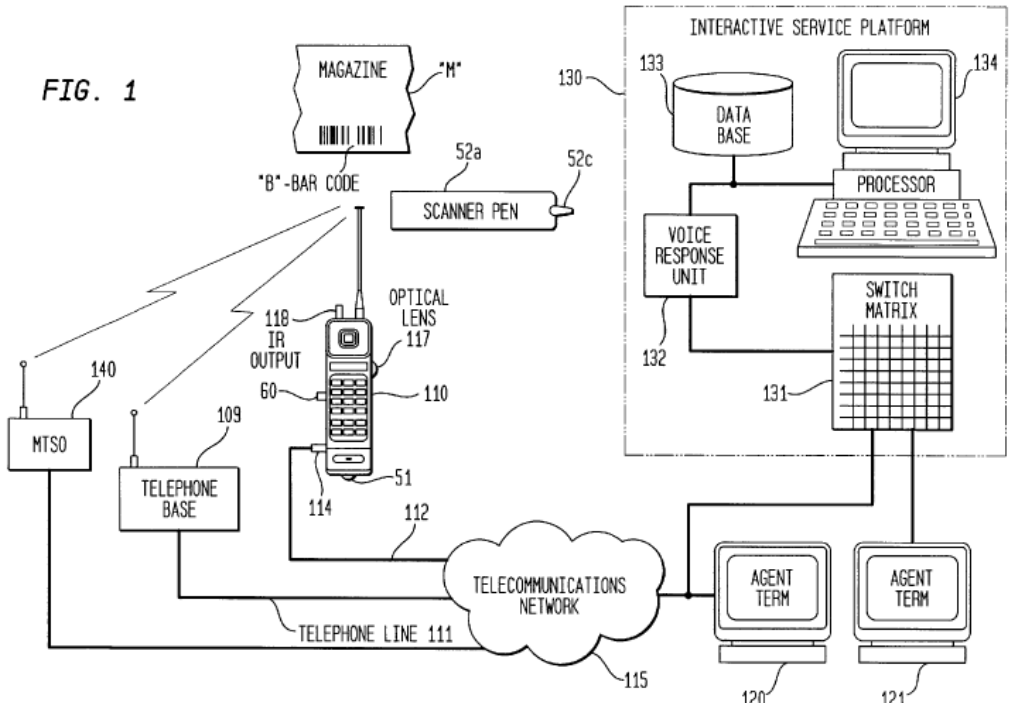

On information and belief, the application that matured into Sizer was filed on March 28, 1997. Sizer published at least as of March 14, 2000, and is available as prior art at least under 35 U.S.C. § 102(a), (b) and (e).

As shown in the chart below, Sizer anticipates asserted claims 1, 6, and 18 of the ’004 Patent. To the extent Sizer is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Sizer is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,324,004 based on  
U.S. Patent No. 6,666,377 to Harris (“Harris”)

### **Exhibit A-6**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Harris was filed on July 18, 2000. Harris published at least as of December 23, 2003, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Harris anticipates asserted claims 1, 2, 3, 6, 11, 15, 18 of the ’004 Patent. To the extent Harris is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Harris is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

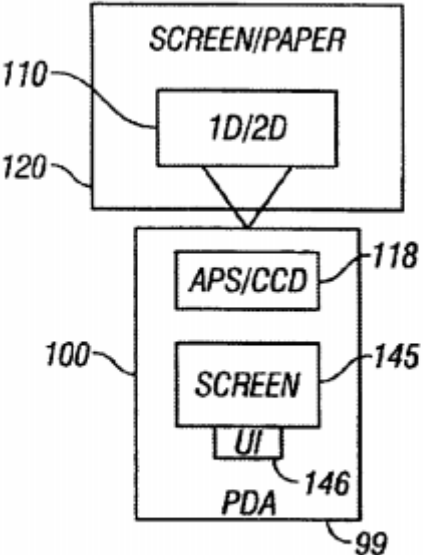

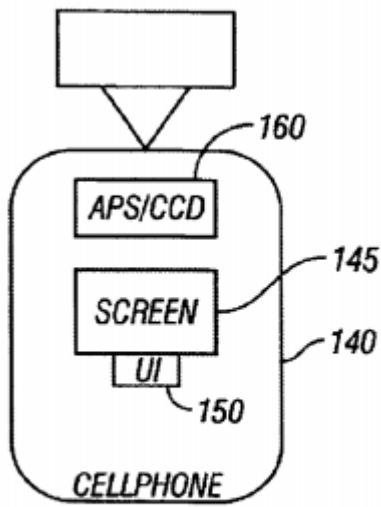

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,324,004 based on  
U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

### **Exhibit A-11**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ehrhart was filed on July 13, 2001, claiming the priority date of July 13, 2001. Ehrhart published at least as of April 20, 2004, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Ehrhart anticipates asserted claims 1, 6, 18 of the ’004 Patent. To the extent Ehrhart is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Ehrhart is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<ul style="list-style-type: none"> <li>• “The optical reader of the present invention automatically, or through manual Selection, determines whether a captured image is a color photographic image or, a color image that includes a graphical Symbol. Subsequently, the optical reader of the present invention processes the acquired imaging data in accordance with that determination. The optical reader of the present invention is operative to acquire and associate a plurality of acquired images.</li> </ul> <p>One aspect of the present invention is an optical reader. The optical reader includes a color imaging assembly for acquiring an image of an object, the color imaging assembly generating imaging data corresponding to the image. An image analysis circuit is coupled to the color imaging assembly. The image analysis circuit being configured to determine if the color imaging data includes at least one graphical Symbol. The image is classified as a graphical Symbol, or the image is classified as a color photograph if the color imaging data does not include at least one graphical Symbol. A processing circuit is coupled to the image analysis circuit. The processing circuit is operative to process the imaging data based on the determination.</p> <p>In another aspect, the present invention includes an optical reader for capturing an image of an object. The optical reader includes a color imaging assembly for converting the image of the object into color digital data corresponding to the image.”</p> <p>Ehrhart at 11:46-12:18</p> <ul style="list-style-type: none"> <li>• “As embodied herein and depicted in FIG. 8, a flow chart showing a method for performing the 1D autodiscrimination of step 702 in FIG. 7 is disclosed. In step 800 processor 40 calculates the activities of selected image data elements. The activity is defined as a measure of the rate of change of the image data over a small two-dimensional portion of the region surrounding the selected data element. In one embodiment, the activity is calculated along any two arbitrarily selected directions which are orthogonal one to the other. Two</li> </ul>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,324,004 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>mutually perpendicular directions are used because the orientation of the symbol is unknown. In step 802, processor 40 looks for “high activity” regions. These high activity regions are referred to as candidate symbol regions(CSRs). A high activity region indicates a transition from a black region to a white region, or vice-versa. If there is more than one CSR, it may indicate the presence of more than one bar code symbol. In step 804, processor 40 selects the largest CSR. In step 806, processor 40 calculates the centroid of the largest CSR. Subsequently, processor 40 finds the direction of the highest activity in the largest CSR. In a 1D bar code, this will be the direction perpendicular to the direction of the bars. In steps 810 and 812, processor defines the initial scan line(SC=0), as being the scan line bisecting the centroid of the bar code. Processor calculates the brightness values of sampling points along the initial scan line. These brightness values are converted to digital data in step 816. In decoding step 818, processor 40 applies one 1D decoding program after another. If decoding is unsuccessful, processor 40 checks if the entire CSR has been scanned. If not, it establishes a new scan line, and repeats the decoding process. If in step 822, the entire CSR has been scanned, and there are no CSRs remaining to be decoded, processor 40 exits the routine. If in step 820, 1D decoding is successful, processor 40 determines if the symbol is a 1D stacked symbol. If it is a 1D stacked symbol, processor 40 scans and decodes the remaining CSRs in the stacked symbol. If it is not a stacked symbol, the decoded 1D data is stored or output to display 60 in step 830. In step 838, processor 40 determines if there any unexamined regions. If there are unexamined regions, the decoding process is repeated. Otherwise, processor 40 exits the routine.”</p> <p>To the extent it is found that Ehrhart does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Ehrhart does not anticipate this claim, Ehrhart renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified in the cover pleading of BofA’s Invalidity</p>

		<p>data element. In one embodiment, the activity is calculated along any two arbitrarily selected directions which are orthogonal one to the other. Two mutually perpendicular directions are used because the orientation of the symbol is unknown. In step 802, processor 40 looks for “high activity” regions. These high activity regions are referred to as candidate symbol regions(CSRs). A high activity region indicates a transition from a black region to a white region, or vice-versa. If there is more than one CSR, it may indicate the presence of more than one bar code symbol. In step 804, processor 40 selects the largest CSR. In step 806, processor 40 calculates the centroid of the largest CSR. Subsequently, processor 40 finds the direction of the highest activity in the largest CSR. In a 1D bar code, this will be the direction perpendicular to the direction of the bars. In steps 810 and 812, processor defines the initial scan line(SC=0), as being the scan line bisecting the centroid of the bar code. Processor calculates the brightness values of sampling points along the initial scan line. These brightness values are converted to digital data in step 816. In decoding step 818, processor 40 applies one 1D decoding program after another. If decoding is unsuccessful, processor 40 checks if the entire CSR has been scanned. If not, it establishes a new scan line, and repeats the decoding process. If in step 822, the entire CSR has been scanned, and there are no CSRs remaining to be decoded, processor 40 exits the routine. If in step 820, 1D decoding is successful, processor 40 determines if the symbol is a 1D stacked symbol. If it is a 1D stacked symbol, processor 40 scans and decodes the remaining CSRs in the stacked symbol. If it is not a stacked symbol, the decoded 1D data is stored or output to display 60 in step 830. In step 838, processor 40 determines if there any unexamined regions. If there are unexamined regions, the decoding process is repeated. Otherwise, processor 40 exits the routine.”</p> <p>Ehrhart at 13:1-9.</p> <ul style="list-style-type: none"> <li>• “As embodied herein and depicted in FIG. 11, a flow chart showing a method for performing OCR in accordance with yet another embodiment of the present</li> </ul>

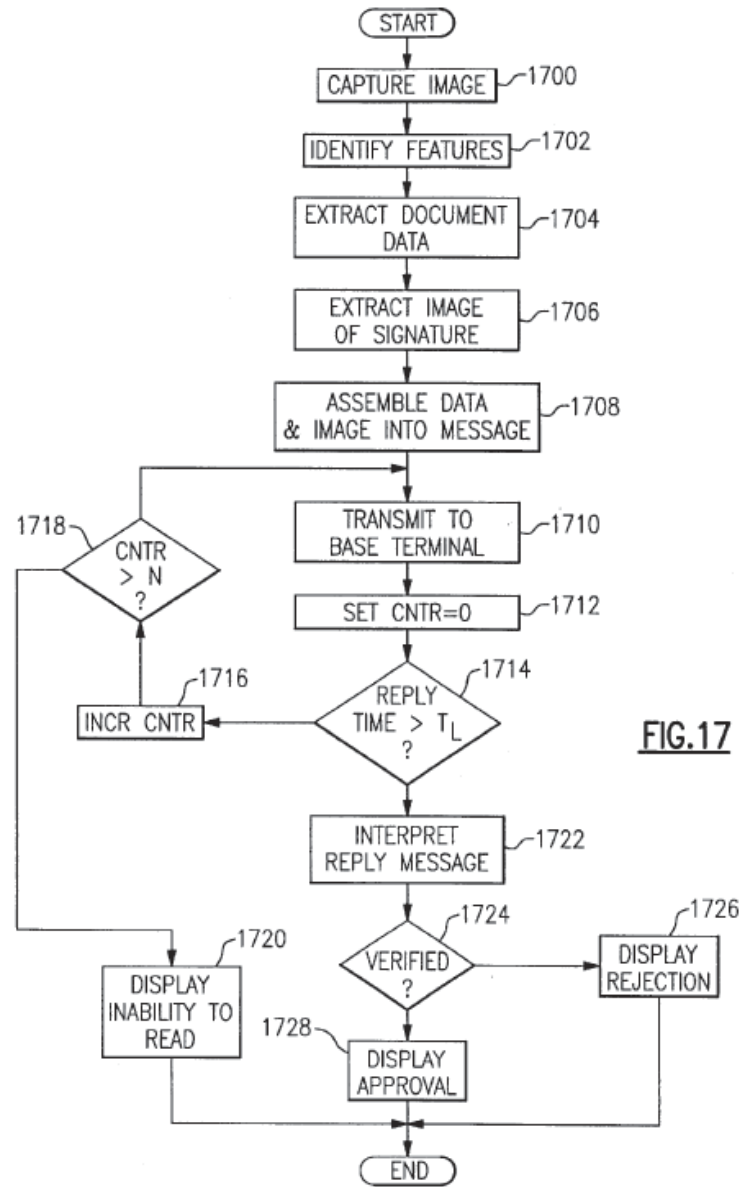

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,324,004 based on  
U.S. Patent No. 6,097,834 to Krouse (“Krouse”)

### **Exhibit A-18**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Krouse was filed on June 13, 1997, claiming the priority date of June 13, 1997. Krouse published at least as of August 1, 2000, and is available as prior art at least under 35 U.S.C. § 102(a).

As shown in the chart below, Krouse anticipates asserted claims 1, 2, 3, 6, 11, 15, 18 of the ’004 Patent. To the extent Krouse is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Krouse is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit A-23

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidation Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al., *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2.htm3](http://www.thinker.org/imagebase/indox-2.htm3) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s *Ultimedia Manager*, the DB2 series of products such as the *Image Extender* in DB2 Universal Database, and the *Enterprise Information Portal*. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16.

As shown in the chart below, QBIC anticipates asserted claims 1, 6, and 18 of the ’004 Patent. The disclosures/exemplary citations for each element incorporate the disclosures citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’004 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidation Contentions, for the reasons identified in the cited references and/or in the cover pleading. These Invalidation Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

the accused products, the claims must also be construed to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit A-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

**1. Claim 1**

Element	'004 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A method for processing a video stream, comprising:	<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 3</p> <p>Querying image databases by their image content is an active area of research. Some examples include the system in [2], which has been used to retrieve images of electrical components and MRI images, the system in [3] which retrieves images based on a sketch or other image example, or by “sense retrieval” (e.g. “retrieve clear, bright and clean images”), [4] which retrieves images based on their color content, and [5] which retrieves MRI images based on the sizes and relative positions of multiple objects in the images. The QBIC system which we are developing allows images to be retrieved by a variety of image content descriptors including color, texture, and shape.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p> <p>“We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

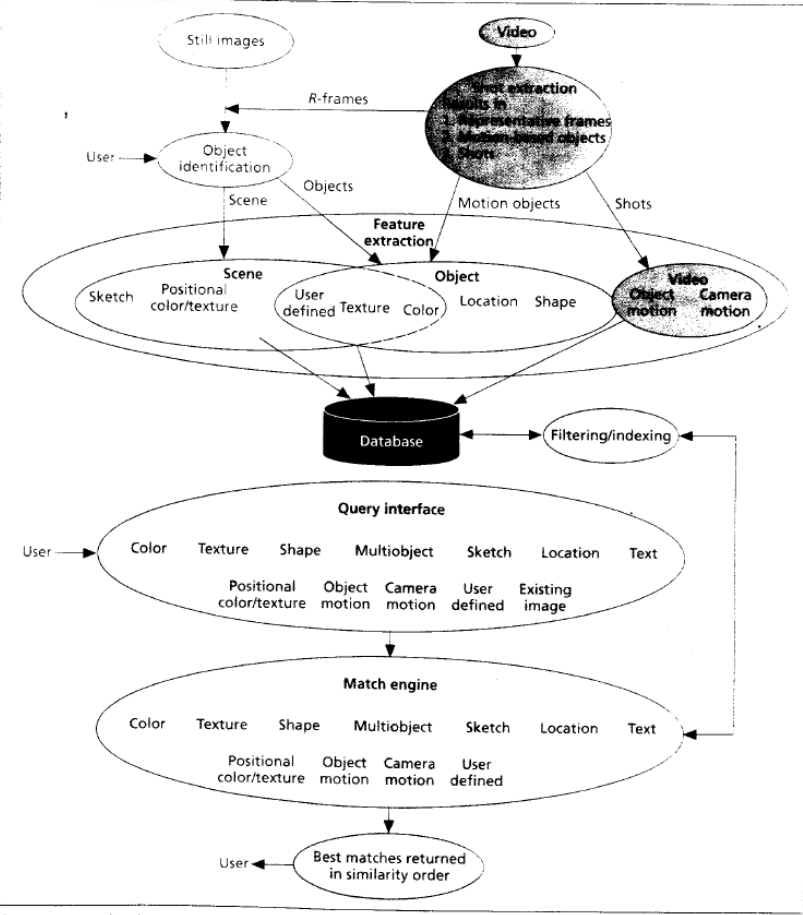

Element	'004 Claim Recitation	Exemplary Citations in Reference
		 <p>The diagram illustrates the QBIC system architecture, divided into two main parts: database population (top) and query (bottom).</p> <p><b>Database Population (Top):</b> This section shows the process of extracting features from video and still images. It starts with 'Still images' and 'Video' inputs. 'Video' undergoes 'Feature extraction' to produce 'Representative frames', 'Motion objects', and 'Shots'. 'Motion objects' are further processed into 'Motion objects' and 'Shots'. 'Still images' are processed into 'R-frames'. 'User' input goes to 'Object identification', which outputs 'Objects' and 'Scene'. 'Objects' and 'Scene' are processed through 'Feature extraction' to produce 'Scene' (Sketch, Positional color/texture) and 'Object' (User defined Texture, Color, Location, Shape). 'Motion objects' and 'Shots' are processed through 'Feature extraction' to produce 'Video Camera motion' (Object motion, Camera motion). All these outputs are stored in a 'Database'. 'Filtering/indexing' is applied to the database.</p> <p><b>Query (Bottom):</b> This section shows the process of querying the database. A 'User' interacts with a 'Query interface' which provides various search criteria: Color, Texture, Shape, Multiobject, Sketch, Location, Text, Positional color/texture, Object motion, Camera motion, User defined, and Existing image. The 'Query interface' sends data to a 'Match engine' which also uses the same search criteria. The 'Match engine' sends data to 'Filtering/indexing', which then returns 'Best matches returned in similarity order' to the 'User'.</p>

Figure 2. QBIC database population (top) and query (bottom) architecture.

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>QBIC SYSTEM OVERVIEW</b>                      Figure 1 illustrates a typical QBIC query.*                      The left side shows the query specification, where the user painted a large magenta circular area on a green background using standard drawing tools. Query results are shown on the right: an ordered list of “hits” similar to the query. The order of the results is top to bottom, then left to right, to support horizontal scrolling. In general, all queries follow this model in that the query is specified by using graphical means—drawing, selecting from a color wheel, selecting a sample image, and so on—and results are displayed as an ordered set of images.</p> <p>To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content—colors, textures, shapes, and camera and object motion—and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.</p> <p><b>Data model</b>                      For both population and query, the QBIC data model has</p> <ul style="list-style-type: none"> <li>• still images or scenes (full images) that contain objects (subsets of an image), and</li> <li>• video shots that consist of sets of contiguous frames and contain motion objects.</li> </ul> <p>For still images, the QBIC data model distinguishes between “scenes” (or images) and “objects.” A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative</p> <p>text at top. Tools in row are polygon outliner, rectangle outliner, ellipse outliner, paintbrush, eraser, line drawing, object translation, flood fill, and snake outliner.</p> <p>frames, or <i>r</i>-frames, are generated for each extracted shot. <i>R</i>-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.</p> <p>Queries are allowed on objects (“Find images with a red, round object”), scenes (“Find images that have approximately 30-percent red and 15-percent blue colors”), shots (“Find all shots panning from left to right”), or any combination (“Find images that have 30 percent red and contain a blue textured object”).</p> <p>In QBIC, similarity queries are done against the database of pre-extracted features using distance functions between the features. These functions are intended to mimic human perception to approximate a perceptual ordering of the database. Figure 2 shows the match engine, the collection of all distance functions. The match engine interacts with a filtering/indexing module (see “Fast searching and indexing” sidebar, next page) to support fast searching methodologies such as indexing. Users interact with the query interface to generate a query specification, resulting in the features that define the query.</p> <p><b>DATABASE POPULATION</b>                      In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like “baby on beach,” can be associated with an outlined object or with the scene as a whole.</p> <p>IBM0000893 at 895</p>

		<p><b>REPRESENTATIVE FRAME GENERATION.</b>                      Once the shot boundaries have been detected, each shot is represented using an <i>r</i>-frame. <i>R</i>-frames are used for several purposes. First, during database population, <i>r</i>-frames are treated as still images in which objects can be identified by using the previously described methods. Secondly, during query, they are the basic units initially returned in a video query. For example, in a query for shots that are dominantly red, a set of <i>r</i>-frames will be displayed. To see the actual video shot, the user clicks on the displayed <i>r</i>-frame icon.</p> <p>The choice of an <i>r</i>-frame could be as simple as a particular frame in the shot: the</p> <p>IBM0000893 at 898</p> <p>WE HAVE DESCRIBED A PROTOTYPE SYSTEM that uses image and video content as the basis for retrievals. Technology from this prototype has already moved into a commercial stand-alone product, IBM's Ultimedia Manager, and is part</p> <p>of IBM's Digital Library and DB2 series of products. Other companies are beginning to offer products with similar capabilities. Key challenges remain in making this technology pervasive and useful.</p> <p>IBM0000893 at 900</p> <p>QBIC Demo (IBM000747)</p>

		<p>1 project at this time?                  2 A. I don't know that.                  3 Q. Okay. Would reviewing -- let's see.                  4 Let's turn to page -- let's turn to page -- this                  5 one is Bates-stamped, so the page ending in                  6 Network1_007316.                  7 Would reviewing this page refresh your                  8 recollection as to whether --                  9 A. Yes.                  10 Q. Okay. Perfect. Feel free.                  11 MR. DeCLERCK: Just give him a chance to                  12 finish his question before you respond.                  13 MR. DANG: Thank you.                  14 THE DEPONENT: Is there a question                  15 standing?                  16 Q. (By Mr. Dang) Sure. Yeah.                  17 So was there any video search                  18 functionality included as part of the QBIC system                  19 at this time?                  20 A. Evidently, yes.                  21 Q. Okay. And how did that video search                  22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using                  2 those images.                  3 Q. Okay. Could you take as -- as you did in                  4 the query by image search system, could you just                  5 search a video using this system?                  6 A. You could search for a key frame and that                  7 could point you to a video.                  8 Q. As an input into the system, could you                  9 search -- could you input a whole video and then                  10 the system would extract the key frames and then --                  11 A. Yes.                  12 Q. -- search that using that?                  13 A. If I recall correctly, yes.                  14 Q. Okay. And the way -- the method by which                  15 it did so, as you mentioned, was -- would it                  16 extract key frames from the video, extract features                  17 from those key frames, and then search those                  18 features; is that right?                  19 A. Correct.                  20 Q. Okay. Other than the use of shots and                  21 key frames, is there any difference between the                  22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in                  2 video and then treat -- treat those as still images                  3 in the QBIC system.                  4 Q. So to break that down, you -- what do you                  5 mean by detecting shots?                  6 A. You try to find some key frame in a video                  7 sequence or multiple key frames in a video                  8 sequence, to give you a summarization of the video.                  9 Q. And how would you detect those key                  10 frames?                  11 A. There were algorithms to do it. I didn't                  12 personally work on any of those algorithms.                  13 Q. Are you otherwise aware of any of those                  14 algorithms?                  15 A. Well, they used histogram methodologies.                  16 I remember that.                  17 Q. Okay. So you would take -- you would use                  18 a histogram methodology to extract key frames from                  19 the video; is that what -- is that right?                  20 A. That's one way to do it.                  21 Q. Okay. And then what would you do with                  22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?                  2 A. There may have been.                  3 Q. Can you think of any now?                  4 A. No.                  5 Q. When you searched for -- or when you                  6 searched a video using this system, what would                  7 the -- or what would the system return?                  8 A. I don't remember if we returned the                  9 stills or a small -- small video clip.                  10 Q. Say it returned the stills, could you use                  11 those stills to point you to a video?                  12 A. Yeah.                  13 Q. And how would you do that?                  14 A. Well, the -- each -- each key frame                  15 typically represents a frame in the video. So                  16 there's a -- the key frame is -- is one frame of                  17 the video so you just seek to that point.                  18 Q. So if I'm understanding this right, you                  19 could take a query video, the system would extract                  20 frames, which would then extract features from it,                  21 and then the system would return either shot clips                  22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>13 Q. Okay. Let me ask -- let me ask that                      14 question using -- using an example.                      15 Say I had a file that -- that was a                      16 snippet of a Star Wars movie.                      17 Could the CueVideo system take that                      18 snippet of the -- of a Star Wars movie and indicate                      19 to the user what Star Wars movie that snippet is                      20 from?                      21 A. Most likely, yes.                      22 Q. And how do you know that?                      1 A. Based on my knowledge in content-based                      2 imagery -- content-based retrieval, in general,                      3 that would be one of the first things you would try                      4 to implement in a video search system.</p> <p>Flickner Depo at 201</p> <p>5 Q. Now, to search a video by content using                      6 CueVideo, how would the features be extracted from                      7 the video?                      8 MS. HAYDEN: Objection. Foundation.                      9 THE DEPONENT: You typically would                      10 extract -- you -- you try to find key frames and                      11 then you populate the image database with key                      12 frames.                      13 Q. (By Mr. Dang) And how would you search                      14 for those key frames in the image data?                      15 A. You could use a QBIC-like engine.                      16 Q. And by QBIC-like engine, what do you                      17 mean?                      18 A. Some image content-based retrieval                      19 system.                      20 Q. And what would the CueVideo system return                      21 in response to a video query?                      22 A. Typically, video snippets or videos</p> <p>Flickner Depo at 214-25</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>1 videos were indexed by shot boundaries?                  2 A. Correct -- well, the images of shot                  3 boundaries were indexed.                  4 Q. What do you mean by the images of shot                  5 boundaries were indexed?                  6 A. Each -- each shot -- the shot -- the shot                  7 boundary detection is trying to extract key frames                  8 or break the video into small subsec --                  9 subsections -- hang on. Let me think here a                  10 second.                  11 So the shot boundary here is different                  12 than key framing. So I'll -- I'll retract what I                  13 said earlier. This -- while similar, they're not                  14 the same.                  15 Q. What are the differences?                  16 A. Shot boundaries are typically detected at                  17 fade to black, and key frames are supposed to be a                  18 representative still image of the video segment.                  19 Q. How would a shot boundary index allow one                  20 to query a video by content?                  21 A. It gives you semantical information as                  22 related to what the -- that -- that -- that is a --</p> <p style="text-align: right;">Page 214</p> <p>1 a reasonable amount of return video. It's -- it's                  2 breaking it into small snippets.                  3 Q. Does it extract features from the key                  4 frames?                  5 A. If there are key frames extracted, it --                  6 it will reference key frames.                  7 Q. But how do you know that there are -- are                  8 other features extracted from the video --                  9 A. I'm sorry. It does -- it does represent                  10 key frames as well, because it says it's -- it's                  11 getting both the -- the boundaries as well as                  12 indi- -- indicative key frame.</p> <p>Flickner 8/29/23 Depo at 32–33</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. Okay. If I refer to "images," do you                      11 understand that is including both a still image or,                      12 for example, a frame of a video image?                      13 A. Sure.                      14 Q. Okay. So when I say "image," I'm                      15 including both in my questions from now on out.                      16 A. Okay.                      17 Q. Okay?                      18 A. Okay.                      19 Q. In terms of running analytics, that would                      20 include both extracting these characteristics from a                      21 query image and from an image that you're storing in                      22 a database; correct?                      23 A. Can you rephrase.                      24 Q. Yes. So the comparison that you're doing                      25 between two images; right, is it correct that that</p> <hr/> <p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                      2 querying image 1 to determine if there are images in                      3 the database that have similar features; is that                      4 right?                      5 A. Correct.                      6 Q. Okay. And the analytics that you're                      7 talking about, where you extract these characters                      8 from the image, that is -- those run on both the                      9 query image and the images that are stored in the                      10 database; is that right?                      11 A. Yeah. We call them features.                      12 Q. Features. Okay.                      13 So when you say "features," you're talking                      14 about the features that we talked about before:                      15 Color, texture, shape, sketch?                      16 A. For example.</p> <p><i>Id.</i> at 42</p>

		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.</p> <p><i>Id.</i> at 65–66</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>23 Q. So let's take a look on the first page,                  24 which is Bates-numbered IBM 893. If you look on the                  25 kind of left side in the middle of the page, there's                  1 a -- kind of a black bar and underneath says "QBIC                  2 lets users."                  3 Do you see that?                  4 A. Yep.                  5 Q. It says, "QBIC lets users find pictorial                  6 information in large image and video databases."                  7 So at the time that this article was                  8 written in 1995, QBIC was able to query both image                  9 and video databases; is that correct?                  10 A. Yes.                  11 Q. And then below that it says, "QBIC                  12 technology is part of several IBM products."                  13 Is that right?                  14 A. I can't read that line.                  15 Yeah.</p> <p><i>Id.</i> at 68 – 72</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>2 Q. Do you see that, "Videos are broken into"?</p> <p>3 A. "Clips called shots."</p> <p>4 Q. Yes. Well, it says, "Videos are broken</p> <p>5 into clips called shots. Representative frames, or</p> <p>6 r-frames, are generated for each extracted shot.</p> <p>7 R-frames are treated as still images, and features</p> <p>8 are extracted and stored in the database."</p> <p>9 Did I read that correctly?</p> <p>10 A. Um-hum.</p> <p>11 Q. Okay. So for purposes of database</p> <p>12 population and queries for video, r-frames were</p> <p>13 used, and those were treated as still images?</p> <p>14 A. Right.</p> <p>15 Q. So what would happen if I queried using an</p> <p>16 r-frame image? What results would I get back?</p> <p>17 Could I get back both still images and r-frames, or</p> <p>18 would it just return r-frame images back?</p> <p>19 A. You could get both back.</p> <p>20 Q. Say it again, louder.</p> <p>21 A. You could get both back.</p> <p>22 Q. Okay. And in what form would those</p> <p>23 results be displayed to me? For images would they</p> <p>24 be displayed as a thumbnail?</p> <p>25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those</p> <p>2 be displayed to you?</p> <p>3 A. It could be as a thumbnail or as a short</p> <p>4 video clip or as a single representative frame.</p> <p>5 Q. Okay. So they could be -- so for a video,</p> <p>6 there's a video that matched the image query of an</p> <p>7 r-frame, the results I could get back could include</p> <p>8 three things. It could be a still image, it could</p> <p>9 be a thumbnail, or it could be an r-frame</p> <p>10 representation?</p> <p>11 A. R-frame, I think, is representative frame.</p> <p>12 So it was a key frame in that video sequence,</p> <p>13 summary frame.</p> <p>14 Q. Once I ran a query on an r-frame; right?</p> <p>15 Well, let's stop there.</p> <p>16 If I run a query on still images,</p> <p>17 typically the results I would get back are</p> <p>18 thumbnails that are most similar to the</p> <p>19 characteristics which I queried from the query</p> <p>20 image; right?</p> <p>21 A. You could get thumbnails back. You could</p> <p>22 also get the full-sized image back.</p> <p>23 Q. Okay.</p> <p>24 A. Thumbnail is a tool for helping you return</p> <p>25 lots of results and quickly scan it.</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'004 Claim Recitation	Exemplary Citations in Reference				
		<table border="1"> <tr> <td data-bbox="926 261 1304 813"> <p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p> </td> <td data-bbox="1304 261 1692 813"> <p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. STRAUSSMAN: You can answer.                  19 THE WITNESS: I don't know.                  20 BY MR. EDWARDS:                  21 Q. But, Mr. Flickner, this -- generally this                  22 article represents the status of the QBIC technology                  23 as of the date of this publication, which is                  24 September 1995; is that right?                  25 A. Actually a little before September 1995</p> </td> </tr> <tr> <td data-bbox="926 813 1304 1373"> <p style="text-align: right;">Page 71</p> <p>1 calls for speculation.                  2 THE WITNESS: As I recall -- I'm not sure                  3 definitely, but, yes, this is -- you could do that.                  4 BY MR. EDWARDS:                  5 Q. So let's go to page IBM 898.                  6 So if you'll take -- just read that                  7 paragraph that starts with the header                  8 "Representative Frame Generation."                  9 MR. STRAUSSMAN: And if you need to read                  10 anything else to put it in context, feel free to do                  11 so.                  12 THE WITNESS: Okay.                  13 (Witness reviews document.)                  14 THE WITNESS: So what was your question, again?                  15 BY MR. EDWARDS:                  16 Q. If you go to the sentence that says,                  17 "First" -- it's the second sentence in that                  18 paragraph. It says, "First, during database                  19 population, r-frames are treated as still images."                  20 See that?                  21 A. Yeah.                  22 Q. And that's what you told me earlier;                  23 correct?                  24 A. Yeah.                  25 Q. And then if you go to the next sentence,</p> </td> <td data-bbox="1304 813 1692 1373"> <p style="text-align: right;">Page 73</p> <p>1 because --                  2 Q. Okay.                  3 A. -- there's an editorial process.                  4 Q. Say that last part?                  5 A. There's an editorial process. You submit                  6 it, they edit and make changes and eventually it                  7 appears.                  8 Q. Right. So what you're saying is there's                  9 some lag between the time that you wrote the article                  10 and the time it was published?                  11 A. Yeah.                  12 Q. So this article -- but this article                  13 represents the state of the QBIC technology at least                  14 as of September 1995?                  15 A. Yeah. Yes.                  16 Q. And then let's go to IBM 900.                  17 And take your time to orient yourself on                  18 that page, but what I really want to ask you about                  19 is the last paragraph on the left-hand column going                  20 up to the top of the right-hand column.                  21 A. Yep.                  22 Q. So it says this paper describes [as read],                  23 "a prototype system that uses image and video                  24 content as the basis for retrievals."                  25 Is that right?</p> </td> </tr> </table>	<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. 		<p style="text-align: center;">1 A. Yeah.</p> <p>IBM0002263 at 2264-65:</p> <hr/> <p style="text-align: center;"><b>Product Positioning</b></p> <hr/> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are business professionals who need the advanced array of decision support database tools to view, query, and analyze data.</p> <p>The QBIC system was implemented in IBM commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender</p>

		<p>in DB2 Universal Database, and the Enterprise Information Portal. All of the features referenced in this chart were incorporated into these commercial implementations before November 6, 2000, as reflected in a combination of scientific papers, IBM’s internal documentation, and the QBIC demo software applications. <i>See, e.g.</i>, Flickner 8/29/23 Depo Tr. at 33:9-24, 71:21-72:10, 164:21-166:2, 166:11-175:24, 178:5-186:17, 186:21-192:4, 192:14-194:1, 195:16-196:4, 194:1-308:1; IBM 000001-617; IBM 000747; IBM 000777-880; IBM 000893-902; IBM 0002315-320; IBM 0002390-404; IBM 0002418-430.</p> <p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1A]	analyzing, via a mobile device, a scene represented by the video stream for at least one object;	<p>QBIC uses still images and video (frames) for query and database population:</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and 15-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions-which we call objects-in the images. . . .</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>6 Earlier you talked about both still images                      7 and video were part of your responsibilities for                      8 these architecture interfaces; correct?                      9 A. Correct.                      10 Q. Okay. If I refer to "images," do you                      11 understand that is including both a still image or,                      12 for example, a frame of a video image?                      13 A. Sure.                      14 Q. Okay. So when I say "image," I'm                      15 including both in my questions from now on out.                      16 A. Okay.                      17 Q. Okay?                      18 A. Okay.</p> <p><i>Id.</i> at 53:</p> <p>4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      0 also add the image to the database, preparing a                      1 reduced thumbnail and adding any available text                      2 information to the database.                      3 A. Yep.                      4 Q. Is that correct?                      5 A. Yep.</p>

*Nantworks, LLC v. Bank of America Corporation*

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 60–61:</p> <p>13 Q. Okay. Did you do that type of                      14 segmentation to differentiate foreground objects                      15 from the background in this database population                      16 step?                      17 A. We did research prototypes of it. I don't                      18 know what all went out.                      19 Q. You don't know whether those made it into                      20 a commercial product?                      21 A. I would say they probably didn't.                      22 Q. Okay. Were they in the -- were they used                      23 in the -- in demo applications that you referred to?                      24 A. They might have been.                      25 Q. Okay. And so let's say that objects were</p> <hr/> <p style="text-align: right;">Page 61</p> <p>1 identified within a particular image, what were done                      2 with those objects? Were they stored, for example,                      3 as a separate image or were they somehow linked to                      4 or associated with the image from which they were                      5 extracted?                      6 A. Typically they were linked.                      7 Q. They were linked to the source image?                      8 A. Yeah.</p> <p><i>Id.</i> at 32–33:</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>22 Q. The question was, any of the commercial 23 repositories that you went to source images, do you 24 know if any of them captured the still images or 25 video images that you purchased?</p> <hr/> <p>1 A. Some of them did, yeah. P</p> <p><i>Id.</i> at 74–75:</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p>17 Q. Mr. Flickner, the images that are in the 18 database and used to submit a image query, could 19 those be images of anything? Or the -- 20 A. Yes. 21 Q. There were no restrictions on what the 22 image was of? 23 A. There are practical restrictions on image 24 size. 25 (Reporter seeks clarification.)</p> <hr/> <p style="text-align: right;">Page 75</p> <p>1 A. On image size, but other than that, no. 2 Q. Okay. Other than -- other than practical 3 restrictions on image size, were there any other 4 restrictions? 5 A. Well, there are some -- there are some 6 restrictions related to content. For example, porn 7 wouldn't be allowed. 8 Q. How would that be -- how was that policed? 9 A. It wasn't. 10 Q. Okay. What about in terms of, like, the 11 format of the image, was there -- were there 12 requirements for the format? 13 A. We had a very general library for doing 14 image import, so we could process all JPEGs or TIFs 15 or GIFs, or whatever. 16 Q. So you could process all image formats and 17 video formats? 18 A. Not -- I wouldn't say all but the 19 majority. 20 Q. The ones that were in existence in the 21 technology at the time? 22 A. And were popular as well.</p>

		<p><i>Id.</i> at 114:</p> <p>1 Q. If I took all the components off of the CD                  2 and put it onto my desktop operating system, could I                  3 then add images to that folder?                  4 MR. HANSEN: Objection; calls for speculation.                  5 THE WITNESS: I think so.                  6 BY MR. EDWARDS:                  7 Q. Okay. Do you -- do you -- based on your                  8 knowledge of putting these demos together, do you                  9 see any reason why -- any -- anything that would                  10 prohibit me from doing that?                  11 MR. HANSEN: Same objection.                  12 THE WITNESS: We have to -- at the time there                  13 was a big issue with the copyright of the image.                  14 BY MR. EDWARDS:                  15 Q. Was there a way that you could                  16 electronically prevent me from moving those contents                  17 from the CD over to a desktop and then adding images                  18 to the -- to the folder?                  19 A. No.</p> <p><i>Id.</i> at 202:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 202</p> <p>1 Q. Okay. For the QBIC system, a user can                  2 take an image with a portable camera and submit that                  3 to the QBIC system for image query; is that correct?                  4 A. Correct.                  5 Q. Okay. And that would -- that would                  6 include any commercial products that we looked at,                  7 like Ultimedia and Enterprise Portal, that use QBIC                  8 system. A user could take an image, submit that to                  9 those systems and QBIC would be able to extract                  10 features from that image from an image query and                  11 also for any images that were taken by a portable                  12 camera used to store in the database; is that right?                  13 MR. HANSEN: Objection; lacks foundation.                  14 THE WITNESS: Yes.</p> <p><i>Id.</i> at 300:                  6 Q. Did QBIC have a camera?                  7 A. Yes.                  8 Q. It did?                  9 A. There were internal versions that we                  10 attached cameras to.                  11 Q. I mean, was the camera part of QBIC or                  12 something you attached to QBIC?                  13 A. Something you attached to OBIC.</p> <p><i>Id.</i> at 312:</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs, start from a single object pixel and repeatedly add adjacent pixels whose values are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve.</p> <p>The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries. . . .</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content. You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b></p> <p>The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b></p> <p>Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>QBIC Demo (IBM000747)</p>

		<p>3 Q. Okay. And the steps that -- at least as</p> <p>4 I understand it -- is you'd have database</p> <p>5 population, feature calculation and image query; is</p> <p>6 that right?</p> <p>7 A. Uh-huh. Yes.</p> <p>8 Q. So let's -- let's start with database</p> <p>9 population.</p> <p>10 What was the database population step?</p> <p>11 A. It's a process of taking a set of images,</p> <p>12 and then putting them in -- into the database and</p> <p>13 the extracting the features and putting the</p> <p>14 features in the database.</p> <p>20 Q. And how large were these database</p> <p>21 structures?</p> <p>22 A. In the order of 15,000 images.</p> <p>Flickner Depo at 25-26</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that                  1 right?                  2 A. That's correct.                  3 Q. Okay. And once it determined matches,                  4 what would the system do next?                  5 A. It would display them, display the image.                  6 Typically, in thumbnail form.                  7 Q. Okay. How many matches would it display?                  8 A. On the order of 20, 30. You -- you could                  9 get more. It's really an ordering of the whole                  10 database.                  11 Q. Okay. And could you vary the amounts of                  12 matches that it would return?                  13 A. Yeah.                  14 Q. Okay. And how would you vary the amount                  15 of matches?                  16 A. I think it was like a configuration                  17 related to the X Windows application that has                  18 scroll bars on it, and you can assess like how many                  19 elements you wanted into it. This is pre-Web.</p>

		<p>1 project at this time?</p> <p>2 A. I don't know that.</p> <p>3 Q. Okay. Would reviewing -- let's see.</p> <p>4 Let's turn to page -- let's turn to page -- this</p> <p>5 one is Bates-stamped, so the page ending in</p> <p>6 Network1_007316.</p> <p>7 Would reviewing this page refresh your</p> <p>8 recollection as to whether --</p> <p>9 A. Yes.</p> <p>10 Q. Okay. Perfect. Feel free.</p> <p>11 MR. DeCLERCK: Just give him a chance to</p> <p>12 finish his question before you respond.</p> <p>13 MR. DANG: Thank you.</p> <p>14 THE DEPONENT: Is there a question</p> <p>15 standing?</p> <p>16 Q. (By Mr. Dang) Sure. Yeah.</p> <p>17 So was there any video search</p> <p>18 functionality included as part of the QBIC system</p> <p>19 at this time?</p> <p>20 A. Evidently, yes.</p> <p>21 Q. Okay. And how did that video search</p> <p>22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using</p> <p>2 those images.</p> <p>3 Q. Okay. Could you take as -- as you did in</p> <p>4 the query by image search system, could you just</p> <p>5 search a video using this system?</p> <p>6 A. You could search for a key frame and that</p> <p>7 could point you to a video.</p> <p>8 Q. As an input into the system, could you</p> <p>9 search -- could you input a whole video and then</p> <p>10 the system would extract the key frames and then --</p> <p>11 A. Yes.</p> <p>12 Q. -- search that using that?</p> <p>13 A. If I recall correctly, yes.</p> <p>14 Q. Okay. And the way -- the method by which</p> <p>15 it did so, as you mentioned, was -- would it</p> <p>16 extract key frames from the video, extract features</p> <p>17 from those key frames, and then search those</p> <p>18 features; is that right?</p> <p>19 A. Correct.</p> <p>20 Q. Okay. Other than the use of shots and</p> <p>21 key frames, is there any difference between the</p> <p>22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in</p> <p>2 video and then treat -- treat those as still images</p> <p>3 in the QBIC system.</p> <p>4 Q. So to break that down, you -- what do you</p> <p>5 mean by detecting shots?</p> <p>6 A. You try to find some key frame in a video</p> <p>7 sequence or multiple key frames in a video</p> <p>8 sequence, to give you a summarization of the video.</p> <p>9 Q. And how would you detect those key</p> <p>10 frames?</p> <p>11 A. There were algorithms to do it. I didn't</p> <p>12 personally work on any of those algorithms.</p> <p>13 Q. Are you otherwise aware of any of those</p> <p>14 algorithms?</p> <p>15 A. Well, they used histogram methodologies.</p> <p>16 I remember that.</p> <p>17 Q. Okay. So you would take -- you would use</p> <p>18 a histogram methodology to extract key frames from</p> <p>19 the video; is that what -- is that right?</p> <p>20 A. That's one way to do it.</p> <p>21 Q. Okay. And then what would you do with</p> <p>22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?</p> <p>2 A. There may have been.</p> <p>3 Q. Can you think of any now?</p> <p>4 A. No.</p> <p>5 Q. When you searched for -- or when you</p> <p>6 searched a video using this system, what would</p> <p>7 the -- or what would the system return?</p> <p>8 A. I don't remember if we returned the</p> <p>9 stills or a small -- small video clip.</p> <p>10 Q. Say it returned the stills, could you use</p> <p>11 those stills to point you to a video?</p> <p>12 A. Yeah.</p> <p>13 Q. And how would you do that?</p> <p>14 A. Well, the -- each -- each key frame</p> <p>15 typically represents a frame in the video. So</p> <p>16 there's a -- the key frame is -- is one frame of</p> <p>17 the video so you just seek to that point.</p> <p>18 Q. So if I'm understanding this right, you</p> <p>19 could take a query video, the system would extract</p> <p>20 frames, which would then extract features from it,</p> <p>21 and then the system would return either shot clips</p> <p>22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

		<p>3 Q. Okay. Could you take as -- as you did in 4 the query by image search system, could you just 5 search a video using this system? 6 A. You could search for a key frame and that 7 could point you to a video. 8 Q. As an input into the system, could you 9 search -- could you input a whole video and then 10 the system would extract the key frames and then -- 11 A. Yes. 12 Q. -- search that using that? 13 A. If I recall correctly, yes. 14 Q. Okay. And the way -- the method by which 15 it did so, as you mentioned, was -- would it 16 extract key frames from the video, extract features 17 from those key frames, and then search those 18 features; is that right? 19 A. Correct. 20 Q. Okay. Other than the use of shots and 21 key frames, is there any difference between the 22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p> <hr/> <p>1 query by image search system? 2 A. There may have been. 3 Q. Can you think of any now? 4 A. No. 5 Q. When you searched for -- or when you 6 searched a video using this system, what would 7 the -- or what would the system return? 8 A. I don't remember if we returned the 9 stills or a small -- small video clip. 10 Q. Say it returned the stills, could you use 11 those stills to point you to a video? 12 A. Yeah. 13 Q. And how would you do that? 14 A. Well, the -- each -- each key frame 15 typically represents a frame in the video. So 16 there's a -- the key frame is -- is one frame of 17 the video so you just seek to that point. 18 Q. So if I'm understanding this right, you 19 could take a query video, the system would extract 20 frames, which would then extract features from it, 21 and then the system would return either shot clips 22 or key frames; is that right?</p>

		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 77–78</p> <p>22 Q. Mr. Flickner, we're back from a break. 23 Next thing I want to talk about is the next step in 24 the process that we talked about earlier in your 25 deposition, which is feature calculation.</p> <p>1 A. Okay. 2 Q. And feature calculation is where you break 3 down the image individual features? 4 A. Features. Not necessarily just visual 5 features. 6 Q. Things like color and shape and texture, 7 though, would be visual features; correct? 8 A. Yes. Yes. 9 Q. And this step of feature calculation can 10 be done on both a query image and images that are 11 used to populate the database? 12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99</p> <p>20 Q. So for each of color, texture, shape, 21 sketch, there are algorithms that are performing 22 some mathematical computation to calculate those 23 features; is that right? 24 A. Yes. 25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two  2 different color computations that are done. One is  3 average color, the other is color histogram; is that  4 right?  5 A. There certainly are those two.  6 Q. Say again.  7 A. There certainly are those two.  8 Q. Okay. And for average color, let's talk  9 about that first, it says [as read], "We compute the  10 average," and it lists four things, "(R, G, B), (Y,  11 i, q), (L, a, b), and MTM coordinates of each object  12 and image."  13 You see that?  14 A. Yep.  15 Q. So does that mean that it does -- every  16 time it -- if it computes average color, it computes  17 all four of those things? Or are those optional,  18 meaning that it can compute one as opposed -- or  19 some combination of those four?  20 A. Some combination of those four.  21 Q. Okay. Are there different algorithms for  22 each of those four or is it the same algorithm?  23 A. RGB, Yiq and LAB are all linear  24 transformations.  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed  2 over time going forward from 1993?  3 A. Most likely they did.  4 Q. Do you recall any details for how they may  5 have changed?  6 A. No.  7 Q. Do you know if functionality was added to  8 compute average color?  9 A. No.  10 Q. Do you -- do you recall any other  11 algorithms or methodologies that were used besides  12 the four that are listed here?  13 A. No.  14 Q. Okay. Second methodology to compute color  15 is referred to as color histogram here; is that  16 correct?  17 A. Yes.  18 Q. And so at a high level can you explain to  19 me what a color histogram is?  20 A. A histogram is a count of each value. And  21 so, for example, if you have 1, 2, 3 as a value and  22 you say 1, 2, 3 again, the histogram would say 2  23 because there are two 1s, two 2s, and two 3s. So  24 it's a count of the number of values across the  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my  2 head.  3 Q. That's something different from a linear  4 transformation?  5 A. It might be a different linear  6 transformation. I don't recall.  7 Q. Okay. So for average color, the  8 algorithms will compute that based on some  9 combination of those four methodologies?  10 A. Yes.  11 Q. Okay. Do you know if those methodologies  12 evolved over time? So this -- so, for example, this  13 argu-- excuse me -- article was written in 1993.  14 Do you know if the way in which QBIC computed  15 average color changed over time or did it stay the  16 same?  17 MR. STRAUSSMAN: Objection; compound.  18 MR. EDWARDS: Let me rephrase.  19 THE WITNESS: I don't recall.  20 MR. EDWARDS: Let me rephrase.  21 BY MR. EDWARDS:  22 Q. So this article was written in 1993, and  23 it lists four methodologies for computing average  24 color features.  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?  2 A. Pixels, color.  3 Q. So is it measuring the probability  4 density --  5 A. It's a --  6 Q. -- of a color being in an image?  7 A. It's a PDF estimator.  8 Q. And what does PDF stand for?  9 A. Probability density function.  10 Q. Okay. Once the color histogram is  11 computed, is it normalized after that?  12 A. Yes, it was normalized.  13 Q. And why did you normalize the color  14 histogram?  15 A. Because different images would have  16 different color balances.  17 (Reporter seeks clarification.)  18 A. Balances, yeah.  19 Q. Is a -- is a reason why you normalize the  20 color histogram in -- for stored images -- well,  21 strike that.  22 Did you -- did you normalize color  23 histograms when you extract -- strike that.  24 When you calculated the color histogram  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or                  2 more of these features than the other?                  3 A. Yes.                  4 Q. Which one?                  5 A. Shape.                  6 Q. Okay.                  7 (Witness reviews document.)                  8 A. So one thing I can state is originally I                  9 couldn't remember the name of the edge operator --                  10 and the name is Canny, the Canny edge operator --                  11 when we were talking about finding edges.                  12 Q. Okay. So this -- the paragraph on                  13 IBM 2393 refreshed your memory that shape                  14 calculation used Canny edge detection?                  15 A. No, that's sketch.                  16 Q. Oh, I'm sorry.                  17 A. I'm just stating that originally I was                  18 asked a question about standard edge operators. I                  19 couldn't remember the name. The name was Canny.                  20 Q. Canny. And Canny is used in the sketch                  21 calculation?                  22 A. Yeah, it's used in the sketch calculation.                  23 Q. Understood. Okay. Let's go back to                  24 shape.                  25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.                  2 Q. Can you say the name of the word again?                  3 A. I think it's called perround.                  4 Q. Per round?                  5 A. Yeah.                  6 Q. Those -- are those two words, p-e-r,                  7 r-o-u-n-d?                  8 A. P-e-r -- one word.                  9 Q. Okay. Perround, one word.                  10 A. It's basically the perimeter squared over                  11 area.                  12 (Reporter seeks clarification.)                  13 A. Perimeter squared over area.                  14 (Reporter seeks clarification.)                  15 A. Length of the -- over area.                  16 Q. Okay. So let's step back a little bit.                  17 So it says -- the second paragraph says [as read],                  18 "Our shape features are based on a combination of                  19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features                  20 area, circularity, eccentricity, major access                  21 orientation and a set of algebraic moment                  22 invariants," i-n-v-a-r-i-a-n-t-s.                  23 Did I read that correctly?                  24 A. Um-hum.                  25 Q. Okay. For circularity, that is computed</p>	
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.                  2 To calculate the shape feature in a query                  3 image or a stored database image, is the first step                  4 to convert that image into a binary image?                  5 A. I don't think so.                  6 Q. So if you look at the second paragraph --                  7 and the reason why I ask is -- it's the second                  8 sentence in the second paragraph under "Shape                  9 features." It says [as read], "All shapes are                  10 assumed to be non-occluded planar shapes allowing                  11 for each shape to be represented as a binary image."                  12 See that?                  13 A. Yeah.                  14 Q. And then the next sentence says [as read],                  15 "The area is computed as the number of pixels set in                  16 the binary image."                  17 A. Right.                  18 Q. So that's why I ask is it the first step                  19 in calculating shape to convert the image to binary?                  20 A. Yes.                  21 Q. And then once you convert it to binary                  22 image, then what do you do next in order to                  23 calculate the shape?                  24 A. You're computing something called                  25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?                  2 A. Right.                  3 Q. All right. Area is the number of pixels                  4 in the binary image?                  5 A. In the binary blob.                  6 Q. In the binary what?                  7 A. Blob.                  8 Q. Blob. And when you say "blob," what does                  9 that refer to?                  10 A. The outline of the object that you're                  11 doing a shape query on.                  12 Q. And so are each of these, area,                  13 circularity, eccentricity, major axis orientation                  14 and algebraic moment invariants, are those each                  15 different algorithms or is it all the same                  16 algorithm?                  17 A. It's different algorithms.                  18 Q. Okay. And since you worked on the shape                  19 feature the most, do you recall any other details                  20 that are not disclosed in this paragraph?                  21 A. Well, this evolved and we ended up doing                  22 an implementation of something that's not in here.                  23 Q. Okay. And what was that implementation?                  24 A. Something called turning angle per round,                  25 turning angle, which is -- it looks at the tangent</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So 2 you're computing the turning angle. You're 3 computing this angle that represents a shape in a 4 very interesting way. 5 They don't seem to be very good for 6 human -- so if you asked a human whether these two 7 shapes are similar, they would say "yes," but under 8 that feature set. 9 Q. And you call that something per round? 10 What was the name of it? Started with a T. 11 Turrent? 12 A. Turning angle. 13 Q. Oh, turning angle. 14 A. Yeah. 15 Q. Well, it said -- your answer -- you did 16 say turning angle, but you said something called 17 something per round, and it started with a T. I 18 thought you said turrent, but maybe I misunderstood. 19 MR. STRAUSSMAN: Tangent? 20 THE WITNESS: Tangent angle, yeah. 21 BY MR. EDWARDS: 22 Q. Okay. So something called tangent per 23 round, is that what you would call it, this -- 24 A. No. 25 Q. -- this implementation?</p>	<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle. 2 Q. Okay. So the name of the new 3 implementation you're talking about for shape 4 calculation is called turning angle? 5 A. It used turning angle as a major feature. 6 Q. Okay. Was there any other name it went 7 by? 8 A. I don't recall. 9 Q. All right. And that was -- that 10 methodology was implemented to calculate shape on a 11 query image and an image stored in the database post 12 this article? 13 A. Yes. 14 Q. Was that the -- did that -- did that 15 implementation, the turning angle, did that replace 16 the methodology in this article or was it 17 supplementing the metho- -- 18 A. Supplementing. 19 Q. Okay. Other than turning angle, were 20 there any other methodologies used after this 21 article? 22 A. Not that I recall. 23 Q. Okay. Okay. Let's go sketch features, if 24 you take a look at that and then let me know when 25 you're done reading it.</p>

		<p><i>Id.</i> at 139–165</p> <p>5 Q. And for the image that you use as a base          6 for the query, the things we all talked about in          7 terms of feature extraction for average color, color          8 histogram, shape, texture, sketch, all of those          9 things, the same algorithms would be used in order          10 to extract those features from the image query?          11 A. They're different algorithms. You would          12 use an algorithm.          13 Q. I'm sorry. Say that again?          14 A. The algorithms are different between the          15 shape features and the color features and sketch          16 features.          17 Q. Yeah. Understood. What I'm trying --          18 what I'm trying to understand is, the process that          19 we talked about before, when you populate the          20 database and you extract the features from the          21 images that are stored in the database.          22 You know, we went through all those          23 different algorithms that are used for shape, color,          24 both average color and histogram, texture and          25 sketch.</p>

		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference				
		<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p> </td> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p> </td> </tr> <tr> <td style="vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p> </td> <td style="vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p> </td> </tr> </table>	<p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>	<p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>
<p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>					
<p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>					

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between                  2 the query image and the database image using                  3 weighted Euclidean distance; is that right?                  4 A. Yep.                  5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.                  6 And can you just tell us at a high level                  7 what -- if you can -- what Euclidean distance is?                  8 A. So if you have multiple features or                  9 multiple scaler features, you have to ask the                  10 question I'm trying to build a distance from that                  11 vector to a query vector.                  12 And as you build that -- the distance, you                  13 have -- you may want to weight different elements of                  14 the vector differently. And we found out that using                  15 variance normalization, where weights of the                  16 variance of the feature, gave good aesthetic                  17 results.                  18 (Reporter seeks clarification.)                  19 A. Aesthetic results.                  20 Q. And I apologize, I couldn't hear what you                  21 said. You said, "And we found out that using                  22 variance" . . .                  23 A. So you normalize each feature with its                  24 variance.                  25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)                  2 Q. Well, let me ask my -- let me get my                  3 question out first.                  4 So we talked about the features for                  5 average color before are RGB, Yiq, LAB and MTM.                  6 A. Correct.                  7 Q. And so, for example, for the RGB, you're                  8 saying that you would take the R and you would                  9 divide it by the variants of red and green, for                  10 example --                  11 A. Just variants of red.                  12 Q. Okay. And so you could do the same for                  13 the others, for Yiq or LAB?                  14 A. Exactly.                  15 Q. Okay. You do that for both the image                  16 input query and the stored image; correct?                  17 A. Correct.                  18 Q. And then you're calculating the distance                  19 between them, so determining how similar they are                  20 based on the distance?                  21 A. Yeah, or vector distance.                  22 Q. Understood.                  23 A. Two vectors of differences --                  24 (Reporter seeks clarification.)                  25 A. Two vectors with a distance calculation on</p>	
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.                  2 Q. With its variance.                  3 A. And then compute the average.                  4 Q. Okay.                  5 A. Or, I'm sorry, compute the weighted sum.                  6 So red divided by the variants of red, plus green                  7 divided by the variants of green --                  8 (Reporter seeks clarification.)                  9 A. Red divided by the variants of red, green                  10 divided by the variants of green, L divided by the                  11 variants of L, that's how you combine the various                  12 features.                  13 Q. Understand. And L represents what?                  14 A. Luminance.                  15 Q. Okay. And this is -- you're talking                  16 specifically with respect to average color?                  17 A. Well, the variance normalization is well                  18 known in terms of multidimensional feature merging.                  19 Q. But for average color, you wouldn't use                  20 luminance, right, as a -- as a variant?                  21 A. Luminance would just -- you wouldn't use                  22 just luminance. You could use luminance . . .                  23 Q. Well, so the color features we talked                  24 about before would be RGB, Yiq, LAB --                  25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.                  2 Q. You're going to have to repeat that and be                  3 just a little bit louder, Mr. Flickner. Sorry.                  4 A. That's all right. Let me get my thoughts                  5 together.                  6 So we have multiple dimensional features.                  7 It's not unusual to take each dimension and                  8 normalize it by the variance because that gives                  9 you -- what that does is if you have tight variances                  10 you divide it by, you get bigger numbers. So you                  11 have more information close by.                  12 Q. What was the word you said before "close                  13 by"?                  14 A. I don't remember.                  15 THE REPORTER: Information?                  16 THE WITNESS: Information close by?                  17 BY MR. EDWARDS:                  18 Q. Okay. Okay. So now let's talk about                  19 color histograms.                  20 A. Okay.                  21 Q. Okay? Well, stop. Let's go back to                  22 average color. So is there -- you described the                  23 weighted Euclidean distance that's calculated                  24 between the query image and the database image for                  25 average color.</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall                  2 that's not disclosed in the paragraph at IBM 2394?                  3 A. Not that I recall.                  4 Q. Okay. Do you recall whether this distance                  5 methodology changed after this article or it stayed                  6 the same?                  7 A. It changed.                  8 Q. Are you certain or do you know?                  9 A. I'm not certain, but I'm pretty certain.                  10 Q. And how did it change?                  11 A. Different features were shaped like an                  12 inch in color. The algorithm evolved. It wasn't                  13 static.                  14 Q. And how did it evolve?                  15 A. I don't recall all the details.                  16 Q. Do you recall whether it supplemented the                  17 weighted Euclidean distance or replaced it?                  18 A. I don't recall.                  19 Q. Is it fair to say there was always some                  20 distance measurement to determine similarity for                  21 average color in the QBIC system?                  22 A. There's some measurement, yeah.                  23 Q. Okay. Let's talk about color histogram.                  24 So in order to determine the similarity                  25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was                  2 determined by weighted Euclidean distance; is that                  3 right?                  4 MR. HANSEN: Same objection.                  5 THE WITNESS: Correct.                  6 BY MR. EDWARDS:                  7 Q. And how did -- how was that weighted                  8 Euclidean distance determined?                  9 A. It was inverse variance.                  10 (Reporter seeks clarification.)                  11 A. Variance.                  12 Q. And it was inverse variance for components                  13 like coarseness, contrast and directionality?                  14 A. Correct.                  15 Q. Okay. And do you recall if that                  16 methodology changed or stayed the same after this                  17 article for the QBIC system?                  18 A. Most likely it evolved.                  19 Q. Do you know for sure?                  20 A. No.                  21 Q. Do you recall any details?                  22 A. No.                  23 Q. All right. Let's talk about shape next.                  24 The similarity between the query image and                  25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines                  2 distance between normalized histograms?                  3 A. Correct.                  4 Q. Do you recall any details of how that                  5 worked?                  6 A. Not off the top of my head.                  7 Q. Do you recall whether that methodology                  8 evolved for matching color histograms after this                  9 article?                  10 A. Not that I recall.                  11 Q. Okay. All right. Let's talk about                  12 texture next. And I don't know if you've read that,                  13 but that's at the bottom of 2394 and it goes to just                  14 barely at the top of 2395.                  15 (Witness reviews document.)                  16 A. Okay.                  17 Q. So for texture, the similarity is                  18 determined by the distance or the weighted Euclidean                  19 distance between the query object and -- the query                  20 object image and the database object image; is that                  21 right?                  22 MR. HANSEN: Objection; vague and ambiguous.                  23 THE WITNESS: Can you repeat.                  24 BY MR. EDWARDS:                  25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?                  2 A. Correct.                  3 Q. And do you recall how that worked?                  4 A. There's computing moments. And we used                  5 the shape measure, which I mentioned earlier,                  6 curvature and turning angle.                  7 (Reporter seeks clarification.)                  8 A. Curvature and turning angle.                  9 Q. And the curvature and turning angle would                  10 be compared between the image query and the database                  11 image; correct?                  12 A. Correct.                  13 Q. And do you recall if that methodology                  14 changed after this article came out in '93?                  15 A. Yes, it did.                  16 Q. How so?                  17 A. Well, in the IEEE computer paper, we                  18 described a different way of doing shape measures.                  19 And they included the moment calculations.                  20 Q. And you use the moment calculations to                  21 determine a distance between the image query and                  22 the -- and the database image?                  23 A. Yes.                  24 Q. Sorry?                  25 A. Yeah. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?          2 A. Given a binary blob, certain high-level          3 moments and then you create -- compute the          4 eigenvectors of certain matrices that are created --          5 (Reporter seeks clarification.)          6 A. Eigenvectors, e-i-g-e -- i-n -- to compute          7 the eigenvectors of certain matrices. And that          8 would give you translation and rotation and          9 variance.          10 Q. And so after the Exhibit 3 1995 IEEE          11 article, did that methodology change to compute the          12 distance for shape?          13 A. I don't recall.          14 Q. So the methodology for shape that you just          15 described using moment calculations, that is          16 different from what is described in the 1993 article          17 for weighted Euclidean distance?          18 A. We still might have used weighted          19 Euclidean distance when the underlying features are          20 different.          21 Q. Understood.          22 And the underlying features are different          23 in the sense that in the 1995 article you're using          24 what features?          25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment          2 invariants.          3 (Witness reviews document.)          4 A. Is there any other papers that we have          5 here?          6 Q. Nope.          7 A. Everything else is screenshots?          8 MR. STRAUSSMAN: I don't think you introduced          9 any other papers.          10 THE WITNESS: I saw it earlier today.          11 BY MR. EDWARDS:          12 Q. Why don't we do it this way. In terms of          13 the feature calculations that were -- for shape on          14 page IBM 900 of Exhibit 3 versus page --          15 A. So if you look at 2393.          16 Q. What page are you directing me to?          17 A. 2393.          18 Q. Okay.          19 A. So it talks about the moment invariants as          20 well.          21 Q. Okay.          22 A. These are those matrices that you compute          23 eigenvectors of.          24 (Reporter seeks clarification.)          25 A. Matrices that you compute eigenvectors of.</p>	
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)          2 Q. I think the page you may be looking for is          3 IBM 900 on the left side.          4 (Witness reviews document.)          5 A. What else do we have here?          6 Q. So if you'll look at -- if you'll -- if          7 you'll compare page IBM 900 from Exhibit 3 to page          8 IBM 2393 from Exhibit 2, those are the descriptions          9 in both articles about the features that are          10 calculated.          11 A. I'm trying to remember what --          12 MR. STRAUSSMAN: Can you direct him a little          13 closer?          14 BY MR. EDWARDS:          15 Q. Can I show you? Do you mind?          16 I believe this is what you're looking for.          17 So if you look right here (indicating).          18 (Witness reviews document.)          19 A. That's the same as this one (indicating).          20 We had another -- there's another discussion about          21 moments.          22 Q. So if you look at -- under "Shape          23 features" at 2393, right there, where you're looking          24 at --          25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment          2 invariants in the 1993 SPIE article?          3 A. Correct.          4 Q. Right. And then if you go to the IEEE          5 article that you primarily co-authored, on page 900,          6 it refers to shape queries using area, circularity,          7 eccentricity, major-axis direction and features          8 derived from the object moments.          9 A. Right.          10 Q. Is that the same thing as algebraic moment          11 invariants?          12 A. Right.          13 Q. So it looks like the methodologies are the          14 same for the features that are extracted between the          15 papers; is that right?          16 A. I thought one paper had algebraic moments          17 and one had turning angle. Maybe they both had          18 turning angle.          19 (Reporter seeks clarification.)          20 A. Turning angle. Algebraic moments.          21 Turning angles.          22 Q. The 1993 paper refers to algebraic moment          23 invariants. The IEEE paper, on IBM 900, refers to          24 features derived from object moments.          25 Are those the same thing?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.                  2 Q. Okay. And so turning angles, which you've                  3 previously testified on, do you think that                  4 calculating shape features based on turning angles                  5 came after these papers?                  6 A. No. They're mentioned in these papers.                  7 Q. Okay. So they're included in these                  8 papers?                  9 A. Yes.                  10 Q. And so any distance measurement using                  11 weighted Euclidean distance would have taken into                  12 account turning angles?                  13 A. As a feature, yeah. Yes.                  14 Q. For both -- for both papers?                  15 A. For both papers.                  16 Q. Okay. Let's talk about sketch, which                  17 is -- if you'll just stick with 2395, which is                  18 Exhibit 2.                  19 MR. STRAUSSMAN: Can you direct him?                  20 THE WITNESS: I found it.                  21 MR. STRAUSSMAN: Okay.                  22 (Witness reviews document.)                  23 BY MR. EDWARDS:                  24 Q. Let me know when you're finished reading                  25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the                  2 best matches based on order of similarity?                  3 A. Um-hum.                  4 Q. Does iterated query refinement mean that I                  5 can further refine that query to search for things                  6 like shape, like a -- you know, some shape in the --                  7 in the query image, like a logo or an icon, and that                  8 will further refine the results to give me things                  9 that have that similar shape inside the results of                  10 the color histogram?                  11 A. Yes.                  12 Q. And then I can -- I can keep doing that, I                  13 can further even refine that result by using a                  14 keyword, for example?                  15 A. Yes. Or you could do it all at once.                  16 Q. Okay. So the results of the query -- so                  17 we talked about before that the results of the                  18 queries display thumbnails of the database images                  19 based on similarity of which they match; correct?                  20 A. Correct.                  21 Q. And then those thumbnails can provide                  22 links to the original image or, if it was an                  23 r-frame, it could be -- you could provide a link to                  24 the video; correct?                  25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.                  2 Q. For sketch, the similarity between the                  3 query image and the database image uses an algorithm                  4 that performs logical binary correlation of the                  5 binary image?                  6 A. Yes.                  7 Q. Are there any other details you recall for                  8 the sketch comparison beyond what's disclosed in                  9 this paragraph on IBM 2395?                  10 A. Not that I recall.                  11 Q. Do you recall the methodology for                  12 determining similarity of the input image and the                  13 database image for sketch changing after this                  14 article?                  15 A. Not that I recall.                  16 Q. So if you go to the next page,                  17 Mr. Flickner, which is 2396, the Section 4.2 talks                  18 about performing queries.                  19 A. Um-hum.                  20 Q. And in the last sentence it refers to                  21 something called iterated query refinement.                  22 A. Yes.                  23 Q. And what does that refer to?                  24 A. It's a way you can refine the query.                  25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links                  2 to information about the image that was associated                  3 with the image in the database?                  4 A. Yes.                  5 Q. And, again, that can be that -- whatever                  6 information that the user inputted or was associated                  7 with the image from the source?                  8 A. Yes.                  9 Q. Could the results also display a matching                  10 score so the user could see how well the particular                  11 result matched to the -- to the query image?                  12 A. It could.                  13 Q. Okay.                  14 MR. EDWARDS: I'm going to hand you the next                  15 exhibit, Mr. Flickner.                  16 (Deposition Exhibit 10 was marked.)                  17 MR. EDWARDS: Handing you what's been marked as                  18 Exhibit 10.                  19 For the record, it's IBM Bates Nos. 002418                  20 to 2430.                  21 BY MR. EDWARDS:                  22 Q. The title of this article is "Updates to                  23 the QBIC system."                  24 Do you see that?                  25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?</p> <p>2 A. Yes.</p> <p>3 Q. You are listed as a co-author of this</p> <p>4 article; is that correct?</p> <p>5 A. Yes.</p> <p>6 Q. And it is a paper that is published in the</p> <p>7 SPIE; correct?</p> <p>8 A. Correct.</p> <p>9 Q. In 1997; correct?</p> <p>10 A. Yes. It was 1997 or 1998.</p> <p>11 Q. No later than 1998; correct?</p> <p>12 A. Correct.</p> <p>13 Q. So just want to kind of orient you to the</p> <p>14 first page, which is IBM 2419.</p> <p>15 A. It's '98 because '97 is a different paper.</p> <p>16 Q. Well, if you turn the page, look at the</p> <p>17 footer on the right-hand side.</p> <p>18 Are you familiar that SPIE usually</p> <p>19 includes footers with the volume and the date at the</p> <p>20 bottom?</p> <p>21 A. Yeah.</p> <p>22 Q. And if you look at the footer kind of</p> <p>23 towards the right it says -786X-97-\$10 [sic]?</p> <p>24 A. Yeah.</p> <p>25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?</p> <p>2 A. Yep.</p> <p>3 Q. Okay. So let's -- I'm going to have you</p> <p>4 jump around, so I apologize in advance. Let's go to</p> <p>5 the -- kind of the back, IBM 2428.</p> <p>6 A. Okay.</p> <p>7 Q. Is that example of the stamps demo that</p> <p>8 was available on IBM's website?</p> <p>9 A. Yes.</p> <p>10 Q. All right. And if you look at the top in</p> <p>11 the location URL it has the almaden.ibm website</p> <p>12 address; correct?</p> <p>13 A. Correct.</p> <p>14 Q. All right. Let's flip forward to 2429.</p> <p>15 And is 2429 a screenshot of a trademark</p> <p>16 demo that was also available in the Almaden --</p> <p>17 excuse me -- almaden.ibm website?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. And that demo looks like the</p> <p>20 trademark query is based on shape; is that right?</p> <p>21 A. It uses shape as one similarity feature.</p> <p>22 Q. Right. So the trademarks are converted to</p> <p>23 a binary image, like we talked before -- talked</p> <p>24 about before, and then they're -- the matching</p> <p>25 process is done based on those binary images?</p>
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the</p> <p>2 conference was in '98.</p> <p>3 Q. Submission was in '97. So the paper was</p> <p>4 published in '97 and then the conference you</p> <p>5 presented it at was in 1998?</p> <p>6 A. That's possible.</p> <p>7 Q. Do you recall presenting this paper at a</p> <p>8 conference in 1998?</p> <p>9 A. No, I don't.</p> <p>10 Q. So the first page refers to the Photonics</p> <p>11 West 1999 -- excuse me. Photonics West 1998</p> <p>12 Electronic Imaging Conference in San Jose.</p> <p>13 Do you recall attending that conference?</p> <p>14 A. It's likely I did, but I don't recall.</p> <p>15 Q. Okay. But you would agree with me this</p> <p>16 paper was made available at least as early as 1998;</p> <p>17 correct?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. So the first page, IBM 2419. Under</p> <p>20 "Introduction," at the time of this paper it says,</p> <p>21 last line on the first paragraph, "Several online</p> <p>22 demos of QBIC are available at</p> <p>23 <a href="http://www.qbic.almaden.ibm.com">http://www.qbic.almaden.ibm.com</a>."</p> <p>24 Do you see that?</p> <p>25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p>22 Q. Okay. So 39 would be the -- so the first</p> <p>23 image at the top left is a 39, the one next to it is</p> <p>24 a 46, so the 39 would be a closer match than the 46;</p> <p>25 correct?</p>

		<p>IBM0002390 at 2391-92:</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16\text{M}</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

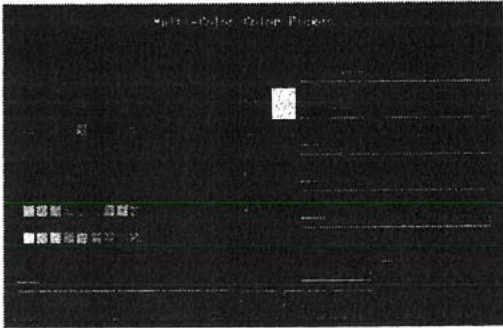

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2395</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <i>R</i>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>IBM0002390 at 2396:</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>4.1. Object/element identification</b></p> <p>Our user interface for object identification, shown in figure 4, allows for user assisted object identification. This interface is made up of four parts (listed from top to bottom): the window menu, the tool selection buttons, the image display area, and the object entry area. From the File menu selection the user has the ability to save the current image and objects and load another image. The Options menu contains selections for tuning panels for Snakes, Flood-Fill, as well as a Zoom selection, useful for working with very large or small images. There are nine drawing tools provided by the interface: Polygon, Rectangle, Ellipse, Paint Brush, Eraser, Line Draw, Object Move, Fill Area, Snake Outline. For example the Polygon tool allows the user to click or drag around bounding edges of the object to be outlined, this can then be refined by the snakes method providing a shrink-wrap effect.</p> <p>Before using any tool on an image the user must first click New to create an object entry (Two shown on bottom of figure 4). The user can then type any text associated with the object to be outlined, or can do this after outlining the object. The user then selected an outlining tool and defines the “mask”. Multiple tools can be used and the last change can be removed with the Undo button or all changes removed with the Clear button.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion- and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative frames, or r-frames,</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions-which we call objects-in the images. . . .</p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>queries return items with matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p> <p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>QBIC SYSTEM OVERVIEW</b>                      Figure 1 illustrates a typical QBIC query.*                      The left side shows the query specification, where the user painted a large magenta circular area on a green background using standard drawing tools. Query results are shown on the right: an ordered list of “hits” similar to the query. The order of the results is top to bottom, then left to right, to support horizontal scrolling. In general, all queries follow this model in that the query is specified by using graphical means—drawing, selecting from a color wheel, selecting a sample image, and so on—and results are displayed as an ordered set of images.</p> <p>To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content—colors, textures, shapes, and camera and object motion—and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.</p> <p><b>Data model</b>                      For both population and query, the QBIC data model has</p> <ul style="list-style-type: none"> <li>• still images or scenes (full images) that contain objects (subsets of an image), and</li> <li>• video shots that consist of sets of contiguous frames and contain motion objects.</li> </ul> <p>For still images, the QBIC data model distinguishes between “scenes” (or images) and “objects.” A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative</p> <p>IBM0000893 at 895</p> <p>text at top. Tools in row are polygon outliner, rectangle outliner, ellipse outliner, paintbrush, eraser, line drawing, object translation, flood fill, and snake outliner.</p> <p>frames, or <i>r</i>-frames, are generated for each extracted shot. <i>R</i>-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.</p> <p>Queries are allowed on objects (“Find images with a red, round object”), scenes (“Find images that have approximately 30-percent red and 15-percent blue colors”), shots (“Find all shots panning from left to right”), or any combination (“Find images that have 30 percent red and contain a blue textured object”).</p> <p>In QBIC, similarity queries are done against the database of pre-extracted features using distance functions between the features. These functions are intended to mimic human perception to approximate a perceptual ordering of the database. Figure 2 shows the match engine, the collection of all distance functions. The match engine interacts with a filtering/indexing module (see “Fast searching and indexing” sidebar, next page) to support fast searching methodologies such as indexing. Users interact with the query interface to generate a query specification, resulting in the features that define the query.</p> <p><b>DATABASE POPULATION</b>                      In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like “baby on beach,” can be associated with an outlined object or with the scene as a whole.</p>

		<p><b>REPRESENTATIVE FRAME GENERATION.</b>                      Once the shot boundaries have been detected, each shot is represented using an <i>r</i>-frame. <i>R</i>-frames are used for several purposes. First, during database population, <i>r</i>-frames are treated as still images in which objects can be identified by using the previously described methods. Secondly, during query, they are the basic units initially returned in a video query. For example, in a query for shots that are dominantly red, a set of <i>r</i>-frames will be displayed. To see the actual video shot, the user clicks on the displayed <i>r</i>-frame icon.</p> <p>The choice of an <i>r</i>-frame could be as simple as a particular frame in the shot: the</p> <p>IBM0000893 at 898</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged</p>

		<p><b>Flickner Depo at 22-25</b></p> <p>1 Q. Okay. And what would you do with the                  2 image after you hit and extracted the color                  3 histogram from it?                  4 A. Nothing.                  5 Q. Would those features be stored in any                  6 database or --                  7 A. Yes.                  8 Q. Okay. And let's do -- what about                  9 texture, could you extract texture features from an                  10 image?                  11 A. We did.                  12 Q. And how would you do that?                  13 A. I don't remember exact features we were                  14 using. There were -- we published some papers on                  15 them.                  16 Q. Okay. Was there any reasoning behind                  17 picking the features that you chose?                  18 A. Yes.                  19 Q. And what was that reasoning?                  20 A. We wanted to make it so that the results                  21 were perceptually good.                  22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red                  2 color in it or some sort red color histogram; is                  3 that right?                  4 A. Well, you -- you take specific -- you                  5 search for a red color. You'd compute the                  6 histogram and then basically match the histogram,                  7 which would give you images that had more colors in                  8 the reds. This is not -- it's not a unique thing.                  9 Q. Were you always searching for a                  10 particular feature, or could you just search some                  11 sort of example image?                  12 A. We could search an example image.                  13 Q. And how would that process work?                  14 A. Just extract the features from it.                  15 Q. So let's break that down.                  16 So you would submit an example image to                  17 the -- to the system, right?                  18 A. Uh-huh.                  19 Q. And then how do the -- how -- how does                  20 the system select which features to extract?                  21 A. It would compute them all, typically, or                  22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that                  2 this is a better match, that the ordering was                  3 reasonable and...                  4 Q. So by that, do you mean that people would                  5 view the results returned as the closest or close                  6 matches to your -- to your image?                  7 A. It was -- it would satisfy their query.                  8 Q. Okay. So -- so you would have this set                  9 of features in your database.                  10 How would you search for those features?                  11 A. Typically, we -- initially, we did linear                  12 scan where you just actually evaluate the -- the                  13 distance metric against all the features.                  14 Q. So in linear scan, you would compare some                  15 sort of search term against all the features in the                  16 database?                  17 A. Well, it depends on which features you're                  18 using. You didn't have to use all the features.                  19 You could use just color features or just texture                  20 features or just...                  21 Q. So to make sure I'm understanding this                  22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

		<p>Flickner Depo at 36</p> <p>10 Q. So underlying this paper, you mentioned</p> <p>11 you did more work on the shape side of things; is</p> <p>12 that right?</p> <p>13 A. I did.</p> <p>14 Q. And what would that work have entailed?</p> <p>15 A. We wanted to query by shape.</p> <p>16 Q. Okay. And how would that have worked?</p> <p>17 A. We created features related to the shape</p> <p>18 of a -- the object of -- as it populated the</p> <p>19 database, and then we would query against those</p> <p>20 features.</p> <p>Flickner 8/29/23 Depo at 33–37</p>

		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 52–53</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p> <p><i>Id.</i> at 77–78</p>

		<p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu-- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or                  2 more of these features than the other?                  3 A. Yes.                  4 Q. Which one?                  5 A. Shape.                  6 Q. Okay.                  7 (Witness reviews document.)                  8 A. So one thing I can state is originally I                  9 couldn't remember the name of the edge operator --                  10 and the name is Canny, the Canny edge operator --                  11 when we were talking about finding edges.                  12 Q. Okay. So this -- the paragraph on                  13 IBM 2393 refreshed your memory that shape                  14 calculation used Canny edge detection?                  15 A. No, that's sketch.                  16 Q. Oh, I'm sorry.                  17 A. I'm just stating that originally I was                  18 asked a question about standard edge operators. I                  19 couldn't remember the name. The name was Canny.                  20 Q. Canny. And Canny is used in the sketch                  21 calculation?                  22 A. Yeah, it's used in the sketch calculation.                  23 Q. Understood. Okay. Let's go back to                  24 shape.                  25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.                  2 Q. Can you say the name of the word again?                  3 A. I think it's called perround.                  4 Q. Per round?                  5 A. Yeah.                  6 Q. Those -- are those two words, p-e-r,                  7 r-o-u-n-d?                  8 A. P-e-r -- one word.                  9 Q. Okay. Perround, one word.                  10 A. It's basically the perimeter squared over                  11 area.                  12 (Reporter seeks clarification.)                  13 A. Perimeter squared over area.                  14 (Reporter seeks clarification.)                  15 A. Length of the -- over area.                  16 Q. Okay. So let's step back a little bit.                  17 So it says -- the second paragraph says [as read],                  18 "Our shape features are based on a combination of                  19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features                  20 area, circularity, eccentricity, major access                  21 orientation and a set of algebraic moment                  22 invariants," i-n-v-a-r-i-a-n-t-s.                  23 Did I read that correctly?                  24 A. Um-hum.                  25 Q. Okay. For circularity, that is computed</p>	
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.                  2 To calculate the shape feature in a query                  3 image or a stored database image, is the first step                  4 to convert that image into a binary image?                  5 A. I don't think so.                  6 Q. So if you look at the second paragraph --                  7 and the reason why I ask is -- it's the second                  8 sentence in the second paragraph under "Shape                  9 features." It says [as read], "All shapes are                  10 assumed to be non-occluded planar shapes allowing                  11 for each shape to be represented as a binary image."                  12 See that?                  13 A. Yeah.                  14 Q. And then the next sentence says [as read],                  15 "The area is computed as the number of pixels set in                  16 the binary image."                  17 A. Right.                  18 Q. So that's why I ask is it the first step                  19 in calculating shape to convert the image to binary?                  20 A. Yes.                  21 Q. And then once you convert it to binary                  22 image, then what do you do next in order to                  23 calculate the shape?                  24 A. You're computing something called                  25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?                  2 A. Right.                  3 Q. All right. Area is the number of pixels                  4 in the binary image?                  5 A. In the binary blob.                  6 Q. In the binary what?                  7 A. Blob.                  8 Q. Blob. And when you say "blob," what does                  9 that refer to?                  10 A. The outline of the object that you're                  11 doing a shape query on.                  12 Q. And so are each of these, area,                  13 circularity, eccentricity, major axis orientation                  14 and algebraic moment invariants, are those each                  15 different algorithms or is it all the same                  16 algorithm?                  17 A. It's different algorithms.                  18 Q. Okay. And since you worked on the shape                  19 feature the most, do you recall any other details                  20 that are not disclosed in this paragraph?                  21 A. Well, this evolved and we ended up doing                  22 an implementation of something that's not in here.                  23 Q. Okay. And what was that implementation?                  24 A. Something called turning angle per round,                  25 turning angle, which is -- it looks at the tangent</p>	

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So 2 you're computing the turning angle. You're 3 computing this angle that represents a shape in a 4 very interesting way. 5 They don't seem to be very good for 6 human -- so if you asked a human whether these two 7 shapes are similar, they would say "yes," but under 8 that feature set. 9 Q. And you call that something per round? 10 What was the name of it? Started with a T. 11 Turrent? 12 A. Turning angle. 13 Q. Oh, turning angle. 14 A. Yeah. 15 Q. Well, it said -- your answer -- you did 16 say turning angle, but you said something called 17 something per round, and it started with a T. I 18 thought you said turrent, but maybe I misunderstood. 19 MR. STRAUSSMAN: Tangent? 20 THE WITNESS: Tangent angle, yeah. 21 BY MR. EDWARDS: 22 Q. Okay. So something called tangent per 23 round, is that what you would call it, this -- 24 A. No. 25 Q. -- this implementation?</p>	<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle. 2 Q. Okay. So the name of the new 3 implementation you're talking about for shape 4 calculation is called turning angle? 5 A. It used turning angle as a major feature. 6 Q. Okay. Was there any other name it went 7 by? 8 A. I don't recall. 9 Q. All right. And that was -- that 10 methodology was implemented to calculate shape on a 11 query image and an image stored in the database post 12 this article? 13 A. Yes. 14 Q. Was that the -- did that -- did that 15 implementation, the turning angle, did that replace 16 the methodology in this article or was it 17 supplementing the metho- -- 18 A. Supplementing. 19 Q. Okay. Other than turning angle, were 20 there any other methodologies used after this 21 article? 22 A. Not that I recall. 23 Q. Okay. Okay. Let's go sketch features, if 24 you take a look at that and then let me know when 25 you're done reading it.</p>

		<p><i>Id.</i> at 119–128:</p> <table border="1"> <tr> <td data-bbox="919 293 1255 776"> <p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p> </td> <td data-bbox="1255 293 1591 776"> <p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p> </td> </tr> <tr> <td data-bbox="919 776 1255 1258"> <p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p> </td> <td data-bbox="1255 776 1591 1258"> <p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p> </td> </tr> </table>	<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>	<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>
<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>					
<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then          2 you're looking for blue water, white sand.          3 BY MR. EDWARDS:          4 Q. Do you recall what the methodologies          5 used -- that were used to calculate the orientation          6 of those colors in the image?          7 MR. HANSEN: Objection; lacks foundation.          8 THE WITNESS: There's no orientation per se.          9 It's just position.          10 BY MR. EDWARDS:          11 Q. Well, then position. Do you recall what          12 the methodologies are to calculate the position?          13 MR. HANSEN: Same objection.          14 THE WITNESS: Position is something the user          15 inputs.          16 BY MR. EDWARDS:          17 Q. Something you use what?          18 A. The user had to input.          19 Q. Okay. And then let's move on to the next          20 one, T. It says, "Click T to search images with          21 similar global texture."          22 A. Yeah.          23 Q. Do you recall, in your work on the QBIC          24 project, a feature called global texture that could          25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?          2 A. G-a-b-o-r.          3 Q. So switch over and look at the second page          4 of this Exhibit 6.          5 So -- well, first back -- go back to -- go          6 back to the first page. If you see on the left-hand          7 side it says, "Goto: IBM Image Search Demo," and a          8 little finger there is clicking it.          9 You see it's in red?          10 A. Yeah.          11 Q. Okay. So that's clicking on that link.          12 And then the second page is going to the IBM image          13 search demo.          14 A. Okay.          15 Q. Okay? On the second page it is showing          16 thumbnails with the different icons that we just          17 walked through, I, C, L, T, S, on each of those          18 icons.          19 Do you see that?          20 A. Yep.          21 Q. Do you recognize this as a similar layout          22 to the QBIC demos you hosted in the '90s?          23 A. I don't.          24 Q. You don't?          25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .          2 Q. Say again?          3 A. I missed one of your words. A feature          4 called what?          5 Q. I said do you recall in your work on the          6 QBIC project a feature called global texture that          7 was extracted from the image?          8 A. Yes.          9 Q. Okay. Is that -- is that akin to texture          10 that we looked at earlier?          11 A. Yes.          12 Q. Okay. And the last one is S. It's,          13 "Search images with special multipass filter."          14 Do you recall, in your work on the QBIC          15 project, being able to calculate a feature called          16 multipass filter?          17 A. Probably Gabor functions.          18 Q. Say again?          19 A. Gabor functions.          20 Q. One more time and louder.          21 A. Gabor functions.          22 Q. Gabor functions. Okay. What are Gabor          23 functions?          24 A. Gabor functions are a way of producing          25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM          2 website that was the AIX operating system in          3 Exhibit 3, that did not have a similar thumbnail          4 layout like this?          5 A. A thumbnail, yes. I don't recall it had          6 the buttons, the I, C, L, T, S.          7 Q. You don't recall it had all the buttons or          8 some of the buttons?          9 A. All the buttons.          10 Q. Okay. So you don't recall that it had any          11 buttons?          12 A. I don't -- yeah. I don't recall.          13 Q. It could have, it couldn't have, you just          14 don't remember?          15 A. I just don't remember, yeah.          16 Q. Okay. But the one that you hosted on          17 IBM's website, it did have thumbnails in a similar          18 format here?          19 A. Yeah, it had thumbnails.          20 Q. And these thumbnails represent the images          21 that are stored in the database?          22 A. Yes.          23 Q. Okay. Here, the 470 images would be          24 reflected at least -- one, two, three, four, five,          25 six, seven -- eight of them right here in this</p>

		<table border="1"> <tr> <td data-bbox="919 256 1283 787"> <p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p> </td> <td data-bbox="1283 256 1654 787"> <p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p> </td> </tr> <tr> <td data-bbox="919 787 1283 1318"> <p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p> </td> <td data-bbox="1283 787 1654 1318"> <p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p> </td> </tr> </table>	<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>	<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>
<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>					
<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p>19 Q. Okay. So one way is to submit an image</p> <p>20 query, where you -- where you submit a -- as an</p> <p>21 input to the query an image, and that could be a</p> <p>22 still image or an r-frame; correct?</p> <p>23 A. Correct.</p>

		<p><i>Id.</i> at 139–165</p> <p>5 Q. And for the image that you use as a base</p> <p>6 for the query, the things we all talked about in</p> <p>7 terms of feature extraction for average color, color</p> <p>8 histogram, shape, texture, sketch, all of those</p> <p>9 things, the same algorithms would be used in order</p> <p>10 to extract those features from the image query?</p> <p>11 A. They're different algorithms. You would</p> <p>12 use an algorithm.</p> <p>13 Q. I'm sorry. Say that again?</p> <p>14 A. The algorithms are different between the</p> <p>15 shape features and the color features and sketch</p> <p>16 features.</p> <p>17 Q. Yeah. Understood. What I'm trying --</p> <p>18 what I'm trying to understand is, the process that</p> <p>19 we talked about before, when you populate the</p> <p>20 database and you extract the features from the</p> <p>21 images that are stored in the database.</p> <p>22 You know, we went through all those</p> <p>23 different algorithms that are used for shape, color,</p> <p>24 both average color and histogram, texture and</p> <p>25 sketch.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference				
		<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p> </td> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p> </td> </tr> <tr> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p> </td> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p> </td> </tr> </table>	<p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>	<p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>
<p style="text-align: right; margin: 0;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right; margin: 0;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>					
<p style="text-align: right; margin: 0;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right; margin: 0;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>					

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between  2 the query image and the database image using  3 weighted Euclidean distance; is that right?  4 A. Yep.  5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.  6 And can you just tell us at a high level  7 what -- if you can -- what Euclidean distance is?  8 A. So if you have multiple features or  9 multiple scaler features, you have to ask the  10 question I'm trying to build a distance from that  11 vector to a query vector.  12 And as you build that -- the distance, you  13 have -- you may want to weight different elements of  14 the vector differently. And we found out that using  15 variance normalization, where weights of the  16 variance of the feature, gave good aesthetic  17 results.  18 (Reporter seeks clarification.)  19 A. Aesthetic results.  20 Q. And I apologize, I couldn't hear what you  21 said. You said, "And we found out that using  22 variance" . . .  23 A. So you normalize each feature with its  24 variance.  25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)  2 Q. Well, let me ask my -- let me get my  3 question out first.  4 So we talked about the features for  5 average color before are RGB, Yiq, LAB and MTM.  6 A. Correct.  7 Q. And so, for example, for the RGB, you're  8 saying that you would take the R and you would  9 divide it by the variants of red and green, for  10 example --  11 A. Just variants of red.  12 Q. Okay. And so you could do the same for  13 the others, for Yiq or LAB?  14 A. Exactly.  15 Q. Okay. You do that for both the image  16 input query and the stored image; correct?  17 A. Correct.  18 Q. And then you're calculating the distance  19 between them, so determining how similar they are  20 based on the distance?  21 A. Yeah, or vector distance.  22 Q. Understood.  23 A. Two vectors of differences --  24 (Reporter seeks clarification.)  25 A. Two vectors with a distance calculation on</p>
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.  2 Q. With its variance.  3 A. And then compute the average.  4 Q. Okay.  5 A. Or, I'm sorry, compute the weighted sum.  6 So red divided by the variants of red, plus green  7 divided by the variants of green --  8 (Reporter seeks clarification.)  9 A. Red divided by the variants of red, green  10 divided by the variants of green, L divided by the  11 variants of L, that's how you combine the various  12 features.  13 Q. Understand. And L represents what?  14 A. Luminance.  15 Q. Okay. And this is -- you're talking  16 specifically with respect to average color?  17 A. Well, the variance normalization is well  18 known in terms of multidimensional feature merging.  19 Q. But for average color, you wouldn't use  20 luminance, right, as a -- as a variant?  21 A. Luminance would just -- you wouldn't use  22 just luminance. You could use luminance . . .  23 Q. Well, so the color features we talked  24 about before would be RGB, Yiq, LAB --  25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.  2 Q. You're going to have to repeat that and be  3 just a little bit louder, Mr. Flickner. Sorry.  4 A. That's all right. Let me get my thoughts  5 together.  6 So we have multiple dimensional features.  7 It's not unusual to take each dimension and  8 normalize it by the variance because that gives  9 you -- what that does is if you have tight variances  10 you divide it by, you get bigger numbers. So you  11 have more information close by.  12 Q. What was the word you said before "close  13 by"?  14 A. I don't remember.  15 THE REPORTER: Information?  16 THE WITNESS: Information close by?  17 BY MR. EDWARDS:  18 Q. Okay. Okay. So now let's talk about  19 color histograms.  20 A. Okay.  21 Q. Okay? Well, stop. Let's go back to  22 average color. So is there -- you described the  23 weighted Euclidean distance that's calculated  24 between the query image and the database image for  25 average color.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall                  2 that's not disclosed in the paragraph at IBM 2394?                  3 A. Not that I recall.                  4 Q. Okay. Do you recall whether this distance                  5 methodology changed after this article or it stayed                  6 the same?                  7 A. It changed.                  8 Q. Are you certain or do you know?                  9 A. I'm not certain, but I'm pretty certain.                  10 Q. And how did it change?                  11 A. Different features were shaped like an                  12 inch in color. The algorithm evolved. It wasn't                  13 static.                  14 Q. And how did it evolve?                  15 A. I don't recall all the details.                  16 Q. Do you recall whether it supplemented the                  17 weighted Euclidean distance or replaced it?                  18 A. I don't recall.                  19 Q. Is it fair to say there was always some                  20 distance measurement to determine similarity for                  21 average color in the QBIC system?                  22 A. There's some measurement, yeah.                  23 Q. Okay. Let's talk about color histogram.                  24 So in order to determine the similarity                  25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was                  2 determined by weighted Euclidean distance; is that                  3 right?                  4 MR. HANSEN: Same objection.                  5 THE WITNESS: Correct.                  6 BY MR. EDWARDS:                  7 Q. And how did -- how was that weighted                  8 Euclidean distance determined?                  9 A. It was inverse variance.                  10 (Reporter seeks clarification.)                  11 A. Variance.                  12 Q. And it was inverse variance for components                  13 like coarseness, contrast and directionality?                  14 A. Correct.                  15 Q. Okay. And do you recall if that                  16 methodology changed or stayed the same after this                  17 article for the QBIC system?                  18 A. Most likely it evolved.                  19 Q. Do you know for sure?                  20 A. No.                  21 Q. Do you recall any details?                  22 A. No.                  23 Q. All right. Let's talk about shape next.                  24 The similarity between the query image and                  25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines                  2 distance between normalized histograms?                  3 A. Correct.                  4 Q. Do you recall any details of how that                  5 worked?                  6 A. Not off the top of my head.                  7 Q. Do you recall whether that methodology                  8 evolved for matching color histograms after this                  9 article?                  10 A. Not that I recall.                  11 Q. Okay. All right. Let's talk about                  12 texture next. And I don't know if you've read that,                  13 but that's at the bottom of 2394 and it goes to just                  14 barely at the top of 2395.                  15 (Witness reviews document.)                  16 A. Okay.                  17 Q. So for texture, the similarity is                  18 determined by the distance or the weighted Euclidean                  19 distance between the query object and -- the query                  20 object image and the database object image; is that                  21 right?                  22 MR. HANSEN: Objection; vague and ambiguous.                  23 THE WITNESS: Can you repeat.                  24 BY MR. EDWARDS:                  25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?                  2 A. Correct.                  3 Q. And do you recall how that worked?                  4 A. There's computing moments. And we used                  5 the shape measure, which I mentioned earlier,                  6 curvature and turning angle.                  7 (Reporter seeks clarification.)                  8 A. Curvature and turning angle.                  9 Q. And the curvature and turning angle would                  10 be compared between the image query and the database                  11 image; correct?                  12 A. Correct.                  13 Q. And do you recall if that methodology                  14 changed after this article came out in '93?                  15 A. Yes, it did.                  16 Q. How so?                  17 A. Well, in the IEEE computer paper, we                  18 described a different way of doing shape measures.                  19 And they included the moment calculations.                  20 Q. And you use the moment calculations to                  21 determine a distance between the image query and                  22 the -- and the database image?                  23 A. Yes.                  24 Q. Sorry?                  25 A. Yeah. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?                  2 A. Given a binary blob, certain high-level                  3 moments and then you create -- compute the                  4 eigenvectors of certain matrices that are created --                  5 (Reporter seeks clarification.)                  6 A. Eigenvectors, e-i-g-e -- i-n -- to compute                  7 the eigenvectors of certain matrices. And that                  8 would give you translation and rotation and                  9 variance.                  10 Q. And so after the Exhibit 3 1995 IEEE                  11 article, did that methodology change to compute the                  12 distance for shape?                  13 A. I don't recall.                  14 Q. So the methodology for shape that you just                  15 described using moment calculations, that is                  16 different from what is described in the 1993 article                  17 for weighted Euclidean distance?                  18 A. We still might have used weighted                  19 Euclidean distance when the underlying features are                  20 different.                  21 Q. Understood.                  22 And the underlying features are different                  23 in the sense that in the 1995 article you're using                  24 what features?                  25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment                  2 invariants.                  3 (Witness reviews document.)                  4 A. Is there any other papers that we have                  5 here?                  6 Q. Nope.                  7 A. Everything else is screenshots?                  8 MR. STRAUSSMAN: I don't think you introduced                  9 any other papers.                  10 THE WITNESS: I saw it earlier today.                  11 BY MR. EDWARDS:                  12 Q. Why don't we do it this way. In terms of                  13 the feature calculations that were -- for shape on                  14 page IBM 900 of Exhibit 3 versus page --                  15 A. So if you look at 2393.                  16 Q. What page are you directing me to?                  17 A. 2393.                  18 Q. Okay.                  19 A. So it talks about the moment invariants as                  20 well.                  21 Q. Okay.                  22 A. These are those matrices that you compute                  23 eigenvectors of.                  24 (Reporter seeks clarification.)                  25 A. Matrices that you compute eigenvectors of.</p>	
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)                  2 Q. I think the page you may be looking for is                  3 IBM 900 on the left side.                  4 (Witness reviews document.)                  5 A. What else do we have here?                  6 Q. So if you'll look at -- if you'll -- if                  7 you'll compare page IBM 900 from Exhibit 3 to page                  8 IBM 2393 from Exhibit 2, those are the descriptions                  9 in both articles about the features that are                  10 calculated.                  11 A. I'm trying to remember what --                  12 MR. STRAUSSMAN: Can you direct him a little                  13 closer?                  14 BY MR. EDWARDS:                  15 Q. Can I show you? Do you mind?                  16 I believe this is what you're looking for.                  17 So if you look right here (indicating).                  18 (Witness reviews document.)                  19 A. That's the same as this one (indicating).                  20 We had another -- there's another discussion about                  21 moments.                  22 Q. So if you look at -- under "Shape                  23 features" at 2393, right there, where you're looking                  24 at --                  25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment                  2 invariants in the 1993 SPIE article?                  3 A. Correct.                  4 Q. Right. And then if you go to the IEEE                  5 article that you primarily co-authored, on page 900,                  6 it refers to shape queries using area, circularity,                  7 eccentricity, major-axis direction and features                  8 derived from the object moments.                  9 A. Right.                  10 Q. Is that the same thing as algebraic moment                  11 invariants?                  12 A. Right.                  13 Q. So it looks like the methodologies are the                  14 same for the features that are extracted between the                  15 papers; is that right?                  16 A. I thought one paper had algebraic moments                  17 and one had turning angle. Maybe they both had                  18 turning angle.                  19 (Reporter seeks clarification.)                  20 A. Turning angle. Algebraic moments.                  21 Turning angles.                  22 Q. The 1993 paper refers to algebraic moment                  23 invariants. The IEEE paper, on IBM 900, refers to                  24 features derived from object moments.                  25 Are those the same thing?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.</p> <p>2 Q. Okay. And so turning angles, which you've</p> <p>3 previously testified on, do you think that</p> <p>4 calculating shape features based on turning angles</p> <p>5 came after these papers?</p> <p>6 A. No. They're mentioned in these papers.</p> <p>7 Q. Okay. So they're included in these</p> <p>8 papers?</p> <p>9 A. Yes.</p> <p>10 Q. And so any distance measurement using</p> <p>11 weighted Euclidean distance would have taken into</p> <p>12 account turning angles?</p> <p>13 A. As a feature, yeah. Yes.</p> <p>14 Q. For both -- for both papers?</p> <p>15 A. For both papers.</p> <p>16 Q. Okay. Let's talk about sketch, which</p> <p>17 is -- if you'll just stick with 2395, which is</p> <p>18 Exhibit 2.</p> <p>19 MR. STRAUSSMAN: Can you direct him?</p> <p>20 THE WITNESS: I found it.</p> <p>21 MR. STRAUSSMAN: Okay.</p> <p>22 (Witness reviews document.)</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Let me know when you're finished reading</p> <p>25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in the --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p>16 Q. Okay. So the results of the query -- so</p> <p>17 we talked about before that the results of the</p> <p>18 queries display thumbnails of the database images</p> <p>19 based on similarity of which they match; correct?</p> <p>20 A. Correct.</p> <p>21 Q. And then those thumbnails can provide</p> <p>22 links to the original image or, if it was an</p> <p>23 r-frame, it could be -- you could provide a link to</p> <p>24 the video; correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.</p> <p>2 Q. For sketch, the similarity between the</p> <p>3 query image and the database image uses an algorithm</p> <p>4 that performs logical binary correlation of the</p> <p>5 binary image?</p> <p>6 A. Yes.</p> <p>7 Q. Are there any other details you recall for</p> <p>8 the sketch comparison beyond what's disclosed in</p> <p>9 this paragraph on IBM 2395?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Do you recall the methodology for</p> <p>12 determining similarity of the input image and the</p> <p>13 database image for sketch changing after this</p> <p>14 article?</p> <p>15 A. Not that I recall.</p> <p>16 Q. So if you go to the next page,</p> <p>17 Mr. Flickner, which is 2396, the Section 4.2 talks</p> <p>18 about performing queries.</p> <p>19 A. Um-hum.</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links</p> <p>2 to information about the image that was associated</p> <p>3 with the image in the database?</p> <p>4 A. Yes.</p> <p>5 Q. And, again, that can be that -- whatever</p> <p>6 information that the user inputted or was associated</p> <p>7 with the image from the source?</p> <p>8 A. Yes.</p> <p>9 Q. Could the results also display a matching</p> <p>10 score so the user could see how well the particular</p> <p>11 result matched to the -- to the query image?</p> <p>12 A. It could.</p> <p>13 Q. Okay.</p> <p>14 MR. EDWARDS: I'm going to hand you the next</p> <p>15 exhibit, Mr. Flickner.</p> <p>16 (Deposition Exhibit 10 was marked.)</p> <p>17 MR. EDWARDS: Handing you what's been marked as</p> <p>18 Exhibit 10.</p> <p>19 For the record, it's IBM Bates Nos. 002418</p> <p>20 to 2430.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. The title of this article is "Updates to</p> <p>23 the QBIC system."</p> <p>24 Do you see that?</p> <p>25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?</p> <p>2 A. Yes.</p> <p>3 Q. You are listed as a co-author of this</p> <p>4 article; is that correct?</p> <p>5 A. Yes.</p> <p>6 Q. And it is a paper that is published in the</p> <p>7 SPIE; correct?</p> <p>8 A. Correct.</p> <p>9 Q. In 1997; correct?</p> <p>10 A. Yes. It was 1997 or 1998.</p> <p>11 Q. No later than 1998; correct?</p> <p>12 A. Correct.</p> <p>13 Q. So just want to kind of orient you to the</p> <p>14 first page, which is IBM 2419.</p> <p>15 A. It's '98 because '97 is a different paper.</p> <p>16 Q. Well, if you turn the page, look at the</p> <p>17 footer on the right-hand side.</p> <p>18 Are you familiar that SPIE usually</p> <p>19 includes footers with the volume and the date at the</p> <p>20 bottom?</p> <p>21 A. Yeah.</p> <p>22 Q. And if you look at the footer kind of</p> <p>23 towards the right it says -786X-97-\$10 [sic]?</p> <p>24 A. Yeah.</p> <p>25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?</p> <p>2 A. Yep.</p> <p>3 Q. Okay. So let's -- I'm going to have you</p> <p>4 jump around, so I apologize in advance. Let's go to</p> <p>5 the -- kind of the back, IBM 2428.</p> <p>6 A. Okay.</p> <p>7 Q. Is that example of the stamps demo that</p> <p>8 was available on IBM's website?</p> <p>9 A. Yes.</p> <p>10 Q. All right. And if you look at the top in</p> <p>11 the location URL it has the almaden.ibm website</p> <p>12 address; correct?</p> <p>13 A. Correct.</p> <p>14 Q. All right. Let's flip forward to 2429.</p> <p>15 And is 2429 a screenshot of a trademark</p> <p>16 demo that was also available in the Almaden --</p> <p>17 excuse me -- almaden.ibm website?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. And that demo looks like the</p> <p>20 trademark query is based on shape; is that right?</p> <p>21 A. It uses shape as one similarity feature.</p> <p>22 Q. Right. So the trademarks are converted to</p> <p>23 a binary image, like we talked before -- talked</p> <p>24 about before, and then they're -- the matching</p> <p>25 process is done based on those binary images?</p>
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the</p> <p>2 conference was in '98.</p> <p>3 Q. Submission was in '97. So the paper was</p> <p>4 published in '97 and then the conference you</p> <p>5 presented it at was in 1998?</p> <p>6 A. That's possible.</p> <p>7 Q. Do you recall presenting this paper at a</p> <p>8 conference in 1998?</p> <p>9 A. No, I don't.</p> <p>10 Q. So the first page refers to the Photonics</p> <p>11 West 1999 -- excuse me. Photonics West 1998</p> <p>12 Electronic Imaging Conference in San Jose.</p> <p>13 Do you recall attending that conference?</p> <p>14 A. It's likely I did, but I don't recall.</p> <p>15 Q. Okay. But you would agree with me this</p> <p>16 paper was made available at least as early as 1998;</p> <p>17 correct?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. So the first page, IBM 2419. Under</p> <p>20 "Introduction," at the time of this paper it says,</p> <p>21 last line on the first paragraph, "Several online</p> <p>22 demos of QBIC are available at</p> <p>23 <a href="http://www.qbic.almaden.ibm.com">http://www.qbic.almaden.ibm.com</a>."</p> <p>24 Do you see that?</p> <p>25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p>22 Q. Okay. So 39 would be the -- so the first</p> <p>23 image at the top left is a 39, the one next to it is</p> <p>24 a 46, so the 39 would be a closer match than the 46;</p> <p>25 correct?</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference		
		<p><i>Id.</i> at 174–182</p> <table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"??                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="width: 50%; vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"??                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. *Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: It points to the file that's the                  4 QBIC catalog.                  5 BY MR. EDWARDS:                  6 Q. Can you walk us through that one more                  7 time? And just be a little bit louder, sorry.                  8 MR. HANSEN: Same objection.                  9 THE WITNESS: So the QBIC catalog is a set of                  10 files that hold data about visual features in the                  11 image.                  12 (Reporter seeks clarification.)                  13 THE WITNESS: Visual features. The image                  14 extender lets you search against that database,                  15 against that object.                  16 BY MR. EDWARDS:                  17 Q. The image extender lets you search against                  18 that catalog, the name of that catalog?                  19 A. The catalog, yeah.                  20 Q. Okay. And it does so by using a pointer                  21 from the handle in the table?                  22 MR. HANSEN: Objection; lacks foundation.                  23 THE WITNESS: Correct.                  24 BY MR. EDWARDS:                  25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold                  2 data for the following image features: Average                  3 color, Histogram color, Positional color and                  4 Texture."                  5 Is that right?                  6 A. Yep.                  7 Q. Okay. We spoke about average color,                  8 histogram color and texture; correct?                  9 A. Right.                  10 Q. What is positional color?                  11 A. We talked about it briefly. It's color in                  12 particular locations in the image.                  13 Q. Ah. Understood.                  14 That is -- that is similar to L in the                  15 demo that we looked at, which is called color                  16 layout.                  17 A. Okay, yes.                  18 Q. Is that correct?                  19 A. I don't remember if it's called L. Sounds                  20 right.                  21 Q. If you look at --                  22 MR. EDWARDS: If you can show -- give him                  23 Exhibit 6.                  24 THE WITNESS: Oh, this L. Yes.                  25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.                  3 MR. HANSEN: Objection; lacks foundation, calls                  4 for speculation.                  5 MR. EDWARDS: You can put that enormous exhibit                  6 aside.                  7 THE WITNESS: Test 1, 2, 3.                  8 BY MR. EDWARDS:                  9 Q. Go back to Exhibit 3, please. If you                  10 could turn to the page Bates-labeled IBM 894 with                  11 the architecture picture.                  12 A. Okay.                  13 Q. So I just -- I just want to kind of walk                  14 the -- through this architecture, Mr. Flickner. But                  15 as a high level, I just want to understand, is                  16 this -- is this a high-level architecture that would                  17 generally be used for any implementation of QBIC?                  18 A. Yes.                  19 Q. All right. So first step is you submit                  20 still images or r-frames for feature extraction; is                  21 that correct?                  22 A. Correct.                  23 Q. Okay. Features are extracted, such as                  24 color, texture, shape, sketch and text; correct?                  25 A. Location, yep.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 182</p> <p>1 Q. And location. Including the ones that I                  2 listed; correct?                  3 A. Yep.                  4 Q. Okay. After feature extraction is done,                  5 the images and those features for the database                  6 images are stored in the database; correct?                  7 A. Correct.                  8 Q. And then once those are stored, a user can                  9 query using some sort of a user interface; is that                  10 right?                  11 A. Correct.                  12 Q. And the user can query based on color,                  13 texture, shape, multi-object, sketch, location or                  14 text; is that right?                  15 A. Correct.                  16 Q. Okay. Those features are then decomposed                  17 and extracted from the query image and then a                  18 matching engine is used to compare those similarly                  19 extracted features from the stored images; is that                  20 correct?                  21 A. Correct.                  22 Q. And then the best matches are returned in                  23 similarity of order back to the user; is that right?                  24 A. Correct.                  25 Q. Okay. Thank you for that.</p> <p><i>Id.</i> at 190–191                  22 Q. So [as read], "Once the image catalogs are                  23 created, you can use the Image Query component to                  24 find image and business information. Business                  25 information, such as character and numeric data, are</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p style="text-align: right;">Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

	<p style="text-align: center;"><b>Description</b></p> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <p style="text-align: center;"><b>Image Classification</b></p> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <p style="text-align: center;"><b>Image Query</b></p> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p>	<p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <p style="text-align: center;"><b>Image Formats</b></p> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCX</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <p style="text-align: center;"><b>Product Positioning</b></p> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p>

		<p>IBM000001 at 37-39</p> <hr/> <p><b>Extender data structures</b></p> <p>The Image, Audio, and Video Extenders create and use administrative support tables and handles to store and access image, audio, and video data. The Image Extender also creates and uses QBIC catalogs to access images by content. The Video Extender also uses index files and shot catalogs to access information about scene changes in a video.</p> <p><b>Administrative support tables</b></p> <p><b>Administrative support tables</b>, also called metadata tables, contain the information that the extenders need to process user requests on image, audio, and video objects. The information in administrative support tables is often referred to as “metadata”.</p> <p>As Figure 7 on page 18 illustrates, some of the administrative support tables identify user tables and columns that are enabled for an extender. These tables reference other administrative support tables that are created to hold attribute information about objects in enabled columns. In these tables, the extenders maintain information about attributes that are unique to a particular extender-defined data type, as well as information about attributes that are common across extender data types. For example, the Image Extender maintains information about the width, height, and number of colors in an</p>

		<p><b>Data structures</b></p> <p>image, as well as information about attributes common to image, audio, and video objects, such as the identification of the person who imported the object into the database or who last updated the object.</p> <p>The administrative support tables can also contain the contents of stored objects in BLOB format. Alternatively, an object can be kept in a file and referenced by the administrative support tables. For example, a video clip can be stored as a BLOB in an administrative support table or kept in a file that is referenced by the table.</p>  <p style="text-align: center;"><i>Figure 7. Administrative support tables</i></p> <p>IBM000001 at 40-41</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

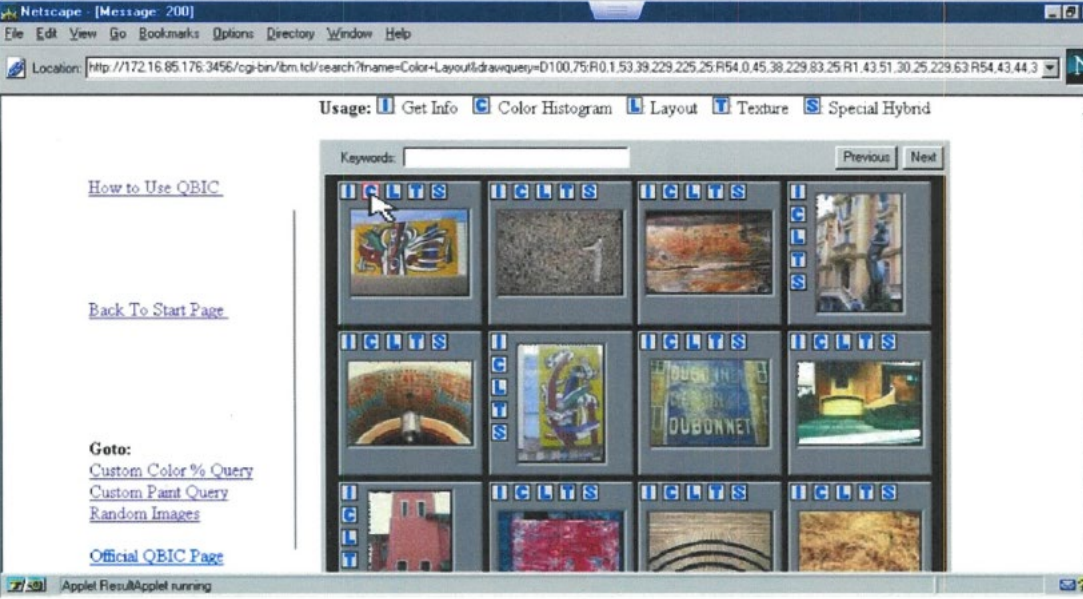

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p>Flickner 8/29/23 Depo Ex. 7 at 1</p>

		<p style="text-align: right;"><b>Data structures</b></p> <p><b>Handles</b></p> <p>When you store an image, audio, or video object in a user table, the object is not actually stored in the table. Instead, an extender creates a character string called a <b>handle</b> to represent the object, and stores the handle in the table. The extender stores the object in an administrative support table, or stores a file identifier in an administrative support table if you keep the content of the object in a file. It also stores the object's attributes and handle in administrative support tables. In this way, the extender can link the handle stored in a user table with the object information stored in the administrative support tables. Figure 8 illustrates the information stored for two images in a user table.</p> <p>User Table</p> <table border="1" data-bbox="961 573 1220 662"> <thead> <tr> <th>ID</th> <th>Name</th> <th>Picture</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> <td>Handle 1</td> </tr> <tr> <td></td> <td></td> <td>Handle 2</td> </tr> </tbody> </table> <p>Administrative Support Tables</p> <table border="1" data-bbox="961 704 1373 915"> <thead> <tr> <th colspan="4">Common Attributes</th> </tr> <tr> <th>Handle</th> <th>Importer</th> <th>Updater</th> <th></th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> <td></td> </tr> </tbody> </table> <table border="1" data-bbox="961 808 1346 915"> <thead> <tr> <th colspan="4">Unique Attributes</th> </tr> <tr> <th>Handle</th> <th>Width</th> <th>Height</th> <th>Numcolors</th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> <td></td> </tr> </tbody> </table>  <p><i>Figure 8. Handles</i></p> <p><b>QBIC catalogs</b></p> <p>A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.</p> <p>You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p style="text-align: right;">Chapter 2. 		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. 		<p style="text-align: center;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot catalog file name</li> <li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li> <li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li> <li>• Shot number</li> <li>• Starting frame number</li> <li>• Ending frame number</li> <li>• Representative frame number</li> <li>• Name of a file that contains the contents of the representative frame</li> </ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot handle</li> <li>• Video table name</li> </ul> <p style="text-align: right;">Chapter 2. Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Description</b> </div> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Classification</b> </div> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Query</b> </div> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p style="text-align: right;">and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Formats</b> </div> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCK</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Product Positioning</b> </div> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <div style="display: flex; justify-content: space-between; margin-top: 20px;"> <span>285-042</span> <span>-2-</span> </div>

		<p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (<i>R, G, B</i>) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.                      For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.                      Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.                      Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).”  <i>Id.</i> at p. 3.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):                      “To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.                      When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><b>QBIC Demo (IBM000747)</b></p>  <p>The screenshot shows a web browser window with the URL <code>http://172.16.85.176:3456/cgi-bin/ibm.tcl/info?france50%2Ejpg</code>. The page features the IBM logo and the text 'QBIC' with a small image of a person. Below this, there is a section titled 'Image france50.jpg' which contains a large image of a building facade with a colorful mural. Navigation links include 'How to Use QBIC' and 'Back To Start Page'. A 'Goto:' field is visible at the bottom left.</p> <p><b>Flickner Depo at 201-202</b></p> <p>5 Q. Now, to search a video by content using          6 CueVideo, how would the features be extracted from          7 the video?          8 MS. HAYDEN: Objection. Foundation.          9 THE DEPONENT: You typically would          10 extract -- you -- you try to find key frames and          11 then you populate the image database with key          12 frames.          13 Q. (By Mr. Dang) And how would you search          14 for those key frames in the image data?          15 A. You could use a QBIC-like engine.          16 Q. And by QBIC-like engine, what do you          17 mean?          18 A. Some image content-based retrieval          19 system.          20 Q. And what would the CueVideo system return          21 in response to a video query?          22 A. Typically, video snippets or videos</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>1 with -- where you already -- you had already seeked</p> <p>2 to the -- the point of the -- of the match.</p> <p>3 Q. Would it return the same video as the</p> <p>4 query video?</p> <p>5 A. It would -- it would return snippets, as</p> <p>6 I recall.</p> <p>7 Q. And snippets of which videos?</p> <p>8 A. Of the video that's -- the -- that the</p> <p>9 database has been created with.</p> <p>10 Q. Were those video snippets indexed in any</p> <p>11 way?</p> <p>12 A. I'm sure they were.</p> <p><b>Flickner Depo at 41-42</b></p> <p>18 Q. So if I'm understanding this right, you</p> <p>19 could take a query video, the system would extract</p> <p>20 frames, which would then extract features from it,</p> <p>21 and then the system would return either shot clips</p> <p>22 or key frames; is that right?</p> <p>1 A. Right.</p> <p>2 Q. Okay. And how many key frames would be</p> <p>3 returned?</p> <p>4 A. It depends how many you requested.</p> <p>5 Q. Could you alter how many you request?</p> <p>6 A. Probably.</p> <p>7 Q. Could you return key frames based on some</p> <p>8 defined threshold of the distance?</p> <p>9 A. Probably.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

		<p>Flickner Depo at 50</p> <p>7 Q. And so if I clicked on this T, and it              8 used the texture features, what would -- what would              9 the system do?</p> <p>10 A. It would return the list of stamps based              11 on similarity and texture.</p> <p>12 Q. And how would it decide which stamps were              13 the most similar to that query image?</p> <p>14 A. It would use those texture features to              15 compute it, and then it -- I think it was using L              16 to distance.</p> <p>Flickner Depo at 162-163</p> <p>15 Q. How did the trade -- how did the              16 technology implemented in the trademark demo decide              17 how many results to return to the user?</p> <p>18 A. So it was -- it was an exact match or a              19 binary search for the text fields using some              20 metric, like string at a distance, or something              21 like that, and that would give you a list and a              22 rank by the image features.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>7 Q. Okay. What about the -- the stamps demo,              8 going back to that, did the stamps demo return a              9 set number of results for each query?              10 For example, was it always the original              11 image and 11 results?              12 A. Again, the output -- the number of              13 results output was probably a parameterized              14 option -- option, and I don't recall having text              15 ability on the stamp demo.              16 Q. So you think that the user may have been              17 able to indicate to the QBIC system how many              18 results he wanted to see?              19 A. The user could configure the -- the GUI              20 to display a certain number of results.</p> <p>Flickner Depo at 131-132              14 Q. An action that the QBIC system would              15 automatically take based on the results it would              16 return.              17 A. So you're saying as you return results,              18 you do some post-filtering on the image or the --              19 what -- what kind of --              20 Q. Perhaps not -- not post-filtering.              21 But, for example, displaying a hyperlink              22 along with the results for a specific result.              1 A. Yeah, you could do that.</p> <p>Flickner 8/29/23 Depo at 119-128</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 118</p> <p>1 Do you see that?                  2 A. Yeah.                  3 Q. And then it describes different icons: I,                  4 C, L, T and S.                  5 Do you see that?                  6 A. Um-hum.                  7 Q. Are those icons similar to the QBIC demo                  8 that you hosted on the IBM's website?                  9 A. I don't recall the specific details. Most                  10 likely, yes.                  11 Q. Okay. So it says, "Click I to view the                  12 full image."                  13 Do you see that?                  14 A. Um-hum.                  15 Q. Was there a similar capability on the demo                  16 that was hosted on IBM's website?                  17 A. I don't recall.                  18 Q. So do you know what happens if you clicked                  19 I?                  20 A. Yeah, you -- pops the window up and you                  21 see the full image.                  22 Q. Okay.                  23 (Reporter seeks clarification.)                  24 A. It pops the window up.                  25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.                  2 Q. Does that correspond to the four features                  3 we looked at earlier, so for -- well, strike that.                  4 For color earlier we looked at two                  5 different flavors. We looked at average color and                  6 we looked at color histogram. So you said --                  7 A. Right.                  8 Q. -- C was color histogram.                  9 Does L correspond to average color or                  10 something different?                  11 A. Well, L has space embedded into it. So                  12 where the color appears in the image matters.                  13 Q. Okay.                  14 A. So C would be the whole image, what was                  15 the color percentage, and L would be I want a                  16 certain percentage in this region and a certain                  17 percentage in this region.                  18 Q. Okay. So what -- if you recall, so to                  19 calculate a color layout feature, do you recall the                  20 details of how that was done?                  21 MR. HANSEN: Objection; foundation.                  22 THE WITNESS: I don't recall.                  23 BY MR. EDWARDS:                  24 Q. Do you recall if that used -- for the                  25 color component, do you recall if that used</p>
		<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such                  2 a . . .                  3 MR. STRAUSSMAN: You got to speak up.                  4 BY MR. EDWARDS:                  5 Q. That's how you implemented what?                  6 A. You implement what the instructions say.                  7 Q. Okay. Is that a similar implementation                  8 for the other demos that you worked on?                  9 A. Most likely, yes.                  10 Q. Okay. So you click on I and then I would                  11 take you to a link that showed the full image?                  12 A. Um-hum.                  13 Q. Okay. And it says, "Click C to search                  14 images with similar color percentage."                  15 Do you see that?                  16 A. Yep.                  17 Q. Is that the color histogram?                  18 A. Most likely.                  19 Q. Okay. And it says, "Click L to search                  20 images with similar color layout."                  21 What does "color layout" mean?                  22 A. So now you're asking for color in                  23 different positions of the image.                  24 Q. Okay.                  25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?                  2 A. Average color or histogram --                  3 (Reporter seeks clarification.)                  4 MR. HANSEN: Objection; foundation.                  5 THE WITNESS: Average color or histogram color.                  6 So histogram as a space a position in the image.                  7 BY MR. EDWARDS:                  8 Q. Right. And color layout, is that                  9 something that you recall being developed by the                  10 QBIC team as a feature that can be extracted?                  11 A. Right.                  12 Q. Okay. And so it is color in a specific                  13 position?                  14 A. Yes.                  15 Q. Do you recall any of the algorithms that                  16 were used to calculate that?                  17 A. I think we were using color histogram.                  18 Q. Color histogram. Okay. And then how                  19 would you calculate the position aspect of it?                  20 MR. HANSEN: Objection; lacks foundation.                  21 THE WITNESS: We had -- the sketch tools would                  22 let you select a region and paint a color. And then                  23 you'd paint a crude map and then you would go search                  24 for color images that have the blue sky and the                  25 white sand. That's a different query than if you</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then          2 you're looking for blue water, white sand.          3 BY MR. EDWARDS:          4 Q. Do you recall what the methodologies          5 used -- that were used to calculate the orientation          6 of those colors in the image?          7 MR. HANSEN: Objection; lacks foundation.          8 THE WITNESS: There's no orientation per se.          9 It's just position.          10 BY MR. EDWARDS:          11 Q. Well, then position. Do you recall what          12 the methodologies are to calculate the position?          13 MR. HANSEN: Same objection.          14 THE WITNESS: Position is something the user          15 inputs.          16 BY MR. EDWARDS:          17 Q. Something you use what?          18 A. The user had to input.          19 Q. Okay. And then let's move on to the next          20 one, T. It says, "Click T to search images with          21 similar global texture."          22 A. Yeah.          23 Q. Do you recall, in your work on the QBIC          24 project, a feature called global texture that could          25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?          2 A. G-a-b-o-r.          3 Q. So switch over and look at the second page          4 of this Exhibit 6.          5 So -- well, first back -- go back to -- go          6 back to the first page. If you see on the left-hand          7 side it says, "Goto: IBM Image Search Demo," and a          8 little finger there is clicking it.          9 You see it's in red?          10 A. Yeah.          11 Q. Okay. So that's clicking on that link.          12 And then the second page is going to the IBM image          13 search demo.          14 A. Okay.          15 Q. Okay? On the second page it is showing          16 thumbnails with the different icons that we just          17 walked through, I, C, L, T, S, on each of those          18 icons.          19 Do you see that?          20 A. Yep.          21 Q. Do you recognize this as a similar layout          22 to the QBIC demos you hosted in the '90s?          23 A. I don't.          24 Q. You don't?          25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .          2 Q. Say again?          3 A. I missed one of your words. A feature          4 called what?          5 Q. I said do you recall in your work on the          6 QBIC project a feature called global texture that          7 was extracted from the image?          8 A. Yes.          9 Q. Okay. Is that -- is that akin to texture          10 that we looked at earlier?          11 A. Yes.          12 Q. Okay. And the last one is S. It's,          13 "Search images with special multipass filter."          14 Do you recall, in your work on the QBIC          15 project, being able to calculate a feature called          16 multipass filter?          17 A. Probably Gabor functions.          18 Q. Say again?          19 A. Gabor functions.          20 Q. One more time and louder.          21 A. Gabor functions.          22 Q. Gabor functions. Okay. What are Gabor          23 functions?          24 A. Gabor functions are a way of producing          25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM          2 website that was the AIX operating system in          3 Exhibit 3, that did not have a similar thumbnail          4 layout like this?          5 A. A thumbnail, yes. I don't recall it had          6 the buttons, the I, C, L, T, S.          7 Q. You don't recall it had all the buttons or          8 some of the buttons?          9 A. All the buttons.          10 Q. Okay. So you don't recall that it had any          11 buttons?          12 A. I don't -- yeah. I don't recall.          13 Q. It could have, it couldn't have, you just          14 don't remember?          15 A. I just don't remember, yeah.          16 Q. Okay. But the one that you hosted on          17 IBM's website, it did have thumbnails in a similar          18 format here?          19 A. Yeah, it had thumbnails.          20 Q. And these thumbnails represent the images          21 that are stored in the database?          22 A. Yes.          23 Q. Okay. Here, the 470 images would be          24 reflected at least -- one, two, three, four, five,          25 six, seven -- eight of them right here in this</p>

		<table border="1"> <tr> <td data-bbox="919 256 1283 787"> <p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p> </td> <td data-bbox="1283 256 1654 787"> <p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p> </td> </tr> <tr> <td data-bbox="919 787 1283 1318"> <p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p> </td> <td data-bbox="1283 787 1654 1318"> <p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p> </td> </tr> </table>	<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>	<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. *Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>5 Q. Well, let's talk about them. We can get                      6 into detail here.                      7 Well, before we -- before we get there, so                      8 how does the QBIC system display the results of                      9 matches to the user?                      10 A. Typically just thumbnails in a window in                      11 multiple ordered hits.                      12 Q. Okay. And it displays them in the order                      13 by which they're most similar. So the, you know,                      14 best match to the next best match to the next best                      15 match, so on and so forth?                      16 A. Correct.</p> <p><i>Id.</i> at 160 – 161                      16 Q. Okay. So the results of the query -- so                      17 we talked about before that the results of the                      18 queries display thumbnails of the database images                      19 based on similarity of which they match; correct?                      20 A. Correct.                      21 Q. And then those thumbnails can provide                      22 links to the original image or, if it was an                      23 r-frame, it could be -- you could provide a link to                      24 the video; correct?                      25 A. Correct.</p>

		<p>1 Q. And does the thumbnail also provide links                  2 to information about the image that was associated                  3 with the image in the database?                  4 A. Yes.                  5 Q. And, again, that can be that -- whatever                  6 information that the user inputted or was associated                  7 with the image from the source?                  8 A. Yes.</p> <p>Flickner 8/29/23 Depo Ex. 7 at 1</p>  <p><i>Id.</i> at 2</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>4.2. <b>Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p>5. <b>Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>IBM0002390 at 2391-92</p> <p>2.1. <b>Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at Figs. 7–9</p>

During the population, images and videos are processed to extract features describing their content—colors, textures, shapes, and camera and object motion—and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p><b>QBIC Demo (IBM000747)</b></p>

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 68–72</p> <p>22 Q. Okay. And in what form would those                  23 results be displayed to me? For images would they                  24 be displayed as a thumbnail?                  25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those                  2 be displayed to you?                  3 A. It could be as a thumbnail or as a short                  4 video clip or as a single representative frame.                  5 Q. Okay. So they could be -- so for a video,                  6 there's a video that matched the image query of an                  7 r-frame, the results I could get back could include                  8 three things. It could be a still image, it could                  9 be a thumbnail, or it could be an r-frame                  10 representation?                  11 A. R-frame, I think, is representative frame.                  12 So it was a key frame in that video sequence,                  13 summary frame.                  14 Q. Once I ran a query on an r-frame; right?                  15 Well, let's stop there.                  16 If I run a query on still images,                  17 typically the results I would get back are                  18 thumbnails that are most similar to the                  19 characteristics which I queried from the query                  20 image; right?                  21 A. You could get thumbnails back. You could                  22 also get the full-sized image back.                  23 Q. Okay.                  24 A. Thumbnail is a tool for helping you return                  25 lots of results and quickly scan it.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

Element	'004 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. STRAUSSMAN: You can answer.                  19 THE WITNESS: I don't know.                  20 BY MR. EDWARDS:                  21 Q. But, Mr. Flickner, this -- generally this                  22 article represents the status of the QBIC technology                  23 as of the date of this publication, which is                  24 September 1995; is that right?                  25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.                  2 THE WITNESS: As I recall -- I'm not sure                  3 definitely, but, yes, this is -- you could do that.                  4 BY MR. EDWARDS:                  5 Q. So let's go to page IBM 898.                  6 So if you'll take -- just read that                  7 paragraph that starts with the header                  8 "Representative Frame Generation."                  9 MR. STRAUSSMAN: And if you need to read                  10 anything else to put it in context, feel free to do                  11 so.                  12 THE WITNESS: Okay.                  13 (Witness reviews document.)                  14 THE WITNESS: So what was your question, again?                  15 BY MR. EDWARDS:                  16 Q. If you go to the sentence that says,                  17 "First" -- it's the second sentence in that                  18 paragraph. It says, "First, during database                  19 population, r-frames are treated as still images."                  20 See that?                  21 A. Yeah.                  22 Q. And that's what you told me earlier,                  23 correct?                  24 A. Yeah.                  25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --                  2 Q. Okay.                  3 A. -- there's an editorial process.                  4 Q. Say that last part?                  5 A. There's an editorial process. You submit                  6 it, they edit and make changes and eventually it                  7 appears.                  8 Q. Right. So what you're saying is there's                  9 some lag between the time that you wrote the article                  10 and the time it was published?                  11 A. Yeah.                  12 Q. So this article -- but this article                  13 represents the state of the QBIC technology at least                  14 as of September 1995?                  15 A. Yeah. Yes.                  16 Q. And then let's go to IBM 900.                  17 And take your time to orient yourself on                  18 that page, but what I really want to ask you about                  19 is the last paragraph on the left-hand column going                  20 up to the top of the right-hand column.                  21 A. Yep.                  22 Q. So it says this paper describes [as read],                  23 "a prototype system that uses image and video                  24 content as the basis for retrievals."                  25 Is that right?</p>

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p>	<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

Element	'004 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 160–161</p> <p>16 Q. Okay. So the results of the query -- so                      17 we talked about before that the results of the                      18 queries display thumbnails of the database images                      19 based on similarity of which they match; correct?                      20 A. Correct.                      21 Q. And then those thumbnails can provide                      22 links to the original image or, if it was an                      23 r-frame, it could be -- you could provide a link to                      24 the video; correct?                      25 A. Correct.</p> <hr/> <p>1 Q. And does the thumbnail also provide links                      2 to information about the image that was associated                      3 with the image in the database?                      4 A. Yes.                      5 Q. And, again, that can be that -- whatever                      6 information that the user inputted or was associated                      7 with the image from the source?                      8 A. Yes.                      9 Q. Could the results also display a matching                      10 score so the user could see how well the particular                      11 result matched to the -- to the query image?                      12 A. It could.</p> <p><i>Id.</i> at 321</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

**2. Claim 6**

Claim	'004 Claim Recitation	Exemplary Citations in Reference
6	<p>The method of claim 1, wherein the at least one object is identified as the target object based at least in part on at least one user input.</p>	<p>QBIC discloses the limitation.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2391-92  <i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2396                      All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

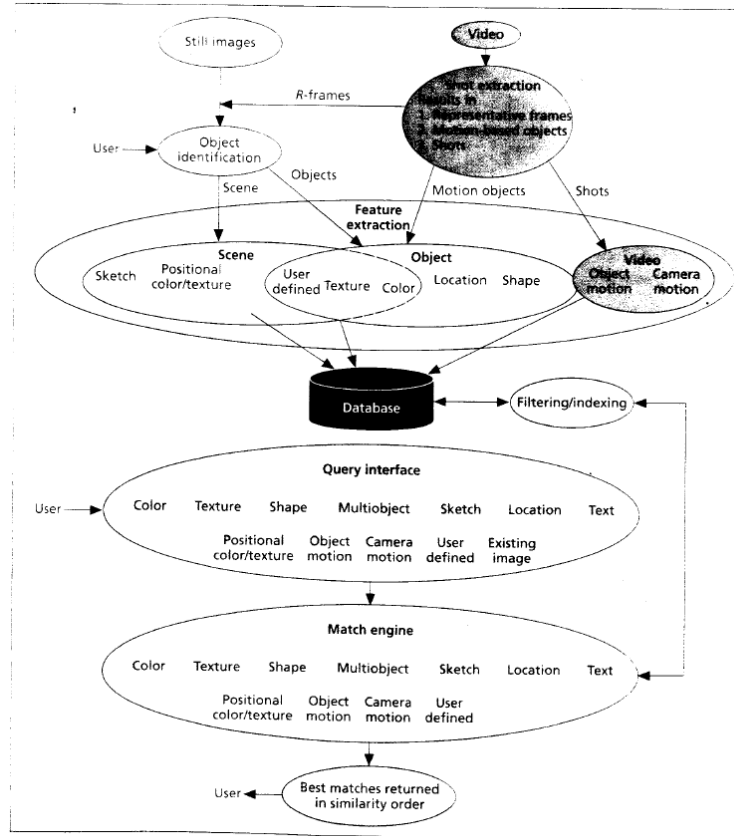

Figure 2. QBIC database population (top) and query (bottom) architecture.

*Id.* at Fig. 2.

“USER INTERFACE. The user interface must be designed to let users easily select content-based properties, allow these properties to be combined with each other and with text or parametric data, and let users reformulate queries and generally navigate the database.” *Id.* at p. 9.

Image, Audio, and Video Extenders Administration and Programming (IBM 000001-617):

“Your applications can even search for images by content. Imagine an application

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p>that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog. When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>
		<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then                  2 you're looking for blue water, white sand.                  3 BY MR. EDWARDS:                  4 Q. Do you recall what the methodologies                  5 used -- that were used to calculate the orientation                  6 of those colors in the image?                  7 MR. HANSEN: Objection; lacks foundation.                  8 THE WITNESS: There's no orientation per se.                  9 It's just position.                  10 BY MR. EDWARDS:                  11 Q. Well, then position. Do you recall what                  12 the methodologies are to calculate the position?                  13 MR. HANSEN: Same objection.                  14 THE WITNESS: Position is something the user                  15 inputs.                  16 BY MR. EDWARDS:                  17 Q. Something you use what?                  18 A. The user had to input.                  19 Q. Okay. And then let's move on to the next                  20 one, T. It says, "Click T to search images with                  21 similar global texture."                  22 A. Yeah.                  23 Q. Do you recall, in your work on the QBIC                  24 project, a feature called global texture that could                  25 be extracted from the image?</p> <p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .                  2 Q. Say again?                  3 A. I missed one of your words. A feature                  4 called what?                  5 Q. I said do you recall in your work on the                  6 QBIC project a feature called global texture that                  7 was extracted from the image?                  8 A. Yes.                  9 Q. Okay. Is that -- is that akin to texture                  10 that we looked at earlier?                  11 A. Yes.                  12 Q. Okay. And the last one is S. It's,                  13 "Search images with special multipass filter."                  14 Do you recall, in your work on the QBIC                  15 project, being able to calculate a feature called                  16 multipass filter?                  17 A. Probably Gabor functions.                  18 Q. Say again?                  19 A. Gabor functions.                  20 Q. One more time and louder.                  21 A. Gabor functions.                  22 Q. Gabor functions. Okay. What are Gabor                  23 functions?                  24 A. Gabor functions are a way of producing                  25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?                  2 A. G-a-b-o-r.                  3 Q. So switch over and look at the second page                  4 of this Exhibit 6.                  5 So -- well, first back -- go back to -- go                  6 back to the first page. If you see on the left-hand                  7 side it says, "Goto: IBM Image Search Demo," and a                  8 little finger there is clicking it.                  9 You see it's in red?                  10 A. Yeah.                  11 Q. Okay. So that's clicking on that link.                  12 And then the second page is going to the IBM image                  13 search demo.                  14 A. Okay.                  15 Q. Okay? On the second page it is showing                  16 thumbnails with the different icons that we just                  17 walked through, I, C, L, T, S, on each of those                  18 icons.                  19 Do you see that?                  20 A. Yep.                  21 Q. Do you recognize this as a similar layout                  22 to the QBIC demos you hosted in the '90s?                  23 A. I don't.                  24 Q. You don't?                  25 A. No.</p> <p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM                  2 website that was the AIX operating system in                  3 Exhibit 3, that did not have a similar thumbnail                  4 layout like this?                  5 A. A thumbnail, yes. I don't recall it had                  6 the buttons, the I, C, L, T, S.                  7 Q. You don't recall it had all the buttons or                  8 some of the buttons?                  9 A. All the buttons.                  10 Q. Okay. So you don't recall that it had any                  11 buttons?                  12 A. I don't -- yeah. I don't recall.                  13 Q. It could have, it couldn't have, you just                  14 don't remember?                  15 A. I just don't remember, yeah.                  16 Q. Okay. But the one that you hosted on                  17 IBM's website, it did have thumbnails in a similar                  18 format here?                  19 A. Yeah, it had thumbnails.                  20 Q. And these thumbnails represent the images                  21 that are stored in the database?                  22 A. Yes.                  23 Q. Okay. Here, the 470 images would be                  24 reflected at least -- one, two, three, four, five,                  25 six, seven -- eight of them right here in this</p>

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

**3. Claim 18**

Claim	'004 Claim Recitation	Exemplary Citations in Reference
18	<p>The method of claim 1, further comprising communicating at least one of banking account information, user data and terminal specific data to a banking company.</p>	<p>QBIC discloses this limitation.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p> <p>“INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at p. 8.</p> <p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,324,004 based on the Query by Image and Video Content (“QBIC”) System

containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.

In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.

Figure 1: Original image, approximate user outline, and automatically refined outline of sun.

Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):

“DB2 (DB2) Universal Database (UDB) is a powerful, object-relational database manager. It stores and protects traditional numeric and character data, as well as large, complex objects (LOBs). DB2 extenders help you exploit DB2’s object-relational features. The extenders define distinct data types and special functions for image, audio, video, and text objects. ... Because of that, the extenders give your applications a single point of access to any or all of these types of data, along with traditional numeric and character data.” *Id.* at p. 3.

“A trigger defines a set of actions that are activated by a change to a table. Triggers can be used to perform actions such as validating input data, automatically generating a value for a newly inserted row, reading from other

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,478,036 based on  
U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

### **Exhibit C-3**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Rhoads was filed on May 15, 2000, claiming the priority date of May 19, 1999. Rhoads published at least as of September 20, 2005, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Rhoads anticipates asserted claim 1 of the ’036 Patent. To the extent Rhoads is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Rhoads is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

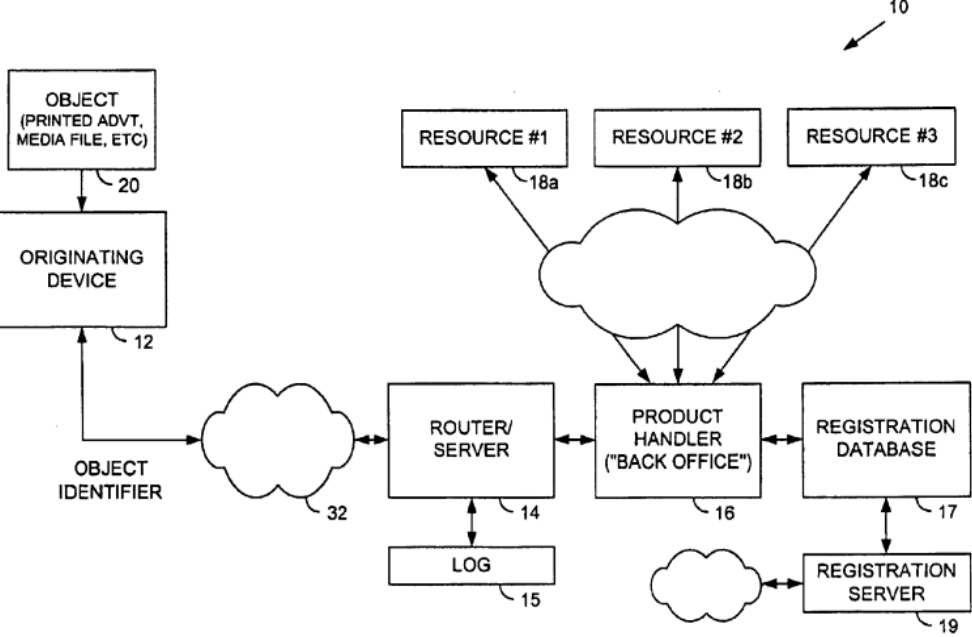

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,478,036 based on  
 U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>To the extent it is found that Rhoads does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Rhoads does not anticipate this claim, Rhoads renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine Rhoads with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1A]	<p>a target database storing known targets of different types and recognition parameters associated with the known targets;</p>	<p>Rhoads discloses a target database storing known targets of different types and recognition parameters associated with the known targets.</p> <p>Rhoads at 9:35–10:21</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from</p>

*Nantworks, LLC v. Bank of America Corporation*

U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example, some objects include subliminal graticule data, or other calibration data, steganographically encoded with the Bedoop data to aid in determining orientation. Others can employ overt markings, either placed for that sole purpose (e.g. reference lines or fiducials), or serving another purpose as well (e.g. lines of text), to discern orientation. Edge-detection algorithms can also be employed to deduce the orientation of the object by reference to its</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>In still other cases, hybrids of the two foregoing cases can be employed, e.g., handler 16 can send some data back to device 12, while also communicating with a remote resource 18.</p> <p>In some cases, the response returned to the device 12 by handler 6 (or a remote resource 18) can serve to trigger some further action by the device 12. For example, the response returned to device 12 can include a WindowsMedia audio file, together with a request that the device 12 launch the WindowsMedia player installed on the device. (The launching of a browser pointed to a URL is another example of such triggering.)”</p> <p>Rhoads at 51:18-37</p> <ul style="list-style-type: none"> <li>• “When shown a watermarked image, the application 28 c analyzes the image and extracts the embedded watermark payload (more particularly detailed below) from the image. The application sends some or all of this information in a message format to the router 14.</li> </ul> <p>The router 14 decodes the received message, looking for vendor and product information. Based on this information, it passes the message to a corresponding product handler 16.</p> <p>The product handler receives the message and attempts to match the detected watermark serial number to a registered watermark serial number earlier stored in the database 17. If a match is found, the product handler performs the desired action. As noted, typical actions include returning a URL for web redirection, serving up an HTML page for initial user navigation, initiating software downloads, etc. If a match is not found, the product handler returns an error code and message to the application 28 c. If a match is found, but the corresponding action is unavailable, incomplete, inactive or invalid, the product handler returns an error code and message to the calling application.”</p>

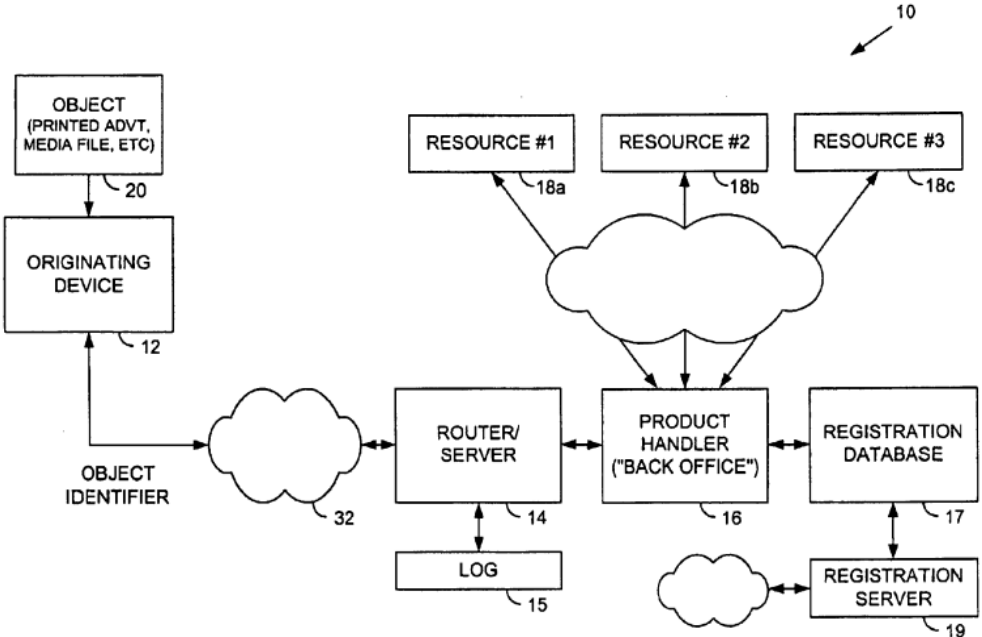

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,478,036 based on  
 U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>Rhoads at 52:38-51</p> <ul style="list-style-type: none"> <li>• “In order for the system to identify the response (e.g., a URL) that corresponds to an object identifier (e.g., a watermark), this data must first be associated within the database 17 in association with the watermark to which it corresponds. The watermark registration process captures some basic identification information used later to validate the incoming message, and identifies the associated information/action In the illustrated example the identification information includes:                      Customer Account,                      Object and associated attributes (name, description, expiration, etc.),                      Action, and                      Registered Serial Number (for registration updates)                      The Customer Account identifies the watermark registrant. In most cases, this is also the party to be billed for services. For validation and security reasons, the Customer Account is required to be a known, existing account. Account information, including the account's password, is maintained by an Account Management system.                      The Object and associated attributes identifies the object to be watermarked. The object attributes typically include the name and description of the object and a list of accounts authorized to access the object's registration. These authorized “supporting” accounts are typically the ad agencies, pre-press houses, etc. involved in the watermark embedding process in the print advertising example contemplated herein.                      The Action defines the response the customer desires when the watermark is detected. It varies byproduct, but in the illustrative embodiment involves the return of some additional information regarding the watermarked object. In the illustrative system, the action is return of a URL or HTML to be used to display a web page associated with the watermarked object. For other products, the desired response may be display of the object's owner &amp; rights</li> </ul>

[1B.iii]	<p>recognizes the target as a known target from the target database based on comparing parameters derived from the digital representation to recognition parameters associated with the known targets; and</p>	<p>Rhoads discloses recognizes the target as a known target from the target database based on comparing parameters derived from the digital representation to recognition parameters associated with the known targets.</p> <p>Rhoads at 9:35–10:21</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object’s boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example, some objects include subliminal graticule data, or other calibration data, steganographically encoded with the Bedoop data to aid in determining orientation. Others can employ overt markings, either placed for that sole purpose (e.g. reference lines or fiducials), or serving another purpose as well (e.g. lines of text), to discern orientation. Edge-detection algorithms can also</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,478,036 based on  
U.S. Patent Publication No. 2002/0047867 to Mault et al. (“Mault”)

### **Exhibit C-4**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, Mault was filed on September 7, 2001, claiming the priority date of September 7, 2000. Mault published at least as of April 25, 2002, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Mault anticipates asserted claim 1 of the ’036 Patent. To the extent Mault is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Mault is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,478,036 based on  
U.S. Patent No. 6,036,086 to Sizer (“Sizer”)

### **Exhibit C-5**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Sizer was filed on March 28, 1997. Sizer published at least as of March 14, 2000, and is available as prior art at least under 35 U.S.C. § 102 (a), (b) and (e).

As shown in the chart below, Sizer anticipates asserted claim 1 of the ’036 Patent. To the extent Sizer is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Sizer is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>that there are comparatively large frequency components at the line rate and at the frame rate and its harmonics, but that between these frequencies, there are other frequency bands in which little information is carried. One such frequency band is between 15 and 30 kHz. By adding a low level carrier signal or tone at a frequency in this band, say 25 kHz, the video image is not degraded, but a properly tuned decoder can receive and decode the encoded information. In this way, digital information can be subliminally inserted in a video signal by adding to the video signal an amplitude shift keyed (ASK) or frequency shift keyed (FSK) carrier signal, and the digital information can later be recovered using ASK or FSK decoding. Encoded data can also be inserted in a television signal and recovered by a receiver that responds to the picture displayed on the television, in the manner described in U.S. Pat. No. 4,807,031 cited above.”</p> <p>Sizer at 6:41-62</p> <ul style="list-style-type: none"> <li>• “If the encoded non-perceptible data is inserted in the video portion of a television signal, the images displayed on a visual display area a monitor or television are captured by optical lens 117 and an associated photo-detector 203, which is arranged to supply an electrical signal to a filter/receiver 215 representing the image.</li> </ul> <p>On the other hand, if the encoded non-perceptible data is inserted in the audio portion of a television signal, e.g. the output from a speaker is captured by a microphone 211 and an associated amplifier 213, which is arranged to supply an electrical signal to filter/receiver 215 representing the sound energy. In either event, the encoded non-perceptible data is decoded in the filter/receiver 215 in a manner consistent with the manner in which the original data was encoded. Thus, filter/receiver 215 can be arranged to perform the same functionality as the elements illustrated in FIG. 4 of the above referenced Broughton et al. patent, or, alternatively, the operation of filter/receiver 215 can be as described in conjunction with FIGS. 4 or 7 in the copending application of T. Sizer.”</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,478,036 based on  
U.S. Patent No. 6,666,377 to Harris (“Harris”)

### **Exhibit C-6**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Harris was filed on July 18, 2000. Harris published at least as of December 23, 2003, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Harris anticipates asserted claim 1 of the ’036 Patent. To the extent Harris is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Harris is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

One embodiment discloses using a camera to input and decode these bar codes. The embodiments are shown in FIGS. 1A and 1B. FIG. 1A describes using <b>a personal digital assistant 100</b> as the input device. One preferred input device of this type is the Palm V(TM) type hand held computer. A bar code scanner can be used, such as the commercially available Symbol Technology SPT 1700. Alternatively, a camera add-on unit can be added to the Palm V and used as described herein. The PDA includes a screen 145 and user interface 146 all within the same housing 99. FIG. 1B shows the client being <b>a cellular telephone</b> which also may include a screen 145 and user interface 150. The cellular telephone can be</li> </ul>

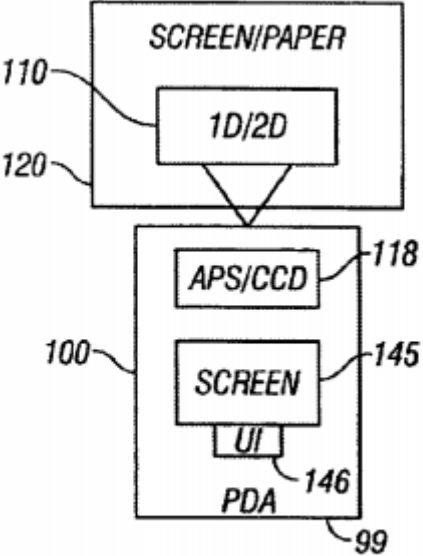

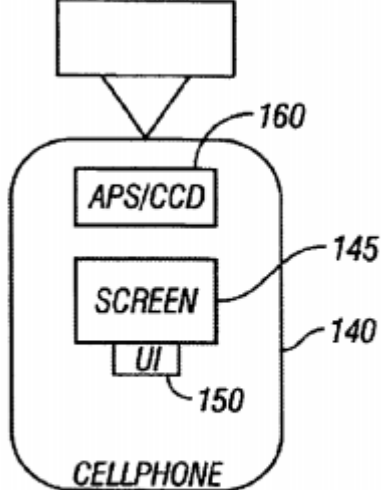

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,478,036 based on  
U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

### **Exhibit C-11**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ehrhart was filed on July 13, 2001, claiming the priority date of July 13, 2001. Ehrhart published at least as of April 20, 2004, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Ehrhart anticipates asserted claim 1 of the ’036 Patent. To the extent Ehrhart is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Ehrhart is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,478,036 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

**1. Claim 1**

Element	'036 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A content provisioning system comprising:	<p>Ehrhart discloses a content provisioning system.</p> <p>“The present invention relates to an optical reader that includes a color imaging assembly that generates color imaging data. An image analysis circuit determines if the acquired image should be characterized as a color photograph or as including a graphical symbol. A processing circuit processes the imaging data based on the image analysis circuit's determination of whether the image is a graphical symbol or a color photograph. The present invention allows a user to acquire and process both color images and graphical symbols, such as bar codes, text, OCR symbols or signatures. The optical reader of the present invention is also configured to associate an acquired image with at least one other acquired image.” Ehrhart at Abstract.</p>
[1A]	a target database storing known targets of different types and recognition parameters associated with the known targets;	<p>Ehrhart discloses a target database storing known targets of barcodes.</p> <p><i>Id.</i> at [1Pre].</p> <p>“In one embodiment, this mode includes a Signature verification program wherein the user may select between a Static verification or a dynamic verification. In the Static mode, the user captures the image of a Signature. The captured image is compared with a reference image Stored in a remote database. In the dynamic mode, optical reader 10 uses the Stylus and Signature block to capture the Signature. In this mode, Signature block 62 measures unique dynamic parameters, Such as applied pressure, direction and timing of movements, or a combination of these parameters. One of ordinary skill in the art will recognize that this list is not meant to be all-</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,478,036 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>“As embodied herein, and depicted in FIGS. 1A-1D, perspective views of the optical reader in accordance with various embodiments of the present invention are disclosed. FIG. 1A shows the underside of hand held wireless optical reader 10. FIG. 1B shows the top of the optical reader depicted in FIG. 1A. Optical reader 10 includes housing 100, antenna 102, window 104 and trigger 12. Window 104 accommodates illumination assembly 20 and imaging assembly 30. As shown in FIG. 1B, the top side of reader 10 includes function keys 14, alphanumeric key pad 16, and display 60. In one embodiment, function keys 14 include an enter key and up and down cursor keys. FIG. 1C is also a hand held wireless optical reader 10. Reader 10 includes function keys 14, alphanumeric key pad 16, writing stylus 18, display 60, and signature block 62. Stylus 18 is employed by a user to write his signature in signature block 62. FIG. 1D shows yet another embodiment of optical reader 10 of the present invention. In this embodiment, reader 10 includes a gun-shaped housing 100. Display 60 and keypad 16 are disposed on a top portion of gun-shaped housing 100, whereas trigger 12 is disposed on the underside of the top portion of housing 100. Housing 100 also includes window 104 that accommodates illumination assembly 20 and imaging assembly 30. Wire 106 is disposed at the butt-end of housing 100. Wire 106 provides optical reader 10 with a hard wired communication link for external devices such as a host processor or other data collection devices.” Ehrhart at 5:51-6:10.</p> <p>“In one embodiment, this mode includes a Signature verification program wherein the user may select between a Static verification or a dynamic verification.  U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>“In accordance with the invention, the present invention for an optical reader includes a color imaging assembly for acquiring color imaging data. An image analysis circuit determines if the acquired image includes at least one graphical symbol. A processing circuit processes the imaging data based on the determination of whether the image includes at least one graphical symbol. The present invention allows a user to read graphical symbols, such as bar codes, text, OCR characters or signatures using a color imager. The color optical reader of the present invention is configured to automatically determine whether a color image includes a graphical symbol, or is merely a color photographic image. The optical reader of the present invention also is operative to associate one acquired image with at least one subsequently acquired image.” Ehrhart at 5:36-50.</p> <p>“In the embodiment depicted in FIG. 2, ASIC 44 is implemented using a programmable logic array (PLA) device. In a similar embodiment, ASIC 44 is implemented using a field programmable gate array (FPGA) device. ASIC 44 is tasked with controlling the image acquisition process, and the storage of image data. As part of the image acquisition process, ASIC 44 performs various timing and control functions including control of light source 24, control of color imager 34, and control of external interface 56. It will be apparent to those of ordinary skill in the pertinent art that modifications and variations can be made to processor 40 of the present invention depending on the cost, availability, and performance of off-the-shelf microprocessors, and the type of color imager used. In one embodiment, microprocessor 42 and ASIC 44 are replaced by a single microprocessor 40. In one embodiment, microprocessor 40 is implemented using a single RISC processor. In yet another embodiment, microprocessor 40 is implemented using a RISC and DSP hybrid processor.” Ehrhart at 7:32-50.</p> <p>To the extent it is found that Ehrhart does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Ehrhart does not</p>

		<p>optical reader 10 uses the Stylus and Signature block to capture the Signature. In this mode, Signature block 62 measures unique dynamic parameters, Such as applied pressure, direction and timing of movements, or a combination of these parameters. One of ordinary skill in the art will recognize that this list is not meant to be all-inclusive, but rather, is a representative example. The captured dynamic parameters are compared with a reference data Stored in a remote database.” Ehrhart at 8:64-9:10.</p> <p>“If processor 40 does not locate a bar code symbol it moves onto step 420 and looks for OCR-A or OCR-B characters. If it finds these characters it performs optical character recognition in step 422. If it does not, processor evaluates the image for the presence of text. If text is located, the image is cropped, and the text is compressed and stored in steps 428 and 430. If the image does not include text, processor 40 evaluates the image for the presence of a signature. If one is present, the image is cropped, and the data is compressed and stored in steps 428 and 430. In another embodiment, optical reader 10 is networked, and processor 40 communicates with remote network resources to provide signature verification services. If processor 40 cannot detect a bar code symbol, OCR symbols, text, or a signature, the user is asked in step 432 if he desires to store the image. If he does, the color photographic image is stored in memory in step 434.” Ehrhart at 10:5-20.</p> <p>“As embodied herein and depicted in FIG. 11, a flow chart showing a method for performing OCR in accordance with yet another embodiment of the present invention is disclosed. In step 1100, reader 10 produces a bit-mapped image of the page. Subsequently, processor 40 finds lines of text in the image, locates the white spaces in each line, and isolates the characters. In step 1108, processor 40 performs character recognition, either OCR-A or OCR-B, as desired. The decoded characters are stored in memory.” Ehrhart at 13:1-9.</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit C-23

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”) (IBM0000893.)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al, *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2 .htm](http://www.thinker.org/imagebase/indox-2.htm) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16.

As shown in the chart below, QBIC anticipates asserted claim 1 of the ’036 Patent. The disclosures/exemplary citations for each element incorporate the disclosures citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cited references and/or in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

the accused products, the claims must also be construed to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit C-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872

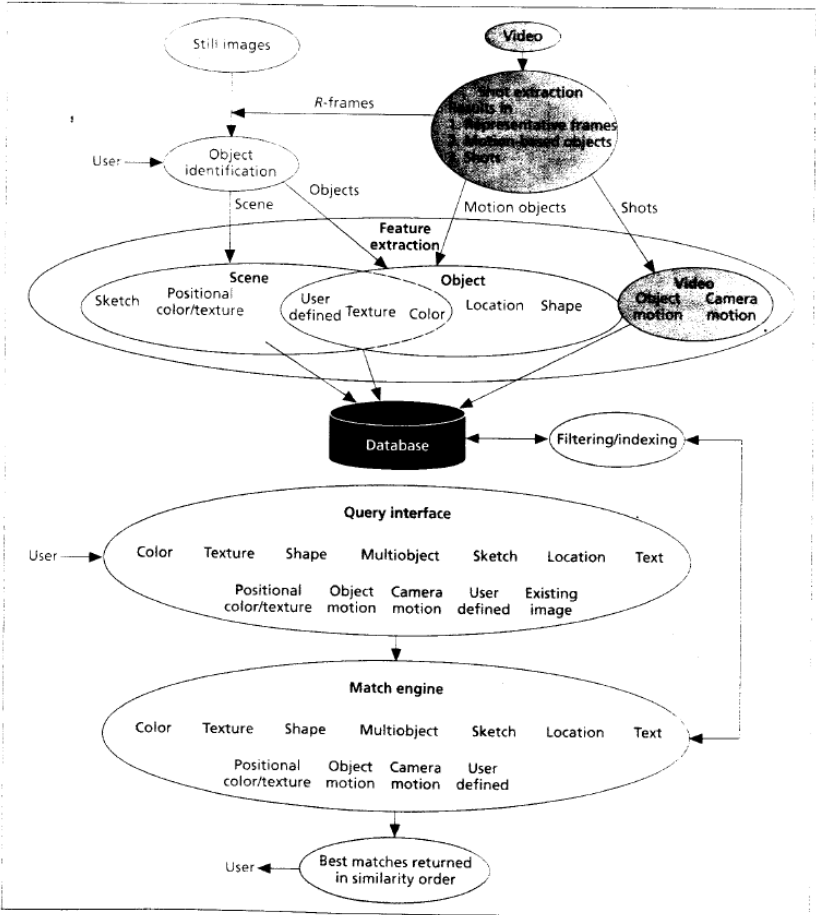

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

**1. Claim 1**

Element	'036 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A content provisioning system comprising:	<p>QBIC discloses a content provisioning system.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 1</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images’ content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure</p>

		<p>2 shows the system architecture.” <i>Id.</i> at p. 3.</p>  <p>The diagram illustrates the QBIC system architecture, divided into database population (top) and query (bottom) phases.   <b>Database Population (Top):</b>           - <b>Input:</b> Still images and Video.           - <b>Object Identification:</b> A user provides input to an 'Object identification' block, which outputs 'Objects' and 'Scene'.           - <b>Feature Extraction:</b> 'Objects' and 'Scene' feed into 'Feature extraction', which outputs 'User defined' (Texture, Color), 'Object' (Location, Shape), and 'Video' (Object motion, Camera motion).           - <b>Database:</b> All extracted features are stored in a 'Database'.           - <b>Filtering/Indexing:</b> A 'Filtering/indexing' block interacts with the 'Database'.   <b>Query (Bottom):</b>           - <b>Query Interface:</b> A user provides input to a 'Query interface' with categories: Color, Texture, Shape, Multiobject, Sketch, Location, Text. Sub-categories include: Positional color/texture, Object motion, Camera motion, User defined, Existing image.           - <b>Match Engine:</b> The query interface feeds into a 'Match engine' with the same categories and sub-categories.           - <b>Output:</b> The match engine returns 'Best matches returned in similarity order' to the user.</p> <p>Figure 2. QBIC database population (top) and query (bottom) architecture.</p> <p><i>Id.</i> at Fig. 2.</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206:</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.</p> <p>Flickner 8/29/23 Depo at Ex. 5:</p>

		<p>(IBM 0002390–404) at 2390</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391:</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2391-92:</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93:</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95:</p> <p>QBIC (Query by Image Content) (BOFA00001391–392) at 1:</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs, start from a single object pixel and repeatedly add adjacent pixels whose values</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve.</p> <p>The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries.</p> <p>...</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>“A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content. You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b>                      The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b>                      Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>QBIC Demo (IBM000747):</p>

		<p>Flickner Depo at 20</p> <p>3 Q. Okay. And the steps that -- at least as</p> <p>4 I understand it -- is you'd have database</p> <p>5 population, feature calculation and image query; is</p> <p>6 that right?</p> <p>7 A. Uh-huh. Yes.</p> <p>8 Q. So let's -- let's start with database</p> <p>9 population.</p> <p>10 What was the database population step?</p> <p>11 A. It's a process of taking a set of images,</p> <p>12 and then putting them in -- into the database and</p> <p>13 the extracting the features and putting the</p> <p>14 features in the database.</p> <p>20 Q. And how large were these database</p> <p>21 structures?</p> <p>22 A. In the order of 15,000 images.</p> <p>Flickner Depo at 25-26:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database, is that                    1 right?                  2 A. That's correct.</p> <p>Flickner Depo at 36:                  10 Q. So underlying this paper, you mentioned                  11 you did more work on the shape side of things; is                  12 that right?                  13 A. I did.                  14 Q. And what would that work have entailed?                  15 A. We wanted to query by shape.                  16 Q. Okay. And how would that have worked?                  17 A. We created features related to the shape                  18 of a -- the object of -- as it populated the                  19 database, and then we would query against those                  20 features.</p>

*Nantworks, LLC v. Bank of America Corporation*

Nantworks, LLC v. Bank of America Corporation  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 Q. Okay. And what would you do with the 2 image after you hit and extracted the color 3 histogram from it? 4 A. Nothing. 5 Q. Would those features be stored in any 6 database or -- 7 A. Yes. 8 Q. Okay. And let's do -- what about 9 texture, could you extract texture features from an 10 image? 11 A. We did. 12 Q. And how would you do that? 13 A. I don't remember exact features we were 14 using. There were -- we published some papers on 15 them. 16 Q. Okay. Was there any reasoning behind 17 picking the features that you chose? 18 A. Yes. 19 Q. And what was that reasoning? 20 A. We wanted to make it so that the results 21 were perceptually good. 22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red 2 color in it or some sort red color histogram; is 3 that right? 4 A. Well, you -- you take specific -- you 5 search for a red color. You'd compute the 6 histogram and then basically match the histogram, 7 which would give you images that had more colors in 8 the reds. This is not -- it's not a unique thing. 9 Q. Were you always searching for a 10 particular feature, or could you just search some 11 sort of example image? 12 A. We could search an example image. 13 Q. And how would that process work? 14 A. Just extract the features from it. 15 Q. So let's break that down. 16 So you would submit an example image to 17 the -- to the system, right? 18 A. Uh-huh. 19 Q. And then how do the -- how -- how does 20 the system select which features to extract? 21 A. It would compute them all, typically, or 22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that 2 this is a better match, that the ordering was 3 reasonable and... 4 Q. So by that, do you mean that people would 5 view the results returned as the closest or close 6 matches to your -- to your image? 7 A. It was -- it would satisfy their query. 8 Q. Okay. So -- so you would have this set 9 of features in your database. 10 How would you search for those features? 11 A. Typically, we -- initially, we did linear 12 scan where you just actually evaluate the -- the 13 distance metric against all the features. 14 Q. So in linear scan, you would compare some 15 sort of search term against all the features in the 16 database? 17 A. Well, it depends on which features you're 18 using. You didn't have to use all the features. 19 You could use just color features or just texture 20 features or just... 21 Q. So to make sure I'm understanding this 22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with 2 those features that it had extracted from that 3 example? 4 A. Then it became the reference point to the 5 search. 6 Q. And by research point to the search, what 7 do you mean? 8 A. So you have a vector in -- in the 9 individual space. 10 (Reporter clarification.) 11 A. That -- that query represents a point in 12 that space, and you're looking for other things 13 near that space or ordered by that space. 14 Q. And by other things near that space, is 15 that the other features that are in the -- in the 16 database? 17 A. Yes. 18 Q. Okay. So at bottom then, you would -- 19 you would take the image, the system would extract 20 features from it, and then those features would be 21 searched against the reference database -- the 22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

		<p>Flickner Depo at 48-49:</p> <p><sup>4</sup> Q. What feature extraction methods did the  <sup>5</sup> UC Davis implementation of QBIC rely on?  <sup>6</sup> A. It was similar to the other texture,  <sup>7</sup> shape, color and layout.</p> <p>Flickner Depo at 159:</p> <p><sup>10</sup> Q. Would either version of the stamps demo  <sup>11</sup> allow a user to submit an unknown image as the  <sup>12</sup> query and ask the system to find images similar to  <sup>13</sup> that query image?  <sup>14</sup> A. I suspect it did.  <sup>15</sup> Q. Why do you suspect that?  <sup>16</sup> A. Because that's one of the nice things you  <sup>17</sup> can do with QBIC.</p> <p>Flickner Depo at 209-210:</p> <p><sup>13</sup> Q. Okay. Let me ask -- let me ask that  <sup>14</sup> question using -- using an example.  <sup>15</sup> Say I had a file that -- that was a  <sup>16</sup> snippet of a Star Wars movie.  <sup>17</sup> Could the CueVideo system take that  <sup>18</sup> snippet of the -- of a Star Wars movie and indicate  <sup>19</sup> to the user what Star Wars movie that snippet is  <sup>20</sup> from?  <sup>21</sup> A. Most likely, yes.  <sup>22</sup> Q. And how do you know that?  <sup>1</sup> A. Based on my knowledge in content-based  <sup>2</sup> imagery -- content-based retrieval, in general,  <sup>3</sup> that would be one of the first things you would try  <sup>4</sup> to implement in a video search system.</p>

		<p><i>See also</i> Flickner Depo at 18, 54-55, 76.</p> <p>Flickner 8/29/23 Depo at 33–37:</p> <p>4 Q. And the second thing you mentioned was you                      5 were responsible for the architecture interface for                      6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to                      8 determine similarity. And to do that you would take                      9 the image and you'd transform -- you'd extract                      10 features from the image, then you would put the                      11 features in the database and you'd query the                      12 database for the features.</p> <p>13 Q. And when you say you are determining                      14 similarity, you mean similarity between features                      15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking                      18 at?</p> <p>19 A. We had features in color, in texture, in                      20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch                      25 of an image and query. And so you could draw a</p>

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p> <p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p> <p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p> <p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example,                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

		<p><i>Id.</i> at 52–56:</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p>

*Nantworks, LLC v. Bank of America Corporation*

		16 Q. And when it refers to "text information," 17 what is it referring to? 18 A. Anything that could be extracted in the 19 context of how the image was annotated. 20 Q. And when you say "annotated," annotated by 21 the user who was populating the database? 22 A. Could be. 23 Q. What else could it be? 24 A. It could be the supplier of the data. 25 Q. Okay. So you may have some annotations	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

		<table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> </td> <td style="width: 50%; vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> </td> </tr> <tr> <td style="vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="vertical-align: top; padding: 5px;"> <p style="text-align: right; margin: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p>	<p style="text-align: right; margin: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p>	<p style="text-align: right; margin: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>
<p style="text-align: right; margin: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p>	<p style="text-align: right; margin: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p>					
<p style="text-align: right; margin: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: It points to the file that's the                  4 QBIC catalog.                  5 BY MR. EDWARDS:                  6 Q. Can you walk us through that one more                  7 time? And just be a little bit louder, sorry.                  8 MR. HANSEN: Same objection.                  9 THE WITNESS: So the QBIC catalog is a set of                  10 files that hold data about visual features in the                  11 image.                  12 (Reporter seeks clarification.)                  13 THE WITNESS: Visual features. The image                  14 extender lets you search against that database,                  15 against that object.                  16 BY MR. EDWARDS:                  17 Q. The image extender lets you search against                  18 that catalog, the name of that catalog?                  19 A. The catalog, yeah.                  20 Q. Okay. And it does so by using a pointer                  21 from the handle in the table?                  22 MR. HANSEN: Objection; lacks foundation.                  23 THE WITNESS: Correct.                  24 BY MR. EDWARDS:                  25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold                  2 data for the following image features: Average                  3 color, Histogram color, Positional color and                  4 Texture."                  5 Is that right?                  6 A. Yep.                  7 Q. Okay. We spoke about average color,                  8 histogram color and texture; correct?                  9 A. Right.                  10 Q. What is positional color?                  11 A. We talked about it briefly. It's color in                  12 particular locations in the image.                  13 Q. Ah. Understood.                  14 That is -- that is similar to L in the                  15 demo that we looked at, which is called color                  16 layout.                  17 A. Okay, yes.                  18 Q. Is that correct?                  19 A. I don't remember if it's called L. Sounds                  20 right.                  21 Q. If you look at --                  22 MR. EDWARDS: If you can show -- give him                  23 Exhibit 6.                  24 THE WITNESS: Oh, this L. Yes.                  25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.                  3 MR. HANSEN: Objection; lacks foundation, calls                  4 for speculation.                  5 MR. EDWARDS: You can put that enormous exhibit                  6 aside.                  7 THE WITNESS: Test 1, 2, 3.                  8 BY MR. EDWARDS:                  9 Q. Go back to Exhibit 3, please. If you                  10 could turn to the page Bates-labeled IBM 894 with                  11 the architecture picture.                  12 A. Okay.                  13 Q. So I just -- I just want to kind of walk                  14 the -- through this architecture, Mr. Flickner. But                  15 as a high level, I just want to understand, is                  16 this -- is this a high-level architecture that would                  17 generally be used for any implementation of QBIC?                  18 A. Yes.                  19 Q. All right. So first step is you submit                  20 still images or r-frames for feature extraction; is                  21 that correct?                  22 A. Correct.                  23 Q. Okay. Features are extracted, such as                  24 color, texture, shape, sketch and text; correct?                  25 A. Location, yep.</p>

		<p style="text-align: right;">Page 182</p> <p>1 Q. And location. Including the ones that I                  2 listed; correct?                  3 A. Yep.                  4 Q. Okay. After feature extraction is done,                  5 the images and those features for the database                  6 images are stored in the database; correct?                  7 A. Correct.                  8 Q. And then once those are stored, a user can                  9 query using some sort of a user interface; is that                  10 right?                  11 A. Correct.                  12 Q. And the user can query based on color,                  13 texture, shape, multi-object, sketch, location or                  14 text; is that right?                  15 A. Correct.                  16 Q. Okay. Those features are then decomposed                  17 and extracted from the query image and then a                  18 matching engine is used to compare those similarly                  19 extracted features from the stored images; is that                  20 correct?                  21 A. Correct.                  22 Q. And then the best matches are returned in                  23 similarity of order back to the user; is that right?                  24 A. Correct.                  25 Q. Okay. Thank you for that.</p> <p><i>Id.</i> at 188–189:</p>

		<p>21 Q. Okay. So let's go to IBM 2264.</p> <p>22 A. Okay.</p> <p>23 Q. And there's a section called "Image</p> <p>24 Classification."</p> <p>25 Do you see that?</p> <hr/> <p style="text-align: right;">Page 189</p> <p>1 A. Yep.</p> <p>2 Q. It says [as read], "With Image Classifier,</p> <p>3 you can create visual indexes based on color, shape,</p> <p>4 category, and layout elements, which are areas of</p> <p>5 the image containing the patterns you want to use</p> <p>6 for searches. You could store these elements in</p> <p>7 catalogs in DB2 for OS/2 databases."</p> <p>8 Did I read that correctly?</p> <p>9 A. Yeah.</p> <p>10 Q. Are you familiar with Image Classifier?</p> <p>11 A. Yeah.</p> <p>12 Q. What is its general function?</p> <p>13 A. It's basically a QBIC functionality.</p> <p>14 Q. It's basically a QBIC functionality?</p> <p>15 A. Yeah.</p> <p>16 Q. Okay. And it's the QBIC functionality</p> <p>17 that actually takes extracted features and stores</p> <p>18 them in a database for later searching?</p> <p>19 A. Yeah.</p> <p><i>Id.</i> at 205–206:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <hr/> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.                      12 Q. Okay. So the database population step,                      13 that's loading the images into a database?                      14 A. Correct.</p> <p><i>Id.</i> at 305:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>7 So these articles describe various              8 features of various versions of QBIC; right?              9 A. Correct.              10 Q. Do they describe any features -- does the              11 demo you operated include any features that weren't              12 described in these articles?              13 A. That weren't described in the articles?              14 No.</p> <p><i>Id.</i> at 35:              6 Q. Okay. And the analytics that you're              7 talking about, where you extract these characters              8 from the image, that is -- those run on both the              9 query image and the images that are stored in the              10 database; is that right?              11 A. Yeah. We call them features.              12 Q. Features. Okay.              13 So when you say "features," you're talking              14 about the features that we talked about before:              15 Color, texture, shape, sketch?              16 A. For example.              17 Q. Any other ones you can think of?              18 A. Nothing comes to mind.              19 Q. But when you refer to features they at              20 least include those four; is that correct?              21 A. Yes. Well, at least includes, yeah.</p> <p><i>Id.</i> at 109-110:</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the</p> <p>20 IBM® D82® Universal Database: Image, Audio, and Video Extenders</p> <p>IBM 000040</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot catalog file name</li> <li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li> <li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li> <li>• Shot number</li> <li>• Starting frame number</li> <li>• Ending frame number</li> <li>• Representative frame number</li> <li>• Name of a file that contains the contents of the representative frame</li> </ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot handle</li> <li>• Video table name</li> </ul> <p style="text-align: right;">Chapter 2. DB2 extender concepts 21                  IBM 000041</p> <p>IBM0002264</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Description</b> </div> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Classification</b> </div> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Query</b> </div> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p style="text-align: right;">and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Formats</b> </div> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCK</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Product Positioning</b> </div> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="font-size: small; margin-top: 20px;">285-042 <span style="float: right;">-2-</span></p> <p style="text-align: right; margin-top: 10px;">IBM 0002264</p>

A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1B]	<p>an identification platform coupled with the target database, and that</p>	<p>QBIC discloses an identification platform coupled with the target database.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2391:</p> <p style="text-align: center;">~</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391-92:</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93:</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16\text{M}</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95:</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		 <p data-bbox="850 912 1243 928">Figure 2. QBIC database population (top) and query (bottom) architecture.</p> <p data-bbox="1444 909 1606 938"><i>Id.</i> at Fig. 2.</p> <p data-bbox="850 982 1885 1414">                     “For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed                 </p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects and features to implement logical And semantics.</p> <p>....</p> <p><b>ANNOTATION AND DATABASE POPULATION TOOLS.</b> Automatic methods (such as our Positional Color query) that don't rely on object identification, methods that identify objects automatically as in the museum image example, fast and easy-to-use semiautomatic outlining tools, and motion-based</p>

		<p>segmentation algorithms will enable additional application areas.</p> <p><b>FEATURE EXTRACTION AND MATCHING METHODS.</b> New mathematical representations of video, image, and object attributes that capture ‘interesting’ features for retrieval are needed. Features that describe new image properties such as alternate texture measures or that are based on fractals or wavelet representations, for example, may offer advantages of representation, indexability, and ease of similarity matching.” <i>Id.</i> at pp. 7–8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2391-92:</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16\text{M}</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

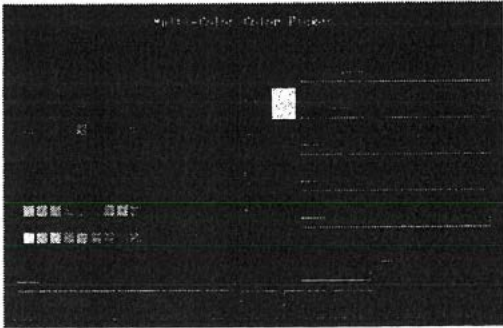

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95:</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. . . . For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.” <i>Id.</i> at p. 3.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):                      “To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog. When you search for an image by content, your query identifies one or</p>

		<p>12 Q. And it indicates the demo does                      13 content-based search based on color histogram, color                      14 position and texture.                      15 Do you see that?                      16 A. Yep.                      17 Q. That's a limited number of the features                      18 that QBIC could extract; right?                      19 A. Correct.                      20 Q. Was there -- for those demo applications                      21 that you -- that you all created, was there a                      22 conscious effort to limit the number of                      23 characteristics you put on the demo?                      24 A. Probably limited by the size of the CD.                      25 (Reporter seeks clarification.)</p> <p style="text-align: right;">Page 110</p> <p>1 A. It was limited by the size of the CD.</p> <p><i>Id.</i> at 311:</p> <p>22 Q. Okay. The purpose of a demo is to                      23 highlight the capabilities of QBIC to people                      24 external to IBM; isn't that correct?                      25 A. Correct.</p> <p><i>Id.</i> at 313-317:</p>

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>22 Q. The question was, any of the commercial 23 repositories that you went to source images, do you 24 know if any of them captured the still images or 25 video images that you purchased?</p> <hr/> <p>1 A. Some of them did, yeah. P</p> <p>Flickner 8/29/23 at 74–75:</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

			<p>17 Q. Mr. Flickner, the images that are in the 18 database and used to submit a image query, could 19 those be images of anything? Or the -- 20 A. Yes. 21 Q. There were no restrictions on what the 22 image was of? 23 A. There are practical restrictions on image 24 size. 25 (Reporter seeks clarification.)</p> <hr/> <p style="text-align: right;">Page 75</p> <p>1 A. On image size, but other than that, no. 2 Q. Okay. Other than -- other than practical 3 restrictions on image size, were there any other 4 restrictions? 5 A. Well, there are some -- there are some 6 restrictions related to content. For example, porn 7 wouldn't be allowed. 8 Q. How would that be -- how was that policed? 9 A. It wasn't. 10 Q. Okay. What about in terms of, like, the 11 format of the image, was there -- were there 12 requirements for the format? 13 A. We had a very general library for doing 14 image import, so we could process all JPEGs or TIFs 15 or GIFs, or whatever. 16 Q. So you could process all image formats and 17 video formats? 18 A. Not -- I wouldn't say all but the 19 majority. 20 Q. The ones that were in existence in the 21 technology at the time? 22 A. And were popular as well.</p>

		<p><i>Id.</i> at 114:</p> <p>1 Q. If I took all the components off of the CD                  2 and put it onto my desktop operating system, could I                  3 then add images to that folder?                  4 MR. HANSEN: Objection; calls for speculation.                  5 THE WITNESS: I think so.                  6 BY MR. EDWARDS:                  7 Q. Okay. Do you -- do you -- based on your                  8 knowledge of putting these demos together, do you                  9 see any reason why -- any -- anything that would                  10 prohibit me from doing that?                  11 MR. HANSEN: Same objection.                  12 THE WITNESS: We have to -- at the time there                  13 was a big issue with the copyright of the image.                  14 BY MR. EDWARDS:                  15 Q. Was there a way that you could                  16 electronically prevent me from moving those contents                  17 from the CD over to a desktop and then adding images                  18 to the -- to the folder?                  19 A. No.</p> <p><i>Id.</i> at 202:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 202</p> <p>1 Q. Okay. For the QBIC system, a user can                  2 take an image with a portable camera and submit that                  3 to the QBIC system for image query; is that correct?                  4 A. Correct.                  5 Q. Okay. And that would -- that would                  6 include any commercial products that we looked at,                  7 like Ultimedia and Enterprise Portal, that use QBIC                  8 system. A user could take an image, submit that to                  9 those systems and QBIC would be able to extract                  10 features from that image from an image query and                  11 also for any images that were taken by a portable                  12 camera used to store in the database; is that right?                  13 MR. HANSEN: Objection; lacks foundation.                  14 THE WITNESS: Yes.</p> <p><i>Id.</i> at 300:                  6 Q. Did QBIC have a camera?                  7 A. Yes.                  8 Q. It did?                  9 A. There were internal versions that we                  10 attached cameras to.                  11 Q. I mean, was the camera part of QBIC or                  12 something you attached to QBIC?                  13 A. Something you attached to OBIC.</p> <p><i>Id.</i> at 312:</p>

		<p><i>See also</i> Flickner Depo at, e.g., 24, 41-42, 62-63 (user could take a picture or video and submit it to the QBIC system).</p> <p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1B.iii]	<p>recognizes the target as a known target from the target database based on comparing parameters derived from the digital representation to recognition parameters associated with the known targets; and</p>	<p>QBIC discloses the target as a known target from the target database based on comparing parameters derived from the digital representation to recognition parameters associated with the known targets.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391:</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2391-92:</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93:</p>

		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95:                      QBIC (Query by Image Content) (BOFA00001391–392) at 1:</p>

		<p>1 Q. And you mentioned that you would extract                  2 features from the images?                  3 A. We did.                  4 Q. How would you do that?                  5 A. We ran algorithms on the pixels of the                  6 image and from that we created a feature.                  7 Q. What sort of features would you extract                  8 from the images?                  9 A. A QBIC system did color, shape and                  10 texture.                  11 Q. Okay. So let's take color.                  12 How would you, say, extract a color                  13 feature from an image?                  14 A. We typically would compute -- compute a                  15 color histogram.                  16 Q. And what's a color histogram?                  17 A. It's a measure of -- it's an estimate of                  18 the probability density of a color being in an                  19 image.                  20 Q. So you would take an image and extract                  21 that color histogram from it?                  22 A. Yup.</p> <p>Flickner Depo at 88:                  7 Q. (By Mr. Dang) Suppose you search for a                  8 set of features or you search using a query image                  9 in this demonstration, what would the system do?                  10 MS. HAYDEN: Objection. Foundation.                  11 THE DEPONENT: The system would                  12 compute -- in the query image case, the system                  13 would compute the features on that -- that image                  14 and then compute the distance associated with each                  15 one of the images in the database.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>Flickner Depo at 25-26:</p> <p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that                    1 right?                  2 A. That's correct.</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 52–53:</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p> <p><i>Id.</i> at 77–78:</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99:</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two  2 different color computations that are done. One is  3 average color, the other is color histogram; is that  4 right?  5 A. There certainly are those two.  6 Q. Say again.  7 A. There certainly are those two.  8 Q. Okay. And for average color, let's talk  9 about that first, it says [as read], "We compute the  10 average," and it lists four things, "(R, G, B), (Y,  11 i, q), (L, a, b), and MTM coordinates of each object  12 and image."  13 You see that?  14 A. Yep.  15 Q. So does that mean that it does -- every  16 time it -- if it computes average color, it computes  17 all four of those things? Or are those optional,  18 meaning that it can compute one as opposed -- or  19 some combination of those four?  20 A. Some combination of those four.  21 Q. Okay. Are there different algorithms for  22 each of those four or is it the same algorithm?  23 A. RGB, Yiq and LAB are all linear  24 transformations.  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed  2 over time going forward from 1993?  3 A. Most likely they did.  4 Q. Do you recall any details for how they may  5 have changed?  6 A. No.  7 Q. Do you know if functionality was added to  8 compute average color?  9 A. No.  10 Q. Do you -- do you recall any other  11 algorithms or methodologies that were used besides  12 the four that are listed here?  13 A. No.  14 Q. Okay. Second methodology to compute color  15 is referred to as color histogram here; is that  16 correct?  17 A. Yes.  18 Q. And so at a high level can you explain to  19 me what a color histogram is?  20 A. A histogram is a count of each value. And  21 so, for example, if you have 1, 2, 3 as a value and  22 you say 1, 2, 3 again, the histogram would say 2  23 because there are two 1s, two 2s, and two 3s. So  24 it's a count of the number of values across the  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my  2 head.  3 Q. That's something different from a linear  4 transformation?  5 A. It might be a different linear  6 transformation. I don't recall.  7 Q. Okay. So for average color, the  8 algorithms will compute that based on some  9 combination of those four methodologies?  10 A. Yes.  11 Q. Okay. Do you know if those methodologies  12 evolved over time? So this -- so, for example, this  13 argu-- excuse me -- article was written in 1993.  14 Do you know if the way in which QBIC computed  15 average color changed over time or did it stay the  16 same?  17 MR. STRAUSSMAN: Objection; compound.  18 MR. EDWARDS: Let me rephrase.  19 THE WITNESS: I don't recall.  20 MR. EDWARDS: Let me rephrase.  21 BY MR. EDWARDS:  22 Q. So this article was written in 1993, and  23 it lists four methodologies for computing average  24 color features.  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?  2 A. Pixels, color.  3 Q. So is it measuring the probability  4 density --  5 A. It's a --  6 Q. -- of a color being in an image?  7 A. It's a PDF estimator.  8 Q. And what does PDF stand for?  9 A. Probability density function.  10 Q. Okay. Once the color histogram is  11 computed, is it normalized after that?  12 A. Yes, it was normalized.  13 Q. And why did you normalize the color  14 histogram?  15 A. Because different images would have  16 different color balances.  17 (Reporter seeks clarification.)  18 A. Balances, yeah.  19 Q. Is a -- is a reason why you normalize the  20 color histogram in -- for stored images -- well,  21 strike that.  22 Did you -- did you normalize color  23 histograms when you extract -- strike that.  24 When you calculated the color histogram  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or                  2 more of these features than the other?                  3 A. Yes.                  4 Q. Which one?                  5 A. Shape.                  6 Q. Okay.                  7 (Witness reviews document.)                  8 A. So one thing I can state is originally I                  9 couldn't remember the name of the edge operator --                  10 and the name is Canny, the Canny edge operator --                  11 when we were talking about finding edges.                  12 Q. Okay. So this -- the paragraph on                  13 IBM 2393 refreshed your memory that shape                  14 calculation used Canny edge detection?                  15 A. No, that's sketch.                  16 Q. Oh, I'm sorry.                  17 A. I'm just stating that originally I was                  18 asked a question about standard edge operators. I                  19 couldn't remember the name. The name was Canny.                  20 Q. Canny. And Canny is used in the sketch                  21 calculation?                  22 A. Yeah, it's used in the sketch calculation.                  23 Q. Understood. Okay. Let's go back to                  24 shape.                  25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.                  2 Q. Can you say the name of the word again?                  3 A. I think it's called perround.                  4 Q. Per round?                  5 A. Yeah.                  6 Q. Those -- are those two words, p-e-r,                  7 r-o-u-n-d?                  8 A. P-e-r -- one word.                  9 Q. Okay. Perround, one word.                  10 A. It's basically the perimeter squared over                  11 area.                  12 (Reporter seeks clarification.)                  13 A. Perimeter squared over area.                  14 (Reporter seeks clarification.)                  15 A. Length of the -- over area.                  16 Q. Okay. So let's step back a little bit.                  17 So it says -- the second paragraph says [as read],                  18 "Our shape features are based on a combination of                  19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features                  20 area, circularity, eccentricity, major access                  21 orientation and a set of algebraic moment                  22 invariants," i-n-v-a-r-i-a-n-t-s.                  23 Did I read that correctly?                  24 A. Um-hum.                  25 Q. Okay. For circularity, that is computed</p>	
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.                  2 To calculate the shape feature in a query                  3 image or a stored database image, is the first step                  4 to convert that image into a binary image?                  5 A. I don't think so.                  6 Q. So if you look at the second paragraph --                  7 and the reason why I ask is -- it's the second                  8 sentence in the second paragraph under "Shape                  9 features." It says [as read], "All shapes are                  10 assumed to be non-occluded planar shapes allowing                  11 for each shape to be represented as a binary image."                  12 See that?                  13 A. Yeah.                  14 Q. And then the next sentence says [as read],                  15 "The area is computed as the number of pixels set in                  16 the binary image."                  17 A. Right.                  18 Q. So that's why I ask is it the first step                  19 in calculating shape to convert the image to binary?                  20 A. Yes.                  21 Q. And then once you convert it to binary                  22 image, then what do you do next in order to                  23 calculate the shape?                  24 A. You're computing something called                  25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?                  2 A. Right.                  3 Q. All right. Area is the number of pixels                  4 in the binary image?                  5 A. In the binary blob.                  6 Q. In the binary what?                  7 A. Blob.                  8 Q. Blob. And when you say "blob," what does                  9 that refer to?                  10 A. The outline of the object that you're                  11 doing a shape query on.                  12 Q. And so are each of these, area,                  13 circularity, eccentricity, major axis orientation                  14 and algebraic moment invariants, are those each                  15 different algorithms or is it all the same                  16 algorithm?                  17 A. It's different algorithms.                  18 Q. Okay. And since you worked on the shape                  19 feature the most, do you recall any other details                  20 that are not disclosed in this paragraph?                  21 A. Well, this evolved and we ended up doing                  22 an implementation of something that's not in here.                  23 Q. Okay. And what was that implementation?                  24 A. Something called turning angle per round,                  25 turning angle, which is -- it looks at the tangent</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

			<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So 2 you're computing the turning angle. You're 3 computing this angle that represents a shape in a 4 very interesting way. 5 They don't seem to be very good for 6 human -- so if you asked a human whether these two 7 shapes are similar, they would say "yes," but under 8 that feature set. 9 Q. And you call that something per round? 10 What was the name of it? Started with a T. 11 Turrent? 12 A. Turning angle. 13 Q. Oh, turning angle. 14 A. Yeah. 15 Q. Well, it said -- your answer -- you did 16 say turning angle, but you said something called 17 something per round, and it started with a T. I 18 thought you said turrent, but maybe I misunderstood. 19 MR. STRAUSSMAN: Tangent? 20 THE WITNESS: Tangent angle, yeah. 21 BY MR. EDWARDS: 22 Q. Okay. So something called tangent per 23 round, is that what you would call it, this -- 24 A. No. 25 Q. -- this implementation?</p>	
			<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle. 2 Q. Okay. So the name of the new 3 implementation you're talking about for shape 4 calculation is called turning angle? 5 A. It used turning angle as a major feature. 6 Q. Okay. Was there any other name it went 7 by? 8 A. I don't recall. 9 Q. All right. And that was -- that 10 methodology was implemented to calculate shape on a 11 query image and an image stored in the database post 12 this article? 13 A. Yes. 14 Q. Was that the -- did that -- did that 15 implementation, the turning angle, did that replace 16 the methodology in this article or was it 17 supplementing the metho- -- 18 A. Supplementing. 19 Q. Okay. Other than turning angle, were 20 there any other methodologies used after this 21 article? 22 A. Not that I recall. 23 Q. Okay. Okay. Let's go sketch features, if 24 you take a look at that and then let me know when 25 you're done reading it.</p>

		<p><i>Id.</i> at 119–128</p> <table border="0"> <tr> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p> </td> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p> </td> </tr> </table>	<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>	<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>
<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>					
<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then  2 you're looking for blue water, white sand.  3 BY MR. EDWARDS:  4 Q. Do you recall what the methodologies  5 used -- that were used to calculate the orientation  6 of those colors in the image?  7 MR. HANSEN: Objection; lacks foundation.  8 THE WITNESS: There's no orientation per se.  9 It's just position.  10 BY MR. EDWARDS:  11 Q. Well, then position. Do you recall what  12 the methodologies are to calculate the position?  13 MR. HANSEN: Same objection.  14 THE WITNESS: Position is something the user  15 inputs.  16 BY MR. EDWARDS:  17 Q. Something you use what?  18 A. The user had to input.  19 Q. Okay. And then let's move on to the next  20 one, T. It says, "Click T to search images with  21 similar global texture."  22 A. Yeah.  23 Q. Do you recall, in your work on the QBIC  24 project, a feature called global texture that could  25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?  2 A. G-a-b-o-r.  3 Q. So switch over and look at the second page  4 of this Exhibit 6.  5 So -- well, first back -- go back to -- go  6 back to the first page. If you see on the left-hand  7 side it says, "Goto: IBM Image Search Demo," and a  8 little finger there is clicking it.  9 You see it's in red?  10 A. Yeah.  11 Q. Okay. So that's clicking on that link.  12 And then the second page is going to the IBM image  13 search demo.  14 A. Okay.  15 Q. Okay? On the second page it is showing  16 thumbnails with the different icons that we just  17 walked through, I, C, L, T, S, on each of those  18 icons.  19 Do you see that?  20 A. Yep.  21 Q. Do you recognize this as a similar layout  22 to the QBIC demos you hosted in the '90s?  23 A. I don't.  24 Q. You don't?  25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .  2 Q. Say again?  3 A. I missed one of your words. A feature  4 called what?  5 Q. I said do you recall in your work on the  6 QBIC project a feature called global texture that  7 was extracted from the image?  8 A. Yes.  9 Q. Okay. Is that -- is that akin to texture  10 that we looked at earlier?  11 A. Yes.  12 Q. Okay. And the last one is S. It's,  13 "Search images with special multipass filter."  14 Do you recall, in your work on the QBIC  15 project, being able to calculate a feature called  16 multipass filter?  17 A. Probably Gabor functions.  18 Q. Say again?  19 A. Gabor functions.  20 Q. One more time and louder.  21 A. Gabor functions.  22 Q. Gabor functions. Okay. What are Gabor  23 functions?  24 A. Gabor functions are a way of producing  25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM  2 website that was the AIX operating system in  3 Exhibit 3, that did not have a similar thumbnail  4 layout like this?  5 A. A thumbnail, yes. I don't recall it had  6 the buttons, the I, C, L, T, S.  7 Q. You don't recall it had all the buttons or  8 some of the buttons?  9 A. All the buttons.  10 Q. Okay. So you don't recall that it had any  11 buttons?  12 A. I don't -- yeah. I don't recall.  13 Q. It could have, it couldn't have, you just  14 don't remember?  15 A. I just don't remember, yeah.  16 Q. Okay. But the one that you hosted on  17 IBM's website, it did have thumbnails in a similar  18 format here?  19 A. Yeah, it had thumbnails.  20 Q. And these thumbnails represent the images  21 that are stored in the database?  22 A. Yes.  23 Q. Okay. Here, the 470 images would be  24 reflected at least -- one, two, three, four, five,  25 six, seven -- eight of them right here in this</p>

Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>
<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>					
<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>					
<p><i>Id.</i> at 135 – 136:</p>						

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 139–165:</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>5 Q. And for the image that you use as a base</p> <p>6 for the query, the things we all talked about in</p> <p>7 terms of feature extraction for average color, color</p> <p>8 histogram, shape, texture, sketch, all of those</p> <p>9 things, the same algorithms would be used in order</p> <p>10 to extract those features from the image query?</p> <p>11 A. They're different algorithms. You would</p> <p>12 use an algorithm.</p> <p>13 Q. I'm sorry. Say that again?</p> <p>14 A. The algorithms are different between the</p> <p>15 shape features and the color features and sketch</p> <p>16 features.</p> <p>17 Q. Yeah. Understood. What I'm trying --</p> <p>18 what I'm trying to understand is, the process that</p> <p>19 we talked about before, when you populate the</p> <p>20 database and you extract the features from the</p> <p>21 images that are stored in the database.</p> <p>22 You know, we went through all those</p> <p>23 different algorithms that are used for shape, color,</p> <p>24 both average color and histogram, texture and</p> <p>25 sketch.</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>
		<p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between</p> <p>2 the query image and the database image using</p> <p>3 weighted Euclidean distance; is that right?</p> <p>4 A. Yep.</p> <p>5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.</p> <p>6 And can you just tell us at a high level</p> <p>7 what -- if you can -- what Euclidean distance is?</p> <p>8 A. So if you have multiple features or</p> <p>9 multiple scaler features, you have to ask the</p> <p>10 question I'm trying to build a distance from that</p> <p>11 vector to a query vector.</p> <p>12 And as you build that -- the distance, you</p> <p>13 have -- you may want to weight different elements of</p> <p>14 the vector differently. And we found out that using</p> <p>15 variance normalization, where weights of the</p> <p>16 variance of the feature, gave good aesthetic</p> <p>17 results.</p> <p>18 (Reporter seeks clarification.)</p> <p>19 A. Aesthetic results.</p> <p>20 Q. And I apologize, I couldn't hear what you</p> <p>21 said. You said, "And we found out that using</p> <p>22 variance" . . .</p> <p>23 A. So you normalize each feature with its</p> <p>24 variance.</p> <p>25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)</p> <p>2 Q. Well, let me ask my -- let me get my</p> <p>3 question out first.</p> <p>4 So we talked about the features for</p> <p>5 average color before are RGB, Yiq, LAB and MTM.</p> <p>6 A. Correct.</p> <p>7 Q. And so, for example, for the RGB, you're</p> <p>8 saying that you would take the R and you would</p> <p>9 divide it by the variants of red and green, for</p> <p>10 example --</p> <p>11 A. Just variants of red.</p> <p>12 Q. Okay. And so you could do the same for</p> <p>13 the others, for Yiq or LAB?</p> <p>14 A. Exactly.</p> <p>15 Q. Okay. You do that for both the image</p> <p>16 input query and the stored image; correct?</p> <p>17 A. Correct.</p> <p>18 Q. And then you're calculating the distance</p> <p>19 between them, so determining how similar they are</p> <p>20 based on the distance?</p> <p>21 A. Yeah, or vector distance.</p> <p>22 Q. Understood.</p> <p>23 A. Two vectors of differences --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Two vectors with a distance calculation on</p>	
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.</p> <p>2 Q. With its variance.</p> <p>3 A. And then compute the average.</p> <p>4 Q. Okay.</p> <p>5 A. Or, I'm sorry, compute the weighted sum.</p> <p>6 So red divided by the variants of red, plus green</p> <p>7 divided by the variants of green --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 A. Red divided by the variants of red, green</p> <p>10 divided by the variants of green, L divided by the</p> <p>11 variants of L, that's how you combine the various</p> <p>12 features.</p> <p>13 Q. Understand. And L represents what?</p> <p>14 A. Luminance.</p> <p>15 Q. Okay. And this is -- you're talking</p> <p>16 specifically with respect to average color?</p> <p>17 A. Well, the variance normalization is well</p> <p>18 known in terms of multidimensional feature merging.</p> <p>19 Q. But for average color, you wouldn't use</p> <p>20 luminance, right, as a -- as a variant?</p> <p>21 A. Luminance would just -- you wouldn't use</p> <p>22 just luminance. You could use luminance . . .</p> <p>23 Q. Well, so the color features we talked</p> <p>24 about before would be RGB, Yiq, LAB --</p> <p>25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.</p> <p>2 Q. You're going to have to repeat that and be</p> <p>3 just a little bit louder, Mr. Flickner. Sorry.</p> <p>4 A. That's all right. Let me get my thoughts</p> <p>5 together.</p> <p>6 So we have multiple dimensional features.</p> <p>7 It's not unusual to take each dimension and</p> <p>8 normalize it by the variance because that gives</p> <p>9 you -- what that does is if you have tight variances</p> <p>10 you divide it by, you get bigger numbers. So you</p> <p>11 have more information close by.</p> <p>12 Q. What was the word you said before "close</p> <p>13 by"?</p> <p>14 A. I don't remember.</p> <p>15 THE REPORTER: Information?</p> <p>16 THE WITNESS: Information close by?</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Okay. So now let's talk about</p> <p>19 color histograms.</p> <p>20 A. Okay.</p> <p>21 Q. Okay? Well, stop. Let's go back to</p> <p>22 average color. So is there -- you described the</p> <p>23 weighted Euclidean distance that's calculated</p> <p>24 between the query image and the database image for</p> <p>25 average color.</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall                  2 that's not disclosed in the paragraph at IBM 2394?                  3 A. Not that I recall.                  4 Q. Okay. Do you recall whether this distance                  5 methodology changed after this article or it stayed                  6 the same?                  7 A. It changed.                  8 Q. Are you certain or do you know?                  9 A. I'm not certain, but I'm pretty certain.                  10 Q. And how did it change?                  11 A. Different features were shaped like an                  12 inch in color. The algorithm evolved. It wasn't                  13 static.                  14 Q. And how did it evolve?                  15 A. I don't recall all the details.                  16 Q. Do you recall whether it supplemented the                  17 weighted Euclidean distance or replaced it?                  18 A. I don't recall.                  19 Q. Is it fair to say there was always some                  20 distance measurement to determine similarity for                  21 average color in the QBIC system?                  22 A. There's some measurement, yeah.                  23 Q. Okay. Let's talk about color histogram.                  24 So in order to determine the similarity                  25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was                  2 determined by weighted Euclidean distance; is that                  3 right?                  4 MR. HANSEN: Same objection.                  5 THE WITNESS: Correct.                  6 BY MR. EDWARDS:                  7 Q. And how did -- how was that weighted                  8 Euclidean distance determined?                  9 A. It was inverse variance.                  10 (Reporter seeks clarification.)                  11 A. Variance.                  12 Q. And it was inverse variance for components                  13 like coarseness, contrast and directionality?                  14 A. Correct.                  15 Q. Okay. And do you recall if that                  16 methodology changed or stayed the same after this                  17 article for the QBIC system?                  18 A. Most likely it evolved.                  19 Q. Do you know for sure?                  20 A. No.                  21 Q. Do you recall any details?                  22 A. No.                  23 Q. All right. Let's talk about shape next.                  24 The similarity between the query image and                  25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines                  2 distance between normalized histograms?                  3 A. Correct.                  4 Q. Do you recall any details of how that                  5 worked?                  6 A. Not off the top of my head.                  7 Q. Do you recall whether that methodology                  8 evolved for matching color histograms after this                  9 article?                  10 A. Not that I recall.                  11 Q. Okay. All right. Let's talk about                  12 texture next. And I don't know if you've read that,                  13 but that's at the bottom of 2394 and it goes to just                  14 barely at the top of 2395.                  15 (Witness reviews document.)                  16 A. Okay.                  17 Q. So for texture, the similarity is                  18 determined by the distance or the weighted Euclidean                  19 distance between the query object and -- the query                  20 object image and the database object image; is that                  21 right?                  22 MR. HANSEN: Objection; vague and ambiguous.                  23 THE WITNESS: Can you repeat.                  24 BY MR. EDWARDS:                  25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?                  2 A. Correct.                  3 Q. And do you recall how that worked?                  4 A. There's computing moments. And we used                  5 the shape measure, which I mentioned earlier,                  6 curvature and turning angle.                  7 (Reporter seeks clarification.)                  8 A. Curvature and turning angle.                  9 Q. And the curvature and turning angle would                  10 be compared between the image query and the database                  11 image; correct?                  12 A. Correct.                  13 Q. And do you recall if that methodology                  14 changed after this article came out in '93?                  15 A. Yes, it did.                  16 Q. How so?                  17 A. Well, in the IEEE computer paper, we                  18 described a different way of doing shape measures.                  19 And they included the moment calculations.                  20 Q. And you use the moment calculations to                  21 determine a distance between the image query and                  22 the -- and the database image?                  23 A. Yes.                  24 Q. Sorry?                  25 A. Yeah. Yes.</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?          2 A. Given a binary blob, certain high-level          3 moments and then you create -- compute the          4 eigenvectors of certain matrices that are created --          5 (Reporter seeks clarification.)          6 A. Eigenvectors, e-i-g-e -- i-n -- to compute          7 the eigenvectors of certain matrices. And that          8 would give you translation and rotation and          9 variance.          10 Q. And so after the Exhibit 3 1995 IEEE          11 article, did that methodology change to compute the          12 distance for shape?          13 A. I don't recall.          14 Q. So the methodology for shape that you just          15 described using moment calculations, that is          16 different from what is described in the 1993 article          17 for weighted Euclidean distance?          18 A. We still might have used weighted          19 Euclidean distance when the underlying features are          20 different.          21 Q. Understood.          22 And the underlying features are different          23 in the sense that in the 1995 article you're using          24 what features?          25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment          2 invariants.          3 (Witness reviews document.)          4 A. Is there any other papers that we have          5 here?          6 Q. Nope.          7 A. Everything else is screenshots?          8 MR. STRAUSSMAN: I don't think you introduced          9 any other papers.          10 THE WITNESS: I saw it earlier today.          11 BY MR. EDWARDS:          12 Q. Why don't we do it this way. In terms of          13 the feature calculations that were -- for shape on          14 page IBM 900 of Exhibit 3 versus page --          15 A. So if you look at 2393.          16 Q. What page are you directing me to?          17 A. 2393.          18 Q. Okay.          19 A. So it talks about the moment invariants as          20 well.          21 Q. Okay.          22 A. These are those matrices that you compute          23 eigenvectors of.          24 (Reporter seeks clarification.)          25 A. Matrices that you compute eigenvectors of.</p>	
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)          2 Q. I think the page you may be looking for is          3 IBM 900 on the left side.          4 (Witness reviews document.)          5 A. What else do we have here?          6 Q. So if you'll look at -- if you'll -- if          7 you'll compare page IBM 900 from Exhibit 3 to page          8 IBM 2393 from Exhibit 2, those are the descriptions          9 in both articles about the features that are          10 calculated.          11 A. I'm trying to remember what --          12 MR. STRAUSSMAN: Can you direct him a little          13 closer?          14 BY MR. EDWARDS:          15 Q. Can I show you? Do you mind?          16 I believe this is what you're looking for.          17 So if you look right here (indicating).          18 (Witness reviews document.)          19 A. That's the same as this one (indicating).          20 We had another -- there's another discussion about          21 moments.          22 Q. So if you look at -- under "Shape          23 features" at 2393, right there, where you're looking          24 at --          25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment          2 invariants in the 1993 SPIE article?          3 A. Correct.          4 Q. Right. And then if you go to the IEEE          5 article that you primarily co-authored, on page 900,          6 it refers to shape queries using area, circularity,          7 eccentricity, major-axis direction and features          8 derived from the object moments.          9 A. Right.          10 Q. Is that the same thing as algebraic moment          11 invariants?          12 A. Right.          13 Q. So it looks like the methodologies are the          14 same for the features that are extracted between the          15 papers; is that right?          16 A. I thought one paper had algebraic moments          17 and one had turning angle. Maybe they both had          18 turning angle.          19 (Reporter seeks clarification.)          20 A. Turning angle. Algebraic moments.          21 Turning angles.          22 Q. The 1993 paper refers to algebraic moment          23 invariants. The IEEE paper, on IBM 900, refers to          24 features derived from object moments.          25 Are those the same thing?</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.  2 Q. Okay. And so turning angles, which you've  3 previously testified on, do you think that  4 calculating shape features based on turning angles  5 came after these papers?  6 A. No. They're mentioned in these papers.  7 Q. Okay. So they're included in these  8 papers?  9 A. Yes.  10 Q. And so any distance measurement using  11 weighted Euclidean distance would have taken into  12 account turning angles?  13 A. As a feature, yeah. Yes.  14 Q. For both -- for both papers?  15 A. For both papers.  16 Q. Okay. Let's talk about sketch, which  17 is -- if you'll just stick with 2395, which is  18 Exhibit 2.  19 MR. STRAUSSMAN: Can you direct him?  20 THE WITNESS: I found it.  21 MR. STRAUSSMAN: Okay.  22 (Witness reviews document.)  23 BY MR. EDWARDS:  24 Q. Let me know when you're finished reading  25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the  2 best matches based on order of similarity?  3 A. Um-hum.  4 Q. Does iterated query refinement mean that I  5 can further refine that query to search for things  6 like shape, like a -- you know, some shape in the --  7 in the query image, like a logo or an icon, and that  8 will further refine the results to give me things  9 that have that similar shape inside the results of  10 the color histogram?  11 A. Yes.  12 Q. And then I can -- I can keep doing that, I  13 can further even refine that result by using a  14 keyword, for example?  15 A. Yes. Or you could do it all at once.  16 Q. Okay. So the results of the query -- so  17 we talked about before that the results of the  18 queries display thumbnails of the database images  19 based on similarity of which they match; correct?  20 A. Correct.  21 Q. And then those thumbnails can provide  22 links to the original image or, if it was an  23 r-frame, it could be -- you could provide a link to  24 the video; correct?  25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.  2 Q. For sketch, the similarity between the  3 query image and the database image uses an algorithm  4 that performs logical binary correlation of the  5 binary image?  6 A. Yes.  7 Q. Are there any other details you recall for  8 the sketch comparison beyond what's disclosed in  9 this paragraph on IBM 2395?  10 A. Not that I recall.  11 Q. Do you recall the methodology for  12 determining similarity of the input image and the  13 database image for sketch changing after this  14 article?  15 A. Not that I recall.  16 Q. So if you go to the next page,  17 Mr. Flickner, which is 2396, the Section 4.2 talks  18 about performing queries.  19 A. Um-hum.  20 Q. And in the last sentence it refers to  21 something called iterated query refinement.  22 A. Yes.  23 Q. And what does that refer to?  24 A. It's a way you can refine the query.  25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links  2 to information about the image that was associated  3 with the image in the database?  4 A. Yes.  5 Q. And, again, that can be that -- whatever  6 information that the user inputted or was associated  7 with the image from the source?  8 A. Yes.  9 Q. Could the results also display a matching  10 score so the user could see how well the particular  11 result matched to the -- to the query image?  12 A. It could.  13 Q. Okay.  14 MR. EDWARDS: I'm going to hand you the next  15 exhibit, Mr. Flickner.  16 (Deposition Exhibit 10 was marked.)  17 MR. EDWARDS: Handing you what's been marked as  18 Exhibit 10.  19 For the record, it's IBM Bates Nos. 002418  20 to 2430.  21 BY MR. EDWARDS:  22 Q. The title of this article is "Updates to  23 the QBIC system."  24 Do you see that?  25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?</p> <p>2 A. Yes.</p> <p>3 Q. You are listed as a co-author of this</p> <p>4 article; is that correct?</p> <p>5 A. Yes.</p> <p>6 Q. And it is a paper that is published in the</p> <p>7 SPIE; correct?</p> <p>8 A. Correct.</p> <p>9 Q. In 1997; correct?</p> <p>10 A. Yes. It was 1997 or 1998.</p> <p>11 Q. No later than 1998; correct?</p> <p>12 A. Correct.</p> <p>13 Q. So just want to kind of orient you to the</p> <p>14 first page, which is IBM 2419.</p> <p>15 A. It's '98 because '97 is a different paper.</p> <p>16 Q. Well, if you turn the page, look at the</p> <p>17 footer on the right-hand side.</p> <p>18 Are you familiar that SPIE usually</p> <p>19 includes footers with the volume and the date at the</p> <p>20 bottom?</p> <p>21 A. Yeah.</p> <p>22 Q. And if you look at the footer kind of</p> <p>23 towards the right it says -786X-97-\$10 [sic]?</p> <p>24 A. Yeah.</p> <p>25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?</p> <p>2 A. Yep.</p> <p>3 Q. Okay. So let's -- I'm going to have you</p> <p>4 jump around, so I apologize in advance. Let's go to</p> <p>5 the -- kind of the back, IBM 2428.</p> <p>6 A. Okay.</p> <p>7 Q. Is that example of the stamps demo that</p> <p>8 was available on IBM's website?</p> <p>9 A. Yes.</p> <p>10 Q. All right. And if you look at the top in</p> <p>11 the location URL it has the almaden.ibm website</p> <p>12 address; correct?</p> <p>13 A. Correct.</p> <p>14 Q. All right. Let's flip forward to 2429.</p> <p>15 And is 2429 a screenshot of a trademark</p> <p>16 demo that was also available in the Almaden --</p> <p>17 excuse me -- almaden.ibm website?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. And that demo looks like the</p> <p>20 trademark query is based on shape; is that right?</p> <p>21 A. It uses shape as one similarity feature.</p> <p>22 Q. Right. So the trademarks are converted to</p> <p>23 a binary image, like we talked before -- talked</p> <p>24 about before, and then they're -- the matching</p> <p>25 process is done based on those binary images?</p>	
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the</p> <p>2 conference was in '98.</p> <p>3 Q. Submission was in '97. So the paper was</p> <p>4 published in '97 and then the conference you</p> <p>5 presented it at was in 1998?</p> <p>6 A. That's possible.</p> <p>7 Q. Do you recall presenting this paper at a</p> <p>8 conference in 1998?</p> <p>9 A. No, I don't.</p> <p>10 Q. So the first page refers to the Photonics</p> <p>11 West 1999 -- excuse me. Photonics West 1998</p> <p>12 Electronic Imaging Conference in San Jose.</p> <p>13 Do you recall attending that conference?</p> <p>14 A. It's likely I did, but I don't recall.</p> <p>15 Q. Okay. But you would agree with me this</p> <p>16 paper was made available at least as early as 1998;</p> <p>17 correct?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. So the first page, IBM 2419. Under</p> <p>20 "Introduction," at the time of this paper it says,</p> <p>21 last line on the first paragraph, "Several online</p> <p>22 demos of QBIC are available at</p> <p>23 <a href="http://www.qbic.almaden.ibm.com">http://www.qbic.almaden.ibm.com</a>."</p> <p>24 Do you see that?</p> <p>25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p>22 Q. Okay. So 39 would be the -- so the first</p> <p>23 image at the top left is a 39, the one next to it is</p> <p>24 a 46, so the 39 would be a closer match than the 46;</p> <p>25 correct?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference		
		<p><i>Id.</i> at 174–182:</p> <table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"??                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="width: 50%; vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"??                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. *Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?  2 MR. HANSEN: Objection; lacks foundation.  3 THE WITNESS: It points to the file that's the  4 QBIC catalog.  5 BY MR. EDWARDS:  6 Q. Can you walk us through that one more  7 time? And just be a little bit louder, sorry.  8 MR. HANSEN: Same objection.  9 THE WITNESS: So the QBIC catalog is a set of  10 files that hold data about visual features in the  11 image.  12 (Reporter seeks clarification.)  13 THE WITNESS: Visual features. The image  14 extender lets you search against that database,  15 against that object.  16 BY MR. EDWARDS:  17 Q. The image extender lets you search against  18 that catalog, the name of that catalog?  19 A. The catalog, yeah.  20 Q. Okay. And it does so by using a pointer  21 from the handle in the table?  22 MR. HANSEN: Objection; lacks foundation.  23 THE WITNESS: Correct.  24 BY MR. EDWARDS:  25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:  2 Q. So take a look at the bottom of IBM  3 page 40 to the top of 41.  4 So it says, "When you search for an image  5 by content, your query identifies one or more  6 features for the search (such as average color), a  7 source for each feature (such as an example image),  8 and a target set of cataloged images. The Image  9 Extender computes the feature value of the source  10 and compares it to the cataloged feature values for  11 the target images. It then computes a score that  12 indicates how similar the feature values of the  13 target images are to the source. You can have the  14 Image Extender return the images whose features are  15 most similar to the source. The Image Extender will  16 return the handle of each image and the image  17 score."  18 Did I read that correctly?  19 A. Yes.  20 Q. So if you were to use the image extender  21 in the DB2 universal database when you search for an  22 image by content using a query image, it will  23 extract the features for whatever you want, compare  24 that to the features of images in a database, return  25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold  2 data for the following image features: Average  3 color, Histogram color, Positional color and  4 Texture."  5 Is that right?  6 A. Yep.  7 Q. Okay. We spoke about average color,  8 histogram color and texture; correct?  9 A. Right.  10 Q. What is positional color?  11 A. We talked about it briefly. It's color in  12 particular locations in the image.  13 Q. Ah. Understood.  14 That is -- that is similar to L in the  15 demo that we looked at, which is called color  16 layout.  17 A. Okay, yes.  18 Q. Is that correct?  19 A. I don't remember if it's called L. Sounds  20 right.  21 Q. If you look at --  22 MR. EDWARDS: If you can show -- give him  23 Exhibit 6.  24 THE WITNESS: Oh, this L. Yes.  25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?  2 A. Correct.  3 MR. HANSEN: Objection; lacks foundation, calls  4 for speculation.  5 MR. EDWARDS: You can put that enormous exhibit  6 aside.  7 THE WITNESS: Test 1, 2, 3.  8 BY MR. EDWARDS:  9 Q. Go back to Exhibit 3, please. If you  10 could turn to the page Bates-labeled IBM 894 with  11 the architecture picture.  12 A. Okay.  13 Q. So I just -- I just want to kind of walk  14 the -- through this architecture, Mr. Flickner. But  15 as a high level, I just want to understand, is  16 this -- is this a high-level architecture that would  17 generally be used for any implementation of QBIC?  18 A. Yes.  19 Q. All right. So first step is you submit  20 still images or r-frames for feature extraction; is  21 that correct?  22 A. Correct.  23 Q. Okay. Features are extracted, such as  24 color, texture, shape, sketch and text; correct?  25 A. Location, yep.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 182</p> <p>1 Q. And location. Including the ones that I                  2 listed; correct?                  3 A. Yep.                  4 Q. Okay. After feature extraction is done,                  5 the images and those features for the database                  6 images are stored in the database; correct?                  7 A. Correct.                  8 Q. And then once those are stored, a user can                  9 query using some sort of a user interface; is that                  10 right?                  11 A. Correct.                  12 Q. And the user can query based on color,                  13 texture, shape, multi-object, sketch, location or                  14 text; is that right?                  15 A. Correct.                  16 Q. Okay. Those features are then decomposed                  17 and extracted from the query image and then a                  18 matching engine is used to compare those similarly                  19 extracted features from the stored images; is that                  20 correct?                  21 A. Correct.                  22 Q. And then the best matches are returned in                  23 similarity of order back to the user; is that right?                  24 A. Correct.                  25 Q. Okay. Thank you for that.</p> <p><i>Id.</i> at 190–191:                  22 Q. So [as read], "Once the image catalogs are                  23 created, you can use the Image Query component to                  24 find image and business information. Business                  25 information, such as character and numeric data, are</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p style="text-align: right;">Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 198 – 199:</p> <p>15 Q. Okay. And then if we can go to IBM 849.                      16 There?                      17 A. Yeah.                      18 Q. Top of the page says, "Adding image search                      19 to your Content Manager."                      20 Do you see that?                      21 A. Yeah. Yeah.                      22 Q. And the first paragraph starts -- talks                      23 about QBIC.                      24 Do you see that?                      25 A. Yeah.</p> <hr/> <p style="text-align: right;">Page 199</p> <p>1 Q. It says, "The image search server uses                      2 IBM's QBIC (query by image content) technology to                      3 help you search for objects by certain visual                      4 properties, such as color and texture."                      5 Did I read that correctly?                      6 A. Yes.                      7 Q. It says [as read], "The image search                      8 server analyzes images and stores the image                      9 information in a database. Then users can run image                      10 queries, which use the visual properties of image,                      11 to match colors, textures, and their positions                      12 without describing them -- describing them in                      13 words."                      14 Did I read that correctly?                      15 A. Yes.                      16 Q. And that's consistent with the features                      17 and functionalities that we have talked about in the                      18 1993 SPIE and 1995 IEEE article; correct?                      19 A. Correct.</p> <p><i>Id.</i> at 312 – 313:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>21 Q. For every implementation of QBIC, if an                      22 input image has an object and the object has colors,                      23 the color histogram feature would match those stored                      24 image that include objects with similar colors;                      25 correct?</p> <hr/> <p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p><i>Id.</i> at 317–322:                      22 Q. Okay. So for every commercial                      23 implementation of QBIC as of the IEEE 1995 article                      24 in Exhibit 3, those implementation calculated                      25 features of a query image and stored image; is that</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 318</p> <p>1 correct?</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Correct.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And those calculations of features</p> <p>6 included color, shape and/or texture in all</p> <p>7 implementations that we looked at today, correct?</p> <p>8 MR. HANSEN: Same objections.</p> <p>9 THE WITNESS: I don't remember if all versions</p> <p>10 supported all features.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. If the 1995 article references calculating</p> <p>13 color, shape and texture, you would agree with me</p> <p>14 that the commercial embodiments implementing QBIC at</p> <p>15 the time would have been able to calculate color,</p> <p>16 shape and texture as part of feature extraction;</p> <p>17 correct?</p> <p>18 MR. HANSEN: Objection; lacks foundation.</p> <p>19 THE WITNESS: I don't remember exactly which</p> <p>20 products incorporated any subsets of the features.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Do you recall that all the products used</p> <p>23 color?</p> <p>24 MR. HANSEN: Objection; lacks foundation.</p> <p>25 THE WITNESS: I'm pretty sure they all did use</p>	<p style="text-align: right;">Page 320</p> <p>1 [as read] "Image Query allows searches by three</p> <p>2 methods: Image content, such as color, shape and</p> <p>3 texture."</p> <p>4 You see that?</p> <p>5 A. Yeah.</p> <p>6 Q. So Ultimedia Manager 1.1 was able to</p> <p>7 perform an image query using color, shape and</p> <p>8 texture, correct?</p> <p>9 MR. HANSEN: Objection; lacks foundation.</p> <p>10 THE WITNESS: And layout.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. And layout. But also color, shape and</p> <p>13 texture, correct?</p> <p>14 A. Yes.</p> <p>15 MR. HANSEN: Same objection.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. And then if you go to the last sentence it</p> <p>18 goes on -- and the bottom of the left column on that</p> <p>19 same page, going to the top of the right column, it</p> <p>20 says, "You can drag and drop visual samples into an</p> <p>21 image query."</p> <p>22 You see that?</p> <p>23 A. Yeah.</p> <p>24 Q. And that would include images, correct?</p> <p>25 A. Correct.</p>	
		<p style="text-align: right;">Page 319</p> <p>1 color.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. And color histograms specifically?</p> <p>4 MR. HANSEN: Same objection.</p> <p>5 (Reporter seeks clarification.)</p> <p>6 BY MR. EDWARDS:</p> <p>7 Q. Histograms specifically.</p> <p>8 (Reporter seeks clarification.)</p> <p>9 THE WITNESS: Most likely, yes.</p> <p>10 BY MR. EDWARDS:</p> <p>11 Q. Well, pick up Exhibit 12, please.</p> <p>12 And go to IBM 2264.</p> <p>13 A. Okay.</p> <p>14 Q. So the Ultimedia Manager 1.1 was able to</p> <p>15 perform an image query using color, shape and</p> <p>16 texture; correct?</p> <p>17 MR. HANSEN: Objection; lacks foundation.</p> <p>18 (Witness reviews document.)</p> <p>19 BY MR. EDWARDS:</p> <p>20 Q. Let me orient you a little more. If you</p> <p>21 go to the bottom of IBM 2264, where it says "Image</p> <p>22 Query."</p> <p>23 You see that?</p> <p>24 A. Yeah.</p> <p>25 Q. Where the bullet points start, it says,</p>	<p style="text-align: right;">Page 321</p> <p>1 MR. HANSEN: Objection; lacks foundation.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. Okay?</p> <p>4 A. Correct.</p> <p>5 Q. Mr. Flickner, every commercial</p> <p>6 implementation of QBIC as of the Exhibit 3, IEEE</p> <p>7 1995 article, returned results of the matching</p> <p>8 process to the user in the form of a stored image</p> <p>9 and information associated with that image; is that</p> <p>10 fair?</p> <p>11 MR. HANSEN: Objection; lacks foundation.</p> <p>12 THE WITNESS: Yes.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Okay. And a thumbnail is an image;</p> <p>15 correct?</p> <p>16 A. Thumbnail is an image.</p> <p>17 Q. And for every commercial embodiment of</p> <p>18 QBIC as of the 1995 IEEE article in Exhibit 3, those</p> <p>19 implementations calculated a distance metric as a</p> <p>20 measure of similarity for each feature between an</p> <p>21 input image and a stored image; correct?</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 THE WITNESS: Correct.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. Okay. And a distance measure value</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 316</p> <p>1 A. Yeah.</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Yes.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. As of the date of this article, the QBIC</p> <p>6 functionality described in this article was in IBM's</p> <p>7 Ultimedia Manager, IBM's --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 Q. Described in this article was in IBM's</p> <p>10 Ultimedia Manager, IBM's Digital library and DB2</p> <p>11 series of products; correct?</p> <p>12 MR. HANSEN: Objection; lacks foundation.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Is that right, Mr. Flickner?</p> <p>15 A. Yes.</p> <p>16 MR. HANSEN: Same objection.</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Let's pick up Exhibit 10, please.</p> <p>19 Look at page IBM 2419. It's the same -- I want to</p> <p>20 ask you about the same sentence I asked you before,</p> <p>21 where it lists the commercial products in -- at the</p> <p>22 bottom of the second full paragraph.</p> <p>23 A. Yeah.</p> <p>24 Q. See that? It says, "QBIC was developed by</p> <p>25 IBM and moved into commercial products including a</p> <p style="text-align: right;">Page 317</p> <p>1 licensable standalone software package, IBM Digital</p> <p>2 Library, Ultimedia Manager, the Image Extender in</p> <p>3 DB2 Universal, and the MediaMiner software tool</p> <p>4 series."</p> <p>5 Do you see that?</p> <p>6 A. Yeah.</p> <p>7 Q. So as of the date of this article in 1997,</p> <p>8 the features that were described in this article and</p> <p>9 previous articles were incorporated into commercial</p> <p>10 products listed -- that I just listed; is that</p> <p>11 correct?</p> <p>12 A. Yes.</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the</p> <p>20 IBM® D82® Universal Database: Image, Audio, and Video Extenders</p> <p>IBM 000040</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot catalog file name</li> <li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li> <li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li> <li>• Shot number</li> <li>• Starting frame number</li> <li>• Ending frame number</li> <li>• Representative frame number</li> <li>• Name of a file that contains the contents of the representative frame</li> </ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot handle</li> <li>• Video table name</li> </ul> <p style="text-align: right;">Chapter 2. DB2 extender concepts 21                  IBM 000041</p> <p>IBM0002263 at 226</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Description</b> </div> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Classification</b> </div> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Query</b> </div> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p style="text-align: right;">and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Image Formats</b> </div> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCK</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"> <b>Product Positioning</b> </div> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="font-size: small; margin-top: 20px;">285-042 <span style="float: right;">-2-</span> <span style="float: right;">IBM 0002264</span></p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1C]	<p>a content service coupled with the identification platform, and that:</p>	<p>QBIC discloses a content service coupled with the identification platform.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 8  <b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):          “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.          For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and 15-percent blue colors’), shots (‘Find all shots</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

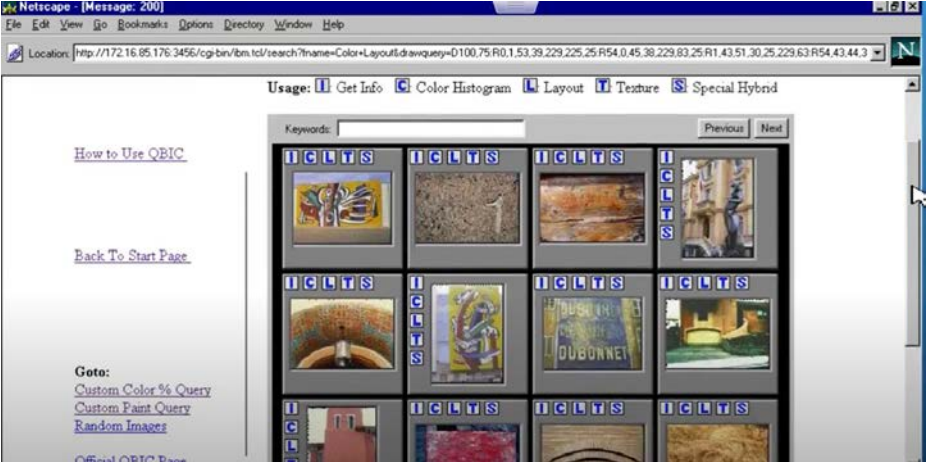

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions-which we call objects-in the images. . . .</p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

Okay. And so let's say that objects were		Page 61	1	identified within a particular image, what were done	2	with those objects? Were they stored, for example,	3	as a separate image or were they somehow linked to	4	or associated with the image from which they were	5	extracted?	6	A. Typically they were linked.	7	Q. They were linked to the source image?	8	A. Yeah.	9	Q. Okay. And this was done in the database?	10	A. Could be done in the database.	11	Q. How was it done?	12	A. It was probably done in a text database or	13	some sort of key index pair database. So database	14	has a lot of different meanings.	14	Q. Yeah, that was a bad question.	15	Once the objects are identified within a	16	particular source image that's stored in the	17	database, how are the objects linked to the source	18	image in the key --	19	A. The key would have been, like, the image	20	name and the value would have been the definition of	21	the -- of the objects.
25	Q. Okay. And so let's say that objects were																																																	
	Page 61																																																	
1	identified within a particular image, what were done																																																	
2	with those objects? Were they stored, for example,																																																	
3	as a separate image or were they somehow linked to																																																	
4	or associated with the image from which they were																																																	
5	extracted?																																																	
6	A. Typically they were linked.																																																	
7	Q. They were linked to the source image?																																																	
8	A. Yeah.																																																	
9	Q. Okay. And this was done in the database?																																																	
10	A. Could be done in the database.																																																	
11	Q. How was it done?																																																	
12	A. It was probably done in a text database or																																																	
13	some sort of key index pair database. So database																																																	
14	has a lot of different meanings.																																																	
14	Q. Yeah, that was a bad question.																																																	
15	Once the objects are identified within a																																																	
16	particular source image that's stored in the																																																	
17	database, how are the objects linked to the source																																																	
18	image in the key --																																																	
19	A. The key would have been, like, the image																																																	
20	name and the value would have been the definition of																																																	
21	the -- of the objects.

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes.</p> <p>2 Q. Okay. And so when a user clicks the I,</p> <p>3 you can see the I is highlighted in red?</p> <p>4 A. Yeah.</p> <p>5 Q. Was there a -- was there a similar</p> <p>6 functionality on the one on the website, where you</p> <p>7 clicked something and it lit up to tell the user</p> <p>8 that they were actually clicking the button?</p> <p>9 A. Yeah.</p> <p>10 Q. Okay. And then you go to the second page,</p> <p>11 and that is the full image of the thumbnail; is that</p> <p>12 correct?</p> <p>13 A. It's not of the thumbnail, it's the</p> <p>14 full-size image.</p> <p>15 Q. Well, yeah, it's the -- it's the</p> <p>16 full-sized image representation of the thumbnail on</p> <p>17 the first page; right?</p> <p>18 A. I would phrase it as the thumbnail is a</p> <p>19 representation of the full-sized image.</p> <p>20 Q. Understood. The first page is a</p> <p>21 thumbnail. You click on "Info" and then it returns</p> <p>22 to you the full-sized image?</p> <p>23 A. Yeah.</p> <p>24 Q. And that's reflected on the second page?</p> <p>25 A. Yeah.</p>	<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that?</p> <p>2 A. That would be the file name of the image.</p> <p>3 Q. Okay. And so if you go back to the first</p> <p>4 page, when the pointer is pointed to I and it clicks</p> <p>5 on that, that is actually directing -- is going to</p> <p>6 direct the user to a separate link, correct, where</p> <p>7 the full-sized image is?</p> <p>8 A. Yes.</p> <p>9 Q. And the address of that link's on the</p> <p>10 second page at the top that says "Location";</p> <p>11 correct?</p> <p>12 A. Yeah, the URL.</p> <p>13 Q. Right. And so that would be similar to</p> <p>14 how the demo is on the website, it would go to a</p> <p>15 specific URL that's linked to where that image is</p> <p>16 stored?</p> <p>17 A. Yes.</p> <p>18 Q. Right? And that's how it would work on</p> <p>19 any implementation, any commercial implementation;</p> <p>20 correct?</p> <p>21 A. Yeah.</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 MR. EDWARDS: So we've been going for about an</p> <p>24 hour. How do you -- how are you feeling?</p> <p>25 THE WITNESS: I'm all right.</p>

		<p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p>2 Q. Exhibits 2, 3 and 10 are the papers that</p> <p>3 you co-authored. If your counsel can provide those</p> <p>4 to you just so that you have them in front of you.</p> <p>5 A. I have them here.</p> <p>6 MR. STRAUSSMAN: Okay.</p> <p>7 THE WITNESS: Okay.</p> <p>8 BY MR. EDWARDS:</p> <p>9 Q. And can you just confirm for me,</p> <p>10 Mr. Flickner, Exhibits 2, 3 and 10 were papers you</p> <p>11 co-authored?</p> <p>12 A. Yes.</p> <p>13 Q. You would have included accurate</p> <p>14 information in those -- in those papers at the time</p> <p>15 that you authored them; is that correct?</p> <p>16 MR. HANSEN: Objection; vague and ambiguous.</p> <p>17 THE WITNESS: Yes.</p> <p>18 BY MR. EDWARDS:</p> <p>19 Q. And the information in those papers</p> <p>20 accurately reflected the functionality of QBIC at</p> <p>21 the time those articles were published; is that</p> <p>22 correct?</p> <p>23 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at Figs. 7–9</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and 15-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. . . .</p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more</p>

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

The key would have been, like, the image</td> </tr> <tr> <td>20</td> <td>name and the value would have been the definition of</td> </tr> <tr> <td>21</td> <td>the -- of the objects.</td> </tr> </table> <p><i>Id.</i> at 103:</p>	25	Q. Okay. And so let's say that objects were		Page 61	1	identified within a particular image, what were done	2	with those objects? Were they stored, for example,	3	as a separate image or were they somehow linked to	4	or associated with the image from which they were	5	extracted?	6	A. Typically they were linked.	7	Q. They were linked to the source image?	8	A. Yeah.	9	Q. Okay. And this was done in the database?	10	A. Could be done in the database.	11	Q. How was it done?	12	A. It was probably done in a text database or	13	some sort of key index pair database. So database	14	has a lot of different meanings.	14	Q. Yeah, that was a bad question.	15	Once the objects are identified within a	16	particular source image that's stored in the	17	database, how are the objects linked to the source	18	image in the key --	19	A. The key would have been, like, the image	20	name and the value would have been the definition of	21	the -- of the objects.
25	Q. Okay. And so let's say that objects were																																																	
	Page 61																																																	
1	identified within a particular image, what were done																																																	
2	with those objects? Were they stored, for example,																																																	
3	as a separate image or were they somehow linked to																																																	
4	or associated with the image from which they were																																																	
5	extracted?																																																	
6	A. Typically they were linked.																																																	
7	Q. They were linked to the source image?																																																	
8	A. Yeah.																																																	
9	Q. Okay. And this was done in the database?																																																	
10	A. Could be done in the database.																																																	
11	Q. How was it done?																																																	
12	A. It was probably done in a text database or																																																	
13	some sort of key index pair database. So database																																																	
14	has a lot of different meanings.																																																	
14	Q. Yeah, that was a bad question.																																																	
15	Once the objects are identified within a																																																	
16	particular source image that's stored in the																																																	
17	database, how are the objects linked to the source																																																	
18	image in the key --																																																	
19	A. The key would have been, like, the image																																																	
20	name and the value would have been the definition of																																																	
21	the -- of the objects.

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>3 Q. Okay. And then once -- for each -- strike                      4 that.                      5 For each of these four feature                      6 calculations, color, whether it's average or                      7 histogram, texture, shape, sketch, once those                      8 features are extracted, those are stored in the                      9 database; is that right?                      10 A. Correct.                      11 Q. And those are linked to the image from                      12 which they are extracted?                      13 A. Yes.                      14 Q. And those -- is it -- is it true that in                      15 the database that the stored image is linked with a                      16 thumbnail is linked with the description that is --                      17 that is entered by the user or comes from the image                      18 source and also is linked to these features that are                      19 extracted, all those things are linked together?                      20 A. Yeah.</p> <p><i>Id.</i> at 129 – 131:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>9 Q. Okay? And if you want to compare, or you                      10 can take my word for it, the image in the top left                      11 corner, the querying image, is the same one that was                      12 on Exhibit 7.                      13 A. Yes.                      14 Q. Okay. And here the user's clicking the I                      15 icon, which stands for "Get Info."                      16 Do you see that?                      17 A. Um-hum.                      18 Q. On the first page?                      19 A. Yeah.                      20 Q. And the second page is doing what?                      21 A. Is presenting the image at full                      22 resolution.                      23 Q. Okay. And was there a similar                      24 functionality on the demo app on the -- on the                      25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p>	<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>
--	--	---	--

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 161:</p> <p>1 Q. And does the thumbnail also provide links                  2 to information about the image that was associated                  3 with the image in the database?                  4 A. Yes.                  5 Q. And, again, that can be that -- whatever                  6 information that the user inputted or was associated                  7 with the image from the source?                  8 A. Yes.                  9 Q. Could the results also display a matching                  10 score so the user could see how well the particular                  11 result matched to the -- to the query image?                  12 A. It could.</p> <p><i>Id.</i> at 321:</p> <p>5 Q. Mr. Flickner, every commercial                  6 implementation of QBIC as of the Exhibit 3, IEEE                  7 1995 article, returned results of the matching                  8 process to the user in the form of a stored image                  9 and information associated with that image; is that                  10 fair?                  11 MR. HANSEN: Objection; lacks foundation.                  12 THE WITNESS: Yes.                  13 BY MR. EDWARDS:                  14 Q. Okay. And a thumbnail is an image;                  15 correct?                  16 A. Thumbnail is an image.</p> <p><i>Id.</i> at 305:</p>

		<p>12 Q. And it indicates the demo does                      13 content-based search based on color histogram, color                      14 position and texture.                      15 Do you see that?                      16 A. Yep.                      17 Q. That's a limited number of the features                      18 that QBIC could extract; right?                      19 A. Correct.                      20 Q. Was there -- for those demo applications                      21 that you -- that you all created, was there a                      22 conscious effort to limit the number of                      23 characteristics you put on the demo?                      24 A. Probably limited by the size of the CD.                      25 (Reporter seeks clarification.)</p> <p style="text-align: right;">Page 110</p> <p>1 A. It was limited by the size of the CD.</p> <p><i>Id.</i> at 311:</p> <p>22 Q. Okay. The purpose of a demo is to                      23 highlight the capabilities of QBIC to people                      24 external to IBM; isn't that correct?                      25 A. Correct.</p> <p><i>Id.</i> at 313-317:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p>2 Q. Exhibits 2, 3 and 10 are the papers that</p> <p>3 you co-authored. If your counsel can provide those</p> <p>4 to you just so that you have them in front of you.</p> <p>5 A. I have them here.</p> <p>6 MR. STRAUSSMAN: Okay.</p> <p>7 THE WITNESS: Okay.</p> <p>8 BY MR. EDWARDS:</p> <p>9 Q. And can you just confirm for me,</p> <p>10 Mr. Flickner, Exhibits 2, 3 and 10 were papers you</p> <p>11 co-authored?</p> <p>12 A. Yes.</p> <p>13 Q. You would have included accurate</p> <p>14 information in those -- in those papers at the time</p> <p>15 that you authored them; is that correct?</p> <p>16 MR. HANSEN: Objection; vague and ambiguous.</p> <p>17 THE WITNESS: Yes.</p> <p>18 BY MR. EDWARDS:</p> <p>19 Q. And the information in those papers</p> <p>20 accurately reflected the functionality of QBIC at</p> <p>21 the time those articles were published; is that</p> <p>22 correct?</p> <p>23 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>QBIC (Query by Image Content) (BOFA00001391–392) at 2:</p>

		<div data-bbox="961 269 1850 678" data-label="Image"> </div> <p data-bbox="842 706 1092 732"><b>Result of QBIC Search</b></p> <p data-bbox="842 779 1885 1105">Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>QBIC Demo (IBM000747):</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content (“QBIC”) System

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p>22 Q. Okay. And in what form would those                      23 results be displayed to me? For images would they                      24 be displayed as a thumbnail?                      25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those                      2 be displayed to you?                      3 A. It could be as a thumbnail or as a short                      4 video clip or as a single representative frame.                      5 Q. Okay. So they could be -- so for a video,                      6 there's a video that matched the image query of an                      7 r-frame, the results I could get back could include                      8 three things. It could be a still image, it could                      9 be a thumbnail, or it could be an r-frame                      10 representation?                      11 A. R-frame, I think, is representative frame.                      12 So it was a key frame in that video sequence,                      13 summary frame.                      14 Q. Once I ran a query on an r-frame; right?                      15 Well, let's stop there.                      16 If I run a query on still images,                      17 typically the results I would get back are                      18 thumbnails that are most similar to the                      19 characteristics which I queried from the query                      20 image; right?                      21 A. You could get thumbnails back. You could                      22 also get the full-sized image back.                      23 Q. Okay.                      24 A. Thumbnail is a tool for helping you return                      25 lots of results and quickly scan it.</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. STRAUSSMAN: You can answer.                  19 THE WITNESS: I don't know.                  20 BY MR. EDWARDS:                  21 Q. But, Mr. Flickner, this -- generally this                  22 article represents the status of the QBIC technology                  23 as of the date of this publication, which is                  24 September 1995; is that right?                  25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.                  2 THE WITNESS: As I recall -- I'm not sure                  3 definitely, but, yes, this is -- you could do that.                  4 BY MR. EDWARDS:                  5 Q. So let's go to page IBM 898.                  6 So if you'll take -- just read that                  7 paragraph that starts with the header                  8 "Representative Frame Generation."                  9 MR. STRAUSSMAN: And if you need to read                  10 anything else to put it in context, feel free to do                  11 so.                  12 THE WITNESS: Okay.                  13 (Witness reviews document.)                  14 THE WITNESS: So what was your question, again?                  15 BY MR. EDWARDS:                  16 Q. If you go to the sentence that says,                  17 "First" -- it's the second sentence in that                  18 paragraph. It says, "First, during database                  19 population, r-frames are treated as still images."                  20 See that?                  21 A. Yeah.                  22 Q. And that's what you told me earlier;                  23 correct?                  24 A. Yeah.                  25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --                  2 Q. Okay.                  3 A. -- there's an editorial process.                  4 Q. Say that last part?                  5 A. There's an editorial process. You submit                  6 it, they edit and make changes and eventually it                  7 appears.                  8 Q. Right. So what you're saying is there's                  9 some lag between the time that you wrote the article                  10 and the time it was published?                  11 A. Yeah.                  12 Q. So this article -- but this article                  13 represents the state of the QBIC technology at least                  14 as of September 1995?                  15 A. Yeah. Yes.                  16 Q. And then let's go to IBM 900.                  17 And take your time to orient yourself on                  18 that page, but what I really want to ask you about                  19 is the last paragraph on the left-hand column going                  20 up to the top of the right-hand column.                  21 A. Yep.                  22 Q. So it says this paper describes [as read],                  23 "a prototype system that uses image and video                  24 content as the basis for retrievals."                  25 Is that right?</p>

Invalidity Chart for U.S. Patent 8,478,036 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p>	<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

		<p><i>See also</i> Flickner Depo at 25-26, 50, 54-55, 209-210</p> <p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on Hewlett-Packard CoolTown System (“CoolTown”)

**Exhibit C-31**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, CoolTown was made, known or used by others in the United States no later than July 10, 2000. *See generally* T. Kindberg et al., A Web-Based Nomadic Computing System; J. Barton et al., The Cooltown User Experience; cooltown developer’s network, coolbase overview; cooltown developer’s network, people, places, things: web presence for the real world. CoolTown is available as prior art at least under 35 U.S.C. § 102(a). On information and belief, HP was using CoolTown and made it available to the public in the United States by releasing the website on the Internet (and accessible to U.S. users) by at least March 2000, making the software available on the HP website by March 2000, and making available on the Internet (and accessible to U.S. users) the open source code, which reflects the functionality of CoolTown by at least March 2000. *See e.g.*, HP000043–044; HP000045–046; HP000060–061; *see also* <https://www.zdnet.com/article/hp-brings-open-source-to-cooltown/>. Therefore, HP Cooltown was at least known, used, and/or sold to the public by at least 2000. On information and belief, CoolTown is also available as prior art under 102(g). BofA is diligently investigating CoolTown and will supplement with additional information, if necessary.

As shown in the chart below, CoolTown anticipates asserted claim 1 of the ’036 Patent. To the extent CoolTown is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent CoolTown is found not to anticipate any asserted claims or claim elements of the ’036 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on Hewlett-Packard CoolTown System (“CoolTown”)

infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

**1. Claim 1**

Element	'036 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A content provisioning system comprising:	<p>CoolTown discloses a content provisioning system.</p> <p>The Cooltown User Experience (HP000088 – 093) at 1:</p> <p style="padding-left: 40px;">The Cooltown project at HP Labs applies Web technology to develop systems that support the users of wireless, handheld devices interacting with their environment, anywhere they may be. The basic elements of Web technology useful for ubiquitous computing are described in several papers and on-line resources from the Cooltown project [1-5]. Here we will give a flavor of the Cooltown user experience, discuss ways that context can be used in web systems, and explain why we think a web-based system for ubiquitous computing can achieve network effects. In our conclusion we will mention some of the many remaining challenges and our initial user studies platform.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 1</p> <p><b>Abstract</b></p> <p>CoolTown offers a web model for supporting nomadic users, based on the convergence of web technology, wireless networks and portable devices. This paper describes how CoolTown ties web resources to physical objects and places, and how users interact with resources using the information appliances they carry, from laptops to smart watches. Enabling the automatic discovery of URLs from our physical surroundings, and using localized web servers for directories, we create location-aware but ubiquitous systems. On top of this infrastructure we leverage device connectivity to support communication services.</p>

		<p>Coolbase<sup>1</sup> Overview at 1                      coolbase overview</p> <p>The coolbase platform consists of several sub-projects which combine to form a coherent framework for bringing together all the elements necessary to build a cooltown service or application. These sub-projects include software for enabling smart, connected web devices; software for representing people, places and things and their contextual relationships; some supporting hardware and software elements; and sample applications that illustrate the use of these various elements.</p>
[1A]	<p>a target database storing known targets of different types and recognition parameters associated with the known targets;</p>	<p>CoolTown discloses a target database storing known targets of barcodes.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</p> <p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>• <i>IR &amp; RF.</i> The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>• <i>Barcodes.</i> Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>• <i>Electronic tags.</i> A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>• <i>Optical recognition.</i> The user's device may have a camera attached, in which case the identifier can be encoded in a form such as a 'glyph' [23] or digital watermark that is amenable to recognition software.</li> </ul> <p>In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p>Direct sensing is the most concrete: it requires no resolver. An advantage of indirect sensing is that the same identifier can be looked up in different resolvers with different, context-dependent results. For example, sensing a book's ISBN barcode could lead to the local library's entry for the book, if the resolver for the ISBN is the local</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,478,036 based on Hewlett-Packard CoolTown System (“CoolTown”)

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b>                      Figure 3 sketches a PDA with several sensing mechanisms (IR, barcode and RF) similar to prototypes we have developed in the CoolTown project. The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display the corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard 'sensing events', bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in their current activity, so that users can 'retrace their steps'.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>                      To get an idea of some of the issues in defining place contexts, imagine that Acme Software Inc. sets up a stand at the Wireless Web World exhibition (Figure 4). Acme has to define its own context within the exhibition, which it uses to provide information, printing, purchasing and other services to users who walk up to the stand. Visitors must be able to discover the Acme context when they walk up, distinguish it from that of neighboring exhibits, and, through their devices, these visitors must be able to browse and access the resources that Acme provides within that context. We are mainly interested here in resources that are based around the physical entities found at the exhibition stand. When the visitor reads a barcode attached, say, to a printer or a guest book on display, they are automatically shown the Acme web page offering them a service connected with it.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>  <b>Place Managers</b>                      Our implementation of place context is as a web server with appropriate content describing the place [6]. The points of web presence of the designated objects will appear as links in the place's web pages. They will also be discoverable programatically, using lookup by identifier, and lookup by service type and other attributes. The 'local resolver' that we described in the previous section is an example of a resource that can be looked up automatically from the place's context.</p> <p><i>A place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"> <li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li> <li>• It acts as a resolver for each place, for looking up resources from their identifier.</li> </ul> <p>Cooltown Developer's Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 8</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>Indirect Sensing</b></p> <p>In the case of indirect sensing, the user’s client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be ‘sensed’ as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place’s Web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding Web page. Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p> <p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings’ URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore’s web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user’s client device obtains a value that it has to look up</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

		<p>to obtain a URL. There are many types of value that can be ‘sensed’ as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place’s web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>  <p><b>Figure 4. Indirect sensing: the web presence for a painting.</b></p>

*Nantworks, LLC v. Bank of America Corporation*

		<p>Barcodes can be used instead of an electronic tag.</p> <p>Figure 4 shows a different art gallery demonstrator in which a PDA client senses a painting’s tag. A correlated web page is resolved from the tag identifier and the client presents it to the user.</p> <p>We have produced a prototype implementation for sensing tagged things and displaying a corresponding context-dependent web page. The sensing device knows the URL of a <i>resolver</i>. When the client senses a tag, it sends the identifier to the resolver. If the resolver has an entry for the identifier, it sends back the corresponding URL. The user may choose a resolver that reflects his or her personal requirements, or those of a group of users with interests or tasks in common. For example, visitors to an art gallery could be offered resolvers that provide the URLs of pages in their native language, or pages provided by the art school at which they study.</p> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1B]	an identification platform coupled with the target	CoolTown discloses an identification platform coupled with the target database.

	<p>database, and that</p>	<p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 20:</p> <p><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 24:</p>

		<p>The Cooltown project at HP Labs applies Web technology to develop systems that support the users of wireless, handheld devices interacting with their environment, anywhere they may be. The basic elements of Web technology useful for ubiquitous computing are described in several papers and on-line resources from the Cooltown project [1-5]. Here we will give a flavor of the Cooltown user experience, discuss ways that context can be used in web systems, and explain why we think a web-based system for ubiquitous computing can achieve network effects. In our conclusion we will mention some of the many remaining challenges and our initial user studies platform.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 1  <b>Abstract</b></p> <p>CoolTown offers a web model for supporting nomadic users, based on the convergence of web technology networks and portable devices. This paper describes how CoolTown ties web resources to physical of places, and how users interact with resources using the information appliances they carry, from laptop watches. Enabling the automatic discovery of URLs from our physical surroundings, and using local servers for directories, we create location-aware but ubiquitous systems. On top of this infrastructure we device connectivity to support communication services.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 2</p> <p>The CoolTown work is not on the devices or wireless communication layers, but rather on the layer of infrastructure that is needed to support nomadic users with portable devices. We work at the “web server” level and we see our work as extending web models to new arenas.</p> <p>As a consequence of the above assumptions, most of our demonstration scenarios use a sensing mechanism, like a barcode reader or a short-range networking subsystem such as infrared, combined with long-range or wired web access. The sensor is used to obtain addresses (URLs) to access web resources. So we imagine our nomadic users carrying devices like:</p> <ul style="list-style-type: none"> <li>• PDAs with 802.11 network access and barcode or other sensors, or</li> <li>• Cellular telephones with additional short-range networking, or</li> <li>• Cameras with short-range networks that interact with Internet-connected kiosks.</li> </ul> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 3</p>

		 <p data-bbox="846 597 1524 621">Figure 3. A sketch of a PDA equipped for sensing URLs and identifiers.</p> <p data-bbox="810 638 932 662"><b>3. Sensing</b></p> <p data-bbox="810 678 1734 768">In this section, we describe the bottom layer of our infrastructure, which enables the user to acquire URLs from their surroundings or from the physical entities in their surroundings. An obvious mechanism, with equally obvious drawbacks, is to write the URL on a label and attach it to the object. The user reads the label and types the URL into their browser.</p> <p data-bbox="810 781 1734 889">Rather than being forced to use that cumbersome method, users should be able to identify conveniently what it is that interests them in their surroundings and obtain the corresponding URL <i>automatically</i>. To achieve this, their PDA is equipped with at least one short-range device that allows them to read URLs and other identifiers associated with places and individual objects in their surroundings, by pointing or positioning the device. We call this URL <i>sensing</i>.</p> <p data-bbox="810 902 1079 922">Some options for sensing include:</p> <ul data-bbox="810 935 1734 1255" style="list-style-type: none"> <li>∇ <i>IR &amp; RF.</i> The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>∇ <i>Barcodes.</i> Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>∇ <i>Electronic tags.</i> A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>∇ <i>Optical recognition.</i> The user’s device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p data-bbox="800 1300 1640 1325"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</b></p> <p data-bbox="800 1333 1829 1398">In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p>

In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p>Direct sensing is the most concrete: it requires no resolver. An advantage of indirect sensing is that the same identifier can be looked up in different resolvers with different, context-dependent results. For example, sensing a book's ISBN barcode could lead to the local library's entry for the book, if the resolver for the ISBN is the local</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b>          Figure 3 sketches a PDA with several sensing mechanisms (IR, barcode and RF) similar to prototypes we have developed in the CoolTown project. The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display the corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard 'sensing events', bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in their current activity, so that users can 'retrace their steps'.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>          To get an idea of some of the issues in defining place contexts, imagine that Acme Software Inc. sets up a stand at the Wireless Web World exhibition (Figure 4). Acme has to define its own context within the exhibition, which it uses to provide information, printing, purchasing and other services to users who walk up to the stand. Visitors must be able to discover the Acme context when they walk up, distinguish it from that of neighboring exhibits, and, through their devices, these visitors must be able to browse and access the resources that Acme provides within that context. We are mainly interested here in resources that are based around the physical entities found at the exhibition stand. When the visitor reads a barcode attached, say, to a printer or a guest book on display, they are automatically shown the Acme web page offering them a service connected with it.</p>

		<p>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</p> <p><b>Place Managers</b></p> <p>Our implementation of place context is as a web server with appropriate content describing the place [6]. The points of web presence of the designated objects will appear as links in the place’s web pages. They will also be discoverable programatically, using lookup by identifier, and lookup by service type and other attributes. The ‘local resolver’ that we described in the previous section is an example of a resource that can be looked up automatically from the place’s context.</p> <p>A <i>place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"> <li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li> <li>• It acts as a resolver for each place, for looking up resources from their identifier.</li> </ul> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 8</p> <p><b>Indirect Sensing</b></p> <p>In the case of indirect sensing, the user’s client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be ‘sensed’ as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place’s Web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding Web page.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p>

Element	'036 Claim Recitation	Exemplary Citations in Reference
		<p><b>Place Managers</b></p> <p>Our implementation of place context is as a web server with appropriate content describing the place [6]. The points of web presence of the designated objects will appear as links in the place’s web pages. They will also be discoverable programatically, using lookup by identifier, and lookup by service type and other attributes. The 'local resolver' that we described in the previous section is an example of a resource that can be looked up automatically from the place's context.</p> <p>A <i>place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"> <li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li> <li>• It acts as a resolver for each place, for looking up resources from their identifier.</li> </ul> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 20 – 21</p> <p><b>2.1. Visiting the Cooltown Museum.</b></p> <p>The Cooltown Museum and Bookstore offers visitors a Web-enhanced experience. As visitors tour the museum, their portable digital assistant (PDA) can receive Web URLs from wireless "beacons". These beacons are small infrared transceivers located close to pictures or</p>

		<p>sculptures; the URLs link into a Web of information about the items. Using the PDA's Web browser, visitors can read or hear about the artist or the work and about related art works in the museum. The URLs can also be stored as bookmarks for further study or they can be used to select reproductions of the artwork from the museum's online store. The museum staff uses the same URLs for inventory control as the URLs point to the object's point of Web presence.</p> <p>As visitor move into the Cooltown Museum bookstore they can use their PDAs to sense the URLs associate with books, calendars, and posters for sale (Figure 2). These URLs will give them book reviews, available inventory of calendars, and other colors of posters for examples. The museum bookstore's Web portal provides services to assist in buying books, including a service to order books that are not available. In addition, the bookstore offers a printing service, for visitors to print out Web pages that they collected during their visit or even order reproductions of paintings to be printed just in time for purchase at the exit.</p> <p>Cooltown Developer's Network, People, Place, and Things: web presence for the real world (HP000025-34) (HP000025-34) at 23</p>

		<p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user's client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be 'sensed' as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place's web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>

		 <p data-bbox="877 716 1812 748">Figure 3. A sketch of a PDA equipped for sensing URLs and identifiers.</p> <p data-bbox="798 797 1640 829"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b></p> <p data-bbox="798 829 1892 1040">Figure 3 sketches a PDA with several sensing mechanisms (IR, barcode and RF) similar to prototypes we have developed in the CoolTown project. The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display the corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard 'sensing events', bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in their current activity, so that users can 'retrace their steps'.</p> <p data-bbox="798 1081 1640 1114"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b></p> <p data-bbox="798 1114 1892 1276">One of those CoolTown applications provides indirect sensing. It can be configured to use any resolver of the user's choosing, but in particular it can automatically discover which is the local resolver when the user has designated which is the local context (see next section). When the user scans a tag such as a barcode, the application handles the sensing event by constructing a URN [3] from the identifier (if it is not in that form already). It uses the standard THHTTP protocol [8] to request the local resolver to turn the URN into the URL of a resource. This URL is then made available to the browser.</p> <p data-bbox="798 1308 1640 1341"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b></p>

		<p><b>Discovery:</b> Discovery is the acquisition of contexts and resources within contexts. Places are discovered in much the same way as individual physical objects, although they are typically extended and so may require several beacons or tags. Prominent “You Are Here” beacons or barcodes (or any other type of tag) attached to the Acme exhibition stand enable the user to pick up that place’s context. The user points the device at the beacon or scans the barcode. The result is the URL of the place: a set of web pages containing information and services that the user can browse on their device, and which devices can query.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) at 5</p> <p><b>2.4 The Common User Experience in Cooltown.</b></p> <p>The three examples above explore various aspects of web presence but they also show a common theme. The typical user experience we seek with web presence is that of collecting links to points of web presence as they are encountered them in the physical world. One could even think of the physical world as a web page, with links at certain physical points. Of course the links are URLs presented on the user’s client device and the result of clicking on such a link will be a real web page, delivered to the user’s screen. The user can then travel through the virtual space of the web page with normal Web techniques or the user can travel through the physical space to find a different point of web presence. The user understands URLs as pointers to meta-information about objects at the same level that users of Web browsers now understand URLs as bookmarks for Web content. While this physical/virtual browsing is a typical scenario, we imagine other usage scenarios for web present things, in the same way that the Web supports many usage scenarios in addition to Web browsing.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p>

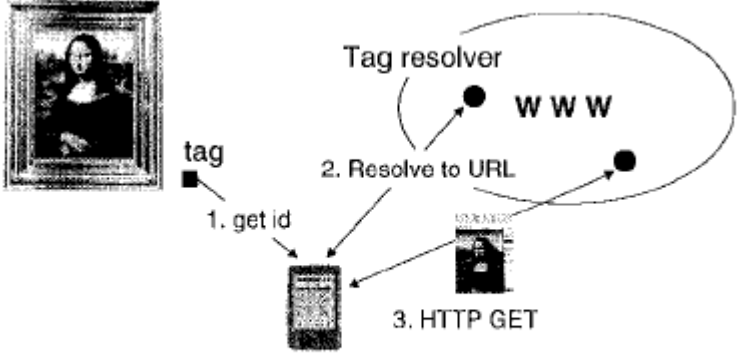

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

### **Exhibit E-3**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Rhoads was filed on May 15, 2000, claiming the priority date of May 19, 1999. Rhoads published at least as of September 20, 2005, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Rhoads anticipates asserted claims 18, 27, 29, and 31 of the ’252 Patent. To the extent Rhoads is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Rhoads is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

		 <p style="text-align: center;"><b>FIG. 11</b></p> <p>Rhoads at 7:13-29</p> <ul style="list-style-type: none"> <li>• “Referring to FIG. 11, a basic embodiment 110 of the present technology includes an optical sensor 112, a computer 114, and a network connection 116 to the internet 118. The illustrated optical sensor 112 is a digital camera having a resolution of 320 by 200 pixels (color or black and white) that stares out, grabbing frames of image data five times per second and storing same in one or more frame buffers. These frames of image data are analyzed</li> </ul>

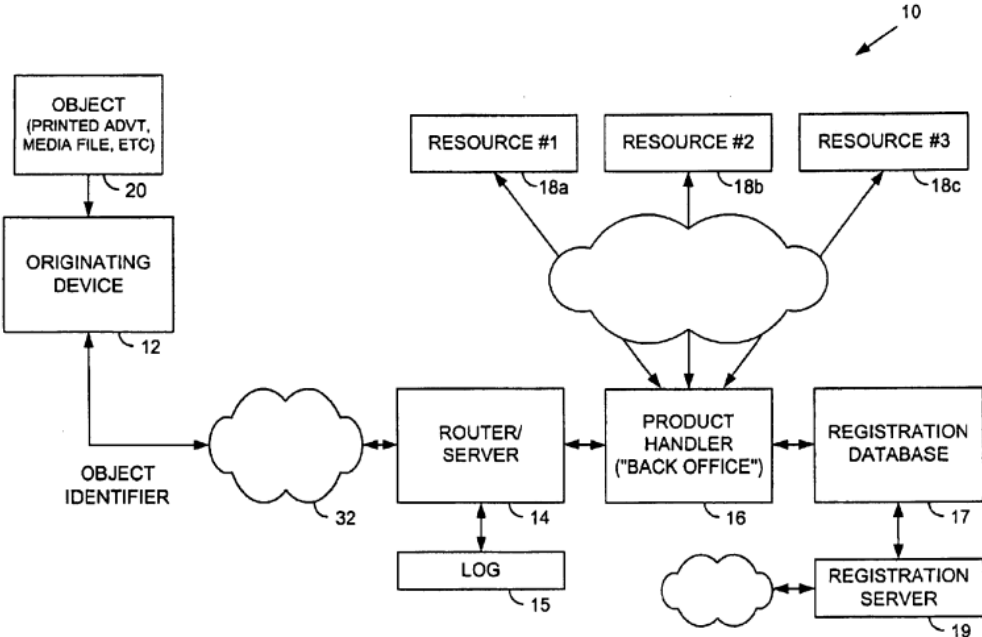

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 7,899,252 based on  
 U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>by a computer 114 for the presence of Bedoop data. (Essentially, Bedoop data is any form of plural-bit data encoding recognized by the system 110— data which, in many embodiments, initiates some action.) Once detected, the system responds in accordance with the detected Bedoop data (e.g., by initiating some local action, or by communication with a remote computer, such as over the internet, via an online service such as AOL, or using point-to-point dial-up communications, as with a bulletin board system).”</p> <p>Rhoads 8:66 – 9:12</p> <ul style="list-style-type: none"> <li>• “In still other embodiments, the camera (or other sensor) can be equipped with one or more auxiliary fixed-focus lenses that can be selectively used, depending on the particular application. Some such embodiments have a first fixed focused lens that always overlies the sensor, with which one or more auxiliary lenses can be optically cascaded (e.g., by hinge or slide arrangements). Such arrangements are desirable, e.g., when a camera is not a dedicated Bedoop sensor but also performs other imaging tasks. When the camera is to be used for Bedoop, the auxiliary lens is positioned (e.g., flipped into) place, changing the focal length of the first lens (which may be unsuitably long for Bedoop purposes, such as infinity) to an appropriate Bedoop imaging range (such as one foot).”</li> </ul> <p>Rhoads at 17:46–54</p> <ul style="list-style-type: none"> <li>• “The building can be provided with an image sensor (such as a video camera or the like), an associated Bedoop. detection system, and the proximity detector. When a user wearing the badge approaches, the proximity detector signals the camera to capture image data. The Bedoop detection system identifies the badge photograph (e.g., by clues as are described in the prior applications, or without such aids), captures optical data, and decodes same to extract the steganographically-embedded data hidden therein.”</li> </ul>

		<p>cans. Special issues can arise when encoding and decoding markings on such objects. For example, when sensing such an object with a camera or the like, part of the image will be out of focus due to differing distances from the camera to different parts of the can surface.</p> <p>While parts of an image sensed from a non-planar object, such as a can, may be out of focus, they still convey useful image data. The out of focus areas are just blurred—as if filtered by a low pass filter. But to make use of this information, a further complication must first be addressed: warping.</p> <p>When viewed from a camera, the planar artwork with which the can is wrapped becomes warped. Portions of the can nearest the camera appear at a nominal full scale, while areas successively further around the can curvature (as viewed from the camera) appear progressively more and more spatially compressed. Regardless of the watermarking technology being employed, the physical warp of the can's surface is likewise manifested as a warping of the encoded watermark data.”</p> <p>Rhoads at 38:1 – 19</p> <ul style="list-style-type: none"> <li>• “Post-It® Notes                      Pads of Post-It® notes, or other pads of paper, can be marked by the manufacturer (either by texturing, watermarked tinting, ink-jet spattering, etc.) to convey steganographic data (e.g., Bedoop data). When such a note is presented to a Bedoop system, the system may launch an application that stores a snapshot of the note. More particularly, the application may mask the note-portion of the image data from the other image data, virtually re-map it to a rectangular format of standardized pixel dimensions, JPEG-compress the resulting image, and store it in a particular computer subdirectory with a name indicating the date of image acquisition, together with the color and/or size of the note. (These latter two data may be</li> </ul>

		<p>character recognition (MICR), optical character recognition (OCR), optical mark recognition (OMR), radio frequency identification (RF/ID), UV/IR identification technologies, data glyphs, organic transistors, magnetic stripe, etc., depending on the particular application requirements.”</p> <p>Rhoads at 9:35–41</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.”</li> </ul> <p>Rhoads at 9:35–10:10</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge</p>

		<p>boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.”</p> <p>Rhoads at 44:66 – 45:11</p> <ul style="list-style-type: none"> <li>• “Just as the scanner 210 can perform watermark decoding, it can similarly perform barcode decoding. Conventional pattern-recognition algorithms can be applied by CPU 212 to either the raw or final scan data to identify barcode patterns. Once the pattern is identified, decoding is straightforward by applying known barcode alphabets. As in the watermark case, barcode decoding can be performed autonomously, or in response to user/auxiliary device command. Similarly, the decoded barcode data can be provided to the auxiliary device whenever detected, or in response to an auxiliary device query. The 2D data can likewise be used to augment the information provided to the CPU so as to aid in the barcode detection/decoding process.”</li> </ul>

		<ul style="list-style-type: none"> <li>• “Although the following specification focuses on applications employing digital watermarking, certain of such applications can alternatively employ other data encoding techniques, including 1D and 2D barcodes, magnetic ink character recognition (MICR), optical character recognition (OCR), optical mark recognition (OMR), radio frequency identification (RF/ID), UV/IR identification technologies, data glyphs, organic transistors, magnetic stripe, etc., depending on the particular application requirements.”</li> </ul> <p>Rhoads at 9:35–10:21</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data.</p> <p>Color is a further object identification clue that may be useful in some</p>

		<p>contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example, some objects include subliminal graticule data, or other calibration data, steganographically encoded with the Bedoop data to aid in determining orientation. Others can employ overt markings, either placed for that sole purpose (e.g. reference lines or fiducials), or serving another purpose as well (e.g. lines of text), to discern orientation. Edge-detection algorithms can also be employed to deduce the orientation of the object by reference to its edges.”</p>

		<p>the gestural movements. Since this functionality is typically utilized by many Bedoop applications, it is generally preferable to provide a single set of gestural interpretation software functions (commonly at the operating system level) to analyze the frame data, and make available gestural output data in standardized form to all Bedoop applications.</p> <p>In one such system, a gestural decoding module tracks the encoded object within the series of image data frames, and outputs various parameters characterizing the object's position and manipulation over time. Two of these parameters indicate the X-Y position of the object within current frame of image data. The module can identify a reference point (or several) on the object, and output two corresponding position data (X and Y). The first represents the horizontal offset of the reference point from the center of the image frame, represented as a percentage of frame width. A two's complement representation, or other representation capable of expressing both positive and negative values, can be used so that this parameter has a positive value if the reference point is right of center-frame, and has a negative value if the reference point is left of center frame. The second parameter, Y, similarly characterizes the position of the reference point above or below center-frame (with above-being represented by a positive value). Each of these two parameters can be expressed as a seven-bit byte. A new pair of X, Y parameters is output from the gestural decoding module each time a new frame of image data is processed.”</p> <p>Rhoads at 44:66 – 45:11</p> <ul style="list-style-type: none"> <li>• “Just as the scanner 210 can perform watermark decoding, it can similarly perform barcode decoding. 		<p>communication with a remote computer, such as over the internet, via an online service such as AOL, or using point-to-point dial-up communications, as with a bulletin board system).”</p> <p>Rhoads 7:30 – 46</p> <ul style="list-style-type: none"><li>• “Consider the milk carton example. The artwork on a milk carton can be adapted to convey Bedoop data. In the preferred embodiment, the Bedoop data is steganographically encoded (e.g., digitally watermarked) on the carton. Numerous digital watermarking techniques are known—all of which convey data in a hidden form (i.e., on human inspection, it is not apparent that digitally encoded data is present). Exemplary techniques operate by slightly changing the luminance, or contours of selected points on artwork or text printed on the carton, or by splattering tiny droplets of ink on the carton in a seemingly random pattern. Each of these techniques has the effect of changing the local luminance at areas across the carton—luminance changes that can be detected by the computer 114 and decoded to extract the encoded digital data. In the case of a milk carton, the data may serve to identify the object as, e.g., a half gallon carton of Alpenrose brand skim milk.”</li></ul> <p>Rhoads at 9:35–10:21</p> <ul style="list-style-type: none"><li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li></ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

		<p>typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example, some objects include subliminal graticule data, or other calibration data, steganographically encoded with the Bedoop data to aid in determining orientation. Others can employ overt markings, either</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent No. 6,947,571 to Rhoads (“Rhoads”)

		<p>In accordance with an exemplary application of the below-detailed technology, digital watermarking is employed to convey a plural bit identifier within print media, such as magazine advertisements or articles, direct mail coupons or catalogs, bank- or credit-cards, and business cards. This identifier is read by software in a user's computing device and forwarded to a remote database. The remote database identifies a URL corresponding to the identifier, and provides the URL back to the user's computer—permitting a browser on the user's computer to display the URL-identified web page. That web page can provide additional information or services—more timely and/or more extensive than that provided by the print material. By such arrangement, more efficient internet navigation and access is provided to consumers, and more effective means for linking readers to e-commerce points of sale is provided to advertisers.”</p> <p>Rhoads at 50:21-48</p> <ul style="list-style-type: none"><li>• “As more particularly detailed below, the handler 16 provides a response in accordance with the particular watermark payload. The response may be provided directly by the product handler to the device 12, or the handler may respond by communicating with a remote resource 18 (which may be, e.g., a data repository or service provider). In the former case, the handler 16 may identify a URL corresponding to the watermark (using the database 17), and return the URL to the application 28 c. Application 28 c can then pass the URL to a web browser 28 b in the device 12, and initiate a link to the internet site identified by the URL. Or the handler may have some locally stored data (e.g., audio or video, or software updates) and send it to the device 12 in response to the watermark.</li></ul> <p>In the latter case, the handler 16 does not respond directly to the device 12. Instead, the handler responds by communicating with a remote resource 18. The communication can be as simple as logging receipt of the watermark message in a remote repository. Or it can be to authenticate</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent Publication No. 2002/0047867 to Mault et al. (“Mault”)

#### **Exhibit E-4**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, Mault was filed on September 7, 2001, claiming the priority date of September 7, 2000. Mault published at least as of April 25, 2002, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Mault anticipates asserted claims 18, 27, 29 and 31 of the ’252 Patent. To the extent Mault is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Mault is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

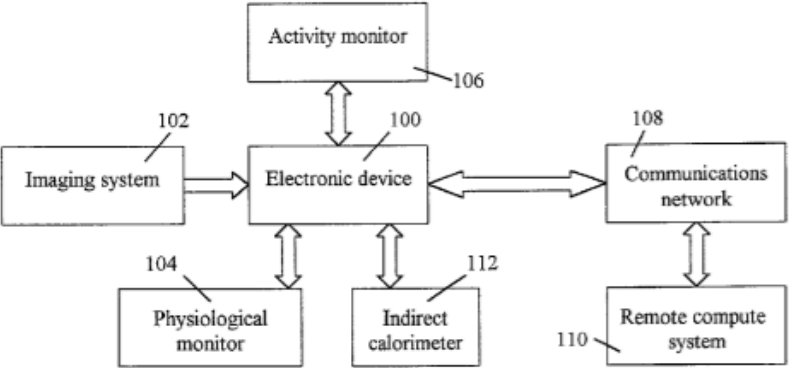

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

To the extent it is found that Mault does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Mault does not anticipate this claim, Mault renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Preliminary Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine Mault with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent No. 6,666,377 to Harris (“Harris”)

### **Exhibit E-6**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

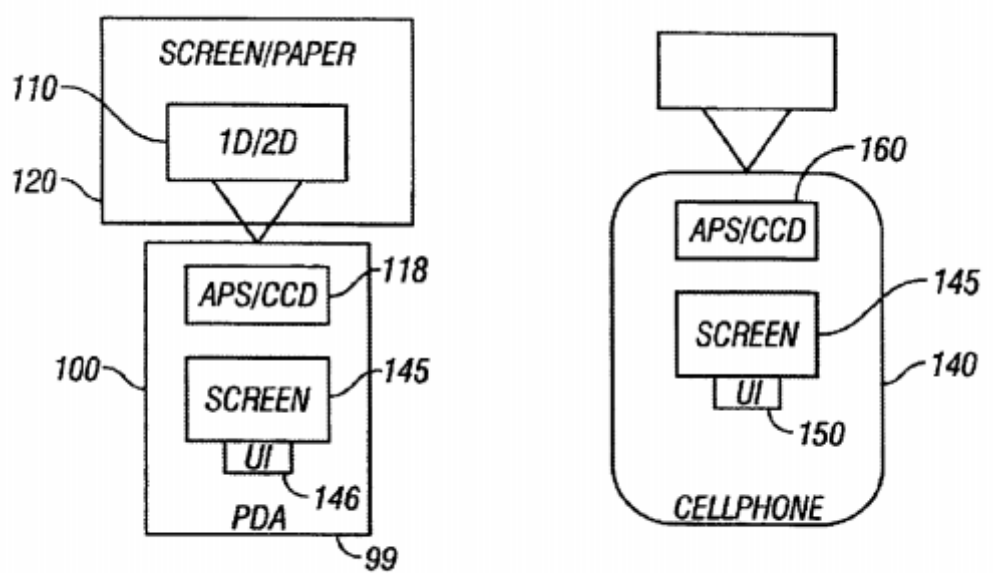

On information and belief, the application that matured into Harris was filed on July 18, 2000. Harris published at least as of December 23, 2003, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Harris anticipates asserted claims 18, 27, 29, and 31 of the ’252 Patent. To the extent Harris is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Harris is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

6.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,899,252 based on  
U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

### **Exhibit E-11**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ehrhart was filed on July 13, 2001, claiming the priority date of July 13, 2001. Ehrhart published at least as of April 20, 2004, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Ehrhart anticipates asserted claims 18, 27, 29, 31, of the ’252 Patent. To the extent Ehrhart is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Ehrhart is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

The present invention allows a user to read graphical symbols, such as bar codes, text, OCR characters or signatures using a color imager. The color optical reader of the present invention is configured to automatically determine whether a color image includes a graphical symbol, or is merely a color photographic image. The optical reader of the present invention also is operative to associate one acquired image with at least one subsequently acquired image.” Ehrhart at 5:36-50.</p> <p>“In step 1004, processor 40 identifies the page features. Processor 40 analyzes the page and divides it into blank and non-blank portions. The non-blank portions are</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit E-23

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al., *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2.htm](http://www.thinker.org/imagebase/indox-2.htm) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16.

As shown in the chart below, QBIC anticipates asserted claims 18, 27, 29, and 31 of the ’252 Patent. The disclosures/exemplary citations for each element incorporate the disclosures/exemplary citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified in the cited references and/or or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

the accused products, the claims must also be construed to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit E-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

**1. Claim 18**

Element	'252 Claim Recitation	Exemplary Citations in Reference
[18Pre]	A method for retrieving information from image processing, the method comprising:	<p>QBIC discloses a method for retrieving information from image processing, the method comprising:</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>QBIC Demo (IBM000747)</p>

		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206</p>

*Nantworks, LLC v. Bank of America Corporation*

		<p>IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. All of the features referenced in this chart were incorporated into these commercial implementations before November 6, 2000, as reflected in a combination of scientific papers, IBM’s internal documentation, and the QBIC demo software applications. <i>See, e.g.</i>, Flickner 8/29/23 Depo Tr. at 33:9-24, 71:21-72:10, 164:21-166:2, 166:11-175:24, 178:5-186:17, 186:21-192:4, 192:14-194:1, 195:16-196:4, 194:1-308:1; IBM 000001-617; IBM 000747; IBM 000777-880; IBM 000893-902; IBM 0002315-320; IBM 0002390-404; IBM 0002418-430.</p>
[18A]	<p>providing a mobile device having a camera the mobile device configured to capture an image and configured to transmit data relating to the image an image processing platform;</p>	<p>QBIC discloses a mobile device having a camera, where the mobile device is configured to capture an image and configured to transmit data relating to the image an image processing platform.</p> <p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93</p>

Central District of California, No. 2:20-cv-7872

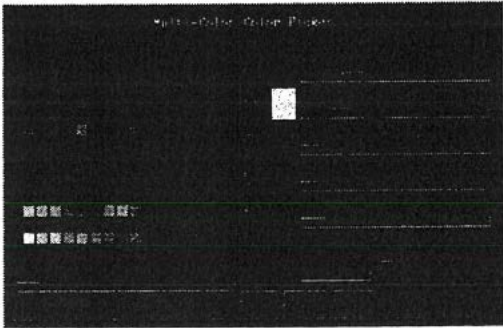

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.”  <i>Id.</i> at p. 3.</p>

		<p>Flickner Depo at 38-41</p> <table border="1"> <tr> <td data-bbox="848 305 1234 846"> <p>1 project at this time?                      2 A. I don't know that.                      3 Q. Okay. Would reviewing -- let's see.                      4 Let's turn to page -- let's turn to page -- this                      5 one is Bates-stamped, so the page ending in                      6 Network1_007316.                      7 Would reviewing this page refresh your                      8 recollection as to whether --                      9 A. Yes.                      10 Q. Okay. Perfect. Feel free.                      11 MR. DeCLERCK: Just give him a chance to                      12 finish his question before you respond.                      13 MR. DANG: Thank you.                      14 THE DEPONENT: Is there a question                      15 standing?                      16 Q. (By Mr. Dang) Sure. Yeah.                      17 So was there any video search                      18 functionality included as part of the QBIC system                      19 at this time?                      20 A. Evidently, yes.                      21 Q. Okay. And how did that video search                      22 functionality work?</p> <p style="text-align: right;">Page 38</p> </td> <td data-bbox="1234 305 1612 846"> <p>1 A. You just populate image database using                      2 those images.                      3 Q. Okay. Could you take as -- as you did in                      4 the query by image search system, could you just                      5 search a video using this system?                      6 A. You could search for a key frame and that                      7 could point you to a video.                      8 Q. As an input into the system, could you                      9 search -- could you input a whole video and then --                      10 the system would extract the key frames and then --                      11 A. Yes.                      12 Q. -- search that using that?                      13 A. If I recall correctly, yes.                      14 Q. Okay. And the way -- the method by which                      15 it did so, as you mentioned, was -- would it                      16 extract key frames from the video, extract features                      17 from those key frames, and then search those                      18 features; is that right?                      19 A. Correct.                      20 Q. Okay. Other than the use of shots and                      21 key frames, is there any difference between the                      22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p> </td> </tr> <tr> <td data-bbox="848 846 1234 1386"> <p>1 A. You detect shots in -- transitions in                      2 video and then treat -- treat those as still images                      3 in the QBIC system.                      4 Q. So to break that down, you -- what do you                      5 mean by detecting shots?                      6 A. You try to find some key frame in a video                      7 sequence or multiple key frames in a video                      8 sequence, to give you a summarization of the video.                      9 Q. And how would you detect those key                      10 frames?                      11 A. There were algorithms to do it. I didn't                      12 personally work on any of those algorithms.                      13 Q. Are you otherwise aware of any of those                      14 algorithms?                      15 A. Well, they used histogram methodologies.                      16 I remember that.                      17 Q. Okay. So you would take -- you would use                      18 a histogram methodology to extract key frames from                      19 the video; is that what -- is that right?                      20 A. That's one way to do it.                      21 Q. Okay. And then what would you do with                      22 those key frames?</p> <p style="text-align: right;">Page 39</p> </td> <td data-bbox="1234 846 1612 1386"> <p>1 query by image search system?                      2 A. There may have been.                      3 Q. Can you think of any now?                      4 A. No.                      5 Q. When you searched for -- or when you                      6 searched a video using this system, what would                      7 the -- or what would the system return?                      8 A. I don't remember if we returned the                      9 stills or a small -- small video clip.                      10 Q. Say it returned the stills, could you use                      11 those stills to point you to a video?                      12 A. Yeah.                      13 Q. And how would you do that?                      14 A. Well, the -- each -- each key frame                      15 typically represents a frame in the video. So                      16 there's a -- the key frame is -- is one frame of                      17 the video so you just seek to that point.                      18 Q. So if I'm understanding this right, you                      19 could take a query video, the system would extract                      20 frames, which would then extract features from it,                      21 and then the system would return either shot clips                      22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p> </td> </tr> </table>	<p>1 project at this time?                      2 A. I don't know that.                      3 Q. Okay. Would reviewing -- let's see.                      4 Let's turn to page -- let's turn to page -- this                      5 one is Bates-stamped, so the page ending in                      6 Network1_007316.                      7 Would reviewing this page refresh your                      8 recollection as to whether --                      9 A. Yes.                      10 Q. Okay. Perfect. Feel free.                      11 MR. DeCLERCK: Just give him a chance to                      12 finish his question before you respond.                      13 MR. DANG: Thank you.                      14 THE DEPONENT: Is there a question                      15 standing?                      16 Q. (By Mr. Dang) Sure. Yeah.                      17 So was there any video search                      18 functionality included as part of the QBIC system                      19 at this time?                      20 A. Evidently, yes.                      21 Q. Okay. And how did that video search                      22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. Yes.                      12 Q. -- search that using that?                      13 A. If I recall correctly, yes.                      14 Q. Okay. And the way -- the method by which                      15 it did so, as you mentioned, was -- would it                      16 extract key frames from the video, extract features                      17 from those key frames, and then search those                      18 features; is that right?                      19 A. Correct.                      20 Q. Okay. Other than the use of shots and                      21 key frames, is there any difference between the                      22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>	<p>1 A. You detect shots in -- transitions in                      2 video and then treat -- treat those as still images                      3 in the QBIC system.                      4 Q. So to break that down, you -- what do you                      5 mean by detecting shots?                      6 A. You try to find some key frame in a video                      7 sequence or multiple key frames in a video                      8 sequence, to give you a summarization of the video.                      9 Q. And how would you detect those key                      10 frames?                      11 A. There were algorithms to do it. I didn't                      12 personally work on any of those algorithms.                      13 Q. Are you otherwise aware of any of those                      14 algorithms?                      15 A. Well, they used histogram methodologies.                      16 I remember that.                      17 Q. Okay. So you would take -- you would use                      18 a histogram methodology to extract key frames from                      19 the video; is that what -- is that right?                      20 A. That's one way to do it.                      21 Q. Okay. And then what would you do with                      22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?                      2 A. There may have been.                      3 Q. Can you think of any now?                      4 A. No.                      5 Q. When you searched for -- or when you                      6 searched a video using this system, what would                      7 the -- or what would the system return?                      8 A. I don't remember if we returned the                      9 stills or a small -- small video clip.                      10 Q. Say it returned the stills, could you use                      11 those stills to point you to a video?                      12 A. Yeah.                      13 Q. And how would you do that?                      14 A. Well, the -- each -- each key frame                      15 typically represents a frame in the video. So                      16 there's a -- the key frame is -- is one frame of                      17 the video so you just seek to that point.                      18 Q. So if I'm understanding this right, you                      19 could take a query video, the system would extract                      20 frames, which would then extract features from it,                      21 and then the system would return either shot clips                      22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>
<p>1 project at this time?                      2 A. I don't know that.                      3 Q. Okay. Would reviewing -- let's see.                      4 Let's turn to page -- let's turn to page -- this                      5 one is Bates-stamped, so the page ending in                      6 Network1_007316.                      7 Would reviewing this page refresh your                      8 recollection as to whether --                      9 A. Yes.                      10 Q. Okay. Perfect. Feel free.                      11 MR. DeCLERCK: Just give him a chance to                      12 finish his question before you respond.                      13 MR. DANG: Thank you.                      14 THE DEPONENT: Is there a question                      15 standing?                      16 Q. (By Mr. Dang) Sure. Yeah.                      17 So was there any video search                      18 functionality included as part of the QBIC system                      19 at this time?                      20 A. Evidently, yes.                      21 Q. Okay. And how did that video search                      22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using                      2 those images.                      3 Q. Okay. Could you take as -- as you did in                      4 the query by image search system, could you just                      5 search a video using this system?                      6 A. You could search for a key frame and that                      7 could point you to a video.                      8 Q. As an input into the system, could you                      9 search -- could you input a whole video and then --                      10 the system would extract the key frames and then --                      11 A. Yes.                      12 Q. -- search that using that?                      13 A. If I recall correctly, yes.                      14 Q. Okay. And the way -- the method by which                      15 it did so, as you mentioned, was -- would it                      16 extract key frames from the video, extract features                      17 from those key frames, and then search those                      18 features; is that right?                      19 A. Correct.                      20 Q. Okay. Other than the use of shots and                      21 key frames, is there any difference between the                      22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>					
<p>1 A. You detect shots in -- transitions in                      2 video and then treat -- treat those as still images                      3 in the QBIC system.                      4 Q. So to break that down, you -- what do you                      5 mean by detecting shots?                      6 A. You try to find some key frame in a video                      7 sequence or multiple key frames in a video                      8 sequence, to give you a summarization of the video.                      9 Q. And how would you detect those key                      10 frames?                      11 A. There were algorithms to do it. I didn't                      12 personally work on any of those algorithms.                      13 Q. Are you otherwise aware of any of those                      14 algorithms?                      15 A. Well, they used histogram methodologies.                      16 I remember that.                      17 Q. Okay. So you would take -- you would use                      18 a histogram methodology to extract key frames from                      19 the video; is that what -- is that right?                      20 A. That's one way to do it.                      21 Q. Okay. And then what would you do with                      22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?                      2 A. There may have been.                      3 Q. Can you think of any now?                      4 A. No.                      5 Q. When you searched for -- or when you                      6 searched a video using this system, what would                      7 the -- or what would the system return?                      8 A. I don't remember if we returned the                      9 stills or a small -- small video clip.                      10 Q. Say it returned the stills, could you use                      11 those stills to point you to a video?                      12 A. Yeah.                      13 Q. And how would you do that?                      14 A. Well, the -- each -- each key frame                      15 typically represents a frame in the video. So                      16 there's a -- the key frame is -- is one frame of                      17 the video so you just seek to that point.                      18 Q. So if I'm understanding this right, you                      19 could take a query video, the system would extract                      20 frames, which would then extract features from it,                      21 and then the system would return either shot clips                      22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

		<p>combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the '252 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. '252 Patent, 3:7-16. Indeed, the '252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>
[18B]	<p>configuring the image processing platform to receive the data relating to the image and to conduct image processing, including:</p>	<p>QBIC discloses configuring the image processing platform to receive the data relating to the image and to conduct image processing.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390.</p> <p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <math>MTM</math> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <math>MTM</math> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93</p>

Central District of California, No. 2:20-cv-7872

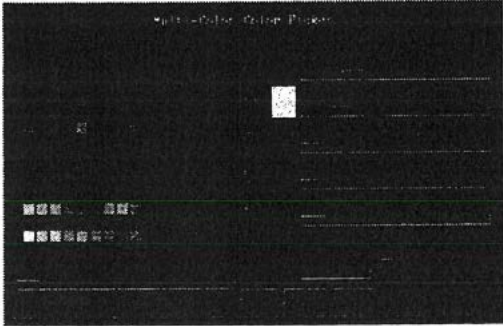

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.</p> <p>For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2. Videos</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs,</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>start from a single object pixel and repeatedly add adjacent pixels whose values are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve. The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries.</p> <p>...</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“ A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content. You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b>                      The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b>                      Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>Flickner Depo at 21</p>

		<p>21 Q. Did MediaMiner support any indexing                  22 structures for the image database?</p> <p style="text-align: right;">Page 72</p> <hr/> <p>1 MS. HAYDEN: Objection. Foundation.                  2 THE DEPONENT: I don't remember.                  3 Q. (By Mr. Dang) Turn to page 735 at the                  4 bottom, the Bates number ending in 735.                  5 You see on the third bullet on this page                  6 it says "Indexing of images as an automatic                  7 preprocessing step."                  8 What does that mean?                  9 A. When you create the database, you build                  10 the indexes.                  11 Q. What indexes could you incorporate?                  12 A. Any -- any index your scheme has                  13 supported.                  14 Q. Could you incorporate a clustered index?                  15 A. You could.                  16 Q. Could you incorporate specifically that                  17 clustering index that was mentioned in the 1998                  18 paper?                  19 MS. HAYDEN: Objection. Calls for                  20 speculation.                  21 THE DEPONENT: You could.                  22</p> <p>Flickner Depo at 54-55</p>

*Nantworks, LLC v. Bank of America Corporation*

		<p>13 Q. Was there also a demo online comparing                      14 trademarks at this time?                      15 A. There was a trademark demo. I don't                      16 remember the time frame.                      17 Q. And how would the trademark demo work?                      18 A. Similar to the stamp demo, just different                      19 database. The features were a little bit different                      20 features. Most trademarks are black-and-white.                      21 Q. What sort of features would be extracted?                      22 A. I don't remember which features we were</p> <p style="text-align: right;">Page 54</p> <hr/> <p>1 using on trademarks.                      2 Q. Could you search for -- could you search                      3 an example trademark into a database of other                      4 trademarks?                      5 A. I believe so.                      6 Q. And would that work in a similar fashion                      7 to this stamps demo?                      8 A. I believe so.                      9 Q. And would that identify the stamp -- or                      10 the trademark that you were searching in any way?                      11 A. What do you mean by identify?                      12 Q. Would the -- would the trademarks                      13 returned ever match the trademark that you                      14 searched, or were they always different trademarks?                      15 A. Well, if your query was in a database, it                      16 would match.                      17 Q. Was there any metadata returned with the                      18 trademarks?                      19 A. I'm sure there was.</p>

		<p>Flickner Depo at 89-90</p> <p>11 Q. Was that used to the QBIC system publicly                      12 available anywhere?</p> <p>13 A. You mean was the Fine Arts demo                      14 available?</p> <p>15 Q. Yes.</p> <p>16 A. I think it was on our site, but I can't                      17 remember for...</p> <p>18 Q. How did their system work to identify art                      19 prints?</p> <p>20 A. Art what?</p> <p>21 Q. How would one identify an art print using                      22 their system?</p> <p>2 THE DEPONENT: Well, you had a picture --                      3 you could take a picture of a painting and then you                      4 could use that as a query content. And you could,                      5 for example, determine its -- its heritage or its                      6 lineage.</p> <p>7 Q. (By Mr. Dang) So you could identify                      8 image about -- or you could identify information                      9 about the painting using the system?</p> <p>10 A. Right.</p>
