		<p>Flickner Depo at 88</p> <p>7 Q. (By Mr. Dang) Suppose you search for a              8 set of features or you search using a query image              9 in this demonstration, what would the system do?              10 MS. HAYDEN: Objection. Foundation.              11 THE DEPONENT: The system would              12 compute -- in the query image case, the system              13 would compute the features on that -- that image              14 and then compute the distance associated with each              15 one of the images in the database.</p> <p>Flickner Depo at 50</p> <p>7 Q. And so if I clicked on this T, and it              8 used the texture features, what would -- what would              9 the system do?              10 A. It would return the list of stamps based              11 on similarity and texture.              12 Q. And how would it decide which stamps were              13 the most similar to that query image?              14 A. It would use those texture features to              15 compute it, and then it -- I think it was using L              16 to distance.</p> <p>Flickner Depo at 78-79</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>6 Q. How would the Db2 universal search a                      7 query image using QBIC technology?                      8 A. You would create a -- create a manager                      9 QB- -- or create a QBIC catalog.                      10 Q. What's a QBIC catalog?                      11 A. It's an instance of a table that has a                      12 bunch of images in it.                      13 Q. And forgive me, what's an instance of a                      14 table?                      15 A. You create a table -- create a database,                      16 and then in the database you create a table and you                      17 have maybe like a file name, and then the actual                      18 image bits into it.                      19 Q. And how would you search for images using                      20 that table?                      21 A. You could search -- you could use                      22 whatever you wanted to for the -- the SQL query</p> <p style="text-align: right;">Page 78</p> <hr/> <p>1 to -- to filter, and then that would give you a                      2 list of results. And then you'd rank all of those                      3 results based on the QBIC distance measures.</p> <p>Flickner Depo at 201-202</p>

		<p>1 with -- where you already -- you had already sought</p> <p>2 to the -- the point of the -- of the match.</p> <p>3 Q. Would it return the same video as the</p> <p>4 query video?</p> <p>5 A. It would -- it would return snippets, as</p> <p>6 I recall.</p> <p>7 Q. And snippets of which videos?</p> <p>8 A. Of the video that's -- the -- that the</p> <p>9 database has been created with.</p> <p>10 Q. Were those video snippets indexed in any</p> <p>11 way?</p> <p>12 A. I'm sure they were.</p> <p>Flickner Depo at 22-25</p>

Nantworks, LLC v. Bank of America Corporation

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>1 Q. Okay. And what would you do with the 2 image after you hit and extracted the color 3 histogram from it? 4 A. Nothing. 5 Q. Would those features be stored in any 6 database or -- 7 A. Yes. 8 Q. Okay. And let's do -- what about 9 texture, could you extract texture features from an 10 image? 11 A. We did. 12 Q. And how would you do that? 13 A. I don't remember exact features we were 14 using. There were -- we published some papers on 15 them. 16 Q. Okay. Was there any reasoning behind 17 picking the features that you chose? 18 A. Yes. 19 Q. And what was that reasoning? 20 A. We wanted to make it so that the results 21 were perceptually good. 22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red 2 color in it or some sort red color histogram; is 3 that right? 4 A. Well, you -- you take specific -- you 5 search for a red color. You'd compute the 6 histogram and then basically match the histogram, 7 which would give you images that had more colors in 8 the reds. This is not -- it's not a unique thing. 9 Q. Were you always searching for a 10 particular feature, or could you just search some 11 sort of example image? 12 A. We could search an example image. 13 Q. And how would that process work? 14 A. Just extract the features from it. 15 Q. So let's break that down. 16 So you would submit an example image to 17 the -- to the system, right? 18 A. Uh-huh. 19 Q. And then how do the -- how -- how does 20 the system select which features to extract? 21 A. It would compute them all, typically, or 22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that 2 this is a better match, that the ordering was 3 reasonable and... 4 Q. So by that, do you mean that people would 5 view the results returned as the closest or close 6 matches to your -- to your image? 7 A. It was -- it would satisfy their query. 8 Q. Okay. So -- so you would have this set 9 of features in your database. 10 How would you search for those features? 11 A. Typically, we -- initially, we did linear 12 scan where you just actually evaluate the -- the 13 distance metric against all the features. 14 Q. So in linear scan, you would compare some 15 sort of search term against all the features in the 16 database? 17 A. Well, it depends on which features you're 18 using. You didn't have to use all the features. 19 You could use just color features or just texture 20 features or just... 21 Q. So to make sure I'm understanding this 22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with 2 those features that it had extracted from that 3 example? 4 A. Then it became the reference point to the 5 search. 6 Q. And by research point to the search, what 7 do you mean? 8 A. So you have a vector in -- in the 9 individual space. 10 (Reporter clarification.) 11 A. That -- that query represents a point in 12 that space, and you're looking for other things 13 near that space or ordered by that space. 14 Q. And by other things near that space, is 15 that the other features that are in the -- in the 16 database? 17 A. Yes. 18 Q. Okay. So at bottom then, you would -- 19 you would take the image, the system would extract 20 features from it, and then those features would be 21 searched against the reference database -- the 22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

		<p>10 Q. So underlying this paper, you mentioned</p> <p>11 you did more work on the shape side of things; is</p> <p>12 that right?</p> <p>13 A. I did.</p> <p>14 Q. And what would that work have entailed?</p> <p>15 A. We wanted to query by shape.</p> <p>16 Q. Okay. And how would that have worked?</p> <p>17 A. We created features related to the shape</p> <p>18 of a -- the object of -- as it populated the</p> <p>19 database, and then we would query against those</p> <p>20 features.</p> <p>Flickner Depo at 38-41</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference	
		<p>1 project at this time?</p> <p>2 A. I don't know that.</p> <p>3 Q. Okay. Would reviewing -- let's see.</p> <p>4 Let's turn to page -- let's turn to page -- this</p> <p>5 one is Bates-stamped, so the page ending in</p> <p>6 Network1_007316.</p> <p>7 Would reviewing this page refresh your</p> <p>8 recollection as to whether --</p> <p>9 A. Yes.</p> <p>10 Q. Okay. Perfect. Feel free.</p> <p>11 MR. DeCLERCK: Just give him a chance to</p> <p>12 finish his question before you respond.</p> <p>13 MR. DANG: Thank you.</p> <p>14 THE DEPONENT: Is there a question</p> <p>15 standing?</p> <p>16 Q. (By Mr. Dang) Sure. Yeah.</p> <p>17 So was there any video search</p> <p>18 functionality included as part of the QBIC system</p> <p>19 at this time?</p> <p>20 A. Evidently, yes.</p> <p>21 Q. Okay. And how did that video search</p> <p>22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using</p> <p>2 those images.</p> <p>3 Q. Okay. Could you take as -- as you did in</p> <p>4 the query by image search system, could you just</p> <p>5 search a video using this system?</p> <p>6 A. You could search for a key frame and that</p> <p>7 could point you to a video.</p> <p>8 Q. As an input into the system, could you</p> <p>9 search -- could you input a whole video and then</p> <p>10 the system would extract the key frames and then --</p> <p>11 A. Yes.</p> <p>12 Q. -- search that using that?</p> <p>13 A. If I recall correctly, yes.</p> <p>14 Q. Okay. And the way -- the method by which</p> <p>15 it did so, as you mentioned, was -- would it</p> <p>16 extract key frames from the video, extract features</p> <p>17 from those key frames, and then search those</p> <p>18 features; is that right?</p> <p>19 A. Correct.</p> <p>20 Q. Okay. Other than the use of shots and</p> <p>21 key frames, is there any difference between the</p> <p>22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in</p> <p>2 video and then treat -- treat those as still images</p> <p>3 in the QBIC system.</p> <p>4 Q. So to break that down, you -- what do you</p> <p>5 mean by detecting shots?</p> <p>6 A. You try to find some key frame in a video</p> <p>7 sequence or multiple key frames in a video</p> <p>8 sequence, to give you a summarization of the video.</p> <p>9 Q. And how would you detect those key</p> <p>10 frames?</p> <p>11 A. There were algorithms to do it. I didn't</p> <p>12 personally work on any of those algorithms.</p> <p>13 Q. Are you otherwise aware of any of those</p> <p>14 algorithms?</p> <p>15 A. Well, they used histogram methodologies.</p> <p>16 I remember that.</p> <p>17 Q. Okay. So you would take -- you would use</p> <p>18 a histogram methodology to extract key frames from</p> <p>19 the video; is that what -- is that right?</p> <p>20 A. That's one way to do it.</p> <p>21 Q. Okay. And then what would you do with</p> <p>22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?</p> <p>2 A. There may have been.</p> <p>3 Q. Can you think of any now?</p> <p>4 A. No.</p> <p>5 Q. When you searched for -- or when you</p> <p>6 searched a video using this system, what would</p> <p>7 the -- or what would the system return?</p> <p>8 A. I don't remember if we returned the</p> <p>9 stills or a small -- small video clip.</p> <p>10 Q. Say it returned the stills, could you use</p> <p>11 those stills to point you to a video?</p> <p>12 A. Yeah.</p> <p>13 Q. And how would you do that?</p> <p>14 A. Well, the -- each -- each key frame</p> <p>15 typically represents a frame in the video. So</p> <p>16 there's a -- the key frame is -- is one frame of</p> <p>17 the video so you just seek to that point.</p> <p>18 Q. So if I'm understanding this right, you</p> <p>19 could take a query video, the system would extract</p> <p>20 frames, which would then extract features from it,</p> <p>21 and then the system would return either shot clips</p> <p>22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>16 Q. Well, for example, if, for example, you --</p> <p>17 the image was sourced from a camera and there was a</p> <p>18 noise from the image sensor on the image, were there</p> <p>19 any methodologies used by IBM in the QBIC system to</p> <p>20 reduce that noise or grain in the image?</p> <p>21 A. I don't recall.</p> <p>22 Q. What about -- and, again, I'm talking</p> <p>23 about preprocessing steps, before you're actually</p> <p>24 extracting features.</p> <p>25 Were there any methodologies to enhance</p> <hr/> <p style="text-align: right;">Page 79</p> <p>1 the contrast of the image?</p> <p>2 A. I don't remember.</p> <p>3 Q. What about resizing the image?</p> <p>4 A. We did -- we probably supported that on</p> <p>5 import.</p> <p>6 Q. Say again?</p> <p>7 A. We supported that on -- most likely we</p> <p>8 supported that on import, on read.</p> <p>9 So the read, you request a particular</p> <p>10 size.</p> <p>11 Q. You're going to have to repeat it. I</p> <p>12 didn't understand you.</p> <p>13 MR. STRAUSSMAN: And speak up.</p> <p>14 THE WITNESS: So resizing would be done</p> <p>15 typically when you import the image into the system.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. Okay. So if you're importing the image</p> <p>18 into the database, is that what you're talking</p> <p>19 about?</p> <p>20 A. Correct.</p> <p>21 Q. Okay. And at that point you would resize</p> <p>22 the image to reduce the size?</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>1 How would you resize the image on</p> <p>2 importation?</p> <p>3 A. You would request a particular size of</p> <p>4 image and then use that to populate the database.</p> <p>5 Q. So if the source images that you were</p> <p>6 acquiring were say too big for purposes of QBIC, on</p> <p>7 importation you could resize those to get them to</p> <p>8 the size that are -- meet the -- meet the</p> <p>9 requirements of the QBIC system?</p> <p>10 A. Yes.</p> <p>11 Q. Was that done as a matter of course in the</p> <p>12 QBIC system?</p> <p>13 MR. HANSEN: Objection; vague and ambiguous.</p> <p>14 THE WITNESS: As I recall, yes.</p> <p>15 BY MR. EDWARDS:</p> <p>16 Q. Was it an automatic process?</p> <p>17 A. As I recall, yes.</p> <p>18 Q. So if a user were to import source images</p> <p>19 into the database, when the user did that, the QBIC</p> <p>20 system would automatically resize it to fit the</p> <p>21 requirement of the QBIC system?</p> <p>22 A. Make sure it's in the range that the QBIC</p> <p>23 system could handle.</p> <p>24 Q. That's a "yes"?</p> <p>25 A. That's a "yes."</p> <p><i>Id.</i> at 80–81</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>6 Q. How about converting the images to binary?</p> <p>7 A. Threshold. There probably was a threshold</p> <p>8 control.</p> <p>9 Q. And what do you mean by "threshold</p> <p>10 control"?</p> <p>11 A. Just change the value of the threshold.</p> <p>12 You make a binary decision, is a pixel bigger than</p> <p>13 a -- is a pixel bigger than a particular number or</p> <p>14 is it smaller and you put a 01 based on that.</p> <p>15 Q. And that would have been done prior to</p> <p>16 feature extraction?</p> <p>17 A. For some features it would be done that</p> <p>18 way.</p> <p>19 Q. So, for example, for shape, was it</p> <p>20 required to convert the image to binary before you</p> <p>21 did your shape analysis?</p> <p>22 A. No.</p> <p>23 Q. Were there any other features that, as</p> <p>24 part of the -- as part of the extraction process,</p> <p>25 the image had to be converted to binary before?</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>2        Were there any features that required the</p> <p>3 image to be converted to binary before the features</p> <p>4 were extracted?</p> <p>5        A. Some features required a binary image,</p> <p>6 yeah.</p> <p>7        Q. Which ones?</p> <p>8        A. Some of the texture features.</p> <p>9        Q. And when you say "some of the texture</p> <p>10 features," do you -- do you recall which ones?</p> <p>11        A. No.</p> <p>12        Q. Let's put a pin in that because we're</p> <p>13 going to get to it.</p> <p>14        What about gray scale? Were any images</p> <p>15 converted to gray scale before features were</p> <p>16 extracted?</p> <p>17        A. Yes.</p> <p>18        Q. Which -- for which features?</p> <p>19        A. For shape, for texture.</p> <p>20        Q. Any others?</p> <p>21        A. Color wouldn't make any difference.</p> <p>22        That's all I can think of.</p> <p>23        Q. At least for shape and texture?</p> <p>24        A. Yeah.</p> <p><i>Id.</i> at 94–97</p> <p>18        Q. So that's why I ask is it the first step</p> <p>19 in calculating shape to convert the image to binary?</p> <p>20        A. Yes.</p> <p><i>Id.</i> at 101–102</p>

*Nantworks, LLC v. Bank of America Corporation*

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>23 Q. So if I needed to resize the image we                  24 would need to do that -- the system would do that                  25 before features are extracted from the image query?</p> <hr/> <p style="text-align: right;">Page 141</p> <p>1 A. Yes.                  2 Q. And for certain things, like you said, for                  3 like texture and shape, for example, you had to                  4 convert the image to binary, as an example, that                  5 would need to be done for the image query -- the                  6 image query image as well; correct?                  7 A. Correct.</p> <p><i>Id.</i> at 164–165</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>14 Q. All right. Let's flip forward to 2429.                      15 And is 2429 a screenshot of a trademark                      16 demo that was also available in the Almaden --                      17 excuse me -- almaden.ibm website?                      18 A. Yes.                      19 Q. Okay. And that demo looks like the                      20 trademark query is based on shape; is that right?                      21 A. It uses shape as one similarity feature.                      22 Q. Right. So the trademarks are converted to                      23 a binary image, like we talked before -- talked                      24 about before, and then they're -- the matching                      25 process is done based on those binary images?</p> <hr/> <p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.                      2 Q. Okay. And here we're showing the query                      3 image is a -- is a heart -- a heart pattern with                      4 Love's next to it. It's in the top part of the                      5 screenshot.                      6 A. Yep.</p> <p><i>Id.</i> at 82</p> <p>12 Q. Let's put a pin in that because we're                      13 going to get to it.                      14 What about gray scale? Were any images                      15 converted to gray scale before features were                      16 extracted?                      17 A. Yes.                      18 Q. Which -- for which features?                      19 A. For shape, for texture.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the ’252 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. ’252 Patent, 3:7-16. Indeed, the ’252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>
[18B.i]	operating on the data relating to the image to determine if the image contains one or more recognizable symbols; and	QBIC discloses operating on the data relating to the image to determine if the image contains one or more recognizable symbols.

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p>7 Q. And do you see anything here that              8 describes making queries on extracted features from              9 video frames?              10 A. No, I do not.              11 MR. DAÑG: Objection. Lacks foundation.              12 Q. (By Ms. Hayden) These are just -- the --              13 the queries here are just about text queries; is              14 that right?              15 A. Correct.              ...</p> <p>Flickner Depo at 78-79</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>6 Q. How would the Db2 universal search a                      7 query image using QBIC technology?                      8 A. You would create a -- create a manager                      9 QB- -- or create a QBIC catalog.                      10 Q. What's a QBIC catalog?                      11 A. It's an instance of a table that has a                      12 bunch of images in it.                      13 Q. And forgive me, what's an instance of a                      14 table?                      15 A. You create a table -- create a database,                      16 and then in the database you create a table and you                      17 have maybe like a file name, and then the actual                      18 image bits into it.                      19 Q. And how would you search for images using                      20 that table?                      21 A. You could search -- you could use                      22 whatever you wanted to for the -- the SQL query</p> <hr/> <p style="text-align: right;">Page 78</p> <p>1 to -- to filter, and then that would give you a                      2 list of results. And then you'd rank all of those                      3 results based on the QBIC distance measures.</p> <p>Flickner Depo at 185</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>4           So for -- for a search in the MediaMiner</p> <p>5           version of QBIC, would the -- the QBIC query be</p> <p>6           compared to all of the records in the database?</p> <p>7           A. I suspect there was support for text</p> <p>8           refinement, based on what I'm seeing here.</p> <p>9           Q. And this is the text refinement that</p> <p>10          would be keyword searching?</p> <p>11          A. Yeah. As I read this on page 735, it's</p> <p>12          clear that you can do -- use image content as the</p> <p>13          query; "Show me images LIKE this one."</p> <p>14          Q. And -- and that is a search without</p> <p>15          using -- without necessarily using a text search or</p> <p>16          keywords, right?</p> <p>17          A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>Flickner Depo at 214-215</p> <p>4 Q. What do you mean by the images of shot                      5 boundaries were indexed?                      6 A. Each -- each shot -- the shot -- the shot                      7 boundary detection is trying to extract key frames                      8 or break the video into small subsec --                      9 subsections -- hang on. Let me think here a                      10 second.                      11 So the shot boundary here is different                      12 than key framing. So I'll -- I'll retract what I                      13 said earlier. This -- while similar, they're not                      14 the same.                      15 Q. What are the differences?                      16 A. Shot boundaries are typically detected at                      17 fade to black, and key frames are supposed to be a                      18 representative still image of the video segment.                      19 Q. How would a shot boundary index allow one                      20 to query a video by content?                      21 A. It gives you semantical information as                      22 related to what the -- that -- that -- that is a --</p> <p style="text-align: right;">Page 214</p> <hr/> <p>1 a reasonable amount of return video. It's -- it's                      2 breaking it into small snippets.                      3 Q. Does it extract features from the key                      4 frames?                      5 A. If there are key frames extracted, it --                      6 it will reference key frames.</p> <p>Flickner Depo at 50.                      Flickner 8/29/23 Depo at 44:</p>

		<p>1 interface with any other software products that did                  2 do OCR?                  3 A. Yes.                  4 Q. What software products?                  5 A. There was a research system that a guy                  6 named Dick Casey built.                  7 (Reporter seeks clarification.)                  8 A. Dick Casey.                  9 Q. And what was the research system called?                  10 A. I don't remember.                  11 Q. And Dick Casey was at IBM?                  12 A. Yeah.                  13 Q. And when you say "research system," are                  14 you referring to just this OCR system or are you                  15 referring to this system that -- a system that                  16 interacted with QBIC?                  17 A. I was referring to the OCR system.                  18 Q. Okay. And was there a system constructed                  19 that interfaced QBIC with this OCR system?                  20 A. I don't recall.                  21 Q. Do you know if there were any IBM                  22 commercial products that implemented QBIC and OCR?                  23 A. I don't recall.                  24 Q. So earlier I'd asked you did the QBIC                  25 system ever interface with any other software</p> <hr/> <p style="text-align: right;">Page 47</p> <p>1 products that did OCR and you said yes, and you said                  2 it was a research system that Dick Casey built; is                  3 that correct?                  4 A. Yeah.                  5 Q. And when you say that it interfaced with                  6 it, was that internally at IBM?                  7 A. Yes.                  8 Q. Okay. And what was the purpose of having                  9 the QBIC system interface with the OCR system?                  10 A. Just to demonstrate new capabilities.</p> <p><i>Id.</i> at 76-77:</p>

		<p>detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. '252 Patent, 3:7-16. Indeed, the '252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>
[18B.ii]	<p>decoding the recognizable symbols to extract symbol information by analyzing the recognizable symbols according to type;</p>	<p>QBIC discloses decoding the recognizable symbols to extract symbol information by analyzing the recognizable symbols according to type.</p> <p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2393-95</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p>1 Q. Okay. And what would you do with the                  2 image after you hit and extracted the color                  3 histogram from it?                  4 A. Nothing.                  5 Q. Would those features be stored in any                  6 database or --                  7 A. Yes.                  8 Q. Okay. And let's do -- what about                  9 texture, could you extract texture features from an                  10 image?                  11 A. We did.                  12 Q. And how would you do that?                  13 A. I don't remember exact features we were                  14 using. There were -- we published some papers on                  15 them.                  16 Q. Okay. Was there any reasoning behind                  17 picking the features that you chose?                  18 A. Yes.                  19 Q. And what was that reasoning?                  20 A. We wanted to make it so that the results                  21 were perceptually good.                  22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red                  2 color in it or some sort red color histogram; is                  3 that right?                  4 A. Well, you -- you take specific -- you                  5 search for a red color. You'd compute the                  6 histogram and then basically match the histogram,                  7 which would give you images that had more colors in                  8 the reds. This is not -- it's not a unique thing.                  9 Q. Were you always searching for a                  10 particular feature, or could you just search some                  11 sort of example image?                  12 A. We could search an example image.                  13 Q. And how would that process work?                  14 A. Just extract the features from it.                  15 Q. So let's break that down.                  16 So you would submit an example image to                  17 the -- to the system, right?                  18 A. Uh-huh.                  19 Q. And then how do the -- how -- how does                  20 the system select which features to extract?                  21 A. It would compute them all, typically, or                  22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that                  2 this is a better match, that the ordering was                  3 reasonable and...                  4 Q. So by that, do you mean that people would                  5 view the results returned as the closest or close                  6 matches to your -- to your image?                  7 A. It was -- it would satisfy their query.                  8 Q. Okay. So -- so you would have this set                  9 of features in your database.                  10 How would you search for those features?                  11 A. Typically, we -- initially, we did linear                  12 scan where you just actually evaluate the -- the                  13 distance metric against all the features.                  14 Q. So in linear scan, you would compare some                  15 sort of search term against all the features in the                  16 database?                  17 A. Well, it depends on which features you're                  18 using. You didn't have to use all the features.                  19 You could use just color features or just texture                  20 features or just...                  21 Q. So to make sure I'm understanding this                  22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>1 interface with any other software products that did                  2 do OCR?                  3 A. Yes.                  4 Q. What software products?                  5 A. There was a research system that a guy                  6 named Dick Casey built.                  7 (Reporter seeks clarification.)                  8 A. Dick Casey.                  9 Q. And what was the research system called?                  10 A. I don't remember.                  11 Q. And Dick Casey was at IBM?                  12 A. Yeah.                  13 Q. And when you say "research system," are                  14 you referring to just this OCR system or are you                  15 referring to this system that -- a system that                  16 interacted with QBIC?                  17 A. I was referring to the OCR system.                  18 Q. Okay. And was there a system constructed                  19 that interfaced QBIC with this OCR system?                  20 A. I don't recall.                  21 Q. Do you know if there were any IBM                  22 commercial products that implemented QBIC and OCR?                  23 A. I don't recall.                  24 Q. So earlier I'd asked you did the QBIC                  25 system ever interface with any other software</p> <hr/> <p style="text-align: right;">Page 47</p> <p>1 products that did OCR and you said yes, and you said                  2 it was a research system that Dick Casey built; is                  3 that correct?                  4 A. Yeah.                  5 Q. And when you say that it interfaced with                  6 it, was that internally at IBM?                  7 A. Yes.                  8 Q. Okay. And what was the purpose of having                  9 the QBIC system interface with the OCR system?                  10 A. Just to demonstrate new capabilities.</p> <p><i>Id.</i> at 76</p>

		<p>9 Q. I could have taken a picture of an  10 electronic billboard or display and submit that to  11 the system?  12 A. Yep.  13 Q. Stamps?  14 A. Yep.  15 Q. Posters?  16 A. Why not?  17 Q. Magazine?  18 A. Subject to copyright issues, yes.  19 Q. Certainly.  20 How about a passport? validity  21 A. Could be done.  22 Q. An album cover?  23 A. Could be done.  24 Q. And could those images not only contain  25 objects but also symbols, like a -- like a logo or a</p> <p style="text-align: right;">Page 77</p> <p>1 trademark?  2 A. Yes.</p> <p><i>Id.</i> at 187–188</p> <p>8 Q. And if you look at the top paragraph, last  9 sentence, it says, "You can now search for images by  10 specifying" -- excuse me. Strike that.  11 It says, "You can now search for images by  12 specifying content attributes (such as color,  13 texture, shape, and layout) and data description  14 elements (such as category and related character and  15 numeric business data)."  16 Do you see that?  17 A. Um-hum.  18 Q. And data description elements, are those  19 things like text or keyword searches that we had  20 talked about before?  21 A. Um-hum.  22 MR. HANSEN: Objection; lacks foundation.  23 (Reporter seeks clarification.)  24 BY MR. EDWARDS:  25 Q. Are those the same as text or keyword</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 188</p> <p>1 searches that we talked about before?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: Text or feature -- textures and                  4 keywords?                  5 BY MR. EDWARDS:                  6 Q. No. I'm sorry, let me ask it so it's                  7 clear.                  8 Data description elements, such as                  9 category and character and numeric business data,                  10 that would be the same as a text or keyword search                  11 that we talked about before; correct?                  12 A. Correct.</p> <p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the '252 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. '252 Patent, 3:7-16. Indeed, the '252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting</p>

		<p>this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>
[18C]	<p>providing access to a distal server configured to use a database to identify pertinent information associated with the recognizable symbols based on the symbol information; and</p>	<p>QBIC discloses providing access to a distal server configured to use a database to identify pertinent information associated with the recognizable symbols based on the symbol information.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 3</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally,</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 7</p> <p><b>3. Indexing and Database Issues</b></p> <p>Currently, we store computed feature values for objects and images in either flat files or in a Starburst database [19]. Starburst, a research prototype developed at IBM Research, is an extensible relational database with numerous extensions such as triggers and support for long fields (up to 1.5 gigabytes). Our current database schema using Starburst is shown in Figure 3. Because we are still defining and experimenting with the set features, we most frequently use the flat file format.</p> <p>...</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “Find images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <i>R*</i>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>“QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content—colors, textures, shapes, and camera and object motion—and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.”  <i>Id.</i> at p. 3.</p>  <p>The diagram illustrates the QBIC system architecture, divided into database population (top) and query (bottom) phases. In the population phase, 'Still images' and 'Video' are processed. 'Still images' go through 'Object identification' (User input) to produce 'Scene' and 'Objects'. 'Video' goes through 'R-frames' to produce 'Motion objects' and 'Shots'. Both 'Objects' and 'Motion objects' feed into 'Feature extraction', which outputs 'Scene' (Sketch, Positional color/texture) and 'Object' (User defined Texture, Color, Location, Shape). 'Shots' feed into 'Video Camera motion' (Object, Camera motion). All extracted features are stored in the 'Database'. A 'Filtering/indexing' step is also shown. In the query phase, a 'Query interface' (User input) allows for queries based on 'Color, Texture, Shape, Multiobject, Sketch, Location, Text, Positional color/texture, Object motion, Camera motion, User defined, Existing image'. These queries are processed by a 'Match engine' (using the same feature categories) to return 'Best matches returned in similarity order' to the 'User'.</p> <p>Figure 2. QBIC database population (top) and query (bottom) architecture.</p> <p><i>Id.</i> at Fig. 2.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color queries return items with matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p> <p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>7 Q. (By Mr. Dang) Suppose you search for a              8 set of features or you search using a query image              9 in this demonstration, what would the system do?              10 MS. HAYDEN: Objection. Foundation.              11 THE DEPONENT: The system would              12 compute -- in the query image case, the system              13 would compute the features on that -- that image              14 and then compute the distance associated with each              15 one of the images in the database.              16 Q. (By Mr. Dang) Were there any              17 circumstances under which the system would not              18 compute the distance for every image in the              19 database during a search?              20 A. If there was a text filter on it, we              21 didn't.              22 Q. Did the Fine Arts Museum of San Francisco</p> <hr/> <p style="text-align: right;">Page 88</p> <p>1 similarly use the QBIC system?              2 A. They did.              3 Q. When did they use the QBIC system?              4 A. It was in the '90s, if I recall right.              5 Q. How did they use the QBIC system?              6 A. Similar to the way Davis did, as I              7 recall.              8 Q. What sorts of images were they including              9 in their database?              10 A. Paintings.</p> <p>Flickner Depo at 142</p>

		<p>1 Q. Do you recall what type of indexing was                  2 used in the database associated with the 1998 demo                  3 version?                  4 A. Most likely, it was just a linear index.                  5 Q. And what do you mean by linear index?                  6 A. You just -- you -- you compute the                  7 features on every record in the database -- you                  8 compare the features against every record in the                  9 database.</p> <p>Flickner Depo at 168-169</p> <p>16 Q. What do you mean that it lets you access                  17 the -- the neighbors to your query point?                  18 A. So your incoming query -- say it's an                  19 image -- you compute a feature vector. And then                  20 you compute some orthogonal transform of the                  21 feature vector such as a wave transform or                  22 wavelets. There's a variety --</p> <p style="text-align: right;">Page 168</p> <hr/> <p>1 MR. DeCLERCK: Slow down, please.                  2 THE DEPONENT: Wavelets, other types of                  3 features that do dimensionality reduction. And                  4 then you put the reduced dimensionality feature                  5 vector into the database, and then the database                  6 queries and R*-tree to be able to get points nearby                  7 to the -- in the lower dimensional space.</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>13 Q. Okay. Let me ask -- let me ask that                      14 question using -- using an example.                      15 Say I had a file that -- that was a                      16 snippet of a Star Wars movie.                      17 Could the CueVideo system take that                      18 snippet of the -- of a Star Wars movie and indicate                      19 to the user what Star Wars movie that snippet is                      20 from?                      21 A. Most likely, yes.                      22 Q. And how do you know that?                      1 A. Based on my knowledge in content-based                      2 imagery -- content-based retrieval, in general,                      3 that would be one of the first things you would try                      4 to implement in a video search system.</p> <p><i>See also</i> Flickner Depo at 21, 22-25, 25-26, 54-55, 76, 78-79, 185, 217</p> <p>Flickner 8/29/23 Depo at 53 – 56                      16 Q. And when it refers to "text information,"                      17 what is it referring to?                      18 A. Anything that could be extracted in the                      19 context of how the image was annotated.                      20 Q. And when you say "annotated," annotated by                      21 the user who was populating the database?                      22 A. Could be.                      23 Q. What else could it be?                      24 A. It could be the supplier of the data.                      25 Q. Okay. So you may have some annotations</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the ’252 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. ’252 Patent, 3:7-16. Indeed, the ’252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>
[18D]	<p>allowing the mobile device to receive the pertinent information over a network.</p>	<p>QBIC discloses allowing the mobile device to receive the pertinent information over a network.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 8  <b>4.1. Object/element identification</b></p> <p>Our user interface for object identification, shown in figure 4, allows for user assisted object identification. The interface is made up of four parts (listed from top to bottom): the window menu, the tool selection button the image display area, and the object entry area. From the File menu selection the user has the ability to save the current image and objects and load another image. The Options menu contains selections for tuning panels for Snakes, Flood-Fill, as well as a Zoom selection, useful for working with very large or small image</p>

		<p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at Figs. 7–9</p>

		<p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.”  <i>Id.</i> at p. 3.</p>  <p>The diagram illustrates the QBIC system architecture, divided into database population (top) and query (bottom) processes. In the population phase, 'Still images' and 'Video' are processed. 'Video' is broken down into 'R-frames' and 'I-frames'. 'I-frames' lead to 'Object identification' (User input), which identifies 'Objects' and 'Motion objects'. 'R-frames' lead to 'Feature extraction', which identifies 'Shots' and 'Video camera motion'. Both 'Objects' and 'Video camera motion' lead to 'Feature extraction', which identifies 'Scene' (Sketch, Positional color/texture, User defined Texture, Color) and 'Object' (Location, Shape). These features are stored in a 'Database'. The query phase starts with a 'User' interacting with a 'Query interface' (Color, Texture, Shape, Multiobject, Sketch, Location, Text, Positional color/texture, Object motion, Camera motion, User defined, Existing image). The 'Query interface' sends data to a 'Match engine' (Color, Texture, Shape, Multiobject, Sketch, Location, Text, Positional color/texture, Object motion, Camera motion, User defined). The 'Match engine' sends data to 'Filtering/indexing', which then returns 'Best matches returned in similarity order' to the 'User'.</p> <p>Figure 2. QBIC database population (top) and query (bottom) architecture. <i>Id.</i> at Fig. 2.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>Managing Enterprise Information Portal (IBM 000777–880):</p> <p>“Many paper-intensive enterprises, such as insurance companies and financial institutions, administer large volumes of business-related content. The need for an enterprise solution for managing and accessing business information spans many industries. A content server is a software system that stores multimedia, business forms, documents, and related data, along with metadata that allows employees to process and work with the content.” <i>Id.</i> at p. 3.</p> <p>“The image search server uses IBM’s QBIC (query by image content) technology to help you search for objects by certain visual properties, such as color and texture. The image search server analyzes images and stores the image information in a database. Then users can run image queries, which use the visual properties of images, to match colors, textures, and their positions without describing them in words. You can combine content-based queries with text and keyword searches for more powerful retrieval of image and multimedia data.” <i>Id.</i> at p. 63.</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>22 Q. Okay. And in what form would those                      23 results be displayed to me? For images would they                      24 be displayed as a thumbnail?                      25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those                      2 be displayed to you?                      3 A. It could be as a thumbnail or as a short                      4 video clip or as a single representative frame.                      5 Q. Okay. So they could be -- so for a video,                      6 there's a video that matched the image query of an                      7 r-frame, the results I could get back could include                      8 three things. It could be a still image, it could                      9 be a thumbnail, or it could be an r-frame                      10 representation?                      11 A. R-frame, I think, is representative frame.                      12 So it was a key frame in that video sequence,                      13 summary frame.                      14 Q. Once I ran a query on an r-frame; right?                      15 Well, let's stop there.                      16 If I run a query on still images,                      17 typically the results I would get back are                      18 thumbnails that are most similar to the                      19 characteristics which I queried from the query                      20 image; right?                      21 A. You could get thumbnails back. You could                      22 also get the full-sized image back.                      23 Q. Okay.                      24 A. Thumbnail is a tool for helping you return                      25 lots of results and quickly scan it.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Element	'252 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. STRAUSSMAN: You can answer.                  19 THE WITNESS: I don't know.                  20 BY MR. EDWARDS:                  21 Q. But, Mr. Flickner, this -- generally this                  22 article represents the status of the QBIC technology                  23 as of the date of this publication, which is                  24 September 1995; is that right?                  25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.                  2 THE WITNESS: As I recall -- I'm not sure                  3 definitely, but, yes, this is -- you could do that.                  4 BY MR. EDWARDS:                  5 Q. So let's go to page IBM 898.                  6 So if you'll take -- just read that                  7 paragraph that starts with the header                  8 "Representative Frame Generation."                  9 MR. STRAUSSMAN: And if you need to read                  10 anything else to put it in context, feel free to do                  11 so.                  12 THE WITNESS: Okay.                  13 (Witness reviews document.)                  14 THE WITNESS: So what was your question, again?                  15 BY MR. EDWARDS:                  16 Q. If you go to the sentence that says,                  17 "First" -- it's the second sentence in that                  18 paragraph. It says, "First, during database                  19 population, r-frames are treated as still images."                  20 See that?                  21 A. Yeah.                  22 Q. And that's what you told me earlier;                  23 correct?                  24 A. Yeah.                  25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --                  2 Q. Okay.                  3 A. -- there's an editorial process.                  4 Q. Say that last part?                  5 A. There's an editorial process. You submit                  6 it, they edit and make changes and eventually it                  7 appears.                  8 Q. Right. So what you're saying is there's                  9 some lag between the time that you wrote the article                  10 and the time it was published?                  11 A. Yeah.                  12 Q. So this article -- but this article                  13 represents the state of the QBIC technology at least                  14 as of September 1995?                  15 A. Yeah. Yes.                  16 Q. And then let's go to IBM 900.                  17 And take your time to orient yourself on                  18 that page, but what I really want to ask you about                  19 is the last paragraph on the left-hand column going                  20 up to the top of the right-hand column.                  21 A. Yep.                  22 Q. So it says this paper describes [as read],                  23 "a prototype system that uses image and video                  24 content as the basis for retrievals."                  25 Is that right?</p>

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p>	
		<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 161</p> <p>1 Q. And does the thumbnail also provide links                  2 to information about the image that was associated                  3 with the image in the database?                  4 A. Yes.                  5 Q. And, again, that can be that -- whatever                  6 information that the user inputted or was associated                  7 with the image from the source?                  8 A. Yes.                  9 Q. Could the results also display a matching                  10 score so the user could see how well the particular                  11 result matched to the -- to the query image?                  12 A. It could.</p> <p><i>Id.</i> at 321</p> <p>5 Q. Mr. Flickner, every commercial                  6 implementation of QBIC as of the Exhibit 3, IEEE                  7 1995 article, returned results of the matching                  8 process to the user in the form of a stored image                  9 and information associated with that image; is that                  10 fair?                  11 MR. HANSEN: Objection; lacks foundation.                  12 THE WITNESS: Yes.                  13 BY MR. EDWARDS:                  14 Q. Okay. And a thumbnail is an image;                  15 correct?                  16 A. Thumbnail is an image.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

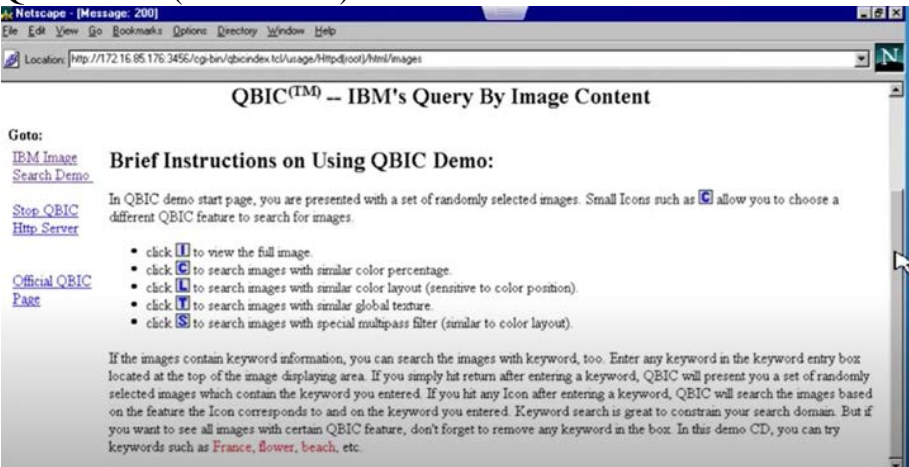

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the '252 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. '252 Patent, 3:7-16. Indeed, the '252 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 11:56-61. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>

Nantworks, LLC v. Bank of America Corporation

Central District of California, No. 2:20-cv-7872

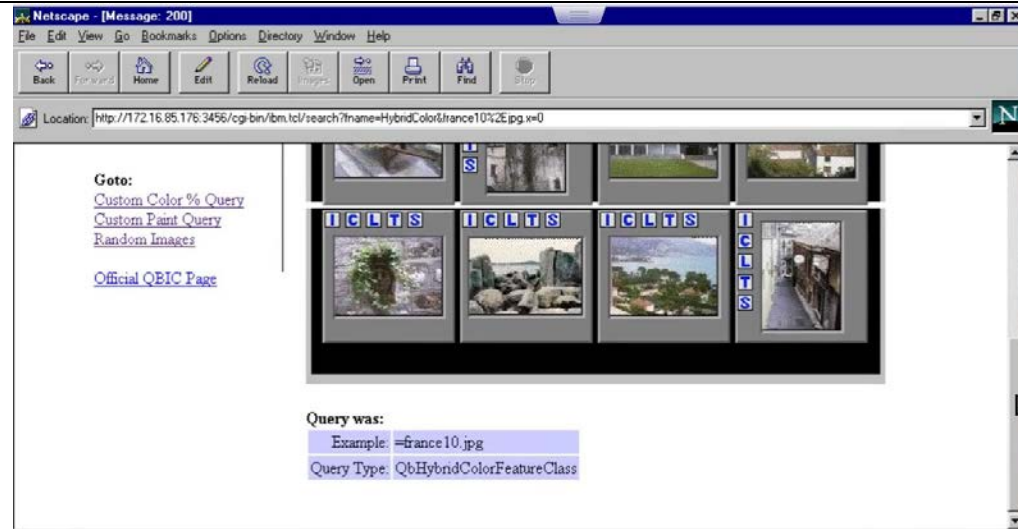

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

2. Claim 26

Claim	'252 Claim Recitation	Exemplary Citations in Reference
26	The method of claim 18, wherein the data relating to the image comprises the image.	<p>QBIC discloses the method of claim 18, wherein the data relating to the image comprises the image.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 8</p> <p>4.1. <b>Object/element identification</b></p> <p>Our user interface for object identification, shown in figure 4, allows for user assisted object identification. This interface is made up of four parts (listed from top to bottom): the window menu, the tool selection buttons, the image display area, and the object entry area. From the File menu selection the user has the ability to save the current image and objects and load another image. The Options menu contains selections for tuning panels for Snakes, Flood-Fill, as well as a Zoom selection, useful for working with very large or small images. There are nine drawing tools provided by the interface: Polygon, Rectangle, Ellipse, Paint Brush, Eraser, Line Draw, Object Move, Fill Area, Snake Outline. For example the Polygon tool allows the user to click or drag around bounding edges of the object to be outlined, this can then be refined by the snakes method providing a shrink-wrap effect.</p> <p>QBIC Demo (IBM000747)</p>  <p>In QBIC demo start page, you are presented with a set of randomly selected images. Small Icons such as  allow you to choose a different QBIC feature to search for images.</p> <ul style="list-style-type: none"> <li>• click [I] to view the full image.</li> <li>• click [C] to search images with similar color percentage.</li> <li>• click [L] to search images with similar color layout (sensitive to color position).</li> <li>• click [T] to search images with similar global texture.</li> <li>• click [S] to search images with special multipass filter (similar to color layout).</li> </ul> <p>If the images contain keyword information, you can search the images with keyword, too. Enter any keyword in the keyword entry box located at the top of the image displaying area. If you simply hit return after entering a keyword, QBIC will present you a set of randomly selected images which contain the keyword you entered. If you hit any Icon after entering a keyword, QBIC will search the images based on the feature the Icon corresponds to and on the keyword you entered. Keyword search is great to constrain your search domain. But if you want to see all images with certain QBIC feature, don't forget to remove any keyword in the box. In this demo CD, you can try keywords such as <i>France, flower, beach</i>, etc.</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>12 Q. Did QBIC -- any version of QBIC ever 13 convert a queried image from color into gray scale? 14 MR. EDWARDS: Objection; form, asked and 15 answered. 16 THE WITNESS: Did any form of QBIC take color 17 and convert into gray scale? 18 It was certainly an option, but you 19 typically do it outside of QBIC. 20 BY MR. HANSEN: 21 Q. Was it an option within QBIC? 22 A. No. Well, actually, in the color queries, 23 you might be able to do . . . 24 Q. I'm sorry, could you speak up? 25 A. I'm thinking. Give me a second.</p> <p>1 You could mimic a gray scale query by 2 selecting a subset of the color features. So you 3 could just select the luminance channel instead of 4 luminance and chrominance, and then you could query 5 gray-level images. 6 Q. So would that process convert the input 7 image to a gray scale image? 8 A. The process converts it to a 9 three-channel. So RGB converts to LIQ. 10 (Reporter seeks clarification.) 11 A. RGB, red/green/blue, converts to LRI -- 12 LIQ. 13 Q. And that's gray scale image? 14 A. L is gray scale. I and Q are chrominance 15 images.</p> <p><i>Id.</i> at 81-86</p> <p>23 Q. Were there any other features that, as 24 part of the -- as part of the extraction process, 25 the image had to be converted to binary before?</p>	
--	--	---	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 82</p> <p>1 Well, strike that. Bad question. 2 Were there any features that required the 3 image to be converted to binary before the features 4 were extracted? 5 A. Some features required a binary image, 6 yeah. 7 Q. Which ones? 8 A. Some of the texture features. 9 Q. And when you say "some of the texture 10 features," do you -- do you recall which ones? 11 A. No. 12 Q. Let's put a pin in that because we're 13 going to get to it. 14 What about gray scale? Were any images 15 converted to gray scale before features were 16 extracted? 17 A. Yes. 18 Q. Which -- for which features? 19 A. For shape, for texture. 20 Q. Any others? 21 A. Color wouldn't make any difference. 22 That's all I can think of. 23 Q. At least for shape and texture? 24 A. Yeah. 25 Q. Okay. Then earlier we talked about</p>	<p style="text-align: right;">Page 83</p> <p>1 segmentation. And I want you to go to Exhibit 3, 2 please, page IBM 896. 3 Well, and real quick before we get there, 4 Mr. Flickner, going back to the gray scale, when you 5 converted the image to gray scale for shape and 6 texture, was the gray scale -- is the gray scale 7 image stored in the database? 8 A. I don't recall whether we actually stored 9 it or not. Probably yes. 10 Q. Was it at least stored temporary while you 11 process -- 12 A. Temporarily, yes. Yes. 13 Q. Okay, sorry. So page 896, if you look 14 at -- I apologize. It's hard to describe, but the 15 page is kind of broken up. There's some bolded, 16 highlighted text kind of in the first half of the 17 page and then the second half of the page is what I 18 want to focus you on the left-hand column. It 19 starts with, "applications. As a result." 20 Do you see that? 21 A. Yeah. 22 Q. Okay. If you look at that second sentence 23 there -- well, I'll read the -- I'll read the first 24 two sentences, first two full sentences. It says, 25 "As a result, we have devoted considerable effort to</p>

		<p style="text-align: right;">Page 84</p> <p>1 developing tools to aid in this step. In recent 2 work, we have successfully used fully automatic 3 unsupervised segmentation methods along with a 4 foreground/background model to identify objects in a 5 restricted class of images.” 6 Did I read that correctly? 7 A. Yep. 8 Q. And can you interpret that for me? What 9 is -- how did -- how were segmentation methods used 10 there? 11 A. This is work by Harpreet Sawhney, and he 12 had algorithms for doing segmentation. So given an 13 input image, identify which pixels belong to which 14 class. So this is a cup, this is a table this is a 15 phone. It's a three-class problem. 16 And you write algorithms that determine 17 what the characteristics of a cup are, what the 18 characteristics of a table is, what the 19 characteristics of a phone cover is. And you 20 populate those in the database. 21 Q. And how are those populated in a database? 22 Are those associated with the underlying image? 23 A. Yes. 24 Q. And that could be done for both a query 25 image and a database image?</p>	
		<p style="text-align: right;">Page 85</p> <p>1 A. It's done for both. 2 Q. Okay. And so let's go back to Exhibit 2. 3 Feature Calculation starts on IBM 2392. 4 So, Mr. Flickner, what I'm going to do is 5 I'm going to walk through each one of these. The -- 6 so for feature calculation, there's a section on 7 color, there's a section on texture and if you turn 8 the page there's a section on shape and sketch. 9 A. Okay. 10 Q. Okay? So I want to talk about color 11 first. So why don't you take your time, take -- you 12 know, read that section and then let me know when 13 you're done and then I want to ask you some 14 questions. 15 (Witness reviews document.) 16 A. Okay. 17 Q. First question, though, is this section is 18 entitled "Feature Calculation"? 19 A. It is. 20 Q. So for each of color, texture, shape, 21 sketch, there are algorithms that are performing 22 some mathematical computation to calculate those 23 features; is that right? 24 A. Yes. 25 Q. Okay. So let's talk about the color</p>	

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two 2 different color computations that are done. One is 3 average color, the other is color histogram; is that 4 right? 5 A. There certainly are those two. 6 Q. Say again. 7 A. There certainly are those two. 8 Q. Okay. And for average color, let's talk 9 about that first, it says [as read], "We compute the 10 average," and it lists four things, "(R, G, B), (Y, 11 i, q), (L, a, b), and MTM coordinates of each object 12 and image." 13 You see that? 14 A. Yep. 15 Q. So does that mean that it does -- every 16 time it -- if it computes average color, it computes 17 all four of those things? Or are those optional, 18 meaning that it can compute one as opposed -- or 19 some combination of those four? 20 A. Some combination of those four. 21 Q. Okay. Are there different algorithms for 22 each of those four or is it the same algorithm? 23 A. RGB, Yiq and LAB are all linear 24 transformations. 25 Q. Okay.</p>	<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA's Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

**5. Claim 31**

Claim	'252 Claim Recitation	Exemplary Citations in Reference
[31]	<p>The method of claim 18, further comprising the distal server using database to identify the pertinent information based on image characteristics of the image derived by the image processing platform based on the data relating to the image.</p>	<p>QBIC discloses the method of claim 18, further comprising the distal server using database to identify the pertinent information based on image characteristics of the image derived by the image processing platform based on the data relating to the image.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390:</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>QBIC Demo (IBM000747):</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>3 Q. Okay. And the steps that -- at least as 4 I understand it -- is you'd have database 5 population, feature calculation and image query; is 6 that right? 7 A. Uh-huh. Yes. 8 Q. So let's -- let's start with database 9 population. 10 What was the database population step? 11 A. It's a process of taking a set of images, 12 and then putting them in -- into the database and 13 the extracting the features and putting the 14 features in the database. 20 Q. And how large were these database 21 structures? 22 A. In the order of 15,000 images.</p> <p>Flickner Depo at 21:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 Q. And you mentioned that you would extract 2 features from the images? 3 A. We did. 4 Q. How would you do that? 5 A. We ran algorithms on the pixels of the 6 image and from that we created a feature. 7 Q. What sort of features would you extract 8 from the images? 9 A. A QBIC system did color, shape and 10 texture. 11 Q. Okay. So let's take color. 12 How would you, say, extract a color 13 feature from an image? 14 A. We typically would compute -- compute a 15 color histogram. 16 Q. And what's a color histogram? 17 A. It's a measure of -- it's an estimate of 18 the probability density of a color being in an 19 image. 20 Q. So you would take an image and extract 21 that color histogram from it? 22 A. Yup.</p> <p>Flickner Depo at 22-25:</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 Q. Okay. And what would you do with the 2 image after you hit and extracted the color 3 histogram from it? 4 A. Nothing. 5 Q. Would those features be stored in any 6 database or -- 7 A. Yes. 8 Q. Okay. And let's do -- what about 9 texture, could you extract texture features from an 10 image? 11 A. We did. 12 Q. And how would you do that? 13 A. I don't remember exact features we were 14 using. There were -- we published some papers on 15 them. 16 Q. Okay. Was there any reasoning behind 17 picking the features that you chose? 18 A. Yes. 19 Q. And what was that reasoning? 20 A. We wanted to make it so that the results 21 were perceptually good. 22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red 2 color in it or some sort red color histogram; is 3 that right? 4 A. Well, you -- you take specific -- you 5 search for a red color. You'd compute the 6 histogram and then basically match the histogram, 7 which would give you images that had more colors in 8 the reds. This is not -- it's not a unique thing. 9 Q. Were you always searching for a 10 particular feature, or could you just search some 11 sort of example image? 12 A. We could search an example image. 13 Q. And how would that process work? 14 A. Just extract the features from it. 15 Q. So let's break that down. 16 So you would submit an example image to 17 the -- to the system, right? 18 A. Uh-huh. 19 Q. And then how do the -- how -- how does 20 the system select which features to extract? 21 A. It would compute them all, typically, or 22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that 2 this is a better match, that the ordering was 3 reasonable and... 4 Q. So by that, do you mean that people would 5 view the results returned as the closest or close 6 matches to your -- to your image? 7 A. It was -- it would satisfy their query. 8 Q. Okay. So -- so you would have this set 9 of features in your database. 10 How would you search for those features? 11 A. Typically, we -- initially, we did linear 12 scan where you just actually evaluate the -- the 13 distance metric against all the features. 14 Q. So in linear scan, you would compare some 15 sort of search term against all the features in the 16 database? 17 A. Well, it depends on which features you're 18 using. You didn't have to use all the features. 19 You could use just color features or just texture 20 features or just... 21 Q. So to make sure I'm understanding this 22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with 2 those features that it had extracted from that 3 example? 4 A. Then it became the reference point to the 5 search. 6 Q. And by research point to the search, what 7 do you mean? 8 A. So you have a vector in -- in the 9 individual space. 10 (Reporter clarification.) 11 A. That -- that query represents a point in 12 that space, and you're looking for other things 13 near that space or ordered by that space. 14 Q. And by other things near that space, is 15 that the other features that are in the -- in the 16 database? 17 A. Yes. 18 Q. Okay. So at bottom then, you would -- 19 you would take the image, the system would extract 20 features from it, and then those features would be 21 searched against the reference database -- the 22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

Flickner Depo at 25-26:

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 Q. Okay. And then what would it do with 2 those features that it had extracted from that 3 example? 4 A. Then it became the reference point to the 5 search. 6 Q. And by research point to the search, what 7 do you mean? 8 A. So you have a vector in -- in the 9 individual space. 10 (Reporter clarification.) 11 A. That -- that query represents a point in 12 that space, and you're looking for other things 13 near that space or ordered by that space. 14 Q. And by other things near that space, is 15 that the other features that are in the -- in the 16 database? 17 A. Yes. 18 Q. Okay. So at bottom then, you would -- 19 you would take the image, the system would extract 20 features from it, and then those features would be 21 searched against the reference database -- the 22 features within the referenced database; is that 1 right? 2 A. That's correct. 3 Q. Okay. And once it determined matches, 4 what would the system do next? 5 A. It would display them, display the image. 6 Typically, in thumbnail form. 7 Q. Okay. How many matches would it display? 8 A. On the order of 20, 30. You -- you could 9 get more. It's really an ordering of the whole 10 database. 11 Q. Okay. And could you vary the amounts of 12 matches that it would return? 13 A. Yeah. 14 Q. Okay. And how would you vary the amount 15 of matches? 16 A. I think it was like a configuration 17 related to the X Windows application that has 18 scroll bars on it, and you can assess like how many 19 elements you wanted into it. This is pre-Web.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>Flickner Depo at 36:</p> <p>10 Q. So underlying this paper, you mentioned 11 you did more work on the shape side of things; is 12 that right?</p> <p>13 A. I did.</p> <p>14 Q. And what would that work have entailed?</p> <p>15 A. We wanted to query by shape.</p> <p>16 Q. Okay. And how would that have worked?</p> <p>17 A. We created features related to the shape 18 of a -- the object of -- as it populated the 19 database, and then we would query against those 20 features.</p> <p>Flickner Depo 38-41:</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 project at this time?                  2 A. I don't know that.                  3 Q. Okay. Would reviewing -- let's see.                  4 Let's turn to page -- let's turn to page -- this                  5 one is Bates-stamped, so the page ending in                  6 Network1_007316.                  7 Would reviewing this page refresh your                  8 recollection as to whether --                  9 A. Yes.                  10 Q. Okay. Perfect. Feel free.                  11 MR. DeCLERCK: Just give him a chance to                  12 finish his question before you respond.                  13 MR. DANG: Thank you.                  14 THE DEPONENT: Is there a question                  15 standing?                  16 Q. (By Mr. Dang) Sure. Yeah.                  17 So was there any video search                  18 functionality included as part of the QBIC system                  19 at this time?                  20 A. Evidently, yes.                  21 Q. Okay. And how did that video search                  22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using                  2 those images.                  3 Q. Okay. Could you take as -- as you did in                  4 the query by image search system, could you just                  5 search a video using this system?                  6 A. You could search for a key frame and that                  7 could point you to a video.                  8 Q. As an input into the system, could you                  9 search -- could you input a whole video and then                  10 the system would extract the key frames and then --                  11 A. Yes.                  12 Q. -- search that using that?                  13 A. If I recall correctly, yes.                  14 Q. Okay. And the way -- the method by which                  15 it did so, as you mentioned, was -- would it                  16 extract key frames from the video, extract features                  17 from those key frames, and then search those                  18 features; is that right?                  19 A. Correct.                  20 Q. Okay. Other than the use of shots and                  21 key frames, is there any difference between the                  22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in                  2 video and then treat -- treat those as still images                  3 in the QBIC system.                  4 Q. So to break that down, you -- what do you                  5 mean by detecting shots?                  6 A. You try to find some key frame in a video                  7 sequence or multiple key frames in a video                  8 sequence, to give you a summarization of the video.                  9 Q. And how would you detect those key                  10 frames?                  11 A. There were algorithms to do it. I didn't                  12 personally work on any of those algorithms.                  13 Q. Are you otherwise aware of any of those                  14 algorithms?                  15 A. Well, they used histogram methodologies.                  16 I remember that.                  17 Q. Okay. So you would take -- you would use                  18 a histogram methodology to extract key frames from                  19 the video; is that what -- is that right?                  20 A. That's one way to do it.                  21 Q. Okay. And then what would you do with                  22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?                  2 A. There may have been.                  3 Q. Can you think of any now?                  4 A. No.                  5 Q. When you searched for -- or when you                  6 searched a video using this system, what would                  7 the -- or what would the system return?                  8 A. I don't remember if we returned the                  9 stills or a small -- small video clip.                  10 Q. Say it returned the stills, could you use                  11 those stills to point you to a video?                  12 A. Yeah.                  13 Q. And how would you do that?                  14 A. Well, the -- each -- each key frame                  15 typically represents a frame in the video. So                  16 there's a -- the key frame is -- is one frame of                  17 the video so you just seek to that point.                  18 Q. So if I'm understanding this right, you                  19 could take a query video, the system would extract                  20 frames, which would then extract features from it,                  21 and then the system would return either shot clips                  22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

Flickner Depo at 41-42:

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>18 Q. So if I'm understanding this right, you 19 could take a query video, the system would extract 20 frames, which would then extract features from it, 21 and then the system would return either shot clips 22 or key frames; is that right?</p> <p>1 A. Right. 2 Q. Okay. And how many key frames would be 3 returned? 4 A. It depends how many you requested. 5 Q. Could you alter how many you request? 6 A. Probably. 7 Q. Could you return key frames based on some 8 defined threshold of the distance? 9 A. Probably.</p> <p>Flickner Depo at 48-49: 4 Q. What feature extraction methods did the 5 UC Davis implementation of QBIC rely on? 6 A. It was similar to the other texture, 7 shape, color and layout.</p> <p>Flickner Depo at 50:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>7 Q. And so if I clicked on this T, and it 8 used the texture features, what would -- what would 9 the system do? 10 A. It would return the list of stamps based 11 on similarity and texture. 12 Q. And how would it decide which stamps were 13 the most similar to that query image? 14 A. It would use those texture features to 15 compute it, and then it -- I think it was using L 16 to distance.</p> <p>Flickner Depo at 54-55:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>13 Q. Was there also a demo online comparing 14 trademarks at this time? 15 A. There was a trademark demo. I don't 16 remember the time frame. 17 Q. And how would the trademark demo work? 18 A. Similar to the stamp demo, just different 19 database. The features were a little bit different 20 features. Most trademarks are black-and-white. 21 Q. What sort of features would be extracted? 22 A. I don't remember which features we were</p> <hr/> <p style="text-align: right;">Page 54</p> <p>1 using on trademarks. 2 Q. Could you search for -- could you search 3 an example trademark into a database of other 4 trademarks? 5 A. I believe so. 6 Q. And would that work in a similar fashion 7 to this stamps demo? 8 A. I believe so. 9 Q. And would that identify the stamp -- or 10 the trademark that you were searching in any way? 11 A. What do you mean by identify? 12 Q. Would the -- would the trademarks 13 returned ever match the trademark that you 14 searched, or were they always different trademarks? 15 A. Well, if your query was in a database, it 16 would match.</p> <p>QBIC could integrate with a camera, such as a portable camera; a user could take an image using a portable camera and submit that image to the QBIC system for query.</p> <p>Flickner Depo at, 62-63 (user could take a picture or video and submit it to the QBIC system):</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>10 Q. Say it returned the stills, could you use 11 those stills to point you to a video? 12 A. Yeah. 13 Q. And how would you do that? 14 A. Well, the -- each -- each key frame 15 typically represents a frame in the video. So 16 there's a -- the key frame is -- is one frame of 17 the video so you just seek to that point. 18 Q. So if I'm understanding this right, you 19 could take a query video, the system would extract 20 frames, which would then extract features from it, 21 and then the system would return either shot clips 22 or key frames; is that right? 1 A. Right.</p> <p>Flickner Depo at 63: 13 Q. And what would the system return, once a 14 user searched an example image? 15 A. A list of images. Typically, thumbnails.</p> <p>Flickner Depo at 72-73:</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

Flickner Depo at 142:

1 Q. Do you recall what type of indexing was  
2 used in the database associated with the 1998 demo  
3 version?

4 A. Most likely, it was just a linear index.

5 Q. And what do you mean by linear index?

6 A. You just -- you -- you compute the  
7 features on every record in the database -- you  
8 compare the features against every record in the  
9 database.

Flickner Depo at 159:

10 Q. Would either version of the stamps demo  
11 allow a user to submit an unknown image as the  
12 query and ask the system to find images similar to  
13 that query image?

14 A. I suspect it did.

15 Q. Why do you suspect that?

16 A. Because that's one of the nice things you  
17 can do with QBIC.

Flickner Depo at 162-163:

18 Q. How did the trade -- how did the  
19 technology implemented in the trademark demo decide  
20 how many results to return to the user?

21 A. So it was -- it was an exact match or a  
22 binary search for the text fields using some  
metric, like string at a distance, or something  
like that, and that would give you a list and a  
rank by the image features.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>7 Q. Okay. What about the -- the stamps demo, 8 going back to that, did the stamps demo return a 9 set number of results for each query? 10 For example, was it always the original 11 image and 11 results? 12 A. Again, the output -- the number of 13 results output was probably a parameterized 14 option -- option, and I don't recall having text 15 ability on the stamp demo. 16 Q. So you think that the user may have been 17 able to indicate to the QBIC system how many 18 results he wanted to see? 19 A. The user could configure the -- the GUI 20 to display a certain number of results.</p> <p>Flickner Depo at 168-169:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>16 Q. What do you mean that it lets you access 17 the -- the neighbors to your query point? 18 A. So your incoming query -- say it's an 19 image -- you compute a feature vector. And then 20 you compute some orthogonal transform of the 21 feature vector such as a wave transform or 22 wavelets. There's a variety --</p> <p style="text-align: right;">Page 168</p> <hr/> <p>1 MR. DeCLERCK: Slow down, please. 2 THE DEPONENT: Wavelets, other types of 3 features that do dimensionality reduction. And 4 then you put the reduced dimensionality feature 5 vector into the database, and then the database 6 queries and R*-tree to be able to get points nearby 7 to the -- in the lower dimensional space.</p> <p>Flickner Depo at 181:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>4 Q. What do you mean by the images of shot 5 boundaries were indexed? 6 A. Each -- each shot -- the shot -- the shot 7 boundary detection is trying to extract key frames 8 or break the video into small subsec -- 9 subsections -- hang on. Let me think here a 10 second. 11 So the shot boundary here is different 12 than key framing. So I'll -- I'll retract what I 13 said earlier. This -- while similar, they're not 14 the same. 15 Q. What are the differences? 16 A. Shot boundaries are typically detected at 17 fade to black, and key frames are supposed to be a 18 representative still image of the video segment. 19 Q. How would a shot boundary index allow one 20 to query a video by content? 21 A. It gives you semantical information as 22 related to what the -- that -- that -- that is a --</p> <hr/> <p style="text-align: center;">Page 214</p> <p>1 a reasonable amount of return video. It's -- it's 2 breaking it into small snippets. 3 Q. Does it extract features from the key 4 frames? 5 A. If there are key frames extracted, it -- 6 it will reference key frames.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902): “We have developed the QBIC (Query by Image Content) system to explore content- based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors,</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.</p> <p>For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen.</p> <p>Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color queries return items with</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p> <p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right. Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects and features to implement logical And semantics.</p> <p>....</p> <p><b>ANNOTATION AND DATABASE POPULATION TOOLS.</b> Automatic methods (such as our Positional Color query) that don't rely on object identification, methods</p>

<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404)</p> <p>IBM0002390 at 2390:</p>																														

Nantworks, LLC v. Bank of America Corporation

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>IBM0002390 at 2391:</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.

In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.

Figure 1: Original image, approximate user outline, and automatically refined outline of sun.

IBM0002390 at 2391-92:

## 2.2. Feature Calculation

The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:

*Color features:* We compute the average  $(R, G, B)$ ,  $(Y, i, q)$ ,  $(L, a, b)$ , and *MTM* (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a  $k$  element color histogram, where  $k$  is user-settable. (We currently run with  $k = 64$ .) Because the original color images may include any of  $(2^8)^3 = 16M$  colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in  $R, G, B$  to 16 levels, giving a color space of 4096 cells. We then compute the *MTM* coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any  $(R, G, B)$  triple to its supercell number. To compute an image or object color histogram, we take the  $(R, G, B)$  for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.

*Texture features:* Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The *coarseness* feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The *contrast* feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The *directionality* feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}</math>, <math>M_{[2,3]} \times M_{[3,2]}</math>, <math>M_{[3,3]}</math>, <math>M_{[3,4]} \times M_{[4,3]}</math>, <math>M_{[4,4]}</math>, <math>M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95:</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.

The matching methods and similarity functions for the different feature types are described below:

**Color:** For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the *L* component of an (*L, a, b*) query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.

Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let *X* be the query histogram and *Y* the histogram of an item in the database, both normalized. We compute the element by element difference histogram *Z*. Then the similarity between *X* and *Y* is given by  $\|Z\| = Z^T A Z$ , where *A* is a symmetric color similarity matrix with

$$a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$$

where *c<sub>i</sub>* and *c<sub>j</sub>* are the *i*th and *j*th colors in the color histograms, and *d(c<sub>i</sub>, c<sub>j</sub>)* is the *MTM* color distance, and *d<sub>max</sub>* is the maximum distance between any two colors ([8] used *Luv* distance.) This metric gives the (weighted) length of the difference vector between *X* and *Y*, weighted by *A*, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).

Based on our experience, we also found it useful for the user to be able to request images with *x*% of color 1, *y*% of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.

Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.

**Texture:** Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the

Nantworks, LLC v. Bank of America Corporation

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2395</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <math>R^*</math>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>IBM 0002390 at 2396-97</p> <p>4.2. Performing Queries</p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of <math>(R, G, B)</math> sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <math>n</math>th best match (<math>n</math> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p>

**5. Sample Query Results**

Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.

(buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.

		 <p>The screenshot displays a software interface titled "QBIC Color Matching". It features a horizontal row of five image thumbnails. The first thumbnail on the left is a query image showing a landscape with a body of water and trees. The subsequent four thumbnails show similar landscape images, representing search results. The interface includes a search bar at the top and a vertical scrollbar on the right side.</p>
<p>Figure 7: Result of query by example using color only.</p>

		<p style="text-align: right;">Page 84</p> <p>1 developing tools to aid in this step. In recent 2 work, we have successfully used fully automatic 3 unsupervised segmentation methods along with a 4 foreground/background model to identify objects in a 5 restricted class of images." 6 Did I read that correctly? 7 A. Yep. 8 Q. And can you interpret that for me? What 9 is -- how did -- how were segmentation methods used 10 there? 11 A. This is work by Harpreet Sawhney, and he 12 had algorithms for doing segmentation. So given an 13 input image, identify which pixels belong to which 14 class. So this is a cup, this is a table this is a 15 phone. It's a three-class problem. 16 And you write algorithms that determine 17 what the characteristics of a cup are, what the 18 characteristics of a table is, what the 19 characteristics of a phone cover is. And you 20 populate those in the database. 21 Q. And how are those populated in a database? 22 Are those associated with the underlying image? 23 A. Yes. 24 Q. And that could be done for both a query 25 image and a database image?</p> <hr/> <p style="text-align: right;">Page 85</p> <p>1 A. It's done for both.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p><i>Id.</i> at 305:</p> <p>7           So these articles describe various 8 features of various versions of QBIC; right? 9           A. Correct. 10          Q. Do they describe any features -- does the 11 demo you operated include any features that weren't 12 described in these articles? 13          A. That weren't described in the articles? 14 No.</p> <p><i>Id.</i> at 35:</p> <p>6           Q. Okay. And the analytics that you're 7 talking about, where you extract these characters 8 from the image, that is -- those run on both the 9 query image and the images that are stored in the 10 database; is that right? 11          A. Yeah. We call them features. 12          Q. Features. Okay. 13                So when you say "features," you're talking 14 about the features that we talked about before: 15 Color, texture, shape, sketch? 16          A. For example. 17          Q. Any other ones you can think of? 18          A. Nothing comes to mind. 19          Q. But when you refer to features they at 20 least include those four; is that correct? 21          A. Yes. Well, at least includes, yeah.</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“ A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content. You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b></p> <p>The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b></p> <p>Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b></p>
--	--	---

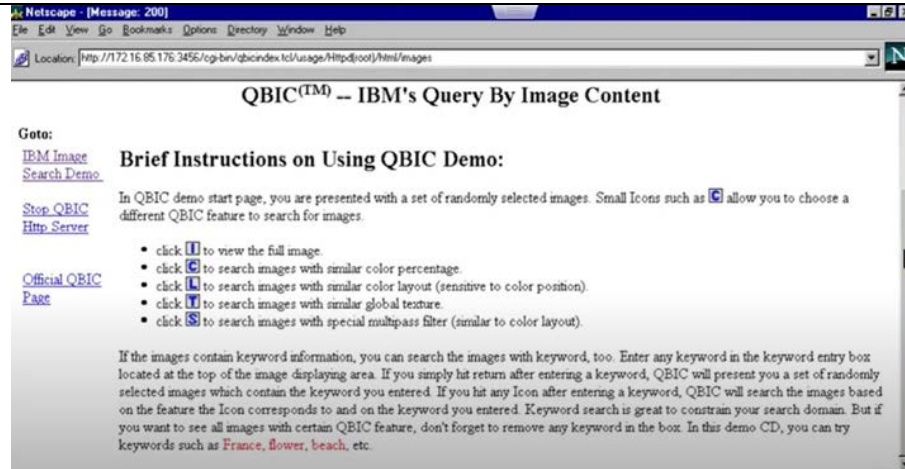

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b></p> <p>Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>QBIC Demo (IBM000747):</p>

**Data structures**

**Handles**

When you store an image, audio, or video object in a user table, the object is not actually stored in the table. Instead, an extender creates a character string called a **handle** to represent the object, and stores the handle in the table. The extender stores the object in an administrative support table, or stores a file identifier in an administrative support table if you keep the content of the object in a file. It also stores the object’s attributes and handle in administrative support tables. In this way, the extender can link the handle stored in a user table with the object information stored in the administrative support tables. Figure 8 illustrates the information stored for two images in a user table.

User Table

ID	Name	Picture
		Handle 1
		Handle 2

Administrative Support Tables

Figure 8. Handles

**QBIC catalogs**

A **QBIC catalog** is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.

You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.

--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: center;"><b>Description</b></p> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <p style="text-align: center;"><b>Image Classification</b></p> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <p style="text-align: center;"><b>Image Query</b></p> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <p style="text-align: center;"><b>Image Formats</b></p> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCK</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <p style="text-align: center;"><b>Product Positioning</b></p> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="text-align: center;">255-042 <span style="margin-left: 100px;">-2-</span> <span style="float: right;">IBM 0002264</span></p>

1 Q. And with respect to -- I think we talked a  
2 bit -- a little bit about this before, but I want to  
3 make sure my understanding is correct.

4 On the -- on the demo application on the  
5 CD, if I took those files off and put it on my  
6 computer and ran it, just like Mr. Hansen was  
7 running it today from a computer, there's no  
8 technical restriction that would prevent me from  
9 capturing an image with a portable camera and  
10 importing that into the file with all the other  
11 images; is that --

12 MR. HANSEN: Objection; lacks foundation.  
13 (Reporter seeks clarification.)

14 THE WITNESS: It would be possible, yes.

15 BY MR. EDWARDS:

16 Q. Okay. The user then could use that  
17 captured image in a query?

18 MR. HANSEN: Same objection.

19 THE WITNESS: Yes.

Flickner 8/29/23 Depo at 42:

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

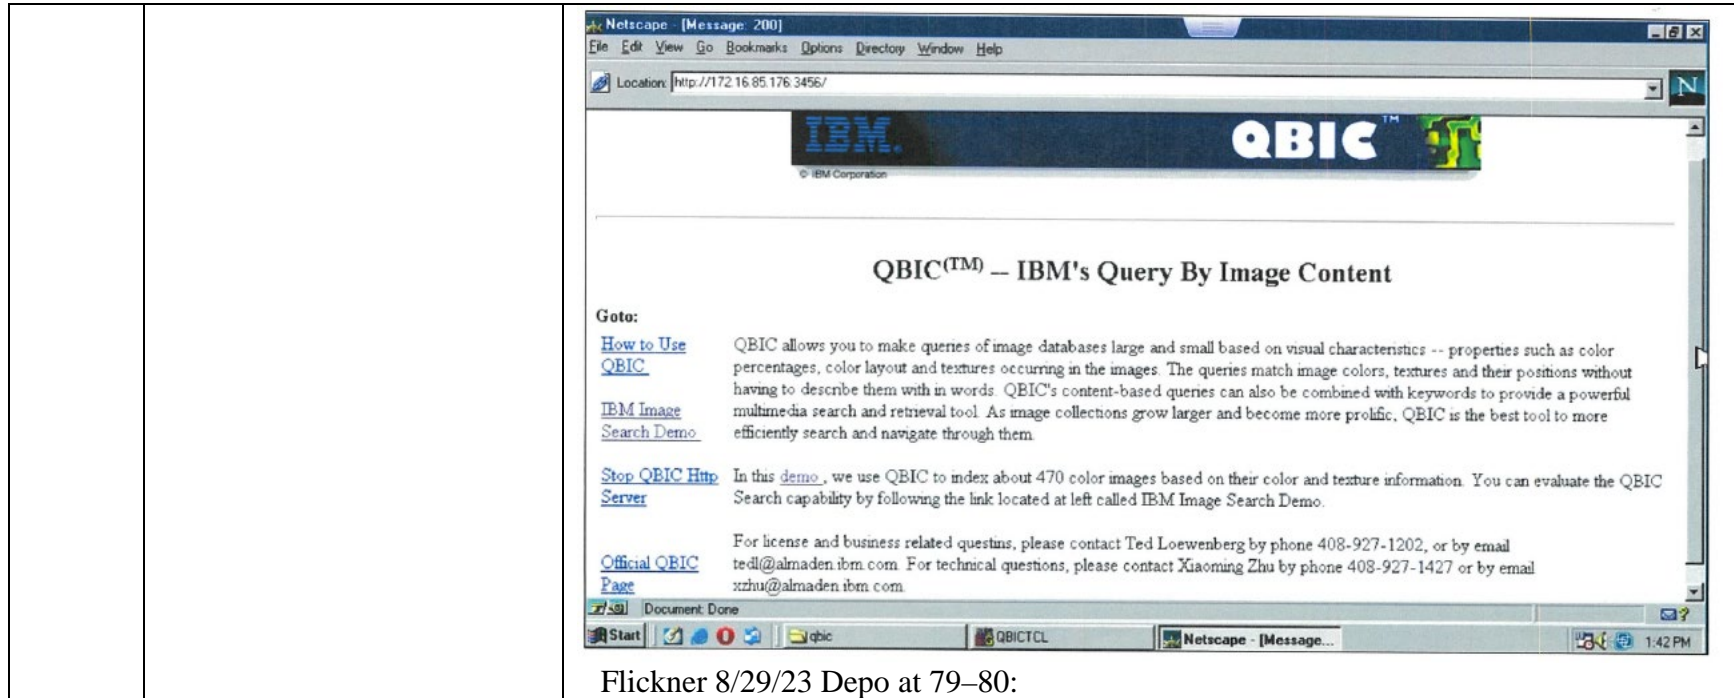

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>10 Q. All right. I want to -- you've been 11 testifying about different systems today. We've 12 heard about Ultimedia Manager. We've heard about 13 DB2. We've heard about image extender. I want to 14 ask you about QBIC piece of things, just to make 15 sure I have the delineation --</p> <p>16 A. Okay.</p> <p>17 Q. -- straight, okay?</p> <p>18 QBIC stood for query by image content; 19 right?</p> <p>20 (Reporter seeks clarification.)</p> <p>21 Q. QBIC stands for query by image content?</p> <p>22 A. Yes.</p> <p>23 Q. Okay. And there are essentially three 24 logical steps associated with QBIC, one of which is 25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.</p> <p>2 Q. Another one of which is called feature 3 calculation?</p> <p>4 A. Feature extraction.</p> <p>5 Q. Okay. Feature extraction. And then image 6 query; is that right?</p> <p>7 A. Yeah.</p> <p>8 Q. Okay. So basically all the steps involved 9 in QBIC fall into one of those three categories; is 10 that right?</p> <p>11 A. Sounds about right.</p> <p>Flickner 8/29/23 Depo at Ex. 5:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>16 Q. Well, for example, if, for example, you -- 17 the image was sourced from a camera and there was a 18 noise from the image sensor on the image, were there 19 any methodologies used by IBM in the QBIC system to 20 reduce that noise or grain in the image? 21 A. I don't recall. 22 Q. What about -- and, again, I'm talking 23 about preprocessing steps, before you're actually 24 extracting features. 25 Were there any methodologies to enhance</p> <hr/> <p style="text-align: right;">Page 79</p> <p>1 the contrast of the image? 2 A. I don't remember. 3 Q. What about resizing the image? 4 A. We did -- we probably supported that on 5 import. 6 Q. Say again? 7 A. We supported that on -- most likely we 8 supported that on import, on read. 9 So the read, you request a particular 10 size. 11 Q. You're going to have to repeat it. I 12 didn't understand you. 13 MR. STRAUSSMAN: And speak up. 14 THE WITNESS: So resizing would be done 15 typically when you import the image into the system. 16 BY MR. EDWARDS: 17 Q. Okay. So if you're importing the image 18 into the database, is that what you're talking 19 about? 20 A. Correct. 21 Q. Okay. And at that point you would resize 22 the image to reduce the size?</p>	
--	--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>1 How would you resize the image on 2 importation? 3 A. You would request a particular size of 4 image and then use that to populate the database. 5 Q. So if the source images that you were 6 acquiring were say too big for purposes of QBIC, on 7 importation you could resize those to get them to 8 the size that are -- meet the -- meet the 9 requirements of the QBIC system? 10 A. Yes. 11 Q. Was that done as a matter of course in the 12 QBIC system? 13 MR. HANSEN: Objection; vague and ambiguous. 14 THE WITNESS: As I recall, yes. 15 BY MR. EDWARDS: 16 Q. Was it an automatic process? 17 A. As I recall, yes. 18 Q. So if a user were to import source images 19 into the database, when the user did that, the QBIC 20 system would automatically resize it to fit the 21 requirement of the QBIC system? 22 A. Make sure it's in the range that the QBIC 23 system could handle. 24 Q. That's a "yes"? 25 A. That's a "yes."</p> <p><i>Id.</i> at 80–81:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>6 Q. How about converting the images to binary?</p> <p>7 A. Threshold. There probably was a threshold</p> <p>8 control.</p> <p>9 Q. And what do you mean by "threshold</p> <p>10 control"?</p> <p>11 A. Just change the value of the threshold.</p> <p>12 You make a binary decision, is a pixel bigger than</p> <p>13 a -- is a pixel bigger than a particular number or</p> <p>14 is it smaller and you put a 01 based on that.</p> <p>15 Q. And that would have been done prior to</p> <p>16 feature extraction?</p> <p>17 A. For some features it would be done that</p> <p>18 way.</p> <p>19 Q. So, for example, for shape, was it</p> <p>20 required to convert the image to binary before you</p> <p>21 did your shape analysis?</p> <p>22 A. No.</p> <p>23 Q. Were there any other features that, as</p> <p>24 part of the -- as part of the extraction process,</p> <p>25 the image had to be converted to binary before?</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>2           Were there any features that required the 3 image to be converted to binary before the features 4 were extracted? 5       A. Some features required a binary image, 6 yeah. 7       Q. Which ones? 8       A. Some of the texture features. 9       Q. And when you say "some of the texture 10 features," do you -- do you recall which ones? 11      A. No. 12      Q. Let's put a pin in that because we're 13 going to get to it. 14           What about gray scale? Were any images 15 converted to gray scale before features were 16 extracted? 17      A. Yes. 18      Q. Which -- for which features? 19      A. For shape, for texture. 20      Q. Any others? 21      A. Color wouldn't make any difference. 22           That's all I can think of. 23      Q. At least for shape and texture? 24      A. Yeah.</p> <p><i>Id.</i> at 94–97: 18      Q. So that's why I ask is it the first step 19 in calculating shape to convert the image to binary? 20      A. Yes.</p> <p><i>Id.</i> at 101–102:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>3           Okay. So first sketch used something 4 called an edge map of each image? 5           A. Yeah. 6           Q. What is an edge map? 7           A. It's an estimate of the edges, the major 8 edges of the image. 9           Q. Okay. Sort of the outline; is that fair? 10          A. The outline is slightly different, but 11 outlines would be closed, whereas sketch would -- 12 you didn't have to always do closed objects, you 13 could do -- you could draw a circle or you could 14 also draw a U. 15          The circle would find sun-like objects and 16 the U would find things that had a dominant curve -- 17 turn to it. 18          Q. So you could draw -- so, for example, you 19 could draw a flower -- 20          A. Right. 21          Q. -- have the circle part for the flower and 22 then for the stem it would just be a line? 23          And that's where you're saying -- 24          A. Right. 25          Q. -- it doesn't necessarily -- it's broader</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

			<p>1 than outline? 2 A. Right. 3 Q. Understood. Okay. 4 And so the steps are you would convert the 5 image to binary to calculate the sketch feature; 6 right? 7 A. No, you're inputting . . . I'm not sure 8 how we did database population. Give me a minute. 9 Yeah, it was done on a binary image. 10 Q. Okay. So you convert the image to binary 11 image; right? 12 A. Right, using a Canny edge operator. 13 Q. Okay. And then that gives you a binary 14 edge map? 15 A. Right. 16 Q. All right. And then you reduce the size 17 of that binary edge map? 18 A. Right.</p> <p><i>Id.</i> at 140–141: 23 Q. So if I needed to resize the image we 24 would need to do that -- the system would do that 25 before features are extracted from the image query?</p> <hr/> <p style="text-align: right;">Page 141</p> <p>1 A. Yes. 2 Q. And for certain things, like you said, for 3 like texture and shape, for example, you had to 4 convert the image to binary, as an example, that 5 would need to be done for the image query -- the 6 image query image as well; correct? 7 A. Correct.</p>	
--	--	--	--	--

		<p>1 would do this?</p> <p>2 A. Or an annotator, yeah.</p> <p>3 Q. Okay. And how would they do that?</p> <p>4 A. They could do it manually or they could</p> <p>5 use tools to help identify objects.</p> <p>6 Q. And manually how would that work?</p> <p>7 A. You look at the image and specify what</p> <p>8 objects are in the image.</p> <p>9 Q. And how would they specify it?</p> <p>10 A. Typing in a text phrase.</p> <p>11 Q. Okay. So if it was an image of a dog,</p> <p>12 they could type in "dog," for example?</p> <p>13 A. Yeah, exactly.</p> <p>14 Q. What if there were multiple objects in the</p> <p>15 image, was there a way for the user to outline or</p> <p>16 demarcate those objects?</p> <p>17 A. Yes.</p> <p>18 Q. How would they do that?</p> <p>19 A. They could just put "German Shepherd" and</p> <p>20 "Retriever" to determine the type of dogs. So they</p> <p>21 could do it using annotations of text --</p> <p>22 Q. Was there a way --</p> <p>23 A. -- or they could use extracting tools</p> <p>24 where you could outline the object more accurately.</p> <p>25 Q. So you could outline the edges of the</p> <hr/> <p>1 shape of the object?</p> <p>2 A. Right.</p> <p>3 Q. And you could do that with a manual -- the</p> <p>4 user could do that with a manual tool?</p> <p>5 A. Yeah.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>6 Q. Were there automatic tools that did -- 7 that did things like look for objects? So, for 8 example, were there automatic tools that QBIC used, 9 like edge detection or segmentation, that extracted 10 object -- 11 A. You could -- 12 Q. -- shapes? 13 A. You could use edge detection. 14 Q. Okay. Did QBIC use edge detection? 15 A. Yes, in certain aspects. 16 Q. In what aspects? 17 A. So on the annotation tool, if you compute 18 gradients, you can make a better prediction of 19 helping the person annotate. 20 So it's very tedious to go through and 21 annotate everything. Whereas if you have a tool, 22 it'll tell you where it thinks the boundaries are. 23 And you could speed up annotation quite a bit doing 24 that. 25 Q. So this tool that you're referring to, a</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 58</p> <p>1 user would provide a rough outline of the object and  2 then the tool would essentially conform that outline  3 better to the actual object in the image?  4 A. That was one way to do it. The other way  5 to do it is to have the next prediction of the  6 outline to be driven by the tool with the user  7 input.  8 Q. And what was the -- I assume an algorithm  9 did that?  10 A. Yeah.  11 Q. Do you know the -- what algorithm was  12 used?  13 A. We were doing a lot of stuff with splines  14 at the time.  15 (Reporter seeks clarification.)  16 A. Splines. S-p-l-i-n-e-s.  17 Q. Okay. And what are splines?  18 A. Splines are curves, mathematical  19 representation of curves -- or a mathematical  20 representation of curves.  21 Q. And so was also any automatic tools, like  22 Canny edge detection or any other edge detection  23 used that didn't require assistance from the user?  24 A. There were -- yeah, there were some that  25 were more automatic. Some tools were more</p>	<p style="text-align: right;">Page 60</p> <p>1 that was --  2 (Reporter seeks clarification.)  3 A. Simple convolution filter that was used  4 for edge detection. Sobel was an advanced version  5 of it.  6 Q. And what about segmentation, do you know  7 what segmentation is?  8 A. Yeah.  9 Q. Okay. Segmentation, as I understand it,  10 essentially separates foreground objects from the  11 background. Is that a high level of explaining it?  12 A. That's a two-class segmentation, yeah.  13 Q. Okay. Did you do that type of  14 segmentation to differentiate foreground objects  15 from the background in this database population  16 step?  17 A. We did research prototypes of it. I don't  18 know what all went out.  19 Q. You don't know whether those made it into  20 a commercial product?  21 A. I would say they probably didn't.  22 Q. Okay. Were they in the -- were they used  23 in the -- in demo applications that you referred to?  24 A. They might have been.  25 Q. Okay. And so let's say that objects were</p>	
		<p style="text-align: right;">Page 59</p> <p>1 automatic.  2 Q. And those were in the form of algorithms?  3 A. Yeah.  4 Q. Do you recall any of the algorithms, the  5 names?  6 A. We did various edge detection stuff.  7 Q. Okay.  8 (Reporter seeks clarification.)  9 A. Just various types. There were things  10 like Sobel operators that we used --  11 (Reporter seeks clarification.)  12 A. Sobel.  13 Q. How do you spell Sobel?  14 A. S-o-b-e-l, I think.  15 Q. Okay.  16 A. That's one form of an edge detector.  17 Q. Any others that you can recall?  18 A. This is kind of image processing 101.  19 There were Gabor filters.  20 (Reporter seeks clarification.)  21 Q. How do you spell that?  22 A. G-a-b-o-r.  23 There was . . . it's been so long. I  24 don't remember what they call it. Very simple  25 filters, but there's a simple convolution filter</p>	<p style="text-align: right;">Page 61</p> <p>1 identified within a particular image, what were done  2 with those objects? Were they stored, for example,  3 as a separate image or were they somehow linked to  4 or associated with the image from which they were  5 extracted?  6 A. Typically they were linked.  7 Q. They were linked to the source image?  8 A. Yeah.  9 Q. Okay. And this was done in the database?  10 A. Could be done in the database.  11 Q. How was it done?  12 A. It was probably done in a text database or  13 some sort of key index pair database. So database  14 has a lot of different meanings.  15 MR. HANSEN: Text database.  16 BY MR. EDWARDS:  17 Q. And, Mr. Flickner, you said probably done  18 in a text database, is that what you said?  19 A. Yeah.  20 MR. STRAUSSMAN: Make sure to speak up.  21 THE WITNESS: Okay.  22 BY MR. EDWARDS:  23 Q. Or some sort of key index database, is  24 that the other one?  25 A. Yes.</p>	

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Id.</i> at 305:</p> <p>7           So these articles describe various 8 features of various versions of QBIC; right? 9       A. Correct. 10       Q. Do they describe any features -- does the 11 demo you operated include any features that weren't 12 described in these articles? 13       A. That weren't described in the articles? 14 No.</p> <p><i>Id.</i> at 35:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>6 Q. Okay. And the analytics that you're 7 talking about, where you extract these characters 8 from the image, that is -- those run on both the 9 query image and the images that are stored in the 10 database; is that right? 11 A. Yeah. We call them features. 12 Q. Features. Okay. 13 So when you say "features," you're talking 14 about the features that we talked about before: 15 Color, texture, shape, sketch? 16 A. For example. 17 Q. Any other ones you can think of? 18 A. Nothing comes to mind. 19 Q. But when you refer to features they at 20 least include those four; is that correct? 21 A. Yes. Well, at least includes, yeah.</p> <p><i>Id.</i> at 311:</p> <p>22 Q. Okay. The purpose of a demo is to 23 highlight the capabilities of QBIC to people 24 external to IBM; isn't that correct? 25 A. Correct.</p> <p><i>Id.</i> at 312-313:</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>21 Q. For every implementation of QBIC, if an 22 input image has an object and the object has colors, 23 the color histogram feature would match those stored 24 image that include objects with similar colors; 25 correct?</p> <hr/> <p>1 A. Correct.</p> <p><i>Id.</i> at 313-317:</p> <p>Page 313</p> <p>1 A. Correct. 2 Q. Exhibits 2, 3 and 10 are the papers that 3 you co-authored. If your counsel can provide those 4 to you just so that you have them in front of you. 5 A. I have them here. 6 MR. STRAUSSMAN: Okay. 7 THE WITNESS: Okay. 8 BY MR. EDWARDS: 9 Q. And can you just confirm for me, 10 Mr. Flickner, Exhibits 2, 3 and 10 were papers you 11 co-authored? 12 A. Yes. 13 Q. You would have included accurate 14 information in those -- in those papers at the time 15 that you authored them; is that correct? 16 MR. HANSEN: Objection; vague and ambiguous. 17 THE WITNESS: Yes. 18 BY MR. EDWARDS: 19 Q. And the information in those papers 20 accurately reflected the functionality of QBIC at 21 the time those articles were published; is that 22 correct? 23 A. Correct.</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultrimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 316</p> <p>1 A. Yeah.</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Yes.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. As of the date of this article, the QBIC</p> <p>6 functionality described in this article was in IBM's</p> <p>7 Ultimedia Manager, IBM's --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 Q. Described in this article was in IBM's</p> <p>10 Ultimedia Manager, IBM's Digital library and DB2</p> <p>11 series of products; correct?</p> <p>12 MR. HANSEN: Objection; lacks foundation.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Is that right, Mr. Flickner?</p> <p>15 A. Yes.</p> <p>16 MR. HANSEN: Same objection.</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Let's pick up Exhibit 10, please.</p> <p>19 Look at page IBM 2419. It's the same -- I want to</p> <p>20 ask you about the same sentence I asked you before,</p> <p>21 where it lists the commercial products in -- at the</p> <p>22 bottom of the second full paragraph.</p> <p>23 A. Yeah.</p> <p>24 Q. See that? It says, "QBIC was developed by</p> <p>25 IBM and moved into commercial products including a</p> <p style="text-align: right;">Page 317</p> <p>1 licensable standalone software package, IBM Digital</p> <p>2 Library, Ultimedia Manager, the Image Extender in</p> <p>3 DB2 Universal, and the MediaMiner software tool</p> <p>4 series."</p> <p>5 Do you see that?</p> <p>6 A. Yeah.</p> <p>7 Q. So as of the date of this article in 1997,</p> <p>8 the features that were described in this article and</p> <p>9 previous articles were incorporated into commercial</p> <p>10 products listed -- that I just listed; is that</p> <p>11 correct?</p> <p>12 A. Yes.</p> <p>Flickner 8/29/23 Depo at 33-37:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>4 Q. And the second thing you mentioned was you 5 were responsible for the architecture interface for 6 running analytics. What did that detail? 7 A. You wanted -- you're writing programs to 8 determine similarity. And to do that you would take 9 the image and you'd transform -- you'd extract 10 features from the image, then you would put the 11 features in the database and you'd query the 12 database for the features. 13 Q. And when you say you are determining 14 similarity, you mean similarity between features 15 from one image to another image; is that right? 16 A. Correct. 17 Q. Okay. And what features were you looking 18 at? 19 A. We had features in color, in texture, in 20 shape. A few other categories. 21 Q. Sketch? 22 A. Yep. 23 Q. What's sketch? 24 A. You could draw a sketch -- a rough sketch 25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p><i>Id.</i> at 52–53:</p> <p>12 Q. Underneath there's a sentence that says, 13 "There are three logical steps in a QBIC 14 application: Database population, feature 15 calculation, and image query." 16 Do you see that? 17 A. Yeah. 18 Q. You agree with that? 19 A. Yeah. 20 Q. All right. Well, let's talk about the 21 first step, database population. 22 What is database population? 23 A. It's taking a set of images, extracting 24 the features and putting them in a database. 25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that 2 in the database as well? 3 A. Could be. 4 Q. So if you look at -- under 2.1 Database 5 Population, it says, "The first step in population 6 is to simply load the images into the system." 7 Is that right? 8 A. Yep. 9 Q. And the next sentence says then you can 10 also add the image to the database, preparing a 11 reduced thumbnail and adding any available text 12 information to the database. 13 A. Yep. 14 Q. Is that correct? 15 A. Yep.</p> <p><i>Id.</i> at 77–78:</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99:</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu- -- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or          2 more of these features than the other?          3 A. Yes.          4 Q. Which one?          5 A. Shape.          6 Q. Okay.          7 (Witness reviews document.)          8 A. So one thing I can state is originally I          9 couldn't remember the name of the edge operator --          10 and the name is Canny, the Canny edge operator --          11 when we were talking about finding edges.          12 Q. Okay. So this -- the paragraph on          13 IBM 2393 refreshed your memory that shape          14 calculation used Canny edge detection?          15 A. No, that's sketch.          16 Q. Oh, I'm sorry.          17 A. I'm just stating that originally I was          18 asked a question about standard edge operators. I          19 couldn't remember the name. The name was Canny.          20 Q. Canny. And Canny is used in the sketch          21 calculation?          22 A. Yeah, it's used in the sketch calculation.          23 Q. Understood. Okay. Let's go back to          24 shape.          25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.          2 Q. Can you say the name of the word again?          3 A. I think it's called perround.          4 Q. Per round?          5 A. Yeah.          6 Q. Those -- are those two words, p-e-r,          7 r-o-u-n-d?          8 A. P-e-r -- one word.          9 Q. Okay. Perround, one word.          10 A. It's basically the perimeter squared over          11 area.          12 (Reporter seeks clarification.)          13 A. Perimeter squared over area.          14 (Reporter seeks clarification.)          15 A. Length of the -- over area.          16 Q. Okay. So let's step back a little bit.          17 So it says -- the second paragraph says [as read],          18 "Our shape features are based on a combination of          19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features          20 area, circularity, eccentricity, major access          21 orientation and a set of algebraic moment          22 invariants," i-n-v-a-r-i-a-n-t-s.          23 Did I read that correctly?          24 A. Um-hum.          25 Q. Okay. For circularity, that is computed</p>
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.          2 To calculate the shape feature in a query          3 image or a stored database image, is the first step          4 to convert that image into a binary image?          5 A. I don't think so.          6 Q. So if you look at the second paragraph --          7 and the reason why I ask is -- it's the second          8 sentence in the second paragraph under "Shape          9 features." It says [as read], "All shapes are          10 assumed to be non-occluded planar shapes allowing          11 for each shape to be represented as a binary image."          12 See that?          13 A. Yeah.          14 Q. And then the next sentence says [as read],          15 "The area is computed as the number of pixels set in          16 the binary image."          17 A. Right.          18 Q. So that's why I ask is it the first step          19 in calculating shape to convert the image to binary?          20 A. Yes.          21 Q. And then once you convert it to binary          22 image, then what do you do next in order to          23 calculate the shape?          24 A. You're computing something called          25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?          2 A. Right.          3 Q. All right. Area is the number of pixels          4 in the binary image?          5 A. In the binary blob.          6 Q. In the binary what?          7 A. Blob.          8 Q. Blob. And when you say "blob," what does          9 that refer to?          10 A. The outline of the object that you're          11 doing a shape query on.          12 Q. And so are each of these, area,          13 circularity, eccentricity, major axis orientation          14 and algebraic moment invariants, are those each          15 different algorithms or is it all the same          16 algorithm?          17 A. It's different algorithms.          18 Q. Okay. And since you worked on the shape          19 feature the most, do you recall any other details          20 that are not disclosed in this paragraph?          21 A. Well, this evolved and we ended up doing          22 an implementation of something that's not in here.          23 Q. Okay. And what was that implementation?          24 A. Something called turning angle per round,          25 turning angle, which is -- it looks at the tangent</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

			<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So</p> <p>2 you're computing the turning angle. You're</p> <p>3 computing this angle that represents a shape in a</p> <p>4 very interesting way.</p> <p>5 They don't seem to be very good for</p> <p>6 human -- so if you asked a human whether these two</p> <p>7 shapes are similar, they would say "yes," but under</p> <p>8 that feature set.</p> <p>9 Q. And you call that something per round?</p> <p>10 What was the name of it? Started with a T.</p> <p>11 Turrent?</p> <p>12 A. Turning angle.</p> <p>13 Q. Oh, turning angle.</p> <p>14 A. Yeah.</p> <p>15 Q. Well, it said -- your answer -- you did</p> <p>16 say turning angle, but you said something called</p> <p>17 something per round, and it started with a T. I</p> <p>18 thought you said turrent, but maybe I misunderstood.</p> <p>19 MR. STRAUSSMAN: Tangent?</p> <p>20 THE WITNESS: Tangent angle, yeah.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Okay. So something called tangent per</p> <p>23 round, is that what you would call it, this --</p> <p>24 A. No.</p> <p>25 Q. -- this implementation?</p>	
			<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle.</p> <p>2 Q. Okay. So the name of the new</p> <p>3 implementation you're talking about for shape</p> <p>4 calculation is called turning angle?</p> <p>5 A. It used turning angle as a major feature.</p> <p>6 Q. Okay. Was there any other name it went</p> <p>7 by?</p> <p>8 A. I don't recall.</p> <p>9 Q. All right. And that was -- that</p> <p>10 methodology was implemented to calculate shape on a</p> <p>11 query image and an image stored in the database post</p> <p>12 this article?</p> <p>13 A. Yes.</p> <p>14 Q. Was that the -- did that -- did that</p> <p>15 implementation, the turning angle, did that replace</p> <p>16 the methodology in this article or was it</p> <p>17 supplementing the metho--</p> <p>18 A. Supplementing.</p> <p>19 Q. Okay. Other than turning angle, were</p> <p>20 there any other methodologies used after this</p> <p>21 article?</p> <p>22 A. Not that I recall.</p> <p>23 Q. Okay. Okay. Let's go sketch features, if</p> <p>24 you take a look at that and then let me know when</p> <p>25 you're done reading it.</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

*Id.* at 119–128:

		<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>
		<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then  2 you're looking for blue water, white sand.  3 BY MR. EDWARDS:  4 Q. Do you recall what the methodologies  5 used -- that were used to calculate the orientation  6 of those colors in the image?  7 MR. HANSEN: Objection; lacks foundation.  8 THE WITNESS: There's no orientation per se.  9 It's just position.  10 BY MR. EDWARDS:  11 Q. Well, then position. Do you recall what  12 the methodologies are to calculate the position?  13 MR. HANSEN: Same objection.  14 THE WITNESS: Position is something the user  15 inputs.  16 BY MR. EDWARDS:  17 Q. Something you use what?  18 A. The user had to input.  19 Q. Okay. And then let's move on to the next  20 one, T. It says, "Click T to search images with  21 similar global texture."  22 A. Yeah.  23 Q. Do you recall, in your work on the QBIC  24 project, a feature called global texture that could  25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?  2 A. G-a-b-o-r.  3 Q. So switch over and look at the second page  4 of this Exhibit 6.  5 So -- well, first back -- go back to -- go  6 back to the first page. If you see on the left-hand  7 side it says, "Goto: IBM Image Search Demo," and a  8 little finger there is clicking it.  9 You see it's in red?  10 A. Yeah.  11 Q. Okay. So that's clicking on that link.  12 And then the second page is going to the IBM image  13 search demo.  14 A. Okay.  15 Q. Okay? On the second page it is showing  16 thumbnails with the different icons that we just  17 walked through, I, C, L, T, S, on each of those  18 icons.  19 Do you see that?  20 A. Yep.  21 Q. Do you recognize this as a similar layout  22 to the QBIC demos you hosted in the '90s?  23 A. I don't.  24 Q. You don't?  25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .  2 Q. Say again?  3 A. I missed one of your words. A feature  4 called what?  5 Q. I said do you recall in your work on the  6 QBIC project a feature called global texture that  7 was extracted from the image?  8 A. Yes.  9 Q. Okay. Is that -- is that akin to texture  10 that we looked at earlier?  11 A. Yes.  12 Q. Okay. And the last one is S. It's,  13 "Search images with special multipass filter."  14 Do you recall, in your work on the QBIC  15 project, being able to calculate a feature called  16 multipass filter?  17 A. Probably Gabor functions.  18 Q. Say again?  19 A. Gabor functions.  20 Q. One more time and louder.  21 A. Gabor functions.  22 Q. Gabor functions. Okay. What are Gabor  23 functions?  24 A. Gabor functions are a way of producing  25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM  2 website that was the ALX operating system in  3 Exhibit 3, that did not have a similar thumbnail  4 layout like this?  5 A. A thumbnail, yes. I don't recall it had  6 the buttons, the I, C, L, T, S.  7 Q. You don't recall it had all the buttons or  8 some of the buttons?  9 A. All the buttons.  10 Q. Okay. So you don't recall that it had any  11 buttons?  12 A. I don't -- yeah. I don't recall.  13 Q. It could have, it couldn't have, you just  14 don't remember?  15 A. I just don't remember, yeah.  16 Q. Okay. But the one that you hosted on  17 IBM's website, it did have thumbnails in a similar  18 format here?  19 A. Yeah, it had thumbnails.  20 Q. And these thumbnails represent the images  21 that are stored in the database?  22 A. Yes.  23 Q. Okay. Here, the 470 images would be  24 reflected at least -- one, two, three, four, five,  25 six, seven -- eight of them right here in this</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>
		<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

*Id.* at 135 – 136:

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 139–165:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>5 Q. And for the image that you use as a base 6 for the query, the things we all talked about in 7 terms of feature extraction for average color, color 8 histogram, shape, texture, sketch, all of those 9 things, the same algorithms would be used in order 10 to extract those features from the image query? 11 A. They're different algorithms. You would 12 use an algorithm. 13 Q. I'm sorry. Say that again? 14 A. The algorithms are different between the 15 shape features and the color features and sketch 16 features. 17 Q. Yeah. Understood. What I'm trying -- 18 what I'm trying to understand is, the process that 19 we talked about before, when you populate the 20 database and you extract the features from the 21 images that are stored in the database. 22 You know, we went through all those 23 different algorithms that are used for shape, color, 24 both average color and histogram, texture and 25 sketch.</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?</p> <p>2 A. Yep.</p> <p>3 Q. And then it would extract whatever feature</p> <p>4 you want from that uncompressed image?</p> <p>5 A. Correct.</p> <p>6 Q. And then those extracted features from the</p> <p>7 uncompressed JPEG image are used in the matching</p> <p>8 process?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And you were using -- you were</p> <p>11 doing this for JPEG image -- or the QBIC system was</p> <p>12 doing this for JPEG images in the -- in the '90s?</p> <p>13 A. Yes.</p> <p>14 Q. Okay. So once the system -- now, we're</p> <p>15 only talking about image-based queries, image using</p> <p>16 as input for the queries.</p> <p>17 Once you submit an image for the query, if</p> <p>18 it's a -- you do your preprocessing that need to be</p> <p>19 done. Features are extracted. So now we've got</p> <p>20 just the extracted features, whatever those are.</p> <p>21 What happens with those extracted features</p> <p>22 next?</p> <p>23 A. They're put in the database and then</p> <p>24 potentially there are indexes built that help you do</p> <p>25 fast search against those features.</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?</p> <p>2 A. You say the matching algorithm?</p> <p>3 Q. Correct.</p> <p>4 A. Yes, they could be different.</p> <p>5 Q. Well, let's talk about them. We can get</p> <p>6 into detail here.</p> <p>7 Well, before we -- before we get there, so</p> <p>8 how does the QBIC system display the results of</p> <p>9 matches to the user?</p> <p>10 A. Typically just thumbnails in a window in</p> <p>11 multiple ordered hits.</p> <p>12 Q. Okay. And it displays them in the order</p> <p>13 by which they're most similar. So the, you know,</p> <p>14 best match to the next best match to the next best</p> <p>15 match, so on and so forth?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And you said the system determines</p> <p>18 similarity based on some distance measure between</p> <p>19 the extracted features in the image query versus the</p> <p>20 stored image?</p> <p>21 A. The features of the stored image.</p> <p>22 Q. But it's a -- it's some sort of distance</p> <p>23 measure?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's go back to Exhibit 2.</p>
		<p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm</p> <p>2 talking about for a query, so I'm taking an image</p> <p>3 and submitting it to a system as a query.</p> <p>4 A. Query by example.</p> <p>5 Q. Query by example. Okay. Once those</p> <p>6 features extracted for that image, what happens next</p> <p>7 in the process?</p> <p>8 A. You take the feature vector and you</p> <p>9 present it to the database and say return the best</p> <p>10 matches to this feature vector.</p> <p>11 Q. Okay. So the system would compare -- the</p> <p>12 QBIC system would compare the features that are</p> <p>13 calculated from the input image to stored calculated</p> <p>14 features of the images in the database and come up</p> <p>15 with a match?</p> <p>16 A. Yes.</p> <p>17 Q. Okay. And those matches would be sorted</p> <p>18 or arranged in order of most similar?</p> <p>19 A. Yes.</p> <p>20 Q. And would algorithms do these comparisons?</p> <p>21 A. Yes.</p> <p>22 Q. Would it be a different algorithm for each</p> <p>23 of the features? So, for example, would there be an</p> <p>24 algorithm that does the comparison for color</p> <p>25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and</p> <p>2 rolling over to IBM 2395, that's a discussion on the</p> <p>3 image query. And so what I want to do -- I have a</p> <p>4 couple high-level questions, but then I want to walk</p> <p>5 through each one. Color starts on 2394, then</p> <p>6 texture and then shape and sketch are on 2395.</p> <p>7 So in terms of the -- in terms of the</p> <p>8 distance measure, Mr. Flickner, if -- I know you</p> <p>9 said that the results are termed based on those that</p> <p>10 are most similar but it could come up with something</p> <p>11 that's an exact match; is that right?</p> <p>12 A. It's possible.</p> <p>13 Q. Like the distance measure, the result</p> <p>14 would be zero if it was an exact match; right?</p> <p>15 A. Typically you'd get that only if you had</p> <p>16 the query image the same as a result image.</p> <p>17 Q. Right. But that's a possibility?</p> <p>18 A. Yeah.</p> <p>19 Q. Okay. So let's take a look at color --</p> <p>20 it's on -- starting at the top of 2394. You know,</p> <p>21 take your time and read that and then I want to ask</p> <p>22 you some questions about it.</p> <p>23 (Witness reviews document.)</p> <p>24 A. Okay.</p> <p>25 Q. Okay. So let's first start with average</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between</p> <p>2 the query image and the database image using</p> <p>3 weighted Euclidean distance; is that right?</p> <p>4 A. Yep.</p> <p>5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.</p> <p>6 And can you just tell us at a high level</p> <p>7 what -- if you can -- what Euclidean distance is?</p> <p>8 A. So if you have multiple features or</p> <p>9 multiple scaler features, you have to ask the</p> <p>10 question I'm trying to build a distance from that</p> <p>11 vector to a query vector.</p> <p>12 And as you build that -- the distance, you</p> <p>13 have -- you may want to weight different elements of</p> <p>14 the vector differently. And we found out that using</p> <p>15 variance normalization, where weights of the</p> <p>16 variance of the feature, gave good aesthetic</p> <p>17 results.</p> <p>18 (Reporter seeks clarification.)</p> <p>19 A. Aesthetic results.</p> <p>20 Q. And I apologize, I couldn't hear what you</p> <p>21 said. You said, "And we found out that using</p> <p>22 variance" . . .</p> <p>23 A. So you normalize each feature with its</p> <p>24 variance.</p> <p>25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)</p> <p>2 Q. Well, let me ask my -- let me get my</p> <p>3 question out first.</p> <p>4 So we talked about the features for</p> <p>5 average color before are RGB, Yiq, LAB and MTM.</p> <p>6 A. Correct.</p> <p>7 Q. And so, for example, for the RGB, you're</p> <p>8 saying that you would take the R and you would</p> <p>9 divide it by the variants of red and green, for</p> <p>10 example --</p> <p>11 A. Just variants of red.</p> <p>12 Q. Okay. And so you could do the same for</p> <p>13 the others, for Yiq or LAB?</p> <p>14 A. Exactly.</p> <p>15 Q. Okay. You do that for both the image</p> <p>16 input query and the stored image; correct?</p> <p>17 A. Correct.</p> <p>18 Q. And then you're calculating the distance</p> <p>19 between them, so determining how similar they are</p> <p>20 based on the distance?</p> <p>21 A. Yeah, or vector distance.</p> <p>22 Q. Understood.</p> <p>23 A. Two vectors of differences --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Two vectors with a distance calculation on</p>
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.</p> <p>2 Q. With its variance.</p> <p>3 A. And then compute the average.</p> <p>4 Q. Okay.</p> <p>5 A. Or, I'm sorry, compute the weighted sum.</p> <p>6 So red divided by the variants of red, plus green</p> <p>7 divided by the variants of green --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 A. Red divided by the variants of red, green</p> <p>10 divided by the variants of green, L divided by the</p> <p>11 variants of L, that's how you combine the various</p> <p>12 features.</p> <p>13 Q. Understand. And L represents what?</p> <p>14 A. Luminance.</p> <p>15 Q. Okay. And this is -- you're talking</p> <p>16 specifically with respect to average color?</p> <p>17 A. Well, the variance normalization is well</p> <p>18 known in terms of multidimensional feature merging.</p> <p>19 Q. But for average color, you wouldn't use</p> <p>20 luminance, right, as a -- as a variant?</p> <p>21 A. Luminance would just -- you wouldn't use</p> <p>22 just luminance. You could use luminance . . .</p> <p>23 Q. Well, so the color features we talked</p> <p>24 about before would be RGB, Yiq, LAB --</p> <p>25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.</p> <p>2 Q. You're going to have to repeat that and be</p> <p>3 just a little bit louder, Mr. Flickner. Sorry.</p> <p>4 A. That's all right. Let me get my thoughts</p> <p>5 together.</p> <p>6 So we have multiple dimensional features.</p> <p>7 It's not unusual to take each dimension and</p> <p>8 normalize it by the variance because that gives</p> <p>9 you -- what that does is if you have tight variances</p> <p>10 you divide it by, you get bigger numbers. So you</p> <p>11 have more information close by.</p> <p>12 Q. What was the word you said before "close</p> <p>13 by"?</p> <p>14 A. I don't remember.</p> <p>15 THE REPORTER: Information?</p> <p>16 THE WITNESS: Information close by?</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Okay. So now let's talk about</p> <p>19 color histograms.</p> <p>20 A. Okay.</p> <p>21 Q. Okay? Well, stop. Let's go back to</p> <p>22 average color. So is there -- you described the</p> <p>23 weighted Euclidean distance that's calculated</p> <p>24 between the query image and the database image for</p> <p>25 average color.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall</p> <p>2 that's not disclosed in the paragraph at IBM 2394?</p> <p>3 A. Not that I recall.</p> <p>4 Q. Okay. Do you recall whether this distance</p> <p>5 methodology changed after this article or it stayed</p> <p>6 the same?</p> <p>7 A. It changed.</p> <p>8 Q. Are you certain or do you know?</p> <p>9 A. I'm not certain, but I'm pretty certain.</p> <p>10 Q. And how did it change?</p> <p>11 A. Different features were shaped like an</p> <p>12 inch in color. The algorithm evolved. It wasn't</p> <p>13 static.</p> <p>14 Q. And how did it evolve?</p> <p>15 A. I don't recall all the details.</p> <p>16 Q. Do you recall whether it supplemented the</p> <p>17 weighted Euclidean distance or replaced it?</p> <p>18 A. I don't recall.</p> <p>19 Q. Is it fair to say there was always some</p> <p>20 distance measurement to determine similarity for</p> <p>21 average color in the QBIC system?</p> <p>22 A. There's some measurement, yeah.</p> <p>23 Q. Okay. Let's talk about color histogram.</p> <p>24 So in order to determine the similarity</p> <p>25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was</p> <p>2 determined by weighted Euclidean distance; is that</p> <p>3 right?</p> <p>4 MR. HANSEN: Same objection.</p> <p>5 THE WITNESS: Correct.</p> <p>6 BY MR. EDWARDS:</p> <p>7 Q. And how did -- how was that weighted</p> <p>8 Euclidean distance determined?</p> <p>9 A. It was inverse variance.</p> <p>10 (Reporter seeks clarification.)</p> <p>11 A. Variance.</p> <p>12 Q. And it was inverse variance for components</p> <p>13 like coarseness, contrast and directionality?</p> <p>14 A. Correct.</p> <p>15 Q. Okay. And do you recall if that</p> <p>16 methodology changed or stayed the same after this</p> <p>17 article for the QBIC system?</p> <p>18 A. Most likely it evolved.</p> <p>19 Q. Do you know for sure?</p> <p>20 A. No.</p> <p>21 Q. Do you recall any details?</p> <p>22 A. No.</p> <p>23 Q. All right. Let's talk about shape next.</p> <p>24 The similarity between the query image and</p> <p>25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines</p> <p>2 distance between normalized histograms?</p> <p>3 A. Correct.</p> <p>4 Q. Do you recall any details of how that</p> <p>5 worked?</p> <p>6 A. Not off the top of my head.</p> <p>7 Q. Do you recall whether that methodology</p> <p>8 evolved for matching color histograms after this</p> <p>9 article?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Okay. All right. Let's talk about</p> <p>12 texture next. And I don't know if you've read that,</p> <p>13 but that's at the bottom of 2394 and it goes to just</p> <p>14 barely at the top of 2395.</p> <p>15 (Witness reviews document.)</p> <p>16 A. Okay.</p> <p>17 Q. So for texture, the similarity is</p> <p>18 determined by the distance or the weighted Euclidean</p> <p>19 distance between the query object and -- the query</p> <p>20 object image and the database object image; is that</p> <p>21 right?</p> <p>22 MR. HANSEN: Objection; vague and ambiguous.</p> <p>23 THE WITNESS: Can you repeat.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?</p> <p>2 A. Correct.</p> <p>3 Q. And do you recall how that worked?</p> <p>4 A. There's computing moments. And we used</p> <p>5 the shape measure, which I mentioned earlier,</p> <p>6 curvature and turning angle.</p> <p>7 (Reporter seeks clarification.)</p> <p>8 A. Curvature and turning angle.</p> <p>9 Q. And the curvature and turning angle would</p> <p>10 be compared between the image query and the database</p> <p>11 image; correct?</p> <p>12 A. Correct.</p> <p>13 Q. And do you recall if that methodology</p> <p>14 changed after this article came out in '93?</p> <p>15 A. Yes, it did.</p> <p>16 Q. How so?</p> <p>17 A. Well, in the IEEE computer paper, we</p> <p>18 described a different way of doing shape measures.</p> <p>19 And they included the moment calculations.</p> <p>20 Q. And you use the moment calculations to</p> <p>21 determine a distance between the image query and</p> <p>22 the -- and the database image?</p> <p>23 A. Yes.</p> <p>24 Q. Sorry?</p> <p>25 A. Yeah. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?  2 A. Given a binary blob, certain high-level  3 moments and then you create -- compute the  4 eigenvectors of certain matrices that are created --  5 (Reporter seeks clarification.)  6 A. Eigenvectors, e-i-g-e -- i-n -- to compute  7 the eigenvectors of certain matrices. And that  8 would give you translation and rotation and  9 variance.  10 Q. And so after the Exhibit 3 1995 IEEE  11 article, did that methodology change to compute the  12 distance for shape?  13 A. I don't recall.  14 Q. So the methodology for shape that you just  15 described using moment calculations, that is  16 different from what is described in the 1993 article  17 for weighted Euclidean distance?  18 A. We still might have used weighted  19 Euclidean distance when the underlying features are  20 different.  21 Q. Understood.  22 And the underlying features are different  23 in the sense that in the 1995 article you're using  24 what features?  25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment  2 invariants.  3 (Witness reviews document.)  4 A. Is there any other papers that we have  5 here?  6 Q. Nope.  7 A. Everything else is screenshots?  8 MR. STRAUSSMAN: I don't think you introduced  9 any other papers.  10 THE WITNESS: I saw it earlier today.  11 BY MR. EDWARDS:  12 Q. Why don't we do it this way. In terms of  13 the feature calculations that were -- for shape on  14 page IBM 900 of Exhibit 3 versus page --  15 A. So if you look at 2393.  16 Q. What page are you directing me to?  17 A. 2393.  18 Q. Okay.  19 A. So it talks about the moment invariants as  20 well.  21 Q. Okay.  22 A. These are those matrices that you compute  23 eigenvectors of.  24 (Reporter seeks clarification.)  25 A. Matrices that you compute eigenvectors of.</p>
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)  2 Q. I think the page you may be looking for is  3 IBM 900 on the left side.  4 (Witness reviews document.)  5 A. What else do we have here?  6 Q. So if you'll look at -- if you'll -- if  7 you'll compare page IBM 900 from Exhibit 3 to page  8 IBM 2393 from Exhibit 2, those are the descriptions  9 in both articles about the features that are  10 calculated.  11 A. I'm trying to remember what --  12 MR. STRAUSSMAN: Can you direct him a little  13 closer?  14 BY MR. EDWARDS:  15 Q. Can I show you? Do you mind?  16 I believe this is what you're looking for.  17 So if you look right here (indicating).  18 (Witness reviews document.)  19 A. That's the same as this one (indicating).  20 We had another -- there's another discussion about  21 moments.  22 Q. So if you look at -- under "Shape  23 features" at 2393, right there, where you're looking  24 at --  25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment  2 invariants in the 1993 SPIE article?  3 A. Correct.  4 Q. Right. And then if you go to the IEEE  5 article that you primarily co-authored, on page 900,  6 it refers to shape queries using area, circularity,  7 eccentricity, major-axis direction and features  8 derived from the object moments.  9 A. Right.  10 Q. Is that the same thing as algebraic moment  11 invariants?  12 A. Right.  13 Q. So it looks like the methodologies are the  14 same for the features that are extracted between the  15 papers; is that right?  16 A. I thought one paper had algebraic moments  17 and one had turning angle. Maybe they both had  18 turning angle.  19 (Reporter seeks clarification.)  20 A. Turning angle. Algebraic moments.  21 Turning angles.  22 Q. The 1993 paper refers to algebraic moment  23 invariants. The IEEE paper, on IBM 900, refers to  24 features derived from object moments.  25 Are those the same thing?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.</p> <p>2 Q. Okay. And so turning angles, which you've</p> <p>3 previously testified on, do you think that</p> <p>4 calculating shape features based on turning angles</p> <p>5 came after these papers?</p> <p>6 A. No. They're mentioned in these papers.</p> <p>7 Q. Okay. So they're included in these</p> <p>8 papers?</p> <p>9 A. Yes.</p> <p>10 Q. And so any distance measurement using</p> <p>11 weighted Euclidean distance would have taken into</p> <p>12 account turning angles?</p> <p>13 A. As a feature, yeah. Yes.</p> <p>14 Q. For both -- for both papers?</p> <p>15 A. For both papers.</p> <p>16 Q. Okay. Let's talk about sketch, which</p> <p>17 is -- if you'll just stick with 2395, which is</p> <p>18 Exhibit 2.</p> <p>19 MR. STRAUSSMAN: Can you direct him?</p> <p>20 THE WITNESS: I found it.</p> <p>21 MR. STRAUSSMAN: Okay.</p> <p>22 (Witness reviews document.)</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Let me know when you're finished reading</p> <p>25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in the --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p>16 Q. Okay. So the results of the query -- so</p> <p>17 we talked about before that the results of the</p> <p>18 queries display thumbnails of the database images</p> <p>19 based on similarity of which they match; correct?</p> <p>20 A. Correct.</p> <p>21 Q. And then those thumbnails can provide</p> <p>22 links to the original image or, if it was an</p> <p>23 r-frame, it could be -- you could provide a link to</p> <p>24 the video; correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.</p> <p>2 Q. For sketch, the similarity between the</p> <p>3 query image and the database image uses an algorithm</p> <p>4 that performs logical binary correlation of the</p> <p>5 binary image?</p> <p>6 A. Yes.</p> <p>7 Q. Are there any other details you recall for</p> <p>8 the sketch comparison beyond what's disclosed in</p> <p>9 this paragraph on IBM 2395?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Do you recall the methodology for</p> <p>12 determining similarity of the input image and the</p> <p>13 database image for sketch changing after this</p> <p>14 article?</p> <p>15 A. Not that I recall.</p> <p>16 Q. So if you go to the next page,</p> <p>17 Mr. Flickner, which is 2396, the Section 4.2 talks</p> <p>18 about performing queries.</p> <p>19 A. Um-hum.</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links</p> <p>2 to information about the image that was associated</p> <p>3 with the image in the database?</p> <p>4 A. Yes.</p> <p>5 Q. And, again, that can be that -- whatever</p> <p>6 information that the user inputted or was associated</p> <p>7 with the image from the source?</p> <p>8 A. Yes.</p> <p>9 Q. Could the results also display a matching</p> <p>10 score so the user could see how well the particular</p> <p>11 result matched to the -- to the query image?</p> <p>12 A. It could.</p> <p>13 Q. Okay.</p> <p>14 MR. EDWARDS: I'm going to hand you the next</p> <p>15 exhibit, Mr. Flickner.</p> <p>16 (Deposition Exhibit 10 was marked.)</p> <p>17 MR. EDWARDS: Handing you what's been marked as</p> <p>18 Exhibit 10.</p> <p>19 For the record, it's IBM Bates Nos. 002418</p> <p>20 to 2430.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. The title of this article is "Updates to</p> <p>23 the QBIC system."</p> <p>24 Do you see that?</p> <p>25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?</p> <p>2 A. Yes.</p> <p>3 Q. You are listed as a co-author of this</p> <p>4 article; is that correct?</p> <p>5 A. Yes.</p> <p>6 Q. And it is a paper that is published in the</p> <p>7 SPIE; correct?</p> <p>8 A. Correct.</p> <p>9 Q. In 1997; correct?</p> <p>10 A. Yes. It was 1997 or 1998.</p> <p>11 Q. No later than 1998; correct?</p> <p>12 A. Correct.</p> <p>13 Q. So just want to kind of orient you to the</p> <p>14 first page, which is IBM 2419.</p> <p>15 A. It's '98 because '97 is a different paper.</p> <p>16 Q. Well, if you turn the page, look at the</p> <p>17 footer on the right-hand side.</p> <p>18 Are you familiar that SPIE usually</p> <p>19 includes footers with the volume and the date at the</p> <p>20 bottom?</p> <p>21 A. Yeah.</p> <p>22 Q. And if you look at the footer kind of</p> <p>23 towards the right it says -786X-97-\$10 [sic]?</p> <p>24 A. Yeah.</p> <p>25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?</p> <p>2 A. Yep.</p> <p>3 Q. Okay. So let's -- I'm going to have you</p> <p>4 jump around, so I apologize in advance. Let's go to</p> <p>5 the -- kind of the back, IBM 2428.</p> <p>6 A. Okay.</p> <p>7 Q. Is that example of the stamps demo that</p> <p>8 was available on IBM's website?</p> <p>9 A. Yes.</p> <p>10 Q. All right. And if you look at the top in</p> <p>11 the location URL it has the almaden.ibm website</p> <p>12 address; correct?</p> <p>13 A. Correct.</p> <p>14 Q. All right. Let's flip forward to 2429.</p> <p>15 And is 2429 a screenshot of a trademark</p> <p>16 demo that was also available in the Almaden --</p> <p>17 excuse me -- almaden.ibm website?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. And that demo looks like the</p> <p>20 trademark query is based on shape; is that right?</p> <p>21 A. It uses shape as one similarity feature.</p> <p>22 Q. Right. So the trademarks are converted to</p> <p>23 a binary image, like we talked before -- talked</p> <p>24 about before, and then they're -- the matching</p> <p>25 process is done based on those binary images?</p>
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the</p> <p>2 conference was in '98.</p> <p>3 Q. Submission was in '97. So the paper was</p> <p>4 published in '97 and then the conference you</p> <p>5 presented it at was in 1998?</p> <p>6 A. That's possible.</p> <p>7 Q. Do you recall presenting this paper at a</p> <p>8 conference in 1998?</p> <p>9 A. No, I don't.</p> <p>10 Q. So the first page refers to the Photonics</p> <p>11 West 1999 -- excuse me. Photonics West 1998</p> <p>12 Electronic Imaging Conference in San Jose.</p> <p>13 Do you recall attending that conference?</p> <p>14 A. It's likely I did, but I don't recall.</p> <p>15 Q. Okay. But you would agree with me this</p> <p>16 paper was made available at least as early as 1998;</p> <p>17 correct?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. So the first page, IBM 2419. Under</p> <p>20 "Introduction," at the time of this paper it says,</p> <p>21 last line on the first paragraph, "Several online</p> <p>22 demos of QBIC are available at</p> <p>23 <a href="http://wwwqbic.almaden.ibm.com">http://wwwqbic.almaden.ibm.com</a>."</p> <p>24 Do you see that?</p> <p>25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p>22 Q. Okay. So 39 would be the -- so the first</p> <p>23 image at the top left is a 39, the one next to it is</p> <p>24 a 46, so the 39 would be a closer match than the 46;</p> <p>25 correct?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Id.</i> at 174–182:</p> <p style="text-align: right;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p>	<p style="text-align: right;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p>
		<p style="text-align: right;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object?"                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: It points to the file that's the</p> <p>4 QBIC catalog.</p> <p>5 BY MR. EDWARDS:</p> <p>6 Q. Can you walk us through that one more</p> <p>7 time? And just be a little bit louder, sorry.</p> <p>8 MR. HANSEN: Same objection.</p> <p>9 THE WITNESS: So the QBIC catalog is a set of</p> <p>10 files that hold data about visual features in the</p> <p>11 image.</p> <p>12 (Reporter seeks clarification.)</p> <p>13 THE WITNESS: Visual features. The image</p> <p>14 extender lets you search against that database,</p> <p>15 against that object.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. The image extender lets you search against</p> <p>18 that catalog, the name of that catalog?</p> <p>19 A. The catalog, yeah.</p> <p>20 Q. Okay. And it does so by using a pointer</p> <p>21 from the handle in the table?</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 THE WITNESS: Correct.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:</p> <p>2 Q. So take a look at the bottom of IBM</p> <p>3 page 40 to the top of 41.</p> <p>4 So it says, "When you search for an image</p> <p>5 by content, your query identifies one or more</p> <p>6 features for the search (such as average color), a</p> <p>7 source for each feature (such as an example image),</p> <p>8 and a target set of cataloged images. The Image</p> <p>9 Extender computes the feature value of the source</p> <p>10 and compares it to the cataloged feature values for</p> <p>11 the target images. It then computes a score that</p> <p>12 indicates how similar the feature values of the</p> <p>13 target images are to the source. You can have the</p> <p>14 Image Extender return the images whose features are</p> <p>15 most similar to the source. The Image Extender will</p> <p>16 return the handle of each image and the image</p> <p>17 score."</p> <p>18 Did I read that correctly?</p> <p>19 A. Yes.</p> <p>20 Q. So if you were to use the image extender</p> <p>21 in the DB2 universal database when you search for an</p> <p>22 image by content using a query image, it will</p> <p>23 extract the features for whatever you want, compare</p> <p>24 that to the features of images in a database, return</p> <p>25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold</p> <p>2 data for the following image features: Average</p> <p>3 color, Histogram color, Positional color and</p> <p>4 Texture."</p> <p>5 Is that right?</p> <p>6 A. Yep.</p> <p>7 Q. Okay. We spoke about average color,</p> <p>8 histogram color and texture; correct?</p> <p>9 A. Right.</p> <p>10 Q. What is positional color?</p> <p>11 A. We talked about it briefly. It's color in</p> <p>12 particular locations in the image.</p> <p>13 Q. Ah. Understood.</p> <p>14 That is -- that is similar to L in the</p> <p>15 demo that we looked at, which is called color</p> <p>16 layout.</p> <p>17 A. Okay, yes.</p> <p>18 Q. Is that correct?</p> <p>19 A. I don't remember if it's called L. Sounds</p> <p>20 right.</p> <p>21 Q. If you look at --</p> <p>22 MR. EDWARDS: If you can show -- give him</p> <p>23 Exhibit 6.</p> <p>24 THE WITNESS: Oh, this L. Yes.</p> <p>25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?</p> <p>2 A. Correct.</p> <p>3 MR. HANSEN: Objection; lacks foundation, calls</p> <p>4 for speculation.</p> <p>5 MR. EDWARDS: You can put that enormous exhibit</p> <p>6 aside.</p> <p>7 THE WITNESS: Test 1, 2, 3.</p> <p>8 BY MR. EDWARDS:</p> <p>9 Q. Go back to Exhibit 3, please. If you</p> <p>10 could turn to the page Bates-labeled IBM 894 with</p> <p>11 the architecture picture.</p> <p>12 A. Okay.</p> <p>13 Q. So I just -- I just want to kind of walk</p> <p>14 the -- through this architecture, Mr. Flickner. But</p> <p>15 as a high level, I just want to understand, is</p> <p>16 this -- is this a high-level architecture that would</p> <p>17 generally be used for any implementation of QBIC?</p> <p>18 A. Yes.</p> <p>19 Q. All right. So first step is you submit</p> <p>20 still images or r-frames for feature extraction; is</p> <p>21 that correct?</p> <p>22 A. Correct.</p> <p>23 Q. Okay. Features are extracted, such as</p> <p>24 color, texture, shape, sketch and text; correct?</p> <p>25 A. Location, yep.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

			Page 182	
			1 Q. And location. Including the ones that I 2 listed; correct? 3 A. Yep. 4 Q. Okay. After feature extraction is done, 5 the images and those features for the database 6 images are stored in the database; correct? 7 A. Correct. 8 Q. And then once those are stored, a user can 9 query using some sort of a user interface; is that 10 right? 11 A. Correct. 12 Q. And the user can query based on color, 13 texture, shape, multi-object, sketch, location or 14 text; is that right? 15 A. Correct. 16 Q. Okay. Those features are then decomposed 17 and extracted from the query image and then a 18 matching engine is used to compare those similarly 19 extracted features from the stored images; is that 20 correct? 21 A. Correct. 22 Q. And then the best matches are returned in 23 similarity of order back to the user; is that right? 24 A. Correct. 25 Q. Okay. Thank you for that.	
		<i>Id.</i> at 190–191:		
			22 Q. So [as read], "Once the image catalogs are 23 created, you can use the Image Query component to 24 find image and business information. Business 25 information, such as character and numeric data, are	

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p style="text-align: right;">Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p><i>Id.</i> at 198 – 199:</p> <p>15 Q. Okay. And then if we can go to IBM 849. 16 There? 17 A. Yeah. 18 Q. Top of the page says, "Adding image search 19 to your Content Manager." 20 Do you see that? 21 A. Yeah. Yeah. 22 Q. And the first paragraph starts -- talks 23 about QBIC. 24 Do you see that? 25 A. Yeah.</p> <hr/> <p style="text-align: right;">Page 199</p> <p>1 Q. It says, "The image search server uses 2 IBM's QBIC (query by image content) technology to 3 help you search for objects by certain visual 4 properties, such as color and texture." 5 Did I read that correctly? 6 A. Yes. 7 Q. It says [as read], "The image search 8 server analyzes images and stores the image 9 information in a database. Then users can run image 10 queries, which use the visual properties of image, 11 to match colors, textures, and their positions 12 without describing them -- describing them in 13 words." 14 Did I read that correctly? 15 A. Yes. 16 Q. And that's consistent with the features 17 and functionalities that we have talked about in the 18 1993 SPIE and 1995 IEEE article; correct? 19 A. Correct.</p> <p><i>Id.</i> at 305:</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p>7           So these articles describe various 8 features of various versions of QBIC; right? 9       A. Correct. 10       Q. Do they describe any features -- does the 11 demo you operated include any features that weren't 12 described in these articles? 13       A. That weren't described in the articles? 14 No.</p> <p><i>Id.</i> at 35:</p> <p>6       Q. Okay. And the analytics that you're 7 talking about, where you extract these characters 8 from the image, that is -- those run on both the 9 query image and the images that are stored in the 10 database; is that right? 11       A. Yeah. We call them features. 12       Q. Features. Okay. 13           So when you say "features," you're talking 14 about the features that we talked about before: 15 Color, texture, shape, sketch? 16       A. For example. 17       Q. Any other ones you can think of? 18       A. Nothing comes to mind. 19       Q. But when you refer to features they at 20 least include those four; is that correct? 21       A. Yes. Well, at least includes, yeah.</p> <p><i>Id.</i> at 109-110:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>12 Q. And it indicates the demo does 13 content-based search based on color histogram, color 14 position and texture. 15 Do you see that? 16 A. Yep. 17 Q. That's a limited number of the features 18 that QBIC could extract; right? 19 A. Correct. 20 Q. Was there -- for those demo applications 21 that you -- that you all created, was there a 22 conscious effort to limit the number of 23 characteristics you put on the demo? 24 A. Probably limited by the size of the CD. 25 (Reporter seeks clarification.)</p> <p style="text-align: right;">Page 110</p> <p>1 A. It was limited by the size of the CD.</p> <p><i>Id.</i> at 311:</p> <p>22 Q. Okay. The purpose of a demo is to 23 highlight the capabilities of QBIC to people 24 external to IBM; isn't that correct? 25 A. Correct.</p> <p><i>Id.</i> at 312 – 313:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>21 Q. For every implementation of QBIC, if an 22 input image has an object and the object has colors, 23 the color histogram feature would match those stored 24 image that include objects with similar colors; 25 correct?</p> <hr/> <p>1 A. Correct.</p> <p><i>Id.</i> at 313-317:</p> <p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p>2 Q. Exhibits 2, 3 and 10 are the papers that 3 you co-authored. If your counsel can provide those 4 to you just so that you have them in front of you. 5 A. I have them here. 6 MR. STRAUSSMAN: Okay. 7 THE WITNESS: Okay. 8 BY MR. EDWARDS: 9 Q. And can you just confirm for me, 10 Mr. Flickner, Exhibits 2, 3 and 10 were papers you 11 co-authored? 12 A. Yes. 13 Q. You would have included accurate 14 information in those -- in those papers at the time 15 that you authored them; is that correct? 16 MR. HANSEN: Objection; vague and ambiguous. 17 THE WITNESS: Yes. 18 BY MR. EDWARDS: 19 Q. And the information in those papers 20 accurately reflected the functionality of QBIC at 21 the time those articles were published; is that 22 correct? 23 A. Correct.</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultrimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 318</p> <p>1 correct?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: Correct.                  4 BY MR. EDWARDS:                  5 Q. And those calculations of features                  6 included color, shape and/or texture in all                  7 implementations that we looked at today, correct?                  8 MR. HANSEN: Same objections.                  9 THE WITNESS: I don't remember if all versions                  10 supported all features.                  11 BY MR. EDWARDS:                  12 Q. If the 1995 article references calculating                  13 color, shape and texture, you would agree with me                  14 that the commercial embodiments implementing QBIC at                  15 the time would have been able to calculate color,                  16 shape and texture as part of feature extraction;                  17 correct?                  18 MR. HANSEN: Objection; lacks foundation.                  19 THE WITNESS: I don't remember exactly which                  20 products incorporated any subsets of the features.                  21 BY MR. EDWARDS:                  22 Q. Do you recall that all the products used                  23 color?                  24 MR. HANSEN: Objection; lacks foundation.                  25 THE WITNESS: I'm pretty sure they all did use</p>	<p style="text-align: right;">Page 320</p> <p>1 [as read] "Image Query allows searches by three                  2 methods: Image content, such as color, shape and                  3 texture."                  4 You see that?                  5 A. Yeah.                  6 Q. So Ultimedia Manager 1.1 was able to                  7 perform an image query using color, shape and                  8 texture, correct?                  9 MR. HANSEN: Objection; lacks foundation.                  10 THE WITNESS: And layout.                  11 BY MR. EDWARDS:                  12 Q. And layout. But also color, shape and                  13 texture, correct?                  14 A. Yes.                  15 MR. HANSEN: Same objection.                  16 BY MR. EDWARDS:                  17 Q. And then if you go to the last sentence it                  18 goes on -- and the bottom of the left column on that                  19 same page, going to the top of the right column, it                  20 says, "You can drag and drop visual samples into an                  21 image query."                  22 You see that?                  23 A. Yeah.                  24 Q. And that would include images, correct?                  25 A. Correct.</p>
		<p style="text-align: right;">Page 319</p> <p>1 color.                  2 BY MR. EDWARDS:                  3 Q. And color histograms specifically?                  4 MR. HANSEN: Same objection.                  5 (Reporter seeks clarification.)                  6 BY MR. EDWARDS:                  7 Q. Histograms specifically.                  8 (Reporter seeks clarification.)                  9 THE WITNESS: Most likely, yes.                  10 BY MR. EDWARDS:                  11 Q. Well, pick up Exhibit 12, please.                  12 And go to IBM 2264.                  13 A. Okay.                  14 Q. So the Ultimedia Manager 1.1 was able to                  15 perform an image query using color, shape and                  16 texture; correct?                  17 MR. HANSEN: Objection; lacks foundation.                  18 (Witness reviews document.)                  19 BY MR. EDWARDS:                  20 Q. Let me orient you a little more. If you                  21 go to the bottom of IBM 2264, where it says "Image                  22 Query."                  23 You see that?                  24 A. Yeah.                  25 Q. Where the bullet points start, it says,</p>	<p style="text-align: right;">Page 321</p> <p>1 MR. HANSEN: Objection; lacks foundation.                  2 BY MR. EDWARDS:                  3 Q. Okay?                  4 A. Correct.                  5 Q. Mr. Flickner, every commercial                  6 implementation of QBIC as of the Exhibit 3, IEEE                  7 1995 article, returned results of the matching                  8 process to the user in the form of a stored image                  9 and information associated with that image; is that                  10 fair?                  11 MR. HANSEN: Objection; lacks foundation.                  12 THE WITNESS: Yes.                  13 BY MR. EDWARDS:                  14 Q. Okay. And a thumbnail is an image;                  15 correct?                  16 A. Thumbnail is an image.                  17 Q. And for every commercial embodiment of                  18 QBIC as of the 1995 IEEE article in Exhibit 3, those                  19 implementations calculated a distance metric as a                  20 measure of similarity for each feature between an                  21 input image and a stored image; correct?                  22 MR. HANSEN: Objection; lacks foundation.                  23 THE WITNESS: Correct.                  24 BY MR. EDWARDS:                  25 Q. Okay. And a distance measure value</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p>22 Q. Okay. And in what form would those 23 results be displayed to me? For images would they 24 be displayed as a thumbnail? 25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those 2 be displayed to you? 3 A. It could be as a thumbnail or as a short 4 video clip or as a single representative frame. 5 Q. Okay. So they could be -- so for a video, 6 there's a video that matched the image query of an 7 r-frame, the results I could get back could include 8 three things. It could be a still image, it could 9 be a thumbnail, or it could be an r-frame 10 representation? 11 A. R-frame, I think, is representative frame. 12 So it was a key frame in that video sequence, 13 summary frame. 14 Q. Once I ran a query on an r-frame; right? 15 Well, let's stop there. 16 If I run a query on still images, 17 typically the results I would get back are 18 thumbnails that are most similar to the 19 characteristics which I queried from the query 20 image; right? 21 A. You could get thumbnails back. You could 22 also get the full-sized image back. 23 Q. Okay. 24 A. Thumbnail is a tool for helping you return 25 lots of results and quickly scan it.</p>	
--	--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I          2 have to click on the thumbnail in order to bring up          3 the full-sized image?          4 A. You could.          5 Q. Otherwise I could automatically receive          6 the full-sized image as part of the result?          7 A. You could.          8 Q. Okay. So walk through that process if I'm          9 using an r-frame of a video. If I do a -- if I run          10 a query on an r-frame of a video as a -- an image          11 query, how could I get the results back?          12 MR. HANSEN: Objection; vague and ambiguous.          13 BY MR. EDWARDS:          14 Q. In what form would I get the results back?          15 MR. HANSEN: Same objection.          16 THE WITNESS: You could get back the still          17 r-frame, representative frame, you could get back          18 the thumbnail, or you could get back the entire          19 video clip that that r-frame represents, a few          20 frames.          21 BY MR. EDWARDS:          22 Q. If I received a thumbnail or the r-frame,          23 would there be some sort of link I could click on to          24 get the underlying full video?          25 MR. HANSEN: Objection; vague and ambiguous.</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic          2 units initially returned in a video query."          3 Meaning the r-frames?          4 A. Correct.          5 Q. "For example, in a query for shots that          6 are dominantly red, a set of r-frames will be          7 displayed. To see the actual video shot, the user          8 clicks on the displayed r-frame icon."          9 A. Yep.          10 Q. And that was one of the ways you were          11 describing that the results of a r-frame query would          12 be returned to the user?          13 A. Right.          14 Q. Do you know if that was the preferred way          15 that was used in demos in commercial applications?          16 MR. HANSEN: Objection; vague and ambiguous,          17 lacks foundation.          18 MR. STRAUSSMAN: You can answer.          19 THE WITNESS: I don't know.          20 BY MR. EDWARDS:          21 Q. But, Mr. Flickner, this -- generally this          22 article represents the status of the QBIC technology          23 as of the date of this publication, which is          24 September 1995; is that right?          25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.          2 THE WITNESS: As I recall -- I'm not sure          3 definitely, but, yes, this is -- you could do that.          4 BY MR. EDWARDS:          5 Q. So let's go to page IBM 898.          6 So if you'll take -- just read that          7 paragraph that starts with the header          8 "Representative Frame Generation."          9 MR. STRAUSSMAN: And if you need to read          10 anything else to put it in context, feel free to do          11 so.          12 THE WITNESS: Okay.          13 (Witness reviews document.)          14 THE WITNESS: So what was your question, again?          15 BY MR. EDWARDS:          16 Q. If you go to the sentence that says,          17 "First" -- it's the second sentence in that          18 paragraph. It says, "First, during database          19 population, r-frames are treated as still images."          20 See that?          21 A. Yeah.          22 Q. And that's what you told me earlier;          23 correct?          24 A. Yeah.          25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --          2 Q. Okay.          3 A. -- there's an editorial process.          4 Q. Say that last part?          5 A. There's an editorial process. You submit          6 it, they edit and make changes and eventually it          7 appears.          8 Q. Right. So what you're saying is there's          9 some lag between the time that you wrote the article          10 and the time it was published?          11 A. Yeah.          12 Q. So this article -- but this article          13 represents the state of the QBIC technology at least          14 as of September 1995?          15 A. Yeah. Yes.          16 Q. And then let's go to IBM 900.          17 And take your time to orient yourself on          18 that page, but what I really want to ask you about          19 is the last paragraph on the left-hand column going          20 up to the top of the right-hand column.          21 A. Yep.          22 Q. So it says this paper describes [as read],          23 "a prototype system that uses image and video          24 content as the basis for retrievals."          25 Is that right?</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Id.</i> at 129 – 131:</p> <p>9 Q. Okay? And if you want to compare, or you 10 can take my word for it, the image in the top left 11 corner, the querying image, is the same one that was 12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I 15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full 22 resolution.</p> <p>23 Q. Okay. And was there a similar 24 functionality on the demo app on the -- on the 25 website in the '90s?</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p> <p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on Hewlett-Packard CoolTown System (“CoolTown”)

**Exhibit E-31**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, CoolTown was made, known or used by others in the United States no later than July 10, 2000. *See generally* T. Kindberg et al., A Web-Based Nomadic Computing System; J. Barton et al., The Cooltown User Experience; cooltown developer’s network, coolbase overview; cooltown developer’s network, people, places, things: web presence for the real world. CoolTown is available as prior art at least under 35 U.S.C. § 102(a). On information and belief, HP was using CoolTown and made it available to the public in the United States by releasing the website on the Internet (and accessible to U.S. users) by at least March 2000, making the software available on the HP website by March 2000, and making available on the Internet (and accessible to U.S. users) the open source code, which reflects the functionality of CoolTown by at least March 2000. *See e.g.*, HP000043–044; HP000045–046; HP000060–061; *see also* <https://www.zdnet.com/article/hp-brings-open-source-to-cooltown/>. Therefore, HP Cooltown was at least known, used, and/or sold to the public by at least 2000. On information and belief, CoolTown is also available as prior art under 102(g). BofA is diligently investigating CoolTown and will supplement with additional information, if necessary.

As shown in the chart below, CoolTown anticipates asserted claims 18, 27, 29, and 31 of the ’252 Patent. To the extent CoolTown is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent CoolTown is found not to anticipate any asserted claims or claim elements of the ’252 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products

*Nantworks, LLC v. Bank of America Corporation*

infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 24:</p>

		<p><b>3.4. Infrastructure for things; ChaiServer and eSquirt</b></p> <p>Given a URL from one of the lower-layer services, we</p>  <p><b>Figure 5. Devices (printer, light), with and without embedded web servers.</b></p> <p>Figure 5 shows interactions between two clients and their respective web devices. It shows a digital camera that interacts with a printer via HTTP operations on the printer's point of web presence. The URL for the printer resolves to its network address. The camera first interrogates the printer to find out the formats it accepts. The printer can supply this as an HTML page or as an XML document that describes it. Then the camera sends the image as, for example, JPEG encoded data. Figure 5 also shows lights connected to a home PC by a controller unit. The home PC acts as a gateway to the lighting unit. A remote user issues HTTP operations via a web browser on a PDA; the programs on the PC that handle HTTP operations directed to the light's URL manipulate the lighting unit accordingly.</p> <p>The Cooltown User Experience (HP000088 – 093) at 1:</p>

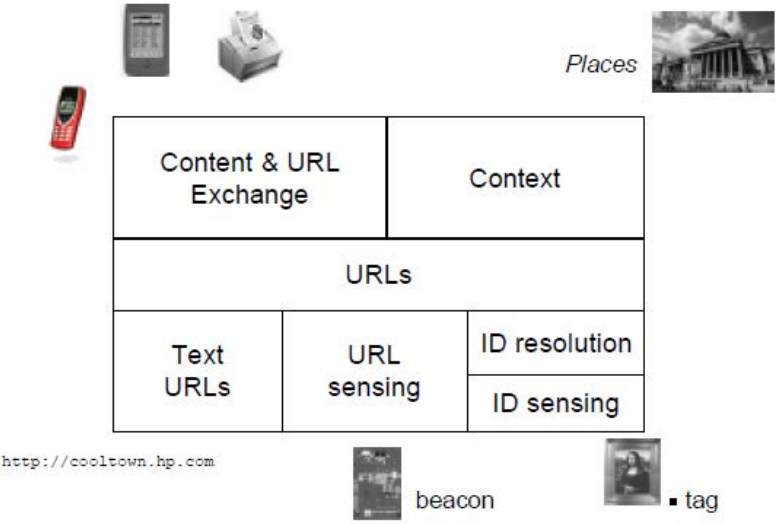

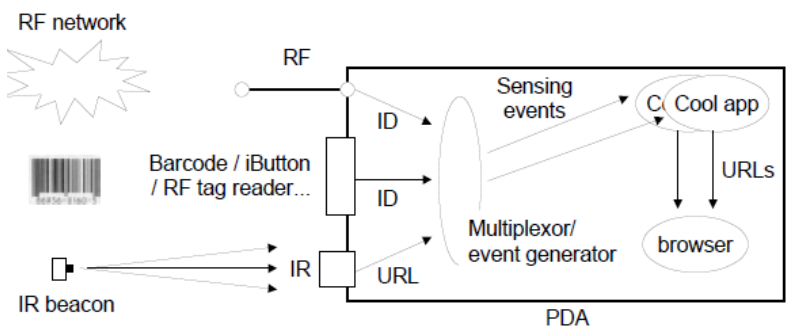

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on Hewlett-Packard CoolTown System (“CoolTown”)

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p>The Cooltown project at HP Labs applies Web technology to develop systems that support the users of wireless, handheld devices interacting with their environment, anywhere they may be. The basic elements of Web technology useful for ubiquitous computing are described in several papers and on-line resources from the Cooltown project [1-5]. Here we will give a flavor of the Cooltown user experience, discuss ways that context can be used in web systems, and explain why we think a web-based system for ubiquitous computing can achieve network effects. In our conclusion we will mention some of the many remaining challenges and our initial user studies platform.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 2</b>                      The CoolTown work is not on the devices or wireless communication layers, but rather on the layer of infrastructure that is needed to support nomadic users with portable devices. We work at the “web server” level and we see our work as extending web models to new arenas.</p> <p>As a consequence of the above assumptions, most of our demonstration scenarios use a sensing mechanism, like a barcode reader or a short-range networking subsystem such as infrared, combined with long-range or wired web access. The sensor is used to obtain addresses (URLs) to access web resources. So we imagine our nomadic users carrying devices like:</p> <ul style="list-style-type: none"> <li>• PDAs with 802.11 network access and barcode or other sensors, or</li> <li>• Cellular telephones with additional short-range networking, or</li> <li>• Cameras with short-range networks that interact with Internet-connected kiosks.</li> </ul> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 3</b></p>

Element	'252 Claim Recitation	Exemplary Citations in Reference
		<p><b>3. Sensing</b></p> <p>In this section, we describe the bottom layer of our infrastructure, which enables the user to acquire URLs from their surroundings or from the physical entities in their surroundings. An obvious mechanism, with equally obvious drawbacks, is to write the URL on a label and attach it to the object. The user reads the label and types the URL into their browser.</p> <p>Rather than being forced to use that cumbersome method, users should be able to identify conveniently what it is that interests them in their surroundings and obtain the corresponding URL <i>automatically</i>. To achieve this, their PDA is equipped with at least one short-range device that allows them to read URLs and other identifiers associated with places and individual objects in their surroundings, by pointing or positioning the device. We call this URL <i>sensing</i>.</p> <p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>∇ <i>IR &amp; RF</i>. The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>∇ <i>Barcodes</i>. Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>∇ <i>Electronic tags</i>. A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>∇ <i>Optical recognition</i>. The user's device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

[18B]	configuring the image processing platform to receive the data relating to the image and to conduct image processing, including:	<p>CoolTown discloses configuring the image processing platform to receive the data relating to the image and to conduct image processing.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 20:</p> <p style="padding-left: 40px;"><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 24:</p>

		<p><b>3.4. Infrastructure for things; ChaiServer and eSquirt</b></p> <p>Given a URL from one of the lower-layer services, we</p>  <p><b>Figure 5. Devices (printer, light), with and without embedded web servers.</b></p> <p>Figure 5 shows interactions between two clients and their respective web devices. It shows a digital camera that interacts with a printer via HTTP operations on the printer's point of web presence. The URL for the printer resolves to its network address. The camera first interrogates the printer to find out the formats it accepts. The printer can supply this as an HTML page or as an XML document that describes it. Then the camera sends the image as, for example, JPEG encoded data. Figure 5 also shows lights connected to a home PC by a controller unit. The home PC acts as a gateway to the lighting unit. A remote user issues HTTP operations via a web browser on a PDA; the programs on the PC that handle HTTP operations directed to the light's URL manipulate the lighting unit accordingly.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</p>

		<p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user's client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be 'sensed' as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place's web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>

The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display the corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard 'sensing events', bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in their current activity, so that users can 'retrace their steps'.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b></p> <p>One of those CoolTown applications provides indirect sensing. It can be configured to use any resolver of the user's choosing, but in particular it can automatically discover which is the local resolver when the user has designated which is the local context (see next section). When the user scans a tag such as a barcode, the application handles the sensing event by constructing a URN [3] from the identifier (if it is not in that form already). It uses the standard THHTTP protocol [8] to request the local resolver to turn the URN into the URL of a resource. This URL is then made available to the browser.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>                      To get an idea of some of the issues in defining place contexts, imagine that Acme Software Inc. sets up a stand at the Wireless Web World exhibition (Figure 4). Acme has to define its own context within the exhibition, which it uses to provide information, printing, purchasing and other services to users who walk up to the stand. Visitors must be able to discover the Acme context when they walk up, distinguish it from that of neighboring exhibits, and, through their devices, these visitors must be able to browse and access the resources that Acme provides within that context. We are mainly interested here in resources that are based around the physical entities found at the exhibition stand. When the visitor reads a barcode attached, say, to a printer or a guest book on display, they are automatically shown the Acme web page offering them a service connected with it.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b></p>

		<p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) at 5</p> <p><b>2.4 The Common User Experience in Cooltown.</b></p> <p>The three examples above explore various aspects of web presence but they also show a common theme. The typical user experience we seek with web presence is that of collecting links to points of web presence as they are encountered them in the physical world. One could even think of the physical world as a web page, with links at certain physical points. Of course the links are URLs presented on the user’s client device and the result of clicking on such a link will be a real web page, delivered to the user’s screen. The user can then travel through the virtual space of the web page with normal Web techniques or the user can travel through the physical space to find a different point of web presence. The user understands URLs as pointers to meta-information about objects at the same level that users of Web browsers now understand URLs as bookmarks for Web content. While this physical/virtual browsing is a typical scenario, we imagine other usage scenarios for web present things, in the same way that the Web supports many usage scenarios in addition to Web browsing.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) at 9</p>

Figure 3. A sketch of a PDA equipped for sensing URLs and identifiers.

#### A Web-Based Nomadic Computing System (HP000074 – 87) at 4

Some options for sensing include:

- *IR & RF.* The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.
- *Barcodes.* Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.
- *Electronic tags.* A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.
- *Optical recognition.* The user's device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.

In *direct sensing*, the beacon or tag directly presents the URL of a web resource. In *indirect sensing*, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a *resolver*, a service that returns a URL when given an identifier.

Direct sensing is the most concrete: it requires no resolver. An advantage of indirect sensing is that the same identifier can be looked up in different resolvers with different, context-dependent results. For example, sensing a book's ISBN barcode could lead to the local library's entry for the book, if the resolver for the ISBN is the local

		<p><b>Direct content post</b></p> <p>Pushing (or ‘posting’) content works between a source of content and a sink for content. Consider a nomadic user entering a conference room with a camera, photographing the content on a white board, then printing the image on the room’s printer. The camera is the source for the image content; the printer is its sink. We could view this interaction as “printing from the camera”. However, imagine the same user with the same camera and image, but interacting with the room’s electronic projector. Or, perhaps the room is equipped with an electronic picture frame and the user wishes it to display the image. Or, the image is on the user’s PDA instead of the camera, but is still sent to the same sink devices. In a pervasive computing environment, we need all combinations that users imagine should work to work. All of these scenarios can be handled similarly: the image just needs to be transferred from source device, the camera or PDA, to a sink device, the printer, projector, or picture frame.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 20 – 21</p> <p><b>2.1. Visiting the Cooltown Museum.</b></p> <p>The Cooltown Museum and Bookstore offers visitors a Web-enhanced experience. *Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,899,252 based on Hewlett-Packard CoolTown System ("CoolTown")

		<p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user's client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be 'sensed' as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place's web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>

It can be configured to use any resolver of the user’s choosing, but in particular it can automatically discover which is the local resolver when the user has designated which is the local context (see next section). When the user scans a tag such as a barcode, the application handles the sensing event by constructing a URN [3] from the identifier (if it is not in that form already). It uses the standard THHTTP protocol [8] to request the local resolver to turn the URN into the URL of a resource. This URL is then made available to the browser.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>  <b>Discovery:</b> Discovery is the acquisition of contexts and resources within contexts. Places are discovered in much the same way as individual physical objects, although they are typically extended and so may require several beacons or tags. Prominent “You Are Here” beacons or barcodes (or any other type of tag) attached to the Acme exhibition stand enable the user to pick up that place’s context. The user points the device at the beacon or scans the barcode. The result is the URL of the place: a set of web pages containing information and services that the user can browse on their device, and which devices can query.</p> <p><b>A Web-Based Nomadic Computing System (HP000074–87) at 6</b></p>

		<p><b>Place Managers</b></p> <p>Our implementation of place context is as a web server with appropriate content describing the place [6]. The points of web presence of the designated objects will appear as links in the place’s web pages. They will also be discoverable programatically, using lookup by identifier, and lookup by service type and other attributes. The ‘local resolver’ that we described in the previous section is an example of a resource that can be looked up automatically from the place’s context.</p> <p>A <i>place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"><li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li><li>• It acts as a resolver for each place, for looking up resources from their identifier.</li></ul> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) at 8</p> <p><b>Indirect Sensing</b></p> <p>In the case of indirect sensing, the user’s client device obtains a value that it has to look up to obtain a URL. *Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,031,278 based on  
U.S. Patent No. 6,512,919 to Ogasawara (“Ogasawara”)

### **Exhibit F-1**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ogasawara was filed on March 30, 1999, claiming the priority date of December 14, 1998. Ogasawara published at least as of May 30, 2002 and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, CoolTown anticipates asserted claims 1, 4, and 5 of the ’278 Patent. To the extent CoolTown is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent CoolTown is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

		<ul style="list-style-type: none"> <li data-bbox="884 302 1885 732">• “It should also be understood that the character recognition, pattern recognition and/or bar code decode routines need not be directly downloaded by the program loader firmware memory of the wireless videophone in order that the system have this particular capability. The wireless videophone is perfectly capable of capturing digital videographic information, such as a bar code pattern or a graphics image pattern, and transferring this information directly to the store's server through the functional electronics section. Once this information is received by the server, a character recognition and/or pattern recognition application routine can be invoked within the server in order to either decode the bar code videographic data or to perform pattern recognition functions on a icon-like patter captured by the digital video camera.</li> </ul> <p data-bbox="926 776 1885 1390">A server personal shopping application 254 is also resident in the server system 210 and might be characterized as a program for facilitating operation of the server in order to perform electronic shopping. The server personal shopping application 254 facilitates the downloading of the purchase transaction program and/or any appropriate character or pattern recognition routines to the wireless videophone 218 after the wireless videophone has established a connection with the server as discussed above. Server personal shopping application 254 also facilitates the reception and processing-of product selections made by a purchaser utilizing the wireless videophone as discussed previously as well as optionally facilitating the reception and decoding of bar codes, character or pattern information by an optional character and/or pattern recognition software routine. The server personal shopping application 254 is also adapted to receive and store payment information, such as credit card account numbers, expiration dates, and the like and is also capable of facilitating reading and updating of information on a purchaser's IC card via the IC card reader/writer 227, if utilized.”</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,031,278 based on  
 U.S. Patent No. 6,512,919 to Ogasawara (“Ogasawara”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>Ogasawara at 20:41–67</p> <ul style="list-style-type: none"> <li>“With particular reference to FIG. 13, once the purchase transaction program has been downloaded, a purchaser may use the wireless videophone, in particular the digital camera, to select various items which the consumer desires to purchase. Such selection is made by capturing an image of an item's UPC bar code data, or the like, within the image field of the digital camera. While the consumer is scanning a particular bar code with the digital camera, the image seen by the camera is displayed on the system's graphic display screen so that the consumer can visually verify that the entire image has been captured. If character and/or pattern recognition software was downloaded to the system as part of the program, the customer need only inform the system that the image is ready for processing by pressing a pre-defined key on the system's keyboard. Those skilled in the art will appreciate that various other codes, indicia, text, icons, and the like may be scanned and recognized by modern character and pattern recognition application routines. Thus, product selection need not be made in accordance with a UPC bar code but might be made with reference to a selection of product specific icons, each of which represent a particular product or service offered for purchase. For example, when grocery shopping, product specific icons might represent the stylistic outlines of a loaf of bread, carton of milk, a bunch of broccoli, and the like, allowing a consumer to quickly and efficiently select items for purchase without recourse to the complications of reading bar codes.”</li> </ul> <p>Ogasawara at 21:15–24.</p> <ul style="list-style-type: none"> <li>“In the case of FIG. 13, if the bar code read key has been depressed the program captures the bar code image taken by the digital camera. Once the bar code image has been captured, the program decodes the bar code image data to its corresponding numeric bar code data, by operating on the bar code image with pattern recognition software. Once the bar code has been</li> </ul>

		<p>decoded to its numeric values, the bar code data is transmitted to the store's server through the wireless telephone function of the system.”</p> <p>Ogasawara at 21:54 – 65</p> <ul style="list-style-type: none"> <li>• “In addition to its use as a simple, efficient electronic shopping system, the wireless videophone of the present invention is not limited to use in retail transactions. Because its program download capability is not application specific, it will be understood that any application program of an appropriate size is able to be downloaded and executed by the wireless videophone of the invention. The program loader capability in combination with the system's digital video camera and graphics display screen allows the system to be eminently suitable for catalog shopping application, in which items are selected for purchase by merely scanning a printed bar code in proximity to an item on the catalog page.”</li> </ul> <p>Ogasawara at 22:41 – 23:10</p> <ul style="list-style-type: none"> <li>• “Notwithstanding the foregoing, it will also be understood that the merchandise item information need not be displayed in bar code form for the invention to perform as intended. Indeed, merchandise item information may be presented in alpha-numeric form (i.e., an item name) or as a numeric code. In either case, character recognition software allows the wireless videophone to identify the item in a seamless fashion. Character recognition software supports identifying a product based on a numeric or alpha-numeric code, while pattern recognition software supports recognition of product characteristics based on bar code data.</li> </ul> <p>As was described above, pattern and/or character recognition can be accomplished by software downloaded to the wireless videophone, or, alternatively, by transmitting the videographic image of the numeric, alpha-numeric or bar code identifier to a server for such recognition processing.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,031,278 based on  
 U.S. Patent No. 6,512,919 to Ogasawara (“Ogasawara”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>Processing results are then transmitted back to the wireless videophone for display to the customer.</p> <p>It will be understood that the system of the present invention allows bar code and/or alpha-numeric information to be captured from almost any form of display means by merely placing the information within the visual image field of the system's digital camera. If the system's downloaded program includes pattern and/or character recognition routines, recognition data processing is performed within the video phone. Where the downloaded program does not include recognition software, the program transmits the videographic image to a server and a recognition processing software resident in the server processes the data and returns recognized merchandise information to the graphics display screen of the videophone. In its simplest form, the downloaded program might transmit videographic image data to a store server which, in turn, displays the information to a store clerk. The store clerk would then manually identify the merchandise associated with the transmitted data (bar code and/or alpha-numeric) and return identified merchandise information to the consumer's videophone graphics display screen.”</p> <p>To the extent it is found that Ogasawara does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Ogasawara does not anticipate this claim, Ogasawara renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine Ogasawara with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,031,278 based on  
U.S. Patent No.6,036,086 to Sizer (“Sizer”)

### **Exhibit F-5**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

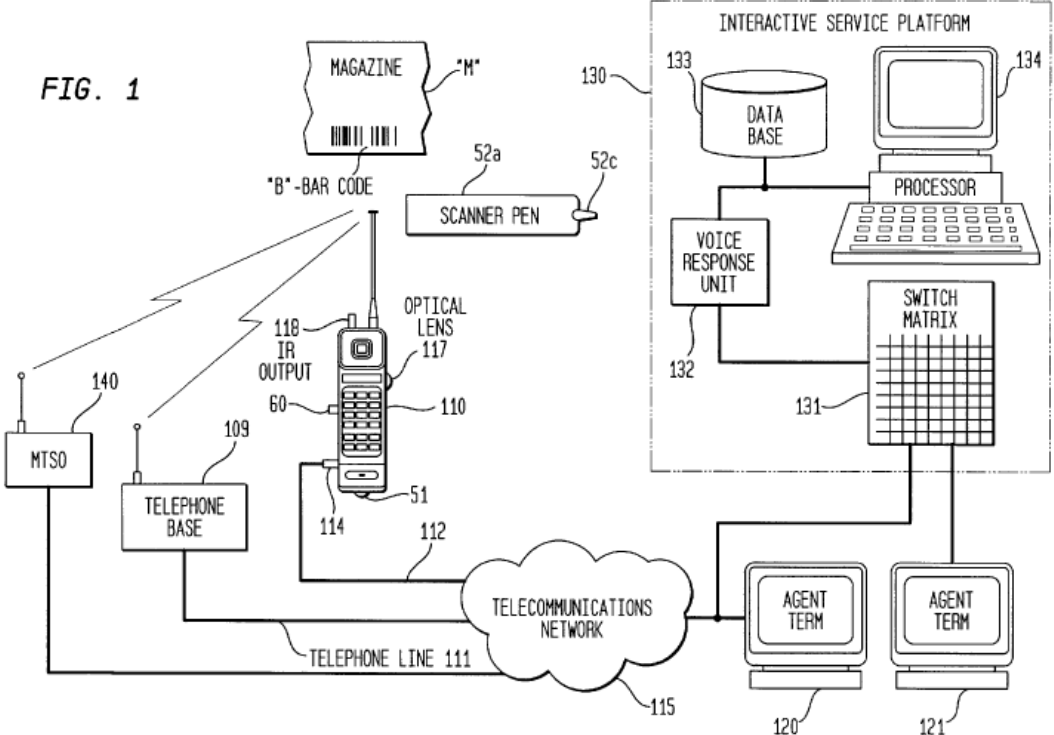

On information and belief, the application that matured into Sizer was filed on March 28, 1997. Sizer published at least as of March 14, 2000, and is available as prior art at least under 35 U.S.C. § 102 (a), (b), (e).

As shown in the chart below, Sizer anticipates asserted claims 1, 4, 5 of the ’278 Patent. To the extent Sizer is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Sizer is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

**2. Claim 3 (Non-asserted)**

Claim	'278 Claim Recitation	Exemplary Citations in Reference
3	The method of claim 1, wherein the symbolic content comprises a unique code.	<p>Sizer discloses the method of claim 1, wherein the symbolic content comprises a unique code.</p> <p>Sizer 2:57-59</p> <ul style="list-style-type: none"> <li>• The marks to be scanned can include a conventional style bar code, alphanumeric characters, or Xerox glyphs on the surface of the object.</li> </ul>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,031,278 based on  
U.S. Patent No.6,036,086 to Sizer (“Sizer”)

		<p>Sizer at 4:11-23</p> <ul style="list-style-type: none"><li>• “The scanner unit 50 of the present invention can be used in combination with marks that represents a unique code for transaction data. A standard bar code format could be used, which has encoded therein an 800 number to be called and other necessary information for completing a transaction. Xerox glyphs also could be appropriate because the glyphs can encode a large amount of data in a short space. FIG. 1 illustrates an object "M" in the form of a Magazine page having a bar code "B" adjacent an advertisement so that information can be gathered concerning the advertisement for initiating a transaction. Additionally, alphanumeric characters could be scanned, which specify a unique identifier for various advertisements.”</li></ul> <p>Sizer at 9:33-53</p> <ul style="list-style-type: none"><li>• “For background purposes, a televised advertisement for a product could include additional ordering or "coupon" information embedded in a subliminal visual pattern within the video image displayed on a television. The coupon information describes the item(s) offered for sale, the regular price, the coupon value, and contains additional information needed for ordering. This embedded information could be transmitted between a television and capture device at a rate of about 60 bits per second, that is sufficient such that the necessary information can be transmitted in a very brief period of time. In the application just described, the embedded product information, dialing number, coupon information and necessary checkbits together comprise approximately 2,000 bits of information, so that between three and four seconds would be required for transmission. Once the coupon information is stored in capture device 110, the user of the capture device can supplement the coupon information with user entered data which can be entered using keypad 247. This supplemental information may include credit card or other</li></ul>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,031,278 based on  
U.S. Patent No. 6,666,337 to Harris (“Harris”)

### **Exhibit F-6**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Preliminary Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

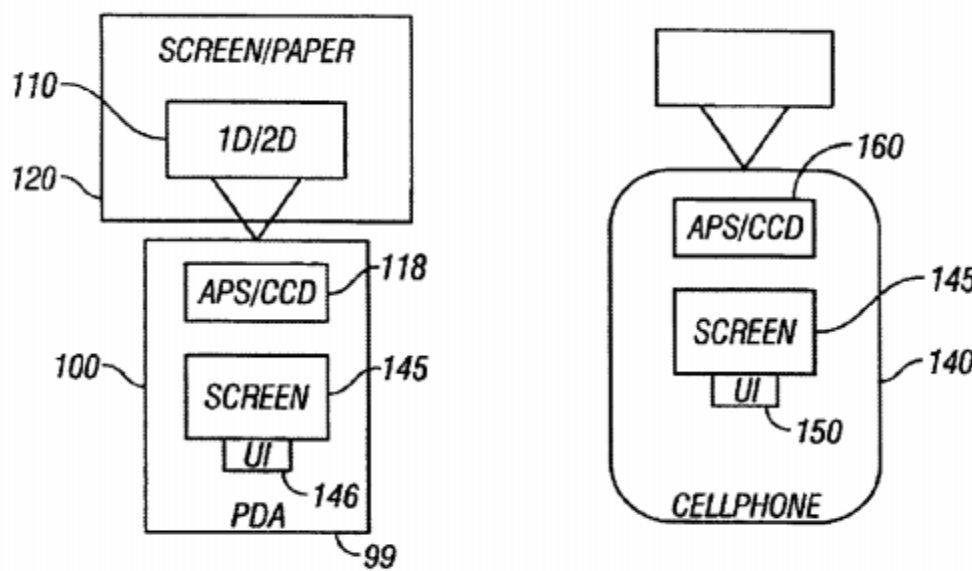

On information and belief, the application that matured into Harris was filed on July 18, 2000. Harris published at least as of December 23, 2003, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Harris anticipates asserted claims 1, 3, 4, 5 of the ’278 Patent. To the extent Harris is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Harris is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Preliminary Invalidity Contentions, for the reasons identified in the cover pleading. These Preliminary Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

### **Exhibit F-11**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ehrhart was filed on July 13, 2001, claiming the priority date of July 13, 2001. Ehrhart published at least as of April 20, 2004, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Ehrhart anticipates asserted claims 1, 3, 4, 5 of the ’278 Patent. To the extent Ehrhart is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Ehrhart is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,031,278 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

**1. Claim 1**

Element	'278 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A computer-assisted method, comprising:	<p>Ehrhart discloses a computer-assisted method.</p> <p>“The present invention relates to an optical reader that includes a color imaging assembly that generates color imaging data. An image analysis circuit determines if the acquired image should be characterized as a color photograph or as including a graphical symbol. A processing circuit processes the imaging data based on the image analysis circuit's determination of whether the image is a graphical symbol or a color photograph. The present invention allows a user to acquire and process both color images and graphical symbols, such as bar codes, text, OCR symbols or signatures. The optical reader of the present invention is also configured to associate an acquired image with at least one other acquired image.” Ehrhart at Abstract.</p> <p>“In another aspect, the present invention includes a method for acquiring an image of an object with an optical reader.” Ehrhart at 2:62-64.</p>
[1A]	receiving, via a mobile device, an image comprising a representation of at least a portion of a document;	<p>Ehrhart discloses receiving, via a mobile device, an image comprising a representation of at least a portion of a document.</p> <p><i>Id.</i> at [1Pre].</p> <p>“The optical reader of the present invention automatically, or through manual Selection, determines whether a captured image is a color photographic image or, a color image that includes a graphical Symbol. Subsequently, the optical reader of the present invention processes the acquired imaging data in accordance with that determination. The optical reader of the present invention is operative to acquire and associate a plurality of acquired images.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,031,278 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>One aspect of the present invention is an optical reader. The optical reader includes a color imaging assembly for acquiring an image of an object, the color imaging assembly generating imaging data corresponding to the image. An image analysis circuit is coupled to the color imaging assembly.</p> <p>The image analysis circuit being configured to determine if the color imaging data includes at least one graphical Symbol. The image is classified as a graphical Symbol, or the image is classified as a color photograph if the color imaging data does not include at least one graphical Symbol. A processing circuit is coupled to the image analysis circuit. The processing circuit is operative to process the imaging data based on the determination.</p> <p>In another aspect, the present invention includes an optical reader for capturing an image of an object. The optical reader includes a color imaging assembly for converting the image of the object into color digital data corresponding to the image.” Ehrhart at 1:57-2:16.</p> <p>“In another aspect, the present invention includes an optical reader for capturing an image of an object. The optical reader includes a color imaging assembly for capturing the image as color imaging data. A classification circuit is coupled to the color imaging assembly, the classification circuit being configured to process at least a portion of the color imaging data to thereby Select one of a plurality of classifications, whereby the image is classified as a color photographic image, or as an image that includes at least one graphical Symbol. An automatic mode Selector is coupled to the classification circuit, the automatic mode Selector being configured to Select an optical reader mode in accordance with the Selected classification. A processor is coupled to the classification circuit, the processor being programmed to process the color imaging data in accordance with the optical reader mode Selected by the automatic mode Selector.” Ehrhart at 2:26-42.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 9,031,278 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>“As embodied herein, and depicted in FIGS. 1A-1D, perspective views of the optical reader in accordance with various embodiments of the present invention are disclosed. FIG. 1A shows the underside of hand held wireless optical reader 10. FIG. 1B shows the top of the optical reader depicted in FIG. 1A. Optical reader 10 includes housing 100, antenna 102, window 104 and trigger 12. Window 104 accommodates illumination assembly 20 and imaging assembly 30. As shown in FIG. 1B, the top side of reader 10 includes function keys 14, alphanumeric key pad 16, and display 60. In one embodiment, function keys 14 include an enter key and up and down cursor keys. FIG. 1C is also a hand held wireless optical reader 10. Reader 10 includes function keys 14, alphanumeric key pad 16, writing stylus 18, display 60, and signature block 62. Stylus 18 is employed by a user to write his signature in signature block 62. FIG. 1D shows yet another embodiment of optical reader 10 of the present invention. In this embodiment, reader 10 includes a gun-shaped housing 100. Display 60 and keypad 16 are disposed on a top portion of gun-shaped housing 100, whereas trigger 12 is disposed on the underside of the top portion of housing 100. Housing 100 also includes window 104 that accommodates illumination assembly 20 and imaging assembly 30. Wire 106 is disposed at the butt-end of housing 100. Wire 106 provides optical reader 10 with a hard wired communication link for external devices such as a host processor or other data collection devices.” Ehrhart at 5:51-6:10.</p> <p>To the extent it is found that Ehrhart does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Ehrhart does not anticipate this claim, Ehrhart renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified in the cover pleading of BofA’s Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine Ehrhart with any of the other prior art references identified in the cover</p>

[1C]	<p>extracting symbol information based on the symbolic content according to symbol type;</p>	<p>Ehrhart discloses extracting symbol information based on the symbolic content according to symbol type.</p> <p>“In step 1004, processor 40 identifies the page features. Processor 40 analyzes the page and divides it into blank and non-blank portions. The non-blank portions are analyzed to distinguish text regions from non-text regions. After determining the layout of the page, processor 40 uses black-to-white transitions to determine degrees of skew. In step 1008, horizontal white spaces are identified to separate lines of text. In step 1010, vertical white spaces are identified within each line of text to thereby separate individual words and characters from each other. In Step 1014, a character recognition algorithm is used in an attempt to recognize each individual character.” Ehrhart at 12:55-66.</p> <p>“As embodied herein and depicted in FIG. 13, an example of image association in accordance with the present invention is disclosed. One of ordinary skill in the art will recognize that associated images 1300 can be disposed on paper, displayed electronically on display 60, or displayed electronically using other electronic means, such as a computer monitor. In this example, the first image captured is color photograph 1302 which shows a damaged parcel. The second image captured is bar code 1304 affixed to the side of the damaged parcel. Processor 40 decodes bar code 1304 and associates decoded bar code data 1306 with color photograph 1302. In this example, the user elected to associate a third image, signature 1308. Thus, personnel viewing record 1300 may reasonably conclude that a damaged parcel was delivered to Company XYZ, and that the person signing for the parcel delivery was someone named John W. Smith.” Ehrhart at 13:27-43.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 9,031,278 based on  
U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>“In the Automatic imaging mode, processor 40 is programmed to analyze the color imaging data to determine if an acquired image includes a graphical symbol or is merely a color photographic image. If it makes the determination that the color image includes a graphical symbol, it further analyzes the acquired image and classifies it as a bar code, OCR symbol, text, or a signature. Based on the classification, optical reader 10 jumps to the appropriate routine in EROM 48. The semi-automatic mode is similar. Thus, in the automatic or semi-automatic modes, the bar code scanning mode, the OCR/text mode, the signature capture mode, the color photography mode, and the association mode are controlled by the application program, not by the user.” Ehrhart at 8:36-49.</p>

		<p>classifies it as a bar code, OCR symbol, text, or a signature. Based on the classification, optical reader 10 jumps to the appropriate routine in EROM 48. The semi-automatic mode is similar. Thus, in the automatic or semi-automatic modes, the bar code scanning mode, the OCR/text mode, the signature capture mode, the color photography mode, and the association mode are controlled by the application program, not by the user.” Ehrhart at 8:36-49.</p> <p>“In one embodiment, this mode includes a Signature verification program wherein the user may select between a Static verification or a dynamic verification. In the Static mode, the user captures the image of a Signature. The captured image is compared with a reference image Stored in a remote database. In the dynamic mode, optical reader 10 uses the Stylus and Signature block to capture the Signature. In this mode, Signature block 62 measures unique dynamic parameters, Such as applied pressure, direction and timing of movements, or a combination of these parameters. One of ordinary skill in the art will recognize that this list is not meant to be all-inclusive, but rather, is a representative example. The captured dynamic parameters are compared with a reference data Stored in a remote database.” Ehrhart at 8:64-9:10.</p> <p>“If processor 40 does not locate a bar code symbol it moves onto step 420 and looks for OCR-A or OCR-B characters. If it finds these characters it performs optical character recognition in step 422. If it does not, processor evaluates the image for the presence of text. If text is located, the image is cropped, and the text is compressed and stored in steps 428 and 430. If the image does not include text, processor 40 evaluates the image for the presence of a signature. If one is present, the image is cropped, and the data is compressed and stored in steps 428 and 430. In another embodiment, optical reader 10 is networked, and processor 40 communicates with remote network resources to provide signature verification services. If processor 40 cannot detect a bar code symbol, OCR symbols, text, or a signature, the user is asked in step 432 if he desires to store the image. If he does, the color photographic image is stored in memory in step 434.” Ehrhart at 10:5-20.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on U.S. Patent No. 6,097,834 to Krouse (“Krouse”)

### **Exhibit F-18**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Krouse was filed on June 13, 1997, claiming the priority date of June 13, 1997. Krouse published at least as of August 1, 2000, and is available as prior art at least under 35 U.S.C. § 102(a).

As shown in the chart below, Krouse anticipates asserted claims 1, 4, 5 of the ’278 Patent. To the extent Krouse is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Krouse is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

**1. Claim 1**

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit F-23

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al., *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2 .htm3](http://www.thinker.org/imagebase/indox-2.htm3) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16.

As shown in the chart below, QBIC anticipates asserted claims 1, 4, and 5 of the ’278 Patent. The disclosures/exemplary citations for each element incorporate the disclosures/exemplary citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cited references and/or in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit F-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

**1. Claim 1**

Element	'278 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A computer-assisted method, comprising:	<p>QBIC discloses a computer-assisted method.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) 2390</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>QBIC Demo (IBM000747)</p>  <p>QBIC Demo (IBM000747)</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. Say it returned the stills, could you use 11 those stills to point you to a video? 12 A. Yeah. 13 Q. And how would you do that? 14 A. Well, the -- each -- each key frame 15 typically represents a frame in the video. So 16 there's a -- the key frame is -- is one frame of 17 the video so you just seek to that point. 18 Q. So if I'm understanding this right, you 19 could take a query video, the system would extract 20 frames, which would then extract features from it, 21 and then the system would return either shot clips 22 or key frames; is that right? 1 A. Right.</p> <p>Flickner 8/29/23 Depo at 31</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>3 Q. And you're getting the images -- where are                      4 the -- where are the source of the images?                      5 A. At the time we were looking at generic                      6 image sources. So we were using things like what                      7 was now called Getty, I think, so it's a standard                      8 image repository.                      9 This is -- this is pre-image search in                      10 Google, for example, so we didn't have a Google to                      11 go find a bunch of images. We had to use data                      12 warehouses or places that archived a lot of images.                      13 And this is before film was popular. So we were                      14 moving to the digital domain, so we wanted the                      15 images to be digitized so the computer could process                      16 them.</p> <p><i>Id.</i> at 42</p> <p>4 Q. So let's just start at a high level. Tell                      5 me generally what is QBIC?                      6 A. QBIC was a technology -- stands for query                      7 by image content. It was a way of extracting                      8 features of various types, putting those features in                      9 a database and then searching the database to get                      10 images that looked visually similar or semantically                      11 similar.                      12 Q. And when you say "semantically similar,"                      13 what do you mean?                      14 A. You could query based on semantics. You                      15 could ask for what does a microphone look like and                      16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206</p>

		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.</p> <p>The QBIC system was implemented in IBM commercial products, including in</p>

		IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. All of the features referenced in this chart were incorporated into these commercial implementations before November 6, 2000, as reflected in a combination of scientific papers, IBM’s internal documentation, and the QBIC demo software applications. <i>See, e.g.</i> , Flickner 8/29/23 Depo Tr. at 33:9-24, 71:21-72:10, 164:21-166:2, 166:11-175:24, 178:5-186:17, 186:21-192:4, 192:14-194:1, 195:16-196:4, 194:1-308:1; IBM 000001-617; IBM 000747; IBM 000777-880; IBM 000893-902; IBM 0002315-320; IBM 0002390-404; IBM 0002418-430.
[1A]	receiving, via a mobile device, an image comprising a representation of at least a portion of a document;	<p>QBIC discloses receiving an image comprising a representation of at least a portion of a document.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2396                      4.2. <b>Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (<i>R, G, B</i>) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p>IBM0002390 at 2391-92:</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                  “We have developed the QBIC (Query by Image Content) system to explore</p>

		<p>pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1B]	<p>determining that symbolic content is on the at least the portion of the document based on the image;</p>	<p>QBIC discloses determining that symbolic content is on the at least the portion of the document based on the image.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to</p>

		<p>developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs, start from a single object pixel and repeatedly add adjacent pixels whose values are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve.</p> <p>The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries. . . .</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b>                      Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source. You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p> <p>Managing Enterprise Information Portal (IBM 000777–880):                      “Many paper-intensive enterprises, such as insurance companies and financial institutions, administer large volumes of business-related content. The need for an enterprise solution for managing and accessing business information spans many industries. A content server is a software system that stores multimedia, business forms, documents, and related data, along with metadata that allows employees to process and work with the content.” <i>Id.</i> at p. 3.</p> <p>“The image search server uses IBM’s QBIC (query by image content) technology to help you search for objects by certain visual properties, such as color and texture. The image search server analyzes images and stores the image information in a database. Then users can run image queries, which use the visual properties of images, to match colors, textures, and their positions without describing them in words. You can combine content-based queries with text and keyword searches for more powerful retrieval of image and multimedia data.” <i>Id.</i> at p. 63.</p> <p>IBM0002390 at 2391-92:</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p>

		<p>1 Q. Okay. And what would you do with the                  2 image after you hit and extracted the color                  3 histogram from it?                  4 A. Nothing.                  5 Q. Would those features be stored in any                  6 database or --                  7 A. Yes.                  8 Q. Okay. And let's do -- what about                  9 texture, could you extract texture features from an                  10 image?                  11 A. We did.                  12 Q. And how would you do that?                  13 A. I don't remember exact features we were                  14 using. There were -- we published some papers on                  15 them.                  16 Q. Okay. Was there any reasoning behind                  17 picking the features that you chose?                  18 A. Yes.                  19 Q. And what was that reasoning?                  20 A. We wanted to make it so that the results                  21 were perceptually good.                  22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red                  2 color in it or some sort red color histogram; is                  3 that right?                  4 A. Well, you -- you take specific -- you                  5 search for a red color. You'd compute the                  6 histogram and then basically match the histogram,                  7 which would give you images that had more colors in                  8 the reds. This is not -- it's not a unique thing.                  9 Q. Were you always searching for a                  10 particular feature, or could you just search some                  11 sort of example image?                  12 A. We could search an example image.                  13 Q. And how would that process work?                  14 A. Just extract the features from it.                  15 Q. So let's break that down.                  16 So you would submit an example image to                  17 the -- to the system, right?                  18 A. Uh-huh.                  19 Q. And then how do the -- how -- how does                  20 the system select which features to extract?                  21 A. It would compute them all, typically, or                  22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that                  2 this is a better match, that the ordering was                  3 reasonable and...                  4 Q. So by that, do you mean that people would                  5 view the results returned as the closest or close                  6 matches to your -- to your image?                  7 A. It was -- it would satisfy their query.                  8 Q. Okay. So -- so you would have this set                  9 of features in your database.                  10 How would you search for those features?                  11 A. Typically, we -- initially, we did linear                  12 scan where you just actually evaluate the -- the                  13 distance metric against all the features.                  14 Q. So in linear scan, you would compare some                  15 sort of search term against all the features in the                  16 database?                  17 A. Well, it depends on which features you're                  18 using. You didn't have to use all the features.                  19 You could use just color features or just texture                  20 features or just...                  21 Q. So to make sure I'm understanding this                  22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

		<p>Flickner Depo at 36</p> <p>10 Q. So underlying this paper, you mentioned</p> <p>11 you did more work on the shape side of things; is</p> <p>12 that right?</p> <p>13 A. I did.</p> <p>14 Q. And what would that work have entailed?</p> <p>15 A. We wanted to query by shape.</p> <p>16 Q. Okay. And how would that have worked?</p> <p>17 A. We created features related to the shape</p> <p>18 of a -- the object of -- as it populated the</p> <p>19 database, and then we would query against those</p> <p>20 features.</p> <p>Flickner Depo at 214-215</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. What do you mean by the images of shot                      5 boundaries were indexed?                      6 A. Each -- each shot -- the shot -- the shot                      7 boundary detection is trying to extract key frames                      8 or break the video into small subsec --                      9 subsections -- hang on. Let me think here a                      10 second.                      11 So the shot boundary here is different                      12 than key framing. So I'll -- I'll retract what I                      13 said earlier. This -- while similar, they're not                      14 the same.                      15 Q. What are the differences?                      16 A. Shot boundaries are typically detected at                      17 fade to black, and key frames are supposed to be a                      18 representative still image of the video segment.                      19 Q. How would a shot boundary index allow one                      20 to query a video by content?                      21 A. It gives you semantical information as                      22 related to what the -- that -- that -- that is a --</p> <p style="text-align: right;">Page 214</p> <hr/> <p>1 a reasonable amount of return video. It's -- it's                      2 breaking it into small snippets.                      3 Q. Does it extract features from the key                      4 frames?                      5 A. If there are key frames extracted, it --                      6 it will reference key frames.</p> <p>Flickner Depo at 40-42</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p>3 Q. Okay. Could you take as -- as you did in 4 the query by image search system, could you just 5 search a video using this system? 6 A. You could search for a key frame and that 7 could point you to a video. 8 Q. As an input into the system, could you 9 search -- could you input a whole video and then 10 the system would extract the key frames and then -- 11 A. Yes. 12 Q. -- search that using that? 13 A. If I recall correctly, yes. 14 Q. Okay. And the way -- the method by which 15 it did so, as you mentioned, was -- would it 16 extract key frames from the video, extract features 17 from those key frames, and then search those 18 features; is that right? 19 A. Correct. 20 Q. Okay. Other than the use of shots and 21 key frames, is there any difference between the 22 video search functionality disclosed here and the</p> <hr/> <p>Page 40</p> <p>1 query by image search system? 2 A. There may have been. 3 Q. Can you think of any now? 4 A. No. 5 Q. When you searched for -- or when you 6 searched a video using this system, what would 7 the -- or what would the system return? 8 A. I don't remember if we returned the 9 stills or a small -- small video clip. 10 Q. Say it returned the stills, could you use 11 those stills to point you to a video? 12 A. Yeah. 13 Q. And how would you do that? 14 A. Well, the -- each -- each key frame 15 typically represents a frame in the video. So 16 there's a -- the key frame is -- is one frame of 17 the video so you just seek to that point. 18 Q. So if I'm understanding this right, you 19 could take a query video, the system would extract 20 frames, which would then extract features from it, 21 and then the system would return either shot clips 22 or key frames; is that right?</p>

		<p>1 A. Right.</p> <p>Flickner Depo at 87.</p> <p>4 Q. What feature extraction methods did the                      5 UC Davis implementation of QBIC rely on?                      6 A. It was similar to the other texture,                      7 shape, color and layout.                      8 Q. Was there any indexing scheme used?                      9 A. There may have been some text indexing                      10 scheme used.</p> <p>Flickner 8/29/23 Depo at 42</p> <p>4 Q. So let's just start at a high level. Tell                      5 me generally what is QBIC?                      6 A. QBIC was a technology -- stands for query                      7 by image content. It was a way of extracting                      8 features of various types, putting those features in                      9 a database and then searching the database to get                      10 images that looked visually similar or semantically                      11 similar.                      12 Q. And when you say "semantically similar,"                      13 what do you mean?                      14 A. You could query based on semantics. You                      15 could ask for what does a microphone look like and                      16 you get various incantations of visual microphones.                      17 Q. So you could do a text or keyword query?                      18 A. You could.</p> <p><i>Id.</i> at 44</p> <p>2 Q. And how did that problem, going through                      3 film stocks being a relatively labor tedious                      4 process, how did that play into developing QBIC?                      5 A. Well, just like you could query -- you                      6 could query text based on court documents or things                      7 like that, now you can make visual queries.                      8 Q. And querying text was known. People were                      9 doing that before the QBIC project started?                      10 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

<b>Description</b>	and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.
<p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p>	<p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p>
<p style="text-align: center;"><b>Image Classification</b></p>	<p style="text-align: center;"><b>Image Formats</b></p>
<p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p>	<p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"><li>• Audio Visual Connection (AVC) images</li><li>• OS/2 bitmap</li><li>• Windows 3.x bitmap</li><li>• PCX</li><li>• Intel and Motorola TIFF</li><li>• TARGA TGA</li><li>• TIFF (FAX)</li><li>• GIF</li><li>• Kodak Photo-CD</li></ul>
<p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p>	<p style="text-align: center;"><b>Product Positioning</b></p>
<p style="text-align: center;"><b>Image Query</b></p>	<p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p>
<p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"><li>• Image content, such as color, shape, texture, or layout</li><li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li><li>• Combinations of image content and data description.</li></ul>	<p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p>
<p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p>	<p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"><li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li><li>• Query and display images</li><li>• View or listen to video and audio information</li><li>• Display formatted text</li></ul>
	<p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p>

		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results. For example, the '278 patent acknowledges that acquiring information about objects through symbols, such as barcodes or some other means to encode detectable information in the image or on the object, were traditional methods known in the art and not part the present invention. '278 Patent, 3:39-48. Indeed, the '278 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 14:54-59. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Description	
<p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p>	<p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p>
<p><b>Image Classification</b></p>	<p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p>
<p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p>	<p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p>
<p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p>	<p><b>Image Formats</b></p>
<p><b>Image Query</b></p>	<p>Ultimedia Manager 1.1 understands these image formats:</p>
<p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p>	<ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCX</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul>
<p>Image Query allows searches by three methods:</p>	<p><b>Product Positioning</b></p>
<ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul>	<p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p>
<p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p>	<p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p>
	<p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p>
	<ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul>
	<p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p><i>See also</i> Flickner Depo at 22-25, 40-42, 54-55, 87, 98-90.</p>

Indeed, the '278 patent acknowledges that algorithms, software, and hardware components were commercially available at the time of the invention that could detect and decode symbols, such as barcodes or text, in an input image. <i>Id.</i> at 14:54-59. This limitation was thus known in the art by patentee’s own admission, and by asserting this claim, Plaintiff is attempting to reclaim disavowed claim scope and claim subject matter which patentee has acknowledged is not part of the invention.</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>“We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color queries return items with matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p> <p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object). An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects and features to implement logical And semantics.</p> <p>....</p> <p><b>ANNOTATION AND DATABASE POPULATION TOOLS.</b> Automatic methods (such as our Positional Color query) that don't rely on object identification, methods that identify objects automatically as in the museum image example, fast and easy-to-use semiautomatic outlining tools, and motion-based segmentation algorithms will enable additional application areas.</p> <p><b>FEATURE EXTRACTION AND MATCHING METHODS.</b> New mathematical representations of video, image, and object attributes that capture ‘interesting’ features for retrieval are needed. Features that describe new image properties such as alternate texture measures or that are based on fractals or wavelet representations, for example, may offer advantages of representation, indexability, and ease of similarity matching.</p> <p><b>INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION.</b></p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

		<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2391-92</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93:</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[i,j]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}, M_{[2,3]} \times M_{[3,2]}, M_{[3,3]}, M_{[3,4]} \times M_{[4,3]}, M_{[4,4]}, M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95:</p>

Central District of California, No. 2:20-cv-7872

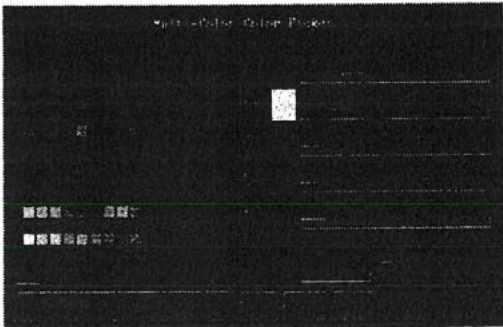

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2395</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <i>R*</i>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>IBM0002390 at 2396:</p>

		<p><b>4.1. Object/element identification</b></p> <p>Our user interface for object identification, shown in figure 4, allows for user assisted object identification. This interface is made up of four parts (listed from top to bottom): the window menu, the tool selection buttons, the image display area, and the object entry area. From the File menu selection the user has the ability to save the current image and objects and load another image. The Options menu contains selections for tuning panels for Snakes, Flood-Fill, as well as a Zoom selection, useful for working with very large or small images. There are are nine drawing tools provided by the interface: Polygon, Rectangle, Ellipse, Paint Brush, Eraser, Line Draw, Object Move, Fill Area, Snake Outline. For example the Polygon tool allows the user to click or drag around bounding edges of the object to be outlined, this can then be refined by the snakes method providing a shrink-wrap effect.</p> <p>Before using any tool on an image the user must first click New to create an object entry (Two shown on bottom of figure 4). The user can then type any text associated with the object to be outlined, or can do this after outlining the object. The user then selected an outlining tool and defines the “mask”. Multiple tools can be used and the last change can be removed with the Undo button or all changes removed with the Clear button.</p> <p>QBIC (Query by Image Content) at 1</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 52–53</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p> <p><i>Id.</i> at 77–78</p>

		<p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>	
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu- -- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appeasing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or 2 more of these features than the other? 3 A. Yes. 4 Q. Which one? 5 A. Shape. 6 Q. Okay. 7 (Witness reviews document.) 8 A. So one thing I can state is originally I 9 couldn't remember the name of the edge operator -- 10 and the name is Canny, the Canny edge operator -- 11 when we were talking about finding edges. 12 Q. Okay. So this -- the paragraph on 13 IBM 2393 refreshed your memory that shape 14 calculation used Canny edge detection? 15 A. No, that's sketch. 16 Q. Oh, I'm sorry. 17 A. I'm just stating that originally I was 18 asked a question about standard edge operators. I 19 couldn't remember the name. The name was Canny. 20 Q. Canny. And Canny is used in the sketch 21 calculation? 22 A. Yeah, it's used in the sketch calculation. 23 Q. Understood. Okay. Let's go back to 24 shape. 25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob. 2 Q. Can you say the name of the word again? 3 A. I think it's called perround. 4 Q. Per round? 5 A. Yeah. 6 Q. Those -- are those two words, p-e-r, 7 r-o-u-n-d? 8 A. P-e-r -- one word. 9 Q. Okay. Perround, one word. 10 A. It's basically the perimeter squared over 11 area. 12 (Reporter seeks clarification.) 13 A. Perimeter squared over area. 14 (Reporter seeks clarification.) 15 A. Length of the -- over area. 16 Q. Okay. So let's step back a little bit. 17 So it says -- the second paragraph says [as read], 18 "Our shape features are based on a combination of 19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features 20 area, circularity, eccentricity, major access 21 orientation and a set of algebraic moment 22 invariants," i-n-v-a-r-i-a-n-t-s. 23 Did I read that correctly? 24 A. Um-hum. 25 Q. Okay. For circularity, that is computed</p>
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that. 2 To calculate the shape feature in a query 3 image or a stored database image, is the first step 4 to convert that image into a binary image? 5 A. I don't think so. 6 Q. So if you look at the second paragraph -- 7 and the reason why I ask is -- it's the second 8 sentence in the second paragraph under "Shape 9 features." It says [as read], "All shapes are 10 assumed to be non-occluded planar shapes allowing 11 for each shape to be represented as a binary image." 12 See that? 13 A. Yeah. 14 Q. And then the next sentence says [as read], 15 "The area is computed as the number of pixels set in 16 the binary image." 17 A. Right. 18 Q. So that's why I ask is it the first step 19 in calculating shape to convert the image to binary? 20 A. Yes. 21 Q. And then once you convert it to binary 22 image, then what do you do next in order to 23 calculate the shape? 24 A. You're computing something called 25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct? 2 A. Right. 3 Q. All right. Area is the number of pixels 4 in the binary image? 5 A. In the binary blob. 6 Q. In the binary what? 7 A. Blob. 8 Q. Blob. And when you say "blob," what does 9 that refer to? 10 A. The outline of the object that you're 11 doing a shape query on. 12 Q. And so are each of these, area, 13 circularity, eccentricity, major axis orientation 14 and algebraic moment invariants, are those each 15 different algorithms or is it all the same 16 algorithm? 17 A. It's different algorithms. 18 Q. Okay. And since you worked on the shape 19 feature the most, do you recall any other details 20 that are not disclosed in this paragraph? 21 A. Well, this evolved and we ended up doing 22 an implementation of something that's not in here. 23 Q. Okay. And what was that implementation? 24 A. Something called turning angle per round, 25 turning angle, which is -- it looks at the tangent</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So</p> <p>2 you're computing the turning angle. You're</p> <p>3 computing this angle that represents a shape in a</p> <p>4 very interesting way.</p> <p>5 They don't seem to be very good for</p> <p>6 human -- so if you asked a human whether these two</p> <p>7 shapes are similar, they would say "yes," but under</p> <p>8 that feature set.</p> <p>9 Q. And you call that something per round?</p> <p>10 What was the name of it? Started with a T.</p> <p>11 Turrent?</p> <p>12 A. Turning angle.</p> <p>13 Q. Oh, turning angle.</p> <p>14 A. Yeah.</p> <p>15 Q. Well, it said -- your answer -- you did</p> <p>16 say turning angle, but you said something called</p> <p>17 something per round, and it started with a T. I</p> <p>18 thought you said turrent, but maybe I misunderstood.</p> <p>19 MR. STRAUSSMAN: Tangent?</p> <p>20 THE WITNESS: Tangent angle, yeah.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Okay. So something called tangent per</p> <p>23 round, is that what you would call it, this --</p> <p>24 A. No.</p> <p>25 Q. -- this implementation?</p>	<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle.</p> <p>2 Q. Okay. So the name of the new</p> <p>3 implementation you're talking about for shape</p> <p>4 calculation is called turning angle?</p> <p>5 A. It used turning angle as a major feature.</p> <p>6 Q. Okay. Was there any other name it went</p> <p>7 by?</p> <p>8 A. I don't recall.</p> <p>9 Q. All right. And that was -- that</p> <p>10 methodology was implemented to calculate shape on a</p> <p>11 query image and an image stored in the database post</p> <p>12 this article?</p> <p>13 A. Yes.</p> <p>14 Q. Was that the -- did that -- did that</p> <p>15 implementation, the turning angle, did that replace</p> <p>16 the methodology in this article or was it</p> <p>17 supplementing the metho- --</p> <p>18 A. Supplementing.</p> <p>19 Q. Okay. Other than turning angle, were</p> <p>20 there any other methodologies used after this</p> <p>21 article?</p> <p>22 A. Not that I recall.</p> <p>23 Q. Okay. Okay. Let's go sketch features, if</p> <p>24 you take a look at that and then let me know when</p> <p>25 you're done reading it.</p>

		<p><i>Id.</i> at 119–128</p> <table border="0"> <tr> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p> </td> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p> </td> </tr> </table>	<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>	<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>
<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>					
<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>					

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then                  2 you're looking for blue water, white sand.                  3 BY MR. EDWARDS:                  4 Q. Do you recall what the methodologies                  5 used -- that were used to calculate the orientation                  6 of those colors in the image?                  7 MR. HANSEN: Objection; lacks foundation.                  8 THE WITNESS: There's no orientation per se.                  9 It's just position.                  10 BY MR. EDWARDS:                  11 Q. Well, then position. Do you recall what                  12 the methodologies are to calculate the position?                  13 MR. HANSEN: Same objection.                  14 THE WITNESS: Position is something the user                  15 inputs.                  16 BY MR. EDWARDS:                  17 Q. Something you use what?                  18 A. The user had to input.                  19 Q. Okay. And then let's move on to the next                  20 one, T. It says, "Click T to search images with                  21 similar global texture."                  22 A. Yeah.                  23 Q. Do you recall, in your work on the QBIC                  24 project, a feature called global texture that could                  25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?                  2 A. G-a-b-o-r.                  3 Q. So switch over and look at the second page                  4 of this Exhibit 6.                  5 So -- well, first back -- go back to -- go                  6 back to the first page. If you see on the left-hand                  7 side it says, "Goto: IBM Image Search Demo," and a                  8 little finger there is clicking it.                  9 You see it's in red?                  10 A. Yeah.                  11 Q. Okay. So that's clicking on that link.                  12 And then the second page is going to the IBM image                  13 search demo.                  14 A. Okay.                  15 Q. Okay? On the second page it is showing                  16 thumbnails with the different icons that we just                  17 walked through, I, C, L, T, S, on each of those                  18 icons.                  19 Do you see that?                  20 A. Yep.                  21 Q. Do you recognize this as a similar layout                  22 to the QBIC demos you hosted in the '90s?                  23 A. I don't.                  24 Q. You don't?                  25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .                  2 Q. Say again?                  3 A. I missed one of your words. A feature                  4 called what?                  5 Q. I said do you recall in your work on the                  6 QBIC project a feature called global texture that                  7 was extracted from the image?                  8 A. Yes.                  9 Q. Okay. Is that -- is that akin to texture                  10 that we looked at earlier?                  11 A. Yes.                  12 Q. Okay. And the last one is S. It's,                  13 "Search images with special multipass filter."                  14 Do you recall, in your work on the QBIC                  15 project, being able to calculate a feature called                  16 multipass filter?                  17 A. Probably Gabor functions.                  18 Q. Say again?                  19 A. Gabor functions.                  20 Q. One more time and louder.                  21 A. Gabor functions.                  22 Q. Gabor functions. Okay. What are Gabor                  23 functions?                  24 A. Gabor functions are a way of producing                  25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM                  2 website that was the AIX operating system in                  3 Exhibit 3, that did not have a similar thumbnail                  4 layout like this?                  5 A. A thumbnail, yes. I don't recall it had                  6 the buttons, the I, C, L, T, S.                  7 Q. You don't recall it had all the buttons or                  8 some of the buttons?                  9 A. All the buttons.                  10 Q. Okay. So you don't recall that it had any                  11 buttons?                  12 A. I don't -- yeah. I don't recall.                  13 Q. It could have, it couldn't have, you just                  14 don't remember?                  15 A. I just don't remember, yeah.                  16 Q. Okay. But the one that you hosted on                  17 IBM's website, it did have thumbnails in a similar                  18 format here?                  19 A. Yeah, it had thumbnails.                  20 Q. And these thumbnails represent the images                  21 that are stored in the database?                  22 A. Yes.                  23 Q. Okay. Here, the 470 images would be                  24 reflected at least -- one, two, three, four, five,                  25 six, seven -- eight of them right here in this</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>
		<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 139–165</p>

		<p>5 Q. And for the image that you use as a base                      6 for the query, the things we all talked about in                      7 terms of feature extraction for average color, color                      8 histogram, shape, texture, sketch, all of those                      9 things, the same algorithms would be used in order                      10 to extract those features from the image query?                      11 A. They're different algorithms. You would                      12 use an algorithm.                      13 Q. I'm sorry. Say that again?                      14 A. The algorithms are different between the                      15 shape features and the color features and sketch                      16 features.                      17 Q. Yeah. Understood. What I'm trying --                      18 what I'm trying to understand is, the process that                      19 we talked about before, when you populate the                      20 database and you extract the features from the                      21 images that are stored in the database.                      22 You know, we went through all those                      23 different algorithms that are used for shape, color,                      24 both average color and histogram, texture and                      25 sketch.</p>

		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?                  2 A. Yep.                  3 Q. And then it would extract whatever feature                  4 you want from that uncompressed image?                  5 A. Correct.                  6 Q. And then those extracted features from the                  7 uncompressed JPEG image are used in the matching                  8 process?                  9 A. Correct.                  10 Q. Okay. And you were using -- you were                  11 doing this for JPEG image -- or the QBIC system was                  12 doing this for JPEG images in the -- in the '90s?                  13 A. Yes.                  14 Q. Okay. So once the system -- now, we're                  15 only talking about image-based queries, image using                  16 as input for the queries.                  17 Once you submit an image for the query, if                  18 it's a -- you do your preprocessing that need to be                  19 done. Features are extracted. So now we've got                  20 just the extracted features, whatever those are.                  21 What happens with those extracted features                  22 next?                  23 A. They're put in the database and then                  24 potentially there are indexes built that help you do                  25 fast search against those features.</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?                  2 A. You say the matching algorithm?                  3 Q. Correct.                  4 A. Yes, they could be different.                  5 Q. Well, let's talk about them. We can get                  6 into detail here.                  7 Well, before we -- before we get there, so                  8 how does the QBIC system display the results of                  9 matches to the user?                  10 A. Typically just thumbnails in a window in                  11 multiple ordered hits.                  12 Q. Okay. And it displays them in the order                  13 by which they're most similar. So the, you know,                  14 best match to the next best match to the next best                  15 match, so on and so forth?                  16 A. Correct.                  17 Q. Okay. And you said the system determines                  18 similarity based on some distance measure between                  19 the extracted features in the image query versus the                  20 stored image?                  21 A. The features of the stored image.                  22 Q. But it's a -- it's some sort of distance                  23 measure?                  24 A. Yes.                  25 Q. Okay. So let's go back to Exhibit 2.</p>
		<p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm                  2 talking about for a query, so I'm taking an image                  3 and submitting it to a system as a query.                  4 A. Query by example.                  5 Q. Query by example. Okay. Once those                  6 features extracted for that image, what happens next                  7 in the process?                  8 A. You take the feature vector and you                  9 present it to the database and say return the best                  10 matches to this feature vector.                  11 Q. Okay. So the system would compare -- the                  12 QBIC system would compare the features that are                  13 calculated from the input image to stored calculated                  14 features of the images in the database and come up                  15 with a match?                  16 A. Yes.                  17 Q. Okay. And those matches would be sorted                  18 or arranged in order of most similar?                  19 A. Yes.                  20 Q. And would algorithms do these comparisons?                  21 A. Yes.                  22 Q. Would it be a different algorithm for each                  23 of the features? So, for example, would there be an                  24 algorithm that does the comparison for color                  25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and                  2 rolling over to IBM 2395, that's a discussion on the                  3 image query. And so what I want to do -- I have a                  4 couple high-level questions, but then I want to walk                  5 through each one. Color starts on 2394, then                  6 texture and then shape and sketch are on 2395.                  7 So in terms of the -- in terms of the                  8 distance measure, Mr. Flickner, if -- I know you                  9 said that the results are termed based on those that                  10 are most similar but it could come up with something                  11 that's an exact match; is that right?                  12 A. It's possible.                  13 Q. Like the distance measure, the result                  14 would be zero if it was an exact match; right?                  15 A. Typically you'd get that only if you had                  16 the query image the same as a result image.                  17 Q. Right. But that's a possibility?                  18 A. Yeah.                  19 Q. Okay. So let's take a look at color --                  20 it's on -- starting at the top of 2394. You know,                  21 take your time and read that and then I want to ask                  22 you some questions about it.                  23 (Witness reviews document.)                  24 A. Okay.                  25 Q. Okay. So let's first start with average</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between  2 the query image and the database image using  3 weighted Euclidean distance; is that right?  4 A. Yep.  5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.  6 And can you just tell us at a high level  7 what -- if you can -- what Euclidean distance is?  8 A. So if you have multiple features or  9 multiple scaler features, you have to ask the  10 question I'm trying to build a distance from that  11 vector to a query vector.  12 And as you build that -- the distance, you  13 have -- you may want to weight different elements of  14 the vector differently. And we found out that using  15 variance normalization, where weights of the  16 variance of the feature, gave good aesthetic  17 results.  18 (Reporter seeks clarification.)  19 A. Aesthetic results.  20 Q. And I apologize, I couldn't hear what you  21 said. You said, "And we found out that using  22 variance" . . .  23 A. So you normalize each feature with its  24 variance.  25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)  2 Q. Well, let me ask my -- let me get my  3 question out first.  4 So we talked about the features for  5 average color before are RGB, Yiq, LAB and MTM.  6 A. Correct.  7 Q. And so, for example, for the RGB, you're  8 saying that you would take the R and you would  9 divide it by the variants of red and green, for  10 example --  11 A. Just variants of red.  12 Q. Okay. And so you could do the same for  13 the others, for Yiq or LAB?  14 A. Exactly.  15 Q. Okay. You do that for both the image  16 input query and the stored image; correct?  17 A. Correct.  18 Q. And then you're calculating the distance  19 between them, so determining how similar they are  20 based on the distance?  21 A. Yeah, or vector distance.  22 Q. Understood.  23 A. Two vectors of differences --  24 (Reporter seeks clarification.)  25 A. Two vectors with a distance calculation on</p>	
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.  2 Q. With its variance.  3 A. And then compute the average.  4 Q. Okay.  5 A. Or, I'm sorry, compute the weighted sum.  6 So red divided by the variants of red, plus green  7 divided by the variants of green --  8 (Reporter seeks clarification.)  9 A. Red divided by the variants of red, green  10 divided by the variants of green, L divided by the  11 variants of L, that's how you combine the various  12 features.  13 Q. Understand. And L represents what?  14 A. Luminance.  15 Q. Okay. And this is -- you're talking  16 specifically with respect to average color?  17 A. Well, the variance normalization is well  18 known in terms of multidimensional feature merging.  19 Q. But for average color, you wouldn't use  20 luminance, right, as a -- as a variant?  21 A. Luminance would just -- you wouldn't use  22 just luminance. You could use luminance . . .  23 Q. Well, so the color features we talked  24 about before would be RGB, Yiq, LAB --  25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.  2 Q. You're going to have to repeat that and be  3 just a little bit louder, Mr. Flickner. Sorry.  4 A. That's all right. Let me get my thoughts  5 together.  6 So we have multiple dimensional features.  7 It's not unusual to take each dimension and  8 normalize it by the variance because that gives  9 you -- what that does is if you have tight variances  10 you divide it by, you get bigger numbers. So you  11 have more information close by.  12 Q. What was the word you said before "close  13 by"?  14 A. I don't remember.  15 THE REPORTER: Information?  16 THE WITNESS: Information close by?  17 BY MR. EDWARDS:  18 Q. Okay. Okay. So now let's talk about  19 color histograms.  20 A. Okay.  21 Q. Okay? Well, stop. Let's go back to  22 average color. So is there -- you described the  23 weighted Euclidean distance that's calculated  24 between the query image and the database image for  25 average color.</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall                  2 that's not disclosed in the paragraph at IBM 2394?                  3 A. Not that I recall.                  4 Q. Okay. Do you recall whether this distance                  5 methodology changed after this article or it stayed                  6 the same?                  7 A. It changed.                  8 Q. Are you certain or do you know?                  9 A. I'm not certain, but I'm pretty certain.                  10 Q. And how did it change?                  11 A. Different features were shaped like an                  12 inch in color. The algorithm evolved. It wasn't                  13 static.                  14 Q. And how did it evolve?                  15 A. I don't recall all the details.                  16 Q. Do you recall whether it supplemented the                  17 weighted Euclidean distance or replaced it?                  18 A. I don't recall.                  19 Q. Is it fair to say there was always some                  20 distance measurement to determine similarity for                  21 average color in the QBIC system?                  22 A. There's some measurement, yeah.                  23 Q. Okay. Let's talk about color histogram.                  24 So in order to determine the similarity                  25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was                  2 determined by weighted Euclidean distance; is that                  3 right?                  4 MR. HANSEN: Same objection.                  5 THE WITNESS: Correct.                  6 BY MR. EDWARDS:                  7 Q. And how did -- how was that weighted                  8 Euclidean distance determined?                  9 A. It was inverse variance.                  10 (Reporter seeks clarification.)                  11 A. Variance.                  12 Q. And it was inverse variance for components                  13 like coarseness, contrast and directionality?                  14 A. Correct.                  15 Q. Okay. And do you recall if that                  16 methodology changed or stayed the same after this                  17 article for the QBIC system?                  18 A. Most likely it evolved.                  19 Q. Do you know for sure?                  20 A. No.                  21 Q. Do you recall any details?                  22 A. No.                  23 Q. All right. Let's talk about shape next.                  24 The similarity between the query image and                  25 the database image also used weighted Euclidean</p>	
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines                  2 distance between normalized histograms?                  3 A. Correct.                  4 Q. Do you recall any details of how that                  5 worked?                  6 A. Not off the top of my head.                  7 Q. Do you recall whether that methodology                  8 evolved for matching color histograms after this                  9 article?                  10 A. Not that I recall.                  11 Q. Okay. All right. Let's talk about                  12 texture next. And I don't know if you've read that,                  13 but that's at the bottom of 2394 and it goes to just                  14 barely at the top of 2395.                  15 (Witness reviews document.)                  16 A. Okay.                  17 Q. So for texture, the similarity is                  18 determined by the distance or the weighted Euclidean                  19 distance between the query object and -- the query                  20 object image and the database object image; is that                  21 right?                  22 MR. HANSEN: Objection; vague and ambiguous.                  23 THE WITNESS: Can you repeat.                  24 BY MR. EDWARDS:                  25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?                  2 A. Correct.                  3 Q. And do you recall how that worked?                  4 A. There's computing moments. And we used                  5 the shape measure, which I mentioned earlier,                  6 curvature and turning angle.                  7 (Reporter seeks clarification.)                  8 A. Curvature and turning angle.                  9 Q. And the curvature and turning angle would                  10 be compared between the image query and the database                  11 image; correct?                  12 A. Correct.                  13 Q. And do you recall if that methodology                  14 changed after this article came out in '93?                  15 A. Yes, it did.                  16 Q. How so?                  17 A. Well, in the IEEE computer paper, we                  18 described a different way of doing shape measures.                  19 And they included the moment calculations.                  20 Q. And you use the moment calculations to                  21 determine a distance between the image query and                  22 the -- and the database image?                  23 A. Yes.                  24 Q. Sorry?                  25 A. Yeah. Yes.</p>	

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?</p> <p>2 A. Given a binary blob, certain high-level</p> <p>3 moments and then you create -- compute the</p> <p>4 eigenvectors of certain matrices that are created --</p> <p>5 (Reporter seeks clarification.)</p> <p>6 A. Eigenvectors, e-i-g-e -- i-n -- to compute</p> <p>7 the eigenvectors of certain matrices. And that</p> <p>8 would give you translation and rotation and</p> <p>9 variance.</p> <p>10 Q. And so after the Exhibit 3 1995 IEEE</p> <p>11 article, did that methodology change to compute the</p> <p>12 distance for shape?</p> <p>13 A. I don't recall.</p> <p>14 Q. So the methodology for shape that you just</p> <p>15 described using moment calculations, that is</p> <p>16 different from what is described in the 1993 article</p> <p>17 for weighted Euclidean distance?</p> <p>18 A. We still might have used weighted</p> <p>19 Euclidean distance when the underlying features are</p> <p>20 different.</p> <p>21 Q. Understood.</p> <p>22 And the underlying features are different</p> <p>23 in the sense that in the 1995 article you're using</p> <p>24 what features?</p> <p>25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment</p> <p>2 invariants.</p> <p>3 (Witness reviews document.)</p> <p>4 A. Is there any other papers that we have</p> <p>5 here?</p> <p>6 Q. Nope.</p> <p>7 A. Everything else is screenshots?</p> <p>8 MR. STRAUSSMAN: I don't think you introduced</p> <p>9 any other papers.</p> <p>10 THE WITNESS: I saw it earlier today.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. Why don't we do it this way. In terms of</p> <p>13 the feature calculations that were -- for shape on</p> <p>14 page IBM 900 of Exhibit 3 versus page --</p> <p>15 A. So if you look at 2393.</p> <p>16 Q. What page are you directing me to?</p> <p>17 A. 2393.</p> <p>18 Q. Okay.</p> <p>19 A. So it talks about the moment invariants as</p> <p>20 well.</p> <p>21 Q. Okay.</p> <p>22 A. These are those matrices that you compute</p> <p>23 eigenvectors of.</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Matrices that you compute eigenvectors of.</p>	
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)</p> <p>2 Q. I think the page you may be looking for is</p> <p>3 IBM 900 on the left side.</p> <p>4 (Witness reviews document.)</p> <p>5 A. What else do we have here?</p> <p>6 Q. So if you'll look at -- if you'll -- if</p> <p>7 you'll compare page IBM 900 from Exhibit 3 to page</p> <p>8 IBM 2393 from Exhibit 2, those are the descriptions</p> <p>9 in both articles about the features that are</p> <p>10 calculated.</p> <p>11 A. I'm trying to remember what --</p> <p>12 MR. STRAUSSMAN: Can you direct him a little</p> <p>13 closer?</p> <p>14 BY MR. EDWARDS:</p> <p>15 Q. Can I show you? Do you mind?</p> <p>16 I believe this is what you're looking for.</p> <p>17 So if you look right here (indicating).</p> <p>18 (Witness reviews document.)</p> <p>19 A. That's the same as this one (indicating).</p> <p>20 We had another -- there's another discussion about</p> <p>21 moments.</p> <p>22 Q. So if you look at -- under "Shape</p> <p>23 features" at 2393, right there, where you're looking</p> <p>24 at --</p> <p>25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment</p> <p>2 invariants in the 1993 SPIE article?</p> <p>3 A. Correct.</p> <p>4 Q. Right. And then if you go to the IEEE</p> <p>5 article that you primarily co-authored, on page 900,</p> <p>6 it refers to shape queries using area, circularity,</p> <p>7 eccentricity, major-axis direction and features</p> <p>8 derived from the object moments.</p> <p>9 A. Right.</p> <p>10 Q. Is that the same thing as algebraic moment</p> <p>11 invariants?</p> <p>12 A. Right.</p> <p>13 Q. So it looks like the methodologies are the</p> <p>14 same for the features that are extracted between the</p> <p>15 papers; is that right?</p> <p>16 A. I thought one paper had algebraic moments</p> <p>17 and one had turning angle. Maybe they both had</p> <p>18 turning angle.</p> <p>19 (Reporter seeks clarification.)</p> <p>20 A. Turning angle. Algebraic moments.</p> <p>21 Turning angles.</p> <p>22 Q. The 1993 paper refers to algebraic moment</p> <p>23 invariants. The IEEE paper, on IBM 900, refers to</p> <p>24 features derived from object moments.</p> <p>25 Are those the same thing?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.</p> <p>2 Q. Okay. And so turning angles, which you've</p> <p>3 previously testified on, do you think that</p> <p>4 calculating shape features based on turning angles</p> <p>5 came after these papers?</p> <p>6 A. No. They're mentioned in these papers.</p> <p>7 Q. Okay. So they're included in these</p> <p>8 papers?</p> <p>9 A. Yes.</p> <p>10 Q. And so any distance measurement using</p> <p>11 weighted Euclidean distance would have taken into</p> <p>12 account turning angles?</p> <p>13 A. As a feature, yeah. Yes.</p> <p>14 Q. For both -- for both papers?</p> <p>15 A. For both papers.</p> <p>16 Q. Okay. Let's talk about sketch, which</p> <p>17 is -- if you'll just stick with 2395, which is</p> <p>18 Exhibit 2.</p> <p>19 MR. STRAUSSMAN: Can you direct him?</p> <p>20 THE WITNESS: I found it.</p> <p>21 MR. STRAUSSMAN: Okay.</p> <p>22 (Witness reviews document.)</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Let me know when you're finished reading</p> <p>25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in the --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p>16 Q. Okay. So the results of the query -- so</p> <p>17 we talked about before that the results of the</p> <p>18 queries display thumbnails of the database images</p> <p>19 based on similarity of which they match; correct?</p> <p>20 A. Correct.</p> <p>21 Q. And then those thumbnails can provide</p> <p>22 links to the original image or, if it was an</p> <p>23 r-frame, it could be -- you could provide a link to</p> <p>24 the video; correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.</p> <p>2 Q. For sketch, the similarity between the</p> <p>3 query image and the database image uses an algorithm</p> <p>4 that performs logical binary correlation of the</p> <p>5 binary image?</p> <p>6 A. Yes.</p> <p>7 Q. Are there any other details you recall for</p> <p>8 the sketch comparison beyond what's disclosed in</p> <p>9 this paragraph on IBM 2395?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Do you recall the methodology for</p> <p>12 determining similarity of the input image and the</p> <p>13 database image for sketch changing after this</p> <p>14 article?</p> <p>15 A. Not that I recall.</p> <p>16 Q. So if you go to the next page,</p> <p>17 Mr. Flickner, which is 2396, the Section 4.2 talks</p> <p>18 about performing queries.</p> <p>19 A. Um-hum.</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links</p> <p>2 to information about the image that was associated</p> <p>3 with the image in the database?</p> <p>4 A. Yes.</p> <p>5 Q. And, again, that can be that -- whatever</p> <p>6 information that the user inputted or was associated</p> <p>7 with the image from the source?</p> <p>8 A. Yes.</p> <p>9 Q. Could the results also display a matching</p> <p>10 score so the user could see how well the particular</p> <p>11 result matched to the -- to the query image?</p> <p>12 A. It could.</p> <p>13 Q. Okay.</p> <p>14 MR. EDWARDS: I'm going to hand you the next</p> <p>15 exhibit, Mr. Flickner.</p> <p>16 (Deposition Exhibit 10 was marked.)</p> <p>17 MR. EDWARDS: Handing you what's been marked as</p> <p>18 Exhibit 10.</p> <p>19 For the record, it's IBM Bates Nos. 002418</p> <p>20 to 2430.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. The title of this article is "Updates to</p> <p>23 the QBIC system."</p> <p>24 Do you see that?</p> <p>25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?                  2 A. Yes.                  3 Q. You are listed as a co-author of this                  4 article; is that correct?                  5 A. Yes.                  6 Q. And it is a paper that is published in the                  7 SPIE; correct?                  8 A. Correct.                  9 Q. In 1997; correct?                  10 A. Yes. It was 1997 or 1998.                  11 Q. No later than 1998; correct?                  12 A. Correct.                  13 Q. So just want to kind of orient you to the                  14 first page, which is IBM 2419.                  15 A. It's '98 because '97 is a different paper.                  16 Q. Well, if you turn the page, look at the                  17 footer on the right-hand side.                  18 Are you familiar that SPIE usually                  19 includes footers with the volume and the date at the                  20 bottom?                  21 A. Yeah.                  22 Q. And if you look at the footer kind of                  23 towards the right it says -786X-97-\$10 [sic]?                  24 A. Yeah.                  25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?                  2 A. Yep.                  3 Q. Okay. So let's -- I'm going to have you                  4 jump around, so I apologize in advance. Let's go to                  5 the -- kind of the back, IBM 2428.                  6 A. Okay.                  7 Q. Is that example of the stamps demo that                  8 was available on IBM's website?                  9 A. Yes.                  10 Q. All right. And if you look at the top in                  11 the location URL it has the almaden.ibm website                  12 address; correct?                  13 A. Correct.                  14 Q. All right. Let's flip forward to 2429.                  15 And is 2429 a screenshot of a trademark                  16 demo that was also available in the Almaden --                  17 excuse me -- almaden.ibm website?                  18 A. Yes.                  19 Q. Okay. And that demo looks like the                  20 trademark query is based on shape; is that right?                  21 A. It uses shape as one similarity feature.                  22 Q. Right. So the trademarks are converted to                  23 a binary image, like we talked before -- talked                  24 about before, and then they're -- the matching                  25 process is done based on those binary images?</p>
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the                  2 conference was in '98.                  3 Q. Submission was in '97. So the paper was                  4 published in '97 and then the conference you                  5 presented it at was in 1998?                  6 A. That's possible.                  7 Q. Do you recall presenting this paper at a                  8 conference in 1998?                  9 A. No, I don't.                  10 Q. So the first page refers to the Photonics                  11 West 1999 -- excuse me. Photonics West 1998                  12 Electronic Imaging Conference in San Jose.                  13 Do you recall attending that conference?                  14 A. It's likely I did, but I don't recall.                  15 Q. Okay. But you would agree with me this                  16 paper was made available at least as early as 1998;                  17 correct?                  18 A. Yes.                  19 Q. Okay. So the first page, IBM 2419. Under                  20 "Introduction," at the time of this paper it says,                  21 last line on the first paragraph, "Several online                  22 demos of QBIC are available at                  23 <a href="http://www.qbic.almaden.ibm.com">http://www.qbic.almaden.ibm.com</a>."                  24 Do you see that?                  25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.                  2 Q. Okay. And here we're showing the query                  3 image is a -- is a heart -- a heart pattern with                  4 Love's next to it. It's in the top part of the                  5 screenshot.                  6 A. Yep.                  7 Q. And the results are shown below that under                  8 "Shapes judged to be most similar"; is that right?                  9 A. Correct.                  10 Q. Okay. And the results also show                  11 underneath each one the trademark number followed by                  12 matching score after the colon.                  13 Do you see that?                  14 A. Yes.                  15 Q. And this is -- is this an example of what                  16 you told me before, that matching scores could be                  17 presented to the user?                  18 A. Yes.                  19 Q. And so is it the lower the score, the                  20 closer the match; is that correct?                  21 A. Typically, yes.                  22 Q. Okay. So 39 would be the -- so the first                  23 image at the top left is a 39, the one next to it is                  24 a 46, so the 39 would be a closer match than the 46;                  25 correct?</p>

		<p><i>Id.</i> at 174–182</p> <table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> </td> <td style="width: 50%; vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> </td> </tr> <tr> <td style="vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p>	<p style="text-align: right; margin-bottom: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>
<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p>					
<p style="text-align: right; margin-bottom: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: It points to the file that's the                  4 QBIC catalog.                  5 BY MR. EDWARDS:                  6 Q. Can you walk us through that one more                  7 time? And just be a little bit louder, sorry.                  8 MR. HANSEN: Same objection.                  9 THE WITNESS: So the QBIC catalog is a set of                  10 files that hold data about visual features in the                  11 image.                  12 (Reporter seeks clarification.)                  13 THE WITNESS: Visual features. The image                  14 extender lets you search against that database,                  15 against that object.                  16 BY MR. EDWARDS:                  17 Q. The image extender lets you search against                  18 that catalog, the name of that catalog?                  19 A. The catalog, yeah.                  20 Q. Okay. And it does so by using a pointer                  21 from the handle in the table?                  22 MR. HANSEN: Objection; lacks foundation.                  23 THE WITNESS: Correct.                  24 BY MR. EDWARDS:                  25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold                  2 data for the following image features: Average                  3 color, Histogram color, Positional color and                  4 Texture."                  5 Is that right?                  6 A. Yep.                  7 Q. Okay. We spoke about average color,                  8 histogram color and texture; correct?                  9 A. Right.                  10 Q. What is positional color?                  11 A. We talked about it briefly. It's color in                  12 particular locations in the image.                  13 Q. Ah. Understood.                  14 That is -- that is similar to L in the                  15 demo that we looked at, which is called color                  16 layout.                  17 A. Okay, yes.                  18 Q. Is that correct?                  19 A. I don't remember if it's called L. Sounds                  20 right.                  21 Q. If you look at --                  22 MR. EDWARDS: If you can show -- give him                  23 Exhibit 6.                  24 THE WITNESS: Oh, this L. Yes.                  25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.                  3 MR. HANSEN: Objection; lacks foundation, calls                  4 for speculation.                  5 MR. EDWARDS: You can put that enormous exhibit                  6 aside.                  7 THE WITNESS: Test 1, 2, 3.                  8 BY MR. EDWARDS:                  9 Q. Go back to Exhibit 3, please. If you                  10 could turn to the page Bates-labeled IBM 894 with                  11 the architecture picture.                  12 A. Okay.                  13 Q. So I just -- I just want to kind of walk                  14 the -- through this architecture, Mr. Flickner. But                  15 as a high level, I just want to understand, is                  16 this -- is this a high-level architecture that would                  17 generally be used for any implementation of QBIC?                  18 A. Yes.                  19 Q. All right. So first step is you submit                  20 still images or r-frames for feature extraction; is                  21 that correct?                  22 A. Correct.                  23 Q. Okay. Features are extracted, such as                  24 color, texture, shape, sketch and text; correct?                  25 A. Location, yep.</p>

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p style="text-align: right;">Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference																																					
		<p style="text-align: right;"><b>Data structures</b></p> <p><b>Handles</b></p> <p>When you store an image, audio, or video object in a user table, the object is not actually stored in the table. Instead, an extender creates a character string called a <b>handle</b> to represent the object, and stores the handle in the table. The extender stores the object in an administrative support table, or stores a file identifier in an administrative support table if you keep the content of the object in a file. It also stores the object's attributes and handle in administrative support tables. In this way, the extender can link the handle stored in a user table with the object information stored in the administrative support tables. Figure 8 illustrates the information stored for two images in a user table.</p> <p>User Table</p> <table border="1" data-bbox="961 578 1218 667"> <thead> <tr> <th>ID</th> <th>Name</th> <th>Picture</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> <td>Handle 1</td> </tr> <tr> <td></td> <td></td> <td>Handle 2</td> </tr> </tbody> </table> <p>Administrative Support Tables</p> <table border="1" data-bbox="961 711 1373 813"> <thead> <tr> <th colspan="3">Common Attributes</th> </tr> <tr> <th>Handle</th> <th>Importer</th> <th>Updater</th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> </tr> </tbody> </table> <table border="1" data-bbox="961 813 1346 922"> <thead> <tr> <th colspan="4">Unique Attributes</th> </tr> <tr> <th>Handle</th> <th>Width</th> <th>Height</th> <th>Numcolors</th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> <td></td> </tr> </tbody> </table>  <p>The diagram shows arrows pointing from the 'Handle' column of the 'Common Attributes' table to a cloud labeled 'Blob', and from the 'Handle' column of the 'Unique Attributes' table to a cylinder labeled 'File Server'.</p> <p><i>Figure 8. Handles</i></p> <p><b>QBIC catalogs</b></p> <p>A <b>QBIC catalog</b> is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.</p> <p>You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p style="text-align: right;">Chapter 2. *Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the</p> <p>20 IBM® DB2® Universal Database: Image, Audio, and Video Extenders <span style="float: right;">IBM 000040</span></p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot catalog file name</li> <li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li> <li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li> <li>• Shot number</li> <li>• Starting frame number</li> <li>• Ending frame number</li> <li>• Representative frame number</li> <li>• Name of a file that contains the contents of the representative frame</li> </ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot handle</li> <li>• Video table name</li> </ul> <p style="text-align: right;">Chapter 2. DB2 extender concepts 21                  IBM 000041</p> <p>IBM0002263 at 226</p>

Nantworks, LLC v. Bank of America Corporation

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>Description</b></p> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <p style="text-align: center;"><b>Image Classification</b></p> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <p style="text-align: center;"><b>Image Query</b></p> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <p style="text-align: center;"><b>Image Formats</b></p> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCX</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <p style="text-align: center;"><b>Product Positioning</b></p> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="text-align: center;">295-042 -2-</p> <p style="text-align: right;">IBM 0002264</p>

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>7 Q. (By Mr. Dang) Suppose you search for a              8 set of features or you search using a query image              9 in this demonstration, what would the system do?              10 MS. HAYDEN: Objection. Foundation.              11 THE DEPONENT: The system would              12 compute -- in the query image case, the system              13 would compute the features on that -- that image              14 and then compute the distance associated with each              15 one of the images in the database.              16 Q. (By Mr. Dang) Were there any              17 circumstances under which the system would not              18 compute the distance for every image in the              19 database during a search?              20 A. If there was a text filter on it, we              21 didn't.              22 Q. Did the Fine Arts Museum of San Francisco</p> <hr/> <p style="text-align: right;">Page 88</p> <p>1 similarly use the QBIC system?              2 A. They did.              3 Q. When did they use the QBIC system?              4 A. It was in the '90s, if I recall right.              5 Q. How did they use the QBIC system?              6 A. Similar to the way Davis did, as I              7 recall.              8 Q. What sorts of images were they including              9 in their database?              10 A. Paintings.</p> <p>Flickner Depo at 142</p>

		<p>1 Q. Do you recall what type of indexing was                  2 used in the database associated with the 1998 demo                  3 version?                  4 A. Most likely, it was just a linear index.                  5 Q. And what do you mean by linear index?                  6 A. You just -- you -- you compute the                  7 features on every record in the database -- you                  8 compare the features against every record in the                  9 database.</p> <p>Flickner Depo at 168-169</p> <p>16 Q. What do you mean that it lets you access                  17 the -- the neighbors to your query point?                  18 A. So your incoming query -- say it's an                  19 image -- you compute a feature vector. And then                  20 you compute some orthogonal transform of the                  21 feature vector such as a wave transform or                  22 wavelets. There's a variety --</p> <p style="text-align: right;">Page 168</p> <hr/> <p>1 MR. DeCLERCK: Slow down, please.                  2 THE DEPONENT: Wavelets, other types of                  3 features that do dimensionality reduction. And                  4 then you put the reduced dimensionality feature                  5 vector into the database, and then the database                  6 queries and R*-tree to be able to get points nearby                  7 to the -- in the lower dimensional space.</p>

		16 Q. And when it refers to "text information," 17 what is it referring to? 18 A. Anything that could be extracted in the 19 context of how the image was annotated. 20 Q. And when you say "annotated," annotated by 21 the user who was populating the database? 22 A. Could be. 23 Q. What else could it be? 24 A. It could be the supplier of the data. 25 Q. Okay. So you may have some annotations

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

		contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.
[1F]	receiving, via an address, first target object information associated with the first target object,	<p>QBIC discloses receiving, via an address, first target object information associated with the first target object.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2391</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93:</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <math>m</math> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[i,j]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}</math>, <math>M_{[2,3]} \times M_{[3,2]}</math>, <math>M_{[3,3]}</math>, <math>M_{[3,4]} \times M_{[4,3]}</math>, <math>M_{[4,4]}</math>, <math>M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size <math>64 \times 64</math>. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

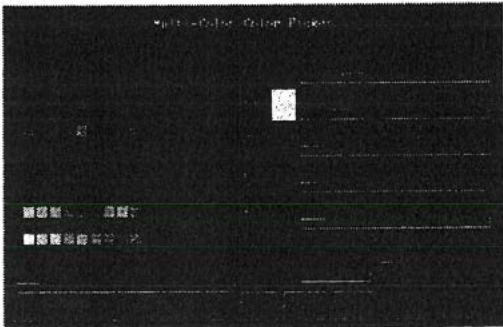

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Nantworks, LLC v. Bank of America Corporation

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2395:</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <math>R^*</math>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>IBM0002390 at 2396-98</p>

		<p><b>4.1. Object/element identification</b></p> <p>Our user interface for object identification, shown in figure 4, allows for user assisted object identification. This interface is made up of four parts (listed from top to bottom): the window menu, the tool selection buttons, the image display area, and the object entry area. From the File menu selection the user has the ability to save the current image and objects and load another image. The Options menu contains selections for tuning panels for Snakes, Flood-Fill, as well as a Zoom selection, useful for working with very large or small images. There are nine drawing tools provided by the interface: Polygon, Rectangle, Ellipse, Paint Brush, Eraser, Line Draw, Object Move, Fill Area, Snake Outline. For example the Polygon tool allows the user to click or drag around bounding edges of the object to be outlined, this can then be refined by the snakes method providing a shrink-wrap effect.</p> <p>Before using any tool on an image the user must first click New to create an object entry (Two shown on bottom of figure 4). The user can then type any text associated with the object to be outlined, or can do this after outlining the object. The user then selected an outlining tool and defines the “mask”. Multiple tools can be used and the last change can be removed with the Undo button or all changes removed with the Clear button.</p> <p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (R, G, B) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to nth best match (n is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at Figs. 7–9</p>

		<p>Query by Image and Video Content: The QBIC System (IBM 0000893–902): “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

		<p><i>Id.</i> at 68–72</p> <p>22 Q. Okay. And in what form would those                  23 results be displayed to me? For images would they                  24 be displayed as a thumbnail?                  25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those                  2 be displayed to you?                  3 A. It could be as a thumbnail or as a short                  4 video clip or as a single representative frame.                  5 Q. Okay. So they could be -- so for a video,                  6 there's a video that matched the image query of an                  7 r-frame, the results I could get back could include                  8 three things. It could be a still image, it could                  9 be a thumbnail, or it could be an r-frame                  10 representation?                  11 A. R-frame, I think, is representative frame.                  12 So it was a key frame in that video sequence,                  13 summary frame.                  14 Q. Once I ran a query on an r-frame; right?                  15 Well, let's stop there.                  16 If I run a query on still images,                  17 typically the results I would get back are                  18 thumbnails that are most similar to the                  19 characteristics which I queried from the query                  20 image; right?                  21 A. You could get thumbnails back. You could                  22 also get the full-sized image back.                  23 Q. Okay.                  24 A. Thumbnail is a tool for helping you return                  25 lots of results and quickly scan it.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

Element	'278 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I                  2 have to click on the thumbnail in order to bring up                  3 the full-sized image?                  4 A. You could.                  5 Q. Otherwise I could automatically receive                  6 the full-sized image as part of the result?                  7 A. You could.                  8 Q. Okay. So walk through that process if I'm                  9 using an r-frame of a video. If I do a -- if I run                  10 a query on an r-frame of a video as a -- an image                  11 query, how could I get the results back?                  12 MR. HANSEN: Objection; vague and ambiguous.                  13 BY MR. EDWARDS:                  14 Q. In what form would I get the results back?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: You could get back the still                  17 r-frame, representative frame, you could get back                  18 the thumbnail, or you could get back the entire                  19 video clip that that r-frame represents, a few                  20 frames.                  21 BY MR. EDWARDS:                  22 Q. If I received a thumbnail or the r-frame,                  23 would there be some sort of link I could click on to                  24 get the underlying full video?                  25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic                  2 units initially returned in a video query."                  3 Meaning the r-frames?                  4 A. Correct.                  5 Q. "For example, in a query for shots that                  6 are dominantly red, a set of r-frames will be                  7 displayed. To see the actual video shot, the user                  8 clicks on the displayed r-frame icon."                  9 A. Yep.                  10 Q. And that was one of the ways you were                  11 describing that the results of a r-frame query would                  12 be returned to the user?                  13 A. Right.                  14 Q. Do you know if that was the preferred way                  15 that was used in demos in commercial applications?                  16 MR. HANSEN: Objection; vague and ambiguous,                  17 lacks foundation.                  18 MR. STRAUSSMAN: You can answer.                  19 THE WITNESS: I don't know.                  20 BY MR. EDWARDS:                  21 Q. But, Mr. Flickner, this -- generally this                  22 article represents the status of the QBIC technology                  23 as of the date of this publication, which is                  24 September 1995; is that right?                  25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.                  2 THE WITNESS: As I recall -- I'm not sure                  3 definitely, but, yes, this is -- you could do that.                  4 BY MR. EDWARDS:                  5 Q. So let's go to page IBM 898.                  6 So if you'll take -- just read that                  7 paragraph that starts with the header                  8 "Representative Frame Generation."                  9 MR. STRAUSSMAN: And if you need to read                  10 anything else to put it in context, feel free to do                  11 so.                  12 THE WITNESS: Okay.                  13 (Witness reviews document.)                  14 THE WITNESS: So what was your question, again?                  15 BY MR. EDWARDS:                  16 Q. If you go to the sentence that says,                  17 "First" -- it's the second sentence in that                  18 paragraph. It says, "First, during database                  19 population, r-frames are treated as still images."                  20 See that?                  21 A. Yeah.                  22 Q. And that's what you told me earlier;                  23 correct?                  24 A. Yeah.                  25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --                  2 Q. Okay.                  3 A. -- there's an editorial process.                  4 Q. Say that last part?                  5 A. There's an editorial process. You submit                  6 it, they edit and make changes and eventually it                  7 appears.                  8 Q. Right. So what you're saying is there's                  9 some lag between the time that you wrote the article                  10 and the time it was published?                  11 A. Yeah.                  12 Q. So this article -- but this article                  13 represents the state of the QBIC technology at least                  14 as of September 1995?                  15 A. Yeah. Yes.                  16 Q. And then let's go to IBM 900.                  17 And take your time to orient yourself on                  18 that page, but what I really want to ask you about                  19 is the last paragraph on the left-hand column going                  20 up to the top of the right-hand column.                  21 A. Yep.                  22 Q. So it says this paper describes [as read],                  23 "a prototype system that uses image and video                  24 content as the basis for retrievals."                  25 Is that right?</p>

			<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p>	
			<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

It stores and protects traditional numeric and character data, as well as large, complex objects (LOBs). DB2 extenders help you exploit DB2’s object-relational features. The extenders define distinct data types and special functions for image, audio, video, and text objects. ... Because of that, the extenders give your applications a single point of access to any or all of these types of data, along with traditional numeric and character data.” <i>Id.</i> at p. 3.</p> <p>“A trigger defines a set of actions that are activated by a change to a table. Triggers can be used to perform actions such as validating input data, automatically generating a value for a newly inserted row, reading from other tables for cross-referencing purposes, or writing to other tables for auditing purposes. Triggers are often used for integrity checking or to enforce business rules.” <i>Id.</i> at 16–17.</p> <p>“When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source. You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image</p>

**3. Claim 4**

Claim	'278 Claim Recitation	Exemplary Citations in Reference
4	The method of claim 3, wherein the image includes a representation of the code.	<p>QBIC discloses the method of claim 3, wherein the image includes a representation of the code.</p> <p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.

In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.

Figure 1: Original image, approximate user outline, and automatically refined outline of sun.

Query by Image and Video Content: The QBIC System (IBM 0000893–902):  
“INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” *Id.* at p. 8.

Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):  
“DB2 (DB2) Universal Database (UDB) is a powerful, object-relational database manager. It stores and protects traditional numeric and character data, as well as large, complex objects (LOBs). DB2 extenders help you exploit DB2 ’s object-relational features. The extenders define distinct data

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p>types and special functions for image, audio, video, and text objects. ... Because of that, the extenders give your applications a single point of access to any or all of these types of data, along with traditional numeric and character data.” <i>Id.</i> at p. 3.</p> <p>“A trigger defines a set of actions that are activated by a change to a table. Triggers can be used to perform actions such as validating input data, automatically generating a value for a newly inserted row, reading from other tables for cross-referencing purposes, or writing to other tables for auditing purposes. Triggers are often used for integrity checking or to enforce business rules.” <i>Id.</i> at 16–17.</p> <p>Managing Enterprise Information Portal (IBM 000777–880): “Many paper-intensive enterprises, such as insurance companies and financial institutions, administer large volumes of business-related content. The need for an enterprise solution for managing and accessing business information spans many industries. A content server is a software system that stores multimedia, business forms, documents, and related data, along with metadata that allows employees to process and work with the content.” <i>Id.</i> at p. 3.</p> <p>“The image search server uses IBM’s QBIC (query by image content) technology to help you search for objects by certain visual properties, such as color and texture. The image search server analyzes images and stores the image information in a database. Then users can run image queries, which use the visual properties of images, to match colors, textures, and their positions without describing them in words. You can combine content-based queries with text and keyword searches for more powerful retrieval of image and multimedia data.” <i>Id.</i> at p. 63.</p> <p>Flickner Depo at 185, 217.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

4. Claim 5

Claim	'278 Claim Recitation	Exemplary Citations in Reference
5	<p>The method of claim 3, further comprising detecting whether there is a match within a specified tolerance and returning a message indicating the absence of a match within a specified tolerance.</p>	<p>QBIC discloses the method of claim 3, further comprising detecting whether there is a match within a specified tolerance and returning a message indicating the absence of a match within a specified tolerance.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2397-98</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <i>L</i> component of an (<i>L, a, b</i>) query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <i>X</i> be the query histogram and <i>Y</i> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <i>Z</i>. Then the similarity between <i>X</i> and <i>Y</i> is given by <math>\ Z\  = Z^T A Z</math>, where <i>A</i> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <i>c<sub>i</sub></i> and <i>c<sub>j</sub></i> are the <i>i</i>th and <i>j</i>th colors in the color histograms, and <i>d(c<sub>i</sub>, c<sub>j</sub>)</i> is the <i>MTM</i> color distance, and <i>d<sub>max</sub></i> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <i>X</i> and <i>Y</i>, weighted by <i>A</i>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 118</p> <p>1 Do you see that?                  2 A. Yeah.                  3 Q. And then it describes different icons: I,                  4 C, L, T and S.                  5 Do you see that?                  6 A. Um-hum.                  7 Q. Are those icons similar to the QBIC demo                  8 that you hosted on the IBM's website?                  9 A. I don't recall the specific details. Most                  10 likely, yes.                  11 Q. Okay. So it says, "Click I to view the                  12 full image."                  13 Do you see that?                  14 A. Um-hum.                  15 Q. Was there a similar capability on the demo                  16 that was hosted on IBM's website?                  17 A. I don't recall.                  18 Q. So do you know what happens if you clicked                  19 I?                  20 A. Yeah, you -- pops the window up and you                  21 see the full image.                  22 Q. Okay.                  23 (Reporter seeks clarification.)                  24 A. It pops the window up.                  25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.                  2 Q. Does that correspond to the four features                  3 we looked at earlier, so for -- well, strike that.                  4 For color earlier we looked at two                  5 different flavors. We looked at average color and                  6 we looked at color histogram. So you said --                  7 A. Right.                  8 Q. -- C was color histogram.                  9 Does L correspond to average color or                  10 something different?                  11 A. Well, L has space embedded into it. So                  12 where the color appears in the image matters.                  13 Q. Okay.                  14 A. So C would be the whole image, what was                  15 the color percentage, and L would be I want a                  16 certain percentage in this region and a certain                  17 percentage in this region.                  18 Q. Okay. So what -- if you recall, so to                  19 calculate a color layout feature, do you recall the                  20 details of how that was done?                  21 MR. HANSEN: Objection; foundation.                  22 THE WITNESS: I don't recall.                  23 BY MR. EDWARDS:                  24 Q. Do you recall if that used -- for the                  25 color component, do you recall if that used</p>
		<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such                  2 a...                  3 MR. STRAUSSMAN: You got to speak up.                  4 BY MR. EDWARDS:                  5 Q. That's how you implemented what?                  6 A. You implement what the instructions say.                  7 Q. Okay. Is that a similar implementation                  8 for the other demos that you worked on?                  9 A. Most likely, yes.                  10 Q. Okay. So you click on I and then I would                  11 take you to a link that showed the full image?                  12 A. Um-hum.                  13 Q. Okay. And it says, "Click C to search                  14 images with similar color percentage."                  15 Do you see that?                  16 A. Yep.                  17 Q. Is that the color histogram?                  18 A. Most likely.                  19 Q. Okay. And it says, "Click L to search                  20 images with similar color layout."                  21 What does "color layout" mean?                  22 A. So now you're asking for color in                  23 different positions of the image.                  24 Q. Okay.                  25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?                  2 A. Average color or histogram --                  3 (Reporter seeks clarification.)                  4 MR. HANSEN: Objection; foundation.                  5 THE WITNESS: Average color or histogram color.                  6 So histogram as a space a position in the image.                  7 BY MR. EDWARDS:                  8 Q. Right. And color layout, is that                  9 something that you recall being developed by the                  10 QBIC team as a feature that can be extracted?                  11 A. Right.                  12 Q. Okay. And so it is color in a specific                  13 position?                  14 A. Yes.                  15 Q. Do you recall any of the algorithms that                  16 were used to calculate that?                  17 A. I think we were using color histogram.                  18 Q. Color histogram. Okay. And then how                  19 would you calculate the position aspect of it?                  20 MR. HANSEN: Objection; lacks foundation.                  21 THE WITNESS: We had -- the sketch tools would                  22 let you select a region and paint a color. And then                  23 you'd paint a crude map and then you would go search                  24 for color images that have the blue sky and the                  25 white sand. That's a different query than if you</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then          2 you're looking for blue water, white sand.          3 BY MR. EDWARDS:          4 Q. Do you recall what the methodologies          5 used -- that were used to calculate the orientation          6 of those colors in the image?          7 MR. HANSEN: Objection; lacks foundation.          8 THE WITNESS: There's no orientation per se.          9 It's just position.          10 BY MR. EDWARDS:          11 Q. Well, then position. Do you recall what          12 the methodologies are to calculate the position?          13 MR. HANSEN: Same objection.          14 THE WITNESS: Position is something the user          15 inputs.          16 BY MR. EDWARDS:          17 Q. Something you use what?          18 A. The user had to input.          19 Q. Okay. And then let's move on to the next          20 one, T. It says, "Click T to search images with          21 similar global texture."          22 A. Yeah.          23 Q. Do you recall, in your work on the QBIC          24 project, a feature called global texture that could          25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?          2 A. G-a-b-o-r.          3 Q. So switch over and look at the second page          4 of this Exhibit 6.          5 So -- well, first back -- go back to -- go          6 back to the first page. If you see on the left-hand          7 side it says, "Goto: IBM Image Search Demo," and a          8 little finger there is clicking it.          9 You see it's in red?          10 A. Yeah.          11 Q. Okay. So that's clicking on that link.          12 And then the second page is going to the IBM image          13 search demo.          14 A. Okay.          15 Q. Okay? On the second page it is showing          16 thumbnails with the different icons that we just          17 walked through, I, C, L, T, S, on each of those          18 icons.          19 Do you see that?          20 A. Yep.          21 Q. Do you recognize this as a similar layout          22 to the QBIC demos you hosted in the '90s?          23 A. I don't.          24 Q. You don't?          25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .          2 Q. Say again?          3 A. I missed one of your words. A feature          4 called what?          5 Q. I said do you recall in your work on the          6 QBIC project a feature called global texture that          7 was extracted from the image?          8 A. Yes.          9 Q. Okay. Is that -- is that akin to texture          10 that we looked at earlier?          11 A. Yes.          12 Q. Okay. And the last one is S. It's,          13 "Search images with special multipass filter."          14 Do you recall, in your work on the QBIC          15 project, being able to calculate a feature called          16 multipass filter?          17 A. Probably Gabor functions.          18 Q. Say again?          19 A. Gabor functions.          20 Q. One more time and louder.          21 A. Gabor functions.          22 Q. Gabor functions. Okay. What are Gabor          23 functions?          24 A. Gabor functions are a way of producing          25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM          2 website that was the AIX operating system in          3 Exhibit 3, that did not have a similar thumbnail          4 layout like this?          5 A. A thumbnail, yes. I don't recall it had          6 the buttons, the I, C, L, T, S.          7 Q. You don't recall it had all the buttons or          8 some of the buttons?          9 A. All the buttons.          10 Q. Okay. So you don't recall that it had any          11 buttons?          12 A. I don't -- yeah. I don't recall.          13 Q. It could have, it couldn't have, you just          14 don't remember?          15 A. I just don't remember, yeah.          16 Q. Okay. But the one that you hosted on          17 IBM's website, it did have thumbnails in a similar          18 format here?          19 A. Yeah, it had thumbnails.          20 Q. And these thumbnails represent the images          21 that are stored in the database?          22 A. Yes.          23 Q. Okay. Here, the 470 images would be          24 reflected at least -- one, two, three, four, five,          25 six, seven -- eight of them right here in this</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>
		<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 144</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on the Query by Image and Video Content (“QBIC”) System

		<p>17 Q. Okay. And you said the system determines 18 similarity based on some distance measure between 19 the extracted features in the image query versus the 20 stored image? 21 A. The features of the stored image. 22 Q. But it's a -- it's some sort of distance 23 measure? 24 A. Yes.</p> <p><i>Id.</i> at 317–322</p>	<p>22 Q. Okay. So for every commercial 23 implementation of QBIC as of the IEEE 1995 article 24 in Exhibit 3, those implementation calculated 25 features of a query image and stored image; is that</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

### **Exhibit F-31**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, CoolTown was made, known or used by others in the United States no later than July 10, 2000. *See generally* T. Kindberg et al., A Web-Based Nomadic Computing System; J. Barton et al., The Cooltown User Experience; cooltown developer’s network, coolbase overview; cooltown developer’s network, people, places, things: web presence for the real world. CoolTown is available as prior art at least under 35 U.S.C. § 102(a). On information and belief, HP was using CoolTown and made it available to the public in the United States by releasing the website on the Internet (and accessible to U.S. users) by at least March 2000, making the software available on the HP website by March 2000, and making available on the Internet (and accessible to U.S. users) the open source code, which reflects the functionality of CoolTown by at least March 2000. *See e.g.*, HP000043–044; HP000045–046; HP000060–061; *see also* <https://www.zdnet.com/article/hp-brings-open-source-to-cooltown/>. Therefore, HP Cooltown was at least known, used, and/or sold to the public by at least 2000. On information and belief, CoolTown is also available as prior art under 102(g). BofA is diligently investigating CoolTown and will supplement with additional information, if necessary.

As shown in the chart below, CoolTown anticipates asserted claims 1, 4, and 5 of the ’278 Patent. To the extent CoolTown is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent CoolTown is found not to anticipate any asserted claims or claim elements of the ’278 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 24:</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>3.4. Infrastructure for things; ChaiServer and eSquirt</b></p> <p>Given a URL from one of the lower-layer services, we</p>  <p><b>Figure 5. Devices (printer, light), with and without embedded web servers.</b></p> <p>Figure 5 shows interactions between two clients and their respective web devices. It shows a digital camera that interacts with a printer via HTTP operations on the printer's point of web presence. The URL for the printer resolves to its network address. The camera first interrogates the printer to find out the formats it accepts. The printer can supply this as an HTML page or as an XML document that describes it. Then the camera sends the image as, for example, JPEG encoded data. Figure 5 also shows lights connected to a home PC by a controller unit. The home PC acts as a gateway to the lighting unit. A remote user issues HTTP operations via a web browser on a PDA; the programs on the PC that handle HTTP operations directed to the light's URL manipulate the lighting unit accordingly.</p>

		<p>The CoolTown work is not on the devices or wireless communication layers, but rather on the layer of infrastructure that is needed to support nomadic users with portable devices. We work at the "web server" level and we see our work as extending web models to new arenas.</p> <p>As a consequence of the above assumptions, most of our demonstration scenarios use a sensing mechanism, like a barcode reader or a short-range networking subsystem such as infrared, combined with long-range or wired web access. The sensor is used to obtain addresses (URLs) to access web resources. So we imagine our nomadic users carrying devices like:</p> <ul style="list-style-type: none"> <li>• PDAs with 802.11 network access and barcode or other sensors, or</li> <li>• Cellular telephones with additional short-range networking, or</li> <li>• Cameras with short-range networks that interact with Internet-connected kiosks.</li> </ul> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 3</b></p> <p>Present-day users of portable wireless devices view them as either adjuncts to larger desktop or workstation computers or as portable communications devices (phones or for e-mail). We view them as portable viewers of web pages and as sources of content, or as clipboards for URLs pointing to discovered content. Then we add support for obtaining location-dependent web pages and for moving content between mobile and fixed but online devices. Figure 2 shows how this support is organized.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 3</b></p>

		<p><b>3. Sensing</b></p> <p>In this section, we describe the bottom layer of our infrastructure, which enables the user to acquire URLs from their surroundings or from the physical entities in their surroundings. An obvious mechanism, with equally obvious drawbacks, is to write the URL on a label and attach it to the object. The user reads the label and types the URL into their browser.</p> <p>Rather than being forced to use that cumbersome method, users should be able to identify conveniently what it is that interests them in their surroundings and obtain the corresponding URL <i>automatically</i>. To achieve this, their PDA is equipped with at least one short-range device that allows them to read URLs and other identifiers associated with places and individual objects in their surroundings, by pointing or positioning the device. We call this URL <i>sensing</i>.</p> <p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>∇ <i>IR &amp; RF</i>. The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>∇ <i>Barcodes</i>. Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>∇ <i>Electronic tags</i>. A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>∇ <i>Optical recognition</i>. The user's device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</b>                      In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 8</b>                      To accomplish direct content transfer we need only have a simple push interaction: the content source opens a connection to the sink and writes the content (See Figure 5a). The only agreement we need between sources and sinks is the format of the data. Many imaging devices support JPEG format: it serves as the common format for images today. Since devices may use other common formats and since formats do evolve, effective interaction requires some introductory content preceding the data that identifies its format. The format of this introductory or</p> <p><b>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 20:</b></p>

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user's client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be 'sensed' as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place's web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>

		 <p><b>Figure 4. Indirect sensing: the web presence for a painting.</b></p> <p>Barcodes can be used instead of an electronic tag.</p> <p>Figure 4 shows a different art gallery demonstrator in which a PDA client senses a painting’s tag. A correlated web page is resolved from the tag identifier and the client presents it to the user.</p> <p>We have produced a prototype implementation for sensing tagged things and displaying a corresponding context-dependent web page. The sensing device knows the URL of a <i>resolver</i>. When the client senses a tag, it sends the identifier to the resolver. If the resolver has an entry for the identifier, it sends back the corresponding URL. The user may choose a resolver that reflects his or her personal requirements, or those of a group of users with interests or tasks in common. For example, visitors to an art gallery could be offered resolvers that provide the URLs of pages in their native language, or pages provided by the art school at which they study.</p>

		<p>A Web-Based Nomadic Computing System (HP000074 – 87) at 10</p> <p><i>Other types of context</i></p> <p>The resolver technology that we have been developing also supports contexts that are not tied to any physical domain. An individual entity such as a painting may possess a point of web presence not only in the context of the gallery where it currently hangs, but also in a variety of virtual art catalogues. It may even have a point of web presence in a private context shared by a group of art students and teachers, which they use to provide comments for one another. That context could contain an entry for each painting in any gallery in the world that students in the class have found interesting. When a student looks up a painting's point of web presence in the context, they will find comments left on that page by other students in the class.</p> <p>Contexts have been established for published artifacts based on their 'distributed object identifier' [10], for products based on their UPC code, for articles in newspapers and magazines, and for artifacts in the office [29] and museums [24]. The research issue is how to choose the context (the resolver) for a given identifier so as to present appropriate resources, but to do so automatically wherever possible. Users require a choice, but a balance is needed between choice and ambiguity. The system must scale to trillions of points of web presence. At CoolTown, we are investigating resolver technologies that will support contexts shared between groups of individuals (the art class) or spanning organizations (the inventory context), while linking those contexts to more global ones where appropriate. Thus a printer's identifier could yield not only its pages within the host organization, but also pages from the manufacturer.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at Fig. 2</p>

The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display the corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard ‘sensing events’, bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in the current activity, so that users can ‘retrace their steps’.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b>          To get an idea of some of the issues in defining place contexts, imagine that Acme Software Inc. sets up a stand at the Wireless Web World exhibition (Figure 4). Acme has to define its own context within the exhibition, which it uses to provide information, printing, purchasing and other services to users who walk up to the stand. Visitors must be able to discover the Acme context when they walk up, distinguish it from that of neighboring exhibits, and, through their devices, these visitors must be able to browse and access the resources that Acme provides within that context. We are mainly interested here in resources that are based around the physical entities found at the exhibition stand. When the visitor reads a barcode attached, say, to a printer or a guest book on display, they are automatically shown the Acme web page offering them a service connected with it.</p>

The device runs a web browser, and one or more CoolTown applications. The latter are simple applications that obtain URLs and present them as links, using the standard browser to display corresponding web resources. As the figure shows, URLs and identifiers that are read by one or other of the sensing devices are multiplexed and announced within the device as standard 'sensing events', bearing the URL or other identifier and its source. The applications consume the events and handle them in various ways. All have a capacity for storing URLs and other identifiers as a record of what the user has physically encountered while engaged in the current activity, so that users can 'retrace their steps'.</p> <p data-bbox="848 1117 1688 1144"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 5</b></p> <p data-bbox="848 1146 1906 1308">One of those CoolTown applications provides indirect sensing. It can be configured to use any resolver of the user's choosing, but in particular it can automatically discover which is the local resolver when the user has designated which is the local context (see next section). When the user scans a tag such as a barcode, the application handles the sensing event by constructing a URN [3] from the identifier (if it is not in that form already). It uses the standard THHTTP protocol [8] to request the local resolver to turn the URN into the URL of a resource. This URL is then made available to the browser.</p> <p data-bbox="848 1349 1688 1377"><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b></p>

		<p><b>Discovery:</b> Discovery is the acquisition of contexts and resources within contexts. Places are discovered much the same way as individual physical objects, although they are typically extended and so may require several beacons or tags. Prominent “You Are Here” beacons or barcodes (or any other type of tag) attached to the Acme exhibition stand enable the user to pick up that place’s context. The user points the device at the beacon or scans the barcode. The result is the URL of the place: a set of web pages containing information about services that the user can browse on their device, and which devices can query.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) at 5</p> <p><b>2.4 The Common User Experience in Cooltown.</b></p> <p>The three examples above explore various aspects of web presence but they also show a common theme. The typical user experience we seek with web presence is that of collecting links to points of web presence as they are encountered in the physical world. One could even think of the physical world as a web page, with links at certain physical points. Of course the links are URLs presented on the user’s client device and the result of clicking on such a link will be a real web page, delivered to the user’s screen. The user can then travel through the virtual space of the web page with normal Web techniques or the user can travel through the physical space to find a different point of web presence. The user understands URLs as pointers to meta-information about objects at the same level that users of Web browsers now understand URLs as bookmarks for Web content. While this physical/virtual browsing is a typical scenario, we imagine other usage scenarios for web present things, in the same way that the Web supports many usage scenarios in addition to Web browsing.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p>

Element	'278 Claim Recitation	Exemplary Citations in Reference
		<p><b><i>Other types of context</i></b></p> <p>The resolver technology that we have been developing also supports contexts that are not tied to any physical domain. An individual entity such as a painting may possess a point of web presence not only in the context of the gallery where it currently hangs, but also in a variety of virtual art catalogues. It may even have a point of web presence in a private context shared by a group of art students and teachers, which they use to provide comments for one another. That context could contain an entry for each painting in any gallery in the world that students in the class have found interesting. When a student looks up a painting's point of web presence in the context, they will find comments left on that page by other students in the class.</p> <p>Contexts have been established for published artifacts based on their 'distributed object identifier' [10], for products based on their UPC code, for articles in newspapers and magazines, and for artifacts in the office [29] and museums [24]. The research issue is how to choose the context (the resolver) for a given identifier so as to present appropriate resources, but to do so automatically wherever possible. Users require a choice, but a balance is needed between choice and ambiguity. The system must scale to trillions of points of web presence. At CoolTown, we are investigating resolver technologies that will support contexts shared between groups of individuals (the art class) or spanning organizations (the inventory context), while linking those contexts to more global ones where appropriate. Thus a printer's identifier could yield not only its pages within the host organization, but also pages from the manufacturer.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at Fig. 2</p>

		<p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>• <i>IR &amp; RF.</i> The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>• <i>Barcodes.</i> Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>• <i>Electronic tags.</i> A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>• <i>Optical recognition.</i> The user’s device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p>In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p>Direct sensing is the most concrete: it requires no resolver. An advantage of indirect sensing is that the same identifier can be looked up in different resolvers with different, context-dependent results. For example, sensing a book’s ISBN barcode could lead to the local library’s entry for the book, if the resolver for the ISBN is the local</p> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

4	The method of claim 3, wherein the image includes a representation of the code.	<p>CoolTown discloses the method of claim 3, wherein the image includes a representation of the code.</p> <p>A Web-Based Nomadic Computing System at (HP000074 – 87) 3</p>  <p>Figure 3. A sketch of a PDA equipped for sensing URLs and identifiers.</p> <p>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

		<p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>• <i>IR &amp; RF.</i> The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>• <i>Barcodes.</i> Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>• <i>Electronic tags.</i> A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>• <i>Optical recognition.</i> The user's device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p>In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p>Direct sensing is the most concrete: it requires no resolver. An advantage of indirect sensing is that the same identifier can be looked up in different resolvers with different, context-dependent results. For example, sensing a book's ISBN barcode could lead to the local library's entry for the book, if the resolver for the ISBN is the local</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p> <p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

**Indirect sensing.** In the case of indirect sensing, the user’s client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be ‘sensed’ as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place’s web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.

We have been experimenting with indirect sensing where the sensed value is obtained from a *tag*. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.

**Figure 4. Indirect sensing: the web presence for a painting.**

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 9,031,278 based on Hewlett-Packard CoolTown System (“CoolTown”)

		<p>Barcodes can be used instead of an electronic tag.</p> <p>Figure 4 shows a different art gallery demonstrator in which a PDA client senses a painting’s tag. A correlated web page is resolved from the tag identifier and the client presents it to the user.</p> <p>We have produced a prototype implementation for sensing tagged things and displaying a corresponding context-dependent web page. The sensing device knows the URL of a <i>resolver</i>. When the client senses a tag, it sends the identifier to the resolver. If the resolver has an entry for the identifier, it sends back the corresponding URL. The user may choose a resolver that reflects his or her personal requirements, or those of a group of users with interests or tasks in common. For example, visitors to an art gallery could be offered resolvers that provide the URLs of pages in their native language, or pages provided by the art school at which they study.</p> <p>.....</p> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

5	The method of claim 3, further comprising detecting whether there is a match within a specified tolerance and returning a message indicating the absence of a match within a specified tolerance.	To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,881,529 based on  
U.S. Patent No. 6,947,517 to Rhoads (“Rhoads”)

### **Exhibit G-3**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Rhoads was filed on May 15, 2000, claiming the priority date of May 19, 1999. Rhoads published at least as of September 20, 2005, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Rhoads anticipates asserted claims 1, 4 and 20 of the ’529 Patent. To the extent Rhoads is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Rhoads is found not to anticipate any asserted claims or claim elements of the ’529 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

		<p>typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.”</p> <p>Rhoads at 3:52–60</p> <ul style="list-style-type: none"> <li>• “According to another aspect, the invention includes a method of interacting with a magazine using a computer, the computer including an internet web browser, the method including: (a) providing a peripheral device having a</li> </ul>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>terminals, such as cell phones (manufactured, e.g., by Motorola, Nokia, Qualcomm, and others). Such a phone can be equipped with a 1D or 2D image sensor, the output of which is applied to Bedoop decoding circuitry within the phone. This decoding circuitry can be the phone's main CPU, or can be a processing circuit dedicated to Bedoop functionality. (In this as in other embodiments, the decoding can be effected by dedicated hardware, by decoding software executing on a general purpose CPU, etc.)</p> <p>Cell phones are already equipped with numerous features that make them well suited for Bedoop operation. One is that cell phones typically include an LCD or similar screen for display of textual or graphic information, and additionally include buttons or other controls for selecting among menu options presented on the screen (e.g., by moving a cursor). Moreover, cell phones naturally include both audio input and output devices (i.e., microphone and speaker). Still further, the protocol by which cell phones transmit data includes data identifying the phone, so that such data need not be separately encoded. And finally, cell phones obviously provide ready links to remote computer systems. Collectively, these capabilities rival those of the most fully-equipped desktop computer system. Thus, essentially all of the applications detailed elsewhere in this specification can be implemented using cell phone Bedoop systems</p> <p>As with the other Bedoop systems, when Bedoop data is sensed, the phone can respond to the data locally, or it can forward Same over the cellular network to a remote System (or computer network) for handling.”</p> <p>Rhoads at 46:10–12.</p> <ul style="list-style-type: none"> <li>• “Bedoop decoding function within the phone, in other embodiments the image data can be transmitted from the phone and decoded at a remote location.”</li> </ul>

		<p>by a computer 114 for the presence of Bedoop data. (Essentially, Bedoop data is any form of plural-bit data encoding recognized by the system 110—data which, in many embodiments, initiates some action.) Once detected, the system responds in accordance with the detected Bedoop data (e.g., by initiating some local action, or by communication with a remote computer, such as over the internet, via an online service such as AOL, or using point-to-point dial-up communications, as with a bulletin board system).”</p> <p>Rhoads 7:30 – 46</p> <ul style="list-style-type: none"> <li>• “Consider the milk carton example. The artwork on a milk carton can be adapted to convey Bedoop data. In the preferred embodiment, the Bedoop data is steganographically encoded (e.g., digitally watermarked) on the carton. Numerous digital watermarking techniques are known—all of which convey data in a hidden form (i.e., on human inspection, it is not apparent that digitally encoded data is present). Exemplary techniques operate by slightly changing the luminance, or contours of selected points on artwork or text printed on the carton, or by splattering tiny droplets of ink on the carton in a seemingly random pattern. Each of these techniques has the effect of changing the local luminance at areas across the carton—luminance changes that can be detected by the computer 114 and decoded to extract the encoded digital data. In the case of a milk carton, the data may serve to identify the object as, e.g., a half gallon carton of Alpenrose brand skim milk.”</li> </ul> <p>Rhoads at 9:35–10:10</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 7,881,529 based on  
 U.S. Patent No. 6,947,517 to Rhoads (“Rhoads”)

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data.</p> <p>Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.”</p>

 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 7,881,529 based on  
 U.S. Patent No. 6,947,517 to Rhoads (“Rhoads”)

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example,</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>some objects include subliminal graticule data, or other calibration data, steganographically encoded with the Bedoop data to aid in determining orientation. Others can employ overt markings, either placed for that sole purpose (e.g. reference lines or fiducials), or serving another purpose as well (e.g. lines of text), to discern orientation. Edge-detection algorithms can also be employed to deduce the orientation of the object by reference to its edges.”</p> <p>Rhoads at 16:66 – 17:10</p> <ul style="list-style-type: none"> <li>• “Inside the building the candidate may encounter a security guard. Seeing an unfamiliar person, the guard may visually compare the photo on the badge with the candidate's face. Additionally, the guard can present the badge to a portable Bedoop device, or to one of many Bedoop systems scattered through the building (e.g., at every telephone). The Bedoop system extracts the Bedoop data from the card (i.e., from the DMV photograph), interrogates the DMV's DNS server with this Bedoop data, and receives in reply the name of the person depicted in the photograph. (If the Bedoop system is a telephone, the name may be displayed on a small LCD display commonly provided on telephones.)”</li> </ul> <p>Rhoads at 22:9–27</p> <ul style="list-style-type: none"> <li>• “To aid in identification, the Bedoop objects (e.g., badges) can be colored a distinctive color, permitting the system to more easily identify candidate objects from other items within the optical capture devices' field of view. Or the object can be provided with a retro-reflective coating, and the elevator can be equipped with one or more illumination sources of known spectral or temporal quality (e.g., constant infra red, or constant illumination with a single- or multi-line spectrum, or a pulsed light source of known periodicity; LEDs or semiconductor lasers, each with an associated diffuser, can be used for each the foregoing and can be paired with the image capture devices).</li> </ul>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,881,529 based on  
U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

### **Exhibit G-11**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Ehrhart was filed on July 13, 2001, claiming the priority date of July 13, 2001. Ehrhart published at least as of April 20, 2004, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Ehrhart anticipates asserted claims 4, 20 of the ’529 Patent. To the extent Ehrhart is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Ehrhart is found not to anticipate any asserted claims or claim elements of the ’529 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 7,881,529 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

**1. Claim 1**

Element	'529 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A system comprising:	<p>Ehrhart discloses a system.</p> <p>“The present invention relates to an optical reader that includes a color imaging assembly that generates color imaging data. An image analysis circuit determines if the acquired image should be characterized as a color photograph or as including a graphical symbol. A processing circuit processes the imaging data based on the image analysis circuit's determination of whether the image is a graphical symbol or a color photograph. The present invention allows a user to acquire and process both color images and graphical symbols, such as bar codes, text, OCR symbols or signatures. The optical reader of the present invention is also configured to associate an acquired image with at least one other acquired image.” Ehrhart at Abstract.</p>
[1A]	a camera that captures an image;	<p>Ehrhart discloses a camera that captures an image.</p> <p><i>Id.</i> at [1Pre].</p> <p>“The optical reader of the present invention automatically, or through manual Selection, determines whether a captured image is a color photographic image or, a color image that includes a graphical Symbol. Subsequently, the optical reader of the present invention processes the acquired imaging data in accordance with that determination. The optical reader of the present invention is operative to acquire and associate a plurality of acquired images. One aspect of the present invention is an optical reader.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 7,881,529 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>The optical reader includes a color imaging assembly for acquiring an image of an object, the color imaging assembly generating imaging data corresponding to the image. An image analysis circuit is coupled to the color imaging assembly. The image analysis circuit being configured to determine if the color imaging data includes at least one graphical Symbol. The image is classified as a graphical Symbol, or the image is classified as a color photograph if the color imaging data does not include at least one graphical Symbol. A processing circuit is coupled to the image analysis circuit. The processing circuit is operative to process the imaging data based on the determination.</p> <p>In another aspect, the present invention includes an optical reader for capturing an image of an object. The optical reader includes a color imaging assembly for converting the image of the object into color digital data corresponding to the image.” Ehrhart at 1:57-2:16.</p> <p>“As embodied herein, and depicted in FIGS. 1A-1D, perspective views of the optical reader in accordance with various embodiments of the present invention are disclosed. FIG. 1A shows the underside of hand held wireless optical reader 10. FIG. 1B shows the top of the optical reader depicted in FIG. 1A. Optical reader 10 includes housing 100, antenna 102, window 104 and trigger 12. Window 104 accommodates illumination assembly 20 and imaging assembly 30. As shown in FIG. 1B, the top side of reader 10 includes function keys 14, alphanumeric key pad 16, and display 60. In one embodiment, function keys 14 include an enter key and up and down cursor keys. FIG. 1C is also a hand held wireless optical reader 10. Reader 10 includes function keys 14, alphanumeric key pad 16, writing stylus 18, display 60, and signature block 62. Stylus 18 is employed by a user to write his signature in signature block 62. FIG. 1D shows yet another embodiment of optical reader 10 of the present invention. In this embodiment, reader 10 includes a gun-shaped housing 100. Display 60 and keypad 16 are disposed on a top portion of gun-shaped housing 100, whereas trigger 12 is disposed on the underside of the top portion of housing 100.</p>

		<p>an image that includes at least one graphical Symbol. An automatic mode Selector is coupled to the classification circuit, the automatic mode Selector being configured to Select an optical reader mode in accordance with the Selected classification. A processor is coupled to the classification circuit, the processor being programmed to process the color imaging data in accordance with the optical reader mode Selected by the automatic mode Selector.” Ehrhart at 2:26-42.</p> <p>“In accordance with the invention, the present invention for an optical reader includes a color imaging assembly for acquiring color imaging data. An image analysis circuit determines if the acquired image includes at least one graphical symbol. A processing circuit processes the imaging data based on the determination of whether the image includes at least one graphical symbol. The present invention allows a user to read graphical symbols, such as bar codes, text, OCR characters or signatures using a color imager. The color optical reader of the present invention is configured to automatically determine whether a color image includes a graphical symbol, or is merely a color photographic image. The optical reader of the present invention also is operative to associate one acquired image with at least one subsequently acquired image.” Ehrhart at 5:36-50.</p> <p>“If processor 40 does not locate a bar code symbol it moves onto step 420 and looks for OCR-A or OCR-B characters. If it finds these characters it performs optical character recognition in Step 422. If it does not, processor evaluates the image for the presence of text. If text is located, the image is cropped, and the text is compressed and Stored in Steps 428 and 430. If the image does not include text, processor 40 evaluates the image for the presence of a signature. If one is present, the image is cropped, and the data is compressed and stored in steps 428 and 430. In another embodiment, optical reader 10 is networked, and processor 40 communicates with remote network resources to provide Signature Verification Services. If processor 40 cannot detect a bar code Symbol, OCR symbols, text, or a signature, the user is asked in step 432 if he desires to store the image. If he does, the color photographic image is Stored in memory in Step 434.” Ehrhart at 10:5-</p>

 Invalidity Chart for U.S. Patent 7,881,529 based on  
 U.S. Patent No. 6,722,569 to Ehrhart et al. (“Ehrhart”)

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>to Company XYZ, and that the person signing for the parcel delivery was someone named John W. Smith.” Ehrhart at 13:27-43.</p> <p>“In the Automatic imaging mode, processor 40 is programmed to analyze the color imaging data to determine if an acquired image includes a graphical symbol or is merely a color photographic image. If it makes the determination that the color image includes a graphical symbol, it further analyzes the acquired image and classifies it as a bar code, OCR symbol, text, or a signature. Based on the classification, optical reader 10 jumps to the appropriate routine in EROM 48. The semi-automatic mode is similar. Thus, in the automatic or semi-automatic modes, the bar code scanning mode, the OCR/text mode, the signature capture mode, the color photography mode, and the association mode are controlled by the application program, not by the user.” Ehrhart at 8:36-49.</p> <p>“In step 1004, processor 40 identifies the page features. Processor 40 analyzes the page and divides it into blank and non-blank portions. The non-blank portions are analyzed to distinguish text regions from non-text regions. After determining the layout of the page, processor 40 uses black-to-white transitions to determine degrees of skew. In step 1008, horizontal white spaces are identified to separate lines of text. In step 1010, vertical white spaces are identified within each line of text to thereby separate individual words and characters from each other. In Step 1014, a character recognition algorithm is used in an attempt to recognize each individual character.” Ehrhart at 12:55-66.</p> <p>“As embodied herein and depicted in FIG. 11, a flow chart showing a method for performing OCR in accordance with yet another embodiment of the present invention is disclosed. In step 1100, reader 10 produces a bit-mapped image of the page. Subsequently, processor 40 finds lines of text in the image, locates the white spaces in each line, and isolates the characters. In step 1108, processor 40 performs character recognition, either OCR-A or OCR-B, as desired. The decoded characters are stored in memory.” Ehrhart at 13:1-9.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on U.S. Patent No. 6,097,834 to Krouse (“Krouse”)

### **Exhibit G-18**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Krouse was filed on June 13, 1997, claiming the priority date of June 13, 1997. Krouse published at least as of August 1, 2000, and is available as prior art at least under 35 U.S.C. § 102(a).

As shown in the chart below, Krouse anticipates asserted claims 4, 20 of the ’529 Patent. To the extent Krouse is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Krouse is found not to anticipate any asserted claims or claim elements of the ’529 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

**1. Claim 1**

Element	'529 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A system comprising:	<p>Krouse discloses a system.</p> <p>Krouse at Abstract</p> <ul style="list-style-type: none"> <li>• “In accordance with the present invention, financial transaction processing systems and methods are provided. One preferred embodiment of a method according to one aspect of the present invention includes generating an optically scanned image of at least a portion of document containing visual data, in a particular format, representing information related to the financial transaction. Recognition characteristics are generated from the scanned image and are compared to respective sets of reference recognition characteristics generated from respective other transaction documents having different respective formats to determine therefrom whether the particular format of the visual data matches one of the respective formats of the other documents. When such a match is found to exist, location is determined of a field in the scanned image to which optical character recognition may be applied to generate therefrom the information, based upon the respective format found to match the particular format of the visual data. Optical character recognition is then utilized to generate said visual data from said location.”</li> </ul>
[1A]	a camera that captures an image;	<p>Krouse discloses a camera that captures an image.</p> <p><i>Id.</i> at [1Pre].</p> <p>Krouse at 1:6-12:</p> <ul style="list-style-type: none"> <li>• The present invention relates generally to financial transaction processing Systems and methods, and more. Specifically, to Such Systems and methods wherein at least one document containing financial transaction-related information is optically Scanned to generate at least one computer-</li> </ul>

		<p>human operator to determine whether to input the reference characteristics and other bill document identification information (i.e., the other types of information stored in association with each set of reference recognition characteristics previously stored in the database archive <b>228</b>) manually for storage in the archive system <b>228</b> as a new set of reference recognition characteristics to permit other bills having the same format as document <b>400</b> to be processable by terminal <b>202</b> in the future, or to process the bill payment transaction as a "one-of-a-kind" transaction (i.e., without storing such recognition characteristics and information in the database archive <b>228</b> for future use by the processor <b>220</b>). Otherwise, if the predetermined match error tolerance conditions are found to exist, processor <b>220</b> selects those sets of reference recognition characteristics that are found to satisfy such conditions, and calculates the displacement differences that exist between each of the imaginary rectangles of the scanned image of the document <b>400</b> and those described in these selected sets of reference recognition characteristics (i.e., the displacements that must be applied to the imaginary rectangles of the scanned image of document <b>400</b> to accomplish a "best fit" match of same with the corresponding imaginary rectangles described in these selected sets of reference recognition characteristics). Such "best fit" match conditions are determined to exist for given corresponding rectangles of the recognition characteristics of the scanned image of the document <b>400</b> and a given respective set of reference recognition characteristics, when the absolute pixel displacement differences between the respective abscissa and ordinate coordinates of the vertices of the rectangles are within 40 pixels and 60 pixels of each other, respectively, and the respective lengths and widths of the rectangles are within 20 pixels and 2 pixels of each other, respectively. Once these absolute displacement differences have been calculated by the processor <b>220</b>, processor <b>220</b> "scores" the degree of best fit match condition that exists between the imaginary rectangles of the scanned image of the document <b>400</b> and those described in the</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit G-23

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al., *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2 .htm3](http://www.thinker.org/imagebase/indox-2.htm3) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16.

As shown in the chart below, QBIC anticipates asserted claims 4 and 20 of the ’529 Patent. The disclosures/citations for each element incorporate the disclosures citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’529 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified in the cited references and/or in the cover pleading of BofA’s Final Invalidity Contentions. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit G-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

1. Claim 1 (Non-Asserted)

Element	'529 Claim Recitation	Exemplary Citations in Reference
[1Pre]	A system comprising:	<p>QBIC discloses a system.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390:</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images' content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>QBIC Demo (IBM000747):</p>  <p>Flickner Depo at, e.g., 24, 41-42, 62-63 (user could take a picture or video and submit it</p>

		<p>to the QBIC system).</p> <p>1 Q. And you mentioned that you would extract</p> <p>2 features from the images?</p> <p>3 A. We did.</p> <p>4 Q. How would you do that?</p> <p>5 A. We ran algorithms on the pixels of the</p> <p>6 image and from that we created a feature.</p> <p>7 Q. What sort of features would you extract</p> <p>8 from the images?</p> <p>9 A. A QBIC system did color, shape and</p> <p>10 texture.</p> <p>11 Q. Okay. So let's take color.</p> <p>12 How would you, say, extract a color</p> <p>13 feature from an image?</p> <p>14 A. We typically would compute -- compute a</p> <p>15 color histogram.</p> <p>16 Q. And what's a color histogram?</p> <p>17 A. It's a measure of -- it's an estimate of</p> <p>18 the probability density of a color being in an</p> <p>19 image.</p> <p>20 Q. So you would take an image and extract</p> <p>21 that color histogram from it?</p> <p>22 A. Yup.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p>11 Q. How would one with the Ultimedia Manager 12 use the query by image search functionality of the 13 QBIC system? 14 A. I don't remember the details. And it's 15 basically rank -- giving you a rank list of images 16 based on a query. 17 Q. And where would the images being searched 18 come from? 19 A. The file system on the -- on the 20 computer. 21 Q. So would the user themselves supply the 22 images?</p> <p style="text-align: right;">Page 62</p>
		<p>1 A. They could, yeah. 2 Q. And how many images could the user 3 search? 4 A. I don't remember specific numbers. 5 Whatever the file system supports. 6 Q. Was there any cap on the amount of images 7 that the user could search? 8 A. I don't know. 9 Q. Could the user search an example image 10 based on the extraction of features from that 11 example image? 12 A. I think so.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. Say it returned the stills, could you use</p> <p>11 those stills to point you to a video?</p> <p>12 A. Yeah.</p> <p>13 Q. And how would you do that?</p> <p>14 A. Well, the -- each -- each key frame</p> <p>15 typically represents a frame in the video. So</p> <p>16 there's a -- the key frame is -- is one frame of</p> <p>17 the video so you just seek to that point.</p> <p>18 Q. So if I'm understanding this right, you</p> <p>19 could take a query video, the system would extract</p> <p>20 frames, which would then extract features from it,</p> <p>21 and then the system would return either shot clips</p> <p>22 or key frames; is that right?</p> <p>1 A. Right.</p> <p>Flickner 8/29/23 Depo at 42:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

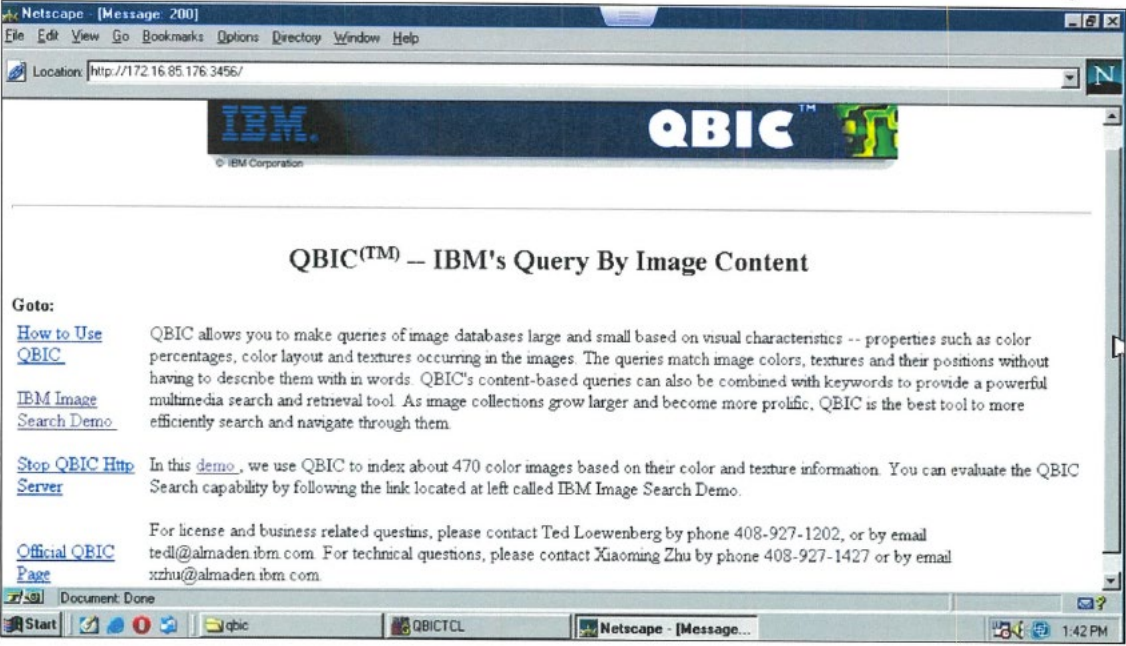

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.</p> <p>Flickner 8/29/23 Depo at Ex. 5:</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		 <p>The QBIC system was implemented in IBM commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. All of the features referenced in this chart were incorporated into these commercial implementations before November 6, 2000, as reflected in a combination of scientific papers, IBM’s internal documentation, and the QBIC demo software applications. <i>See, e.g.</i>, Flickner 8/29/23 Depo Tr. at 33:9-24, 71:21-72:10, 164:21-166:2, 166:11-175:24, 178:5-186:17, 186:21-192:4, 192:14-194:1, 195:16-196:4, 194:1-308:1; IBM 000001-617; IBM 000747; IBM 000777-880; IBM 000893-902; IBM 0002315-320; IBM 0002390-404; IBM 0002418-430.</p>
[1A]	a camera that captures an image;	QBIC uses still images and video (frames) for query and database population:

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.                      For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.                      Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen.                      Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and 15-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions-which we call objects-in the images. . . .</p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images</p>

		<p>13 Q. Was there also a demo online comparing                      14 trademarks at this time?                      15 A. There was a trademark demo. I don't                      16 remember the time frame.                      17 Q. And how would the trademark demo work?                      18 A. Similar to the stamp demo, just different                      19 database. The features were a little bit different                      20 features. Most trademarks are black-and-white.                      21 Q. What sort of features would be extracted?                      22 A. I don't remember which features we were</p> <hr/> <p style="text-align: right;">Page 54</p> <p>1 using on trademarks.                      2 Q. Could you search for -- could you search                      3 an example trademark into a database of other                      4 trademarks?                      5 A. I believe so.                      6 Q. And would that work in a similar fashion                      7 to this stamps demo?                      8 A. I believe so.                      9 Q. And would that identify the stamp -- or                      10 the trademark that you were searching in any way?                      11 A. What do you mean by identify?                      12 Q. Would the -- would the trademarks                      13 returned ever match the trademark that you                      14 searched, or were they always different trademarks?                      15 A. Well, if your query was in a database, it                      16 would match.</p> <p>QBIC could integrate with a camera, such as a portable camera; a user could take an image using a portable camera and submit that image to the QBIC system for query.</p> <p>Flickner Depo at, e.g., 24, 41-42, 62-63 (user could take a picture or video and submit it to the QBIC system):</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>1 Q. And you mentioned that you would extract</p> <p>2 features from the images?</p> <p>3 A. We did.</p> <p>4 Q. How would you do that?</p> <p>5 A. We ran algorithms on the pixels of the</p> <p>6 image and from that we created a feature.</p> <p>7 Q. What sort of features would you extract</p> <p>8 from the images?</p> <p>9 A. A QBIC system did color, shape and</p> <p>10 texture.</p> <p>11 Q. Okay. So let's take color.</p> <p>12 How would you, say, extract a color</p> <p>13 feature from an image?</p> <p>14 A. We typically would compute -- compute a</p> <p>15 color histogram.</p> <p>16 Q. And what's a color histogram?</p> <p>17 A. It's a measure of -- it's an estimate of</p> <p>18 the probability density of a color being in an</p> <p>19 image.</p> <p>20 Q. So you would take an image and extract</p> <p>21 that color histogram from it?</p> <p>22 A. Yup.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p>11 Q. How would one with the Ultimedia Manager 12 use the query by image search functionality of the 13 QBIC system? 14 A. I don't remember the details. And it's 15 basically rank -- giving you a rank list of images 16 based on a query. 17 Q. And where would the images being searched 18 come from? 19 A. The file system on the -- on the 20 computer. 21 Q. So would the user themselves supply the 22 images?</p> <hr/> <p>1 A. They could, yeah. 2 Q. And how many images could the user 3 search? 4 A. I don't remember specific numbers. 5 Whatever the file system supports. 6 Q. Was there any cap on the amount of images 7 that the user could search? 8 A. I don't know. 9 Q. Could the user search an example image 10 based on the extraction of features from that 11 example image? 12 A. I think so.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>6 Earlier you talked about both still images                      7 and video were part of your responsibilities for                      8 these architecture interfaces; correct?                      9 A. Correct.                      10 Q. Okay. If I refer to "images," do you                      11 understand that is including both a still image or,                      12 for example, a frame of a video image?                      13 A. Sure.                      14 Q. Okay. So when I say "image," I'm                      15 including both in my questions from now on out.                      16 A. Okay.                      17 Q. Okay?                      18 A. Okay.</p> <p><i>Id.</i> at 53:</p> <p>4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      0 also add the image to the database, preparing a                      1 reduced thumbnail and adding any available text                      2 information to the database.                      3 A. Yep.                      4 Q. Is that correct?                      5 A. Yep.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1B]	<p>a network-enabled device that conducts a data processing operation on at least a portion of the image to produce data, and sends the data to a service;</p>	<p>QBIC discloses a network-enabled device that conducts a data processing operation on at least a portion of the image to produce data, and sends the data to a service.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404)</p> <p>IBM0002390 at 2390:</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images’ content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>IBM0002390 at 2391:</p> <p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>IBM0002390 at 2391-92:</p> <p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

*Nantworks, LLC v. Bank of America Corporation*

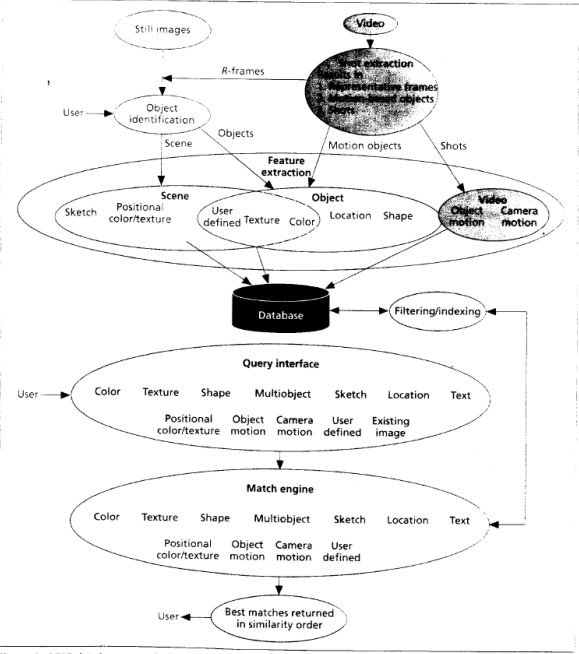

Central District of California, No. 2:20-cv-7872

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}</math>, <math>M_{[2,3]} \times M_{[3,2]}</math>, <math>M_{[3,3]}</math>, <math>M_{[3,4]} \times M_{[4,3]}</math>, <math>M_{[4,4]}</math>, <math>M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2392-93</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population</p>

*Nantworks, LLC v. Bank of America Corporation*

		<p>similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>21 Q. Did MediaMiner support any indexing                  22 structures for the image database?</p> <p style="text-align: right;">Page 72</p> <hr/> <p>1 MS. HAYDEN: Objection. Foundation.                  2 THE DEPONENT: I don't remember.                  3 Q. (By Mr. Dang) Turn to page 735 at the                  4 bottom, the Bates number ending in 735.                  5 You see on the third bullet on this page                  6 it says "Indexing of images as an automatic                  7 preprocessing step."                  8 What does that mean?                  9 A. When you create the database, you build                  10 the indexes.                  11 Q. What indexes could you incorporate?                  12 A. Any -- any index your scheme has                  13 supported.                  14 Q. Could you incorporate a clustered index?                  15 A. You could.                  16 Q. Could you incorporate specifically that                  17 clustering index that was mentioned in the 1998                  18 paper?                  19 MS. HAYDEN: Objection. Calls for                  20 speculation.                  21 THE DEPONENT: You could.                  22</p> <p>Flickner Depo at 214-215:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. What do you mean by the images of shot                      5 boundaries were indexed?                      6 A. Each -- each shot -- the shot -- the shot                      7 boundary detection is trying to extract key frames                      8 or break the video into small subsec --                      9 subsections -- hang on. Let me think here a                      10 second.                      11 So the shot boundary here is different                      12 than key framing. So I'll -- I'll retract what I                      13 said earlier. This -- while similar, they're not                      14 the same.                      15 Q. What are the differences?                      16 A. Shot boundaries are typically detected at                      17 fade to black, and key frames are supposed to be a                      18 representative still image of the video segment.                      19 Q. How would a shot boundary index allow one                      20 to query a video by content?                      21 A. It gives you semantical information as                      22 related to what the -- that -- that -- that is a --</p> <p style="text-align: right;">Page 214</p> <hr/> <p>1 a reasonable amount of return video. It's -- it's                      2 breaking it into small snippets.                      3 Q. Does it extract features from the key                      4 frames?                      5 A. If there are key frames extracted, it --                      6 it will reference key frames.</p> <p>Flickner Depo at 22-25:</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference	
		<p>1 Q. Okay. And what would you do with the                  2 image after you hit and extracted the color                  3 histogram from it?                  4 A. Nothing.                  5 Q. Would those features be stored in any                  6 database or --                  7 A. Yes.                  8 Q. Okay. And let's do -- what about                  9 texture, could you extract texture features from an                  10 image?                  11 A. We did.                  12 Q. And how would you do that?                  13 A. I don't remember exact features we were                  14 using. There were -- we published some papers on                  15 them.                  16 Q. Okay. Was there any reasoning behind                  17 picking the features that you chose?                  18 A. Yes.                  19 Q. And what was that reasoning?                  20 A. We wanted to make it so that the results                  21 were perceptually good.                  22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>	<p>1 want to look for all of the images that have a red                  2 color in it or some sort red color histogram; is                  3 that right?                  4 A. Well, you -- you take specific -- you                  5 search for a red color. You'd compute the                  6 histogram and then basically match the histogram,                  7 which would give you images that had more colors in                  8 the reds. This is not -- it's not a unique thing.                  9 Q. Were you always searching for a                  10 particular feature, or could you just search some                  11 sort of example image?                  12 A. We could search an example image.                  13 Q. And how would that process work?                  14 A. Just extract the features from it.                  15 Q. So let's break that down.                  16 So you would submit an example image to                  17 the -- to the system, right?                  18 A. Uh-huh.                  19 Q. And then how do the -- how -- how does                  20 the system select which features to extract?                  21 A. It would compute them all, typically, or                  22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
		<p>1 A. That people would get -- would agree that                  2 this is a better match, that the ordering was                  3 reasonable and...                  4 Q. So by that, do you mean that people would                  5 view the results returned as the closest or close                  6 matches to your -- to your image?                  7 A. It was -- it would satisfy their query.                  8 Q. Okay. So -- so you would have this set                  9 of features in your database.                  10 How would you search for those features?                  11 A. Typically, we -- initially, we did linear                  12 scan where you just actually evaluate the -- the                  13 distance metric against all the features.                  14 Q. So in linear scan, you would compare some                  15 sort of search term against all the features in the                  16 database?                  17 A. Well, it depends on which features you're                  18 using. You didn't have to use all the features.                  19 You could use just color features or just texture                  20 features or just...                  21 Q. So to make sure I'm understanding this                  22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>	<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

		<p>13 Q. And could you, in general terms, describe                      14 what Virage was?                      15 A. It was a content-based retrieval system                      16 tailored to secure surveillance information.                      17 Q. And you went to their website; was there                      18 something on their website, say, a demonstration?                      19 A. I don't remember.                      20 Q. Was their system commercially available                      21 during the 1990s?                      22 A. Yes.</p> <p>1 Q. How did their content-based retrieval                      2 system work?                      3 A. It was similar to QBIC.                      4 Q. Could you, say, extract features from a                      5 query image?                      6 A. Yes.                      7 Q. And could you search those features into                      8 some sort of reference database?                      9 A. Yes.</p> <p><i>See also</i> Flickner Depo at 54-55.                      Flickner 8/29/23 Depo at 79–80:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>16 Q. Well, for example, if, for example, you --</p> <p>17 the image was sourced from a camera and there was a</p> <p>18 noise from the image sensor on the image, were there</p> <p>19 any methodologies used by IBM in the QBIC system to</p> <p>20 reduce that noise or grain in the image?</p> <p>21 A. I don't recall.</p> <p>22 Q. What about -- and, again, I'm talking</p> <p>23 about preprocessing steps, before you're actually</p> <p>24 extracting features.</p> <p>25 Were there any methodologies to enhance</p> <p style="text-align: right;">Page 79</p> <p>1 the contrast of the image?</p> <p>2 A. I don't remember.</p> <p>3 Q. What about resizing the image?</p> <p>4 A. We did -- we probably supported that on</p> <p>5 import.</p> <p>6 Q. Say again?</p> <p>7 A. We supported that on -- most likely we</p> <p>8 supported that on import, on read.</p> <p>9 So the read, you request a particular</p> <p>10 size.</p> <p>11 Q. You're going to have to repeat it. I</p> <p>12 didn't understand you.</p> <p>13 MR. STRAUSSMAN: And speak up.</p> <p>14 THE WITNESS: So resizing would be done</p> <p>15 typically when you import the image into the system.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. Okay. So if you're importing the image</p> <p>18 into the database, is that what you're talking</p> <p>19 about?</p> <p>20 A. Correct.</p> <p>21 Q. Okay. And at that point you would resize</p> <p>22 the image to reduce the size?</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>1 How would you resize the image on</p> <p>2 importation?</p> <p>3 A. You would request a particular size of</p> <p>4 image and then use that to populate the database.</p> <p>5 Q. So if the source images that you were</p> <p>6 acquiring were say too big for purposes of QBIC, on</p> <p>7 importation you could resize those to get them to</p> <p>8 the size that are -- meet the -- meet the</p> <p>9 requirements of the QBIC system?</p> <p>10 A. Yes.</p> <p>11 Q. Was that done as a matter of course in the</p> <p>12 QBIC system?</p> <p>13 MR. HANSEN: Objection; vague and ambiguous.</p> <p>14 THE WITNESS: As I recall, yes.</p> <p>15 BY MR. EDWARDS:</p> <p>16 Q. Was it an automatic process?</p> <p>17 A. As I recall, yes.</p> <p>18 Q. So if a user were to import source images</p> <p>19 into the database, when the user did that, the QBIC</p> <p>20 system would automatically resize it to fit the</p> <p>21 requirement of the QBIC system?</p> <p>22 A. Make sure it's in the range that the QBIC</p> <p>23 system could handle.</p> <p>24 Q. That's a "yes"?</p> <p>25 A. That's a "yes."</p> <p><i>Id.</i> at 80–81:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>6 Q. How about converting the images to binary?</p> <p>7 A. Threshold. There probably was a threshold</p> <p>8 control.</p> <p>9 Q. And what do you mean by "threshold</p> <p>10 control"?</p> <p>11 A. Just change the value of the threshold.</p> <p>12 You make a binary decision, is a pixel bigger than</p> <p>13 a -- is a pixel bigger than a particular number or</p> <p>14 is it smaller and you put a 01 based on that.</p> <p>15 Q. And that would have been done prior to</p> <p>16 feature extraction?</p> <p>17 A. For some features it would be done that</p> <p>18 way.</p> <p>19 Q. So, for example, for shape, was it</p> <p>20 required to convert the image to binary before you</p> <p>21 did your shape analysis?</p> <p>22 A. No.</p> <p>23 Q. Were there any other features that, as</p> <p>24 part of the -- as part of the extraction process,</p> <p>25 the image had to be converted to binary before?</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>2           Were there any features that required the                      3 image to be converted to binary before the features                      4 were extracted?                      5       A. Some features required a binary image,                      6 yeah.                      7       Q. Which ones?                      8       A. Some of the texture features.                      9       Q. And when you say "some of the texture                      10 features," do you -- do you recall which ones?                      11       A. No.                      12       Q. Let's put a pin in that because we're                      13 going to get to it.                      14           What about gray scale? Were any images                      15 converted to gray scale before features were                      16 extracted?                      17       A. Yes.                      18       Q. Which -- for which features?                      19       A. For shape, for texture.                      20       Q. Any others?                      21       A. Color wouldn't make any difference.                      22           That's all I can think of.                      23       Q. At least for shape and texture?                      24       A. Yeah.</p> <p><i>Id.</i> at 94–97:                      18       Q. So that's why I ask is it the first step                      19 in calculating shape to convert the image to binary?                      20       A. Yes.</p> <p><i>Id.</i> at 101–102:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p>14 Q. All right. Let's flip forward to 2429.                      15 And is 2429 a screenshot of a trademark                      16 demo that was also available in the Almaden --                      17 excuse me -- almaden.ibm website?                      18 A. Yes.                      19 Q. Okay. And that demo looks like the                      20 trademark query is based on shape; is that right?                      21 A. It uses shape as one similarity feature.                      22 Q. Right. So the trademarks are converted to                      23 a binary image, like we talked before -- talked                      24 about before, and then they're -- the matching                      25 process is done based on those binary images?</p> <p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.                      2 Q. Okay. And here we're showing the query                      3 image is a -- is a heart -- a heart pattern with                      4 Love's next to it. It's in the top part of the                      5 screenshot.                      6 A. Yep.</p> <p><i>Id.</i> at 82:                      12 Q. Let's put a pin in that because we're                      13 going to get to it.                      14 What about gray scale? Were any images                      15 converted to gray scale before features were                      16 extracted?                      17 A. Yes.                      18 Q. Which -- for which features?                      19 A. For shape, for texture.</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 84</p> <p>1 developing tools to aid in this step. In recent                  2 work, we have successfully used fully automatic                  3 unsupervised segmentation methods along with a                  4 foreground/background model to identify objects in a                  5 restricted class of images."                  6 Did I read that correctly?                  7 A. Yep.                  8 Q. And can you interpret that for me? What                  9 is -- how did -- how were segmentation methods used                  10 there?                  11 A. This is work by Harpreet Sawhney, and he                  12 had algorithms for doing segmentation. So given an                  13 input image, identify which pixels belong to which                  14 class. So this is a cup, this is a table this is a                  15 phone. It's a three-class problem.                  16 And you write algorithms that determine                  17 what the characteristics of a cup are, what the                  18 characteristics of a table is, what the                  19 characteristics of a phone cover is. And you                  20 populate those in the database.                  21 Q. And how are those populated in a database?                  22 Are those associated with the underlying image?                  23 A. Yes.                  24 Q. And that could be done for both a query                  25 image and a database image?</p> <hr/> <p style="text-align: right;">Page 85</p> <p>1 A. It's done for both.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1C]	<p>the service programmed to receive the data; identify an object within the image:</p>	<p>QBIC discloses the service programmed to receive the data; identify an object within the image.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at IBM0002390 at 2390</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images’ content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>IBM0002390 at 2391:</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2/Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}</math>, <math>M_{[2,3]} \times M_{[3,2]}</math>, <math>M_{[3,3]}</math>, <math>M_{[3,4]} \times M_{[4,3]}</math>, <math>M_{[4,4]}</math>, <math>M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.</p> <p>For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.</p> <p>Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised</p>

		<p>segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs, start from a single object pixel and repeatedly add adjacent pixels whose values are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve.</p> <p>The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries. . . .</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>“INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by</p>

		<p>visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at p. 8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):                      “Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“ A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.                      You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created. A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b>                      The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b>                      Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white</p>

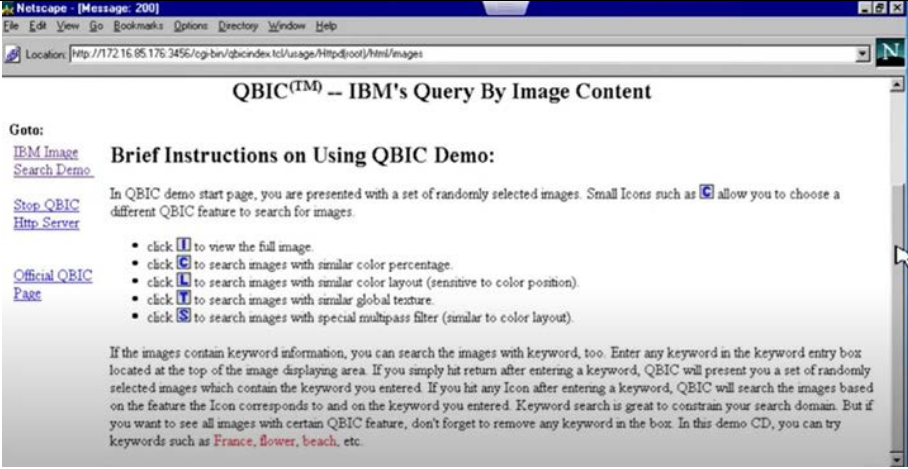

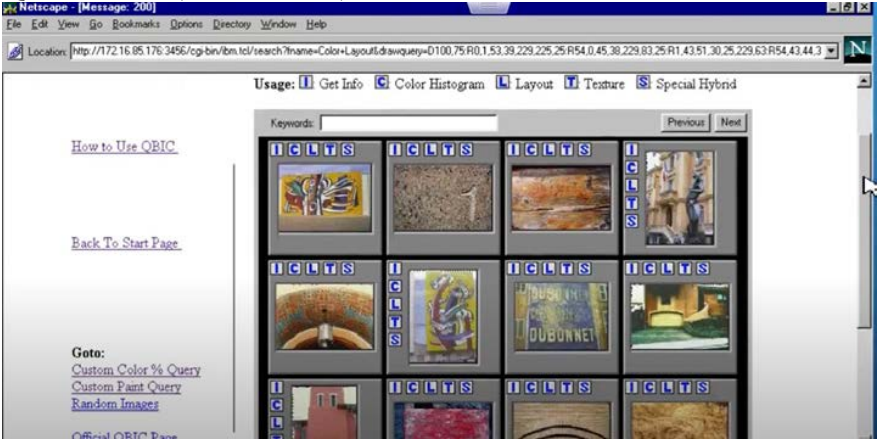

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.”  <i>Id.</i> at pp. 20–21.</p> <p>QBIC Demo (IBM000747):</p>

		<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by research point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that                  1 right?                  2 A. That's correct.                  3 Q. Okay. And once it determined matches,                  4 what would the system do next?                  5 A. It would display them, display the image.                  6 Typically, in thumbnail form.                  7 Q. Okay. How many matches would it display?                  8 A. On the order of 20, 30. You -- you could                  9 get more. It's really an ordering of the whole                  10 database.                  11 Q. Okay. And could you vary the amounts of                  12 matches that it would return?                  13 A. Yeah.                  14 Q. Okay. And how would you vary the amount                  15 of matches?                  16 A. I think it was like a configuration                  17 related to the X Windows application that has                  18 scroll bars on it, and you can assess like how many                  19 elements you wanted into it. This is pre-Web.</p>

		<p>6 Q. How would the Db2 universal search a                      7 query image using QBIC technology?                      8 A. You would create a -- create a manager                      9 QB- -- or create a QBIC catalog.                      10 Q. What's a QBIC catalog?                      11 A. It's an instance of a table that has a                      12 bunch of images in it.                      13 Q. And forgive me, what's an instance of a                      14 table?                      15 A. You create a table -- create a database,                      16 and then in the database you create a table and you                      17 have maybe like a file name, and then the actual                      18 image bits into it.                      19 Q. And how would you search for images using                      20 that table?                      21 A. You could search -- you could use                      22 whatever you wanted to for the -- the SQL query</p> <p style="text-align: right;">Page 78</p> <hr/> <p>1 to -- to filter, and then that would give you a                      2 list of results. And then you'd rank all of those                      3 results based on the QBIC distance measures.</p> <p>Flickner Depo at 201:</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 58</p> <p>1 user would provide a rough outline of the object and                  2 then the tool would essentially conform that outline                  3 better to the actual object in the image?                  4 A. That was one way to do it. The other way                  5 to do it is to have the next prediction of the                  6 outline to be driven by the tool with the user                  7 input.                  8 Q. And what was the -- I assume an algorithm                  9 did that?                  10 A. Yeah.                  11 Q. Do you know the -- what algorithm was                  12 used?                  13 A. We were doing a lot of stuff with splines                  14 at the time.                  15 (Reporter seeks clarification.)                  16 A. Splines. S-p-l-i-n-e-s.                  17 Q. Okay. And what are splines?                  18 A. Splines are curves, mathematical                  19 representation of curves -- or a mathematical                  20 representation of curves.                  21 Q. And so was also any automatic tools, like                  22 Canny edge detection or any other edge detection                  23 used that didn't require assistance from the user?                  24 A. There were -- yeah, there were some that                  25 were more automatic. Some tools were more</p>	<p style="text-align: right;">Page 60</p> <p>1 that was --                  2 (Reporter seeks clarification.)                  3 A. Simple convolution filter that was used                  4 for edge detection. Sobel was an advanced version                  5 of it.                  6 Q. And what about segmentation, do you know                  7 what segmentation is?                  8 A. Yeah.                  9 Q. Okay. Segmentation, as I understand it,                  10 essentially separates foreground objects from the                  11 background. Is that a high level of explaining it?                  12 A. That's a two-class segmentation, yeah.                  13 Q. Okay. Did you do that type of                  14 segmentation to differentiate foreground objects                  15 from the background in this database population                  16 step?                  17 A. We did research prototypes of it. I don't                  18 know what all went out.                  19 Q. You don't know whether those made it into                  20 a commercial product?                  21 A. I would say they probably didn't.                  22 Q. Okay. Were they in the -- were they used                  23 in the -- in demo applications that you referred to?                  24 A. They might have been.                  25 Q. Okay. And so let's say that objects were</p>
		<p style="text-align: right;">Page 59</p> <p>1 automatic.                  2 Q. And those were in the form of algorithms?                  3 A. Yeah.                  4 Q. Do you recall any of the algorithms, the                  5 names?                  6 A. We did various edge detection stuff.                  7 Q. Okay.                  8 (Reporter seeks clarification.)                  9 A. Just various types. There were things                  10 like Sobel operators that we used --                  11 (Reporter seeks clarification.)                  12 A. Sobel.                  13 Q. How do you spell Sobel?                  14 A. S-o-b-e-l, I think.                  15 Q. Okay.                  16 A. That's one form of an edge detector.                  17 Q. Any others that you can recall?                  18 A. This is kind of image processing 101.                  19 There were Gabor filters.                  20 (Reporter seeks clarification.)                  21 Q. How do you spell that?                  22 A. G-a-b-o-r.                  23 There was . . . it's been so long. I                  24 don't remember what they call it. Very simple                  25 filters, but there's a simple convolution filter</p>	<p style="text-align: right;">Page 61</p> <p>1 identified within a particular image, what were done                  2 with those objects? Were they stored, for example,                  3 as a separate image or were they somehow linked to                  4 or associated with the image from which they were                  5 extracted?                  6 A. Typically they were linked.                  7 Q. They were linked to the source image?                  8 A. Yeah.                  9 Q. Okay. And this was done in the database?                  10 A. Could be done in the database.                  11 Q. How was it done?                  12 A. It was probably done in a text database or                  13 some sort of key index pair database. So database                  14 has a lot of different meanings.                  15 MR. HANSEN: Text database.                  16 BY MR. EDWARDS:                  17 Q. And, Mr. Flickner, you said probably done                  18 in a text database, is that what you said?                  19 A. Yeah.                  20 MR. STRAUSSMAN: Make sure to speak up.                  21 THE WITNESS: Okay.                  22 BY MR. EDWARDS:                  23 Q. Or some sort of key index database, is                  24 that the other one?                  25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 83 – 85:</p> <p>22 Q. Okay. If you look at that second sentence                  23 there -- well, I'll read the -- I'll read the first                  24 two sentences, first two full sentences. It says,                  25 "As a result, we have devoted considerable effort to</p> <p>1 developing tools to aid in this step. In recent                  2 work, we have successfully used fully automatic                  3 unsupervised segmentation methods along with a                  4 foreground/background model to identify objects in a                  5 restricted class of images."</p> <p>6 Did I read that correctly?                  7 A. Yep.</p> <p>8 Q. And can you interpret that for me? What                  9 is -- how did -- how were segmentation methods used                  10 there?</p> <p>11 A. This is work by Harpreet Sawhney, and he                  12 had algorithms for doing segmentation. So given an                  13 input image, identify which pixels belong to which                  14 class. So this is a cup, this is a table this is a                  15 phone. It's a three-class problem.</p> <p>16 And you write algorithms that determine                  17 what the characteristics of a cup are, what the                  18 characteristics of a table is, what the                  19 characteristics of a phone cover is. And you                  20 populate those in the database.</p> <p>21 Q. And how are those populated in a database?                  22 Are those associated with the underlying image?</p> <p>23 A. Yes.</p> <p>24 Q. And that could be done for both a query                  25 image and a database image?</p> <hr/> <p>1 A. It's done for both.</p> <p style="text-align: right;">Page 85</p>

		<p>To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1D]	<p>distinguish an object present in the image from others using a database that stores data characteristics of target objects;</p>	<p>QBIC discloses distinguish an object present in the image from others using a database that stores data characteristics of target objects.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2390</p> <p style="text-align: center;"><b>ABSTRACT</b></p> <p>In the QBIC (Query By Image Content) project we are studying methods to query large on-line image databases using the images’ content as the basis of the queries. Examples of the content we use include color, texture, and shape of image objects and regions. Potential applications include medical (“Give me other images that contain a tumor with a texture like this one”), photo-journalism (“Give me images that have blue at the top and red at the bottom”), and many others in art, fashion, cataloging, retailing, and industry. Key issues include derivation and computation of attributes of images and objects that provide useful query functionality, retrieval methods based on similarity as opposed to exact match, query by image example or user drawn image, the user interfaces, query refinement and navigation, high dimensional database indexing, and automatic and semi-automatic database population. We currently have a prototype system written in X/Motif and C running on an RS/6000 that allows a variety of queries, and a test database of over 1000 images and 1000 objects populated from commercially available photo clip art images. In this paper we present the main algorithms for color texture, shape and sketch query that we use, show example query results, and discuss future directions.</p> <p>IBM0002390 at 2391</p>

		<p style="text-align: center;"><b>2. Operational Steps</b></p> <p>There are three logical steps in a QBIC application: database population, feature calculation, and image query.</p> <p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p> <p>IBM0002390 at 2392-93</p>

		<p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <i>MTM</i> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of <math>(2^8)^3 = 16M</math> colors, we quantize color space to 256 levels. Following [8], we initially quantize each axis in <math>R, G, B</math> to 16 levels, giving a color space of 4096 cells. We then compute the <i>MTM</i> coordinates of the center of each cell, and perform a standard, greedy, minimum sum of squares clustering [9] (pp. 235), to obtain the best 256 colors. Each color is actually the center of a “super-cell” in color space, where these supercells form a partition of the space. The image or object histogram is the normalized count of the number of pixels that fall in each of the supercells. As part of the clustering, we also compute a 4096 element table that maps any <math>(R, G, B)</math> triple to its supercell number. To compute an image or object color histogram, we take the <math>(R, G, B)</math> for each pixel, look up its cell number in the table, and increment the corresponding histogram bucket. As a final step, the histogram is normalized so that its sum is unity.</p> <p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>object), and is a measure of the “peakedness” of the distribution of gradient directions in the image. There is a wide variety of texture features described in the machine vision literature, but many were inappropriate for our application due to their computational complexity or their assumptions about the homogeneity of the images being analyzed. In fact, even though the methods in [10] were the most successful published method we tried, we found that we could improve the performance in our application by modifying them to be more robust with respect to different sized and non-homogeneous images. We also modified the methods to make them more computationally feasible for the size of application we were designing for. See [11] for more details on our exact implementation.</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p>Currently, our shape features are based on a combination of heuristic shape features area, circularity, eccentricity, major axis orientation and a set of algebraic moment invariants. All shapes are assumed to be non-occluded planar shapes allowing for each shape to be represented as a binary image.</p> <p>The area is computed as the number of pixels set in the binary image. Circularity is computed as <math>perimeter^2 / Area</math> where <i>perimeter</i> is computed using bit-quad information [14]. The second order covariance matrix is computed using just the boundary pixels. From this covariance matrix the major axis orientation is the direction of the largest eigenvector. Similarly, eccentricity is computed as the ratio of the smallest eigenvalue to the largest eigenvalue [15].</p> <p>The algebraic moment invariants are computed from the first <i>m</i> central moments and are given as the eigenvalues of predefined matrices, <math>M_{[j,k]}</math>, whose elements are scaled factors of the central moments [16]. Using the notation of [16] we use moments up to degree 8 and the eigenvalues of the matrices <math>M_{[2,2]}</math>, <math>M_{[2,3]} \times M_{[3,2]}</math>, <math>M_{[3,3]}</math>, <math>M_{[3,4]} \times M_{[4,3]}</math>, <math>M_{[4,4]}</math>, <math>M_{[4,5]} \times M_{[5,4]}</math> for a total of 18 features invariant to affine transformations.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <i>w</i> the width of the image in pixels and <i>h</i> its height, we partition the image into blocks of size <math>w/64 \times h/64</math>, and if any pixel in a partition of the full size edge image is an edge pixel, the corresponding pixel in the reduced edge map is set to an edge pixel. Finally, we thin this reduced image. This gives the reduced edge map or “image abstraction” ([17]) on which the retrieval by sketch is performed.</p> <p>IBM0002390 at 2393-95:</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

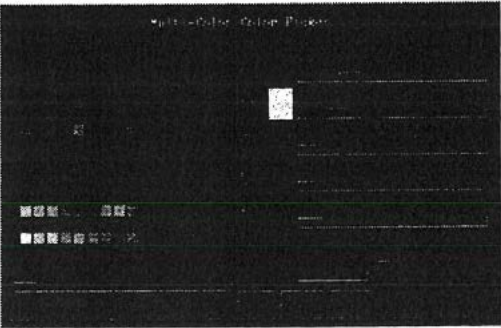

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><b>2.3. Image query</b></p> <p>Once the set of features for objects and images has been computed, queries may be run. In one scenario, a query may be initiated by a user in an interactive session by specifying an object or set of object attributes and requesting images with objects “like the query object”. For example, images can be requested that contain objects whose color is similar to the color of an indicated object, or to the color selected from a color picker.</p> <p>In addition, QBIC supports “full scene” queries, or queries based on the global set of color and texture features occurring in an image. These queries avoid the need for outlining objects, simplifying the data entry. Images can be retrieved that are globally similar, in terms of color and/or texture, to a given image. Also, using a menu-based color or texture picker, a user can select a set of colors and textures and request images containing them in selected proportions.</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Based on our experience, we also found it useful for the user to be able to request images with <math>x\%</math> of color 1, <math>y\%</math> of color 2, etc. where both the percentages and the colors are explicitly specified by the user. This allows searches such as for a beach scene (25% white (for the sand) and 50% blue (for the sky and water)), and for many scenes for which the user has seen before, and for which he/she can remember approximate color percentages. The color picker that allows this type of query is shown in Figure 2.</p>  <p>Figure 2: Multi-Color Color Picker with two selected colors. The palette on the left displays the set of selectable colors. Once a color is selected, it appears in a box on the right, and the amount of the color can be specified by the sliders. In this case, 25% light blue and 15% white have been selected.</p> <p><i>Texture:</i> Texture distance is computed as weighted Euclidean distance in the three dimensional texture space. The most common weighting factors are the inverse variances for each component, computed over the</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>samples in the databases.</p> <p><i>Shape:</i> The matching on the shape features is done as weighted Euclidean distance where the weights are the inverse variances for each features. Any subset of the features can be selected, enabling queries that are sensitive/insensitive to selected shape properties, in particular, to object size and object orientation. Since similar moments do not guarantee similar shapes we sometimes see perceptually different matches. This fact is leading us to examine more perceptual shape measures such as curvature and turning angle.</p> <p><i>Sketch:</i> In the full scene matching we call “query by sketch”, a user roughly draws a set of dominant lines or edges in a drawing area. Images from the database with a similar set of edges are retrieved. The method, based on [17, 18], works by matching the user drawn edges to automatically extracted edges from the images in the database. The main steps of the algorithm are: (1) reduce the user sketch, which is a binary image, to size 64 by 64; (2) partition this into an 8 by 8 set of blocks, each block being 8 by 8 pixels; (3) for each image in the database, correlate each block of the sketch with a corresponding search area of size 16 x 16 in the database image; (4) compute a score for each database image as the sum of the correlation scores of each local block. The correlation in step (3) is done as a “logical binary” correlation, with specific values given on a pixel by pixel basis to edge-edge match between the user sketch and database image, edge-no edge match, no edge-no edge match, etc. Because each 8 by 8 block is spatially correlated separately, the method allows for some spatial warping between the sketch and database images.</p> <p>IBM0002390 at 2395</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <i>R*</i>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>QBIC (Query by Image Content) at 1</p>

		<p>Query by example using <i>color histograms</i></p> <ul style="list-style-type: none"> <li>Example image:                             <div data-bbox="1247 358 1430 500" data-label="Image"> </div> </li> <li>One of the colour histograms for the example image is shown in Fig. 28.1.                             <div data-bbox="932 570 1738 935" data-label="Figure"> </div> </li> </ul> <p><b>Colour Histogram of Image</b></p> <ul style="list-style-type: none"> <li>Store a histogram vector for each image in the database,                      compare images using mean squared difference,                      return images sorted by this metric.</li> </ul> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.</p> <p>For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.</p> <p>Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color queries return items with matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture (pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects and features to implement logical And semantics.</p> <p>.....</p> <p><b>ANNOTATION AND DATABASE POPULATION TOOLS.</b> Automatic methods (such as our Positional Color query) that don't rely on object identification, methods that identify objects automatically as in the museum image example, fast and easy-to-use</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>semiautomatic outlining tools, and motion-based segmentation algorithms will enable additional application areas.</p> <p><b>FEATURE EXTRACTION AND MATCHING METHODS.</b> New mathematical representations of video, image, and object attributes that capture ‘interesting’ features for retrieval are needed. Features that describe new image properties such as alternate texture measures or that are based on fractals or wavelet representations, for example, may offer advantages of representation, indexability, and ease of similarity matching.</p> <p><b>INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION.</b> Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at pp. 7–8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to</p>

		Flickner Depo 38-41:	
		<p>1 project at this time?                  2 A. I don't know that.                  3 Q. Okay. Would reviewing -- let's see.                  4 Let's turn to page -- let's turn to page -- this                  5 one is Bates-stamped, so the page ending in                  6 Network1_007316.                  7 Would reviewing this page refresh your                  8 recollection as to whether --                  9 A. Yes.                  10 Q. Okay. Perfect. Feel free.                  11 MR. DeCLERCK: Just give him a chance to                  12 finish his question before you respond.                  13 MR. DANG: Thank you.                  14 THE DEPONENT: Is there a question                  15 standing?                  16 Q. (By Mr. Dang) Sure. Yeah.                  17 So was there any video search                  18 functionality included as part of the QBIC system                  19 at this time?                  20 A. Evidently, yes.                  21 Q. Okay. And how did that video search                  22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using                  2 those images.                  3 Q. Okay. Could you take as -- as you did in                  4 the query by image search system, could you just                  5 search a video using this system?                  6 A. You could search for a key frame and that                  7 could point you to a video.                  8 Q. As an input into the system, could you                  9 search -- could you input a whole video and then                  10 the system would extract the key frames and then --                  11 A. Yes.                  12 Q. -- search that using that?                  13 A. If I recall correctly, yes.                  14 Q. Okay. And the way -- the method by which                  15 it did so, as you mentioned, was -- would it                  16 extract key frames from the video, extract features                  17 from those key frames, and then search those                  18 features; is that right?                  19 A. Correct.                  20 Q. Okay. Other than the use of shots and                  21 key frames, is there any difference between the                  22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in                  2 video and then treat -- treat those as still images                  3 in the QBIC system.                  4 Q. So to break that down, you -- what do you                  5 mean by detecting shots?                  6 A. You try to find some key frame in a video                  7 sequence or multiple key frames in a video                  8 sequence, to give you a summarization of the video.                  9 Q. And how would you detect those key                  10 frames?                  11 A. There were algorithms to do it. I didn't                  12 personally work on any of those algorithms.                  13 Q. Are you otherwise aware of any of those                  14 algorithms?                  15 A. Well, they used histogram methodologies.                  16 I remember that.                  17 Q. Okay. So you would take -- you would use                  18 a histogram methodology to extract key frames from                  19 the video; is that what -- is that right?                  20 A. That's one way to do it.                  21 Q. Okay. And then what would you do with                  22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?                  2 A. There may have been.                  3 Q. Can you think of any now?                  4 A. No.                  5 Q. When you searched for -- or when you                  6 searched a video using this system, what would                  7 the -- or what would the system return?                  8 A. I don't remember if we returned the                  9 stills or a small -- small video clip.                  10 Q. Say it returned the stills, could you use                  11 those stills to point you to a video?                  12 A. Yeah.                  13 Q. And how would you do that?                  14 A. Well, the -- each -- each key frame                  15 typically represents a frame in the video. So                  16 there's a -- the key frame is -- is one frame of                  17 the video so you just seek to that point.                  18 Q. So if I'm understanding this right, you                  19 could take a query video, the system would extract                  20 frames, which would then extract features from it,                  21 and then the system would return either shot clips                  22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

*Nantworks, LLC v. Bank of America Corporation*

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and  2 then you could send that sketch in and you'd get  3 images of a sun in the trees.  4 Q. And if I refer to images, can I -- let  5 me -- let me back up.  6 Earlier you talked about both still images  7 and video were part of your responsibilities for  8 these architecture interfaces; correct?  9 A. Correct.  10 Q. Okay. If I refer to "images," do you  11 understand that is including both a still image or,  12 for example, a frame of a video image?  13 A. Sure.  14 Q. Okay. So when I say "image," I'm  15 including both in my questions from now on out.  16 A. Okay.  17 Q. Okay?  18 A. Okay.  19 Q. In terms of running analytics, that would  20 include both extracting these characteristics from a  21 query image and from an image that you're storing in  22 a database; correct?  23 A. Can you rephrase.  24 Q. Yes. So the comparison that you're doing  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.  2 When you refer to features, does it  3 include at least color, texture, shape and sketch?  4 A. Or a subset thereof.  5 (Reporter seeks clarification.)  6 A. Or a subset thereof.  7 So you could do just color queries, you  8 could do just shape queries, you could do just --  9 you didn't need to have all the feature sets in  10 all -- in every query.  11 Q. Understood. But would a user have the  12 option to query at least those four features?  13 A. Yes.  14 Q. Okay.  15 A. For their QBIC system, that's true.  16 Q. And then I believe the last area you  17 indicated you were responsible for was architecture  18 interface for saving images; is that right?  19 A. Correct.  20 Q. And what did that entail?  21 A. It's both saving images and saving  22 features. That was to define the API, so you would  23 give it a feature, and it would write the feature in  24 a database or into a file.  25 Q. Would that also include saving any</p>	
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're  2 querying image 1 to determine if there are images in  3 the database that have similar features; is that  4 right?  5 A. Correct.  6 Q. Okay. And the analytics that you're  7 talking about, where you extract these characters  8 from the image, that is -- those run on both the  9 query image and the images that are stored in the  10 database; is that right?  11 A. Yeah. We call them features.  12 Q. Features. Okay.  13 So when you say "features," you're talking  14 about the features that we talked about before:  15 Color, texture, shape, sketch?  16 A. For example.  17 Q. Any other ones you can think of?  18 A. Nothing comes to mind.  19 Q. But when you refer to features they at  20 least include those four; is that correct?  21 A. Yes. Well, at least includes, yeah.  22 Q. Is that correct? I'm sorry, I didn't --  23 you trailed off, so I -- that's why I reasked it.  24 A. Yeah.  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example  2 like any text description about the image?  3 A. Yeah. Text is just another feature here.  4 Q. Text is another feature?  5 A. Yeah.  6 Q. I understand when the images were saved,  7 thumbnails were saved of those images; is that  8 correct?  9 A. Typically, yeah.  10 Q. And was that a part of your  11 responsibilities, to architect the interface for  12 saving images?  13 A. Saving . . . hmm. Can you rephrase.  14 Q. What's -- what was confusing about my  15 question?  16 A. I just need you to repeat it.  17 Q. Oh. One of the areas you mentioned that  18 you were responsible for was to architect the  19 interface for saving images.  20 My question is, as part of that  21 responsibility, did that include architecting the  22 features related to saving thumbnails associated  23 with those images?  24 A. The thumbnail is an extracted feature.  25 Q. Okay. So is that a "yes"?</p>	

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 52–53:</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p> <p><i>Id.</i> at 77–78:</p>

		<p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99:</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu- -- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or          2 more of these features than the other?          3 A. Yes.          4 Q. Which one?          5 A. Shape.          6 Q. Okay.          7 (Witness reviews document.)          8 A. So one thing I can state is originally I          9 couldn't remember the name of the edge operator --          10 and the name is Canny, the Canny edge operator --          11 when we were talking about finding edges.          12 Q. Okay. So this -- the paragraph on          13 IBM 2393 refreshed your memory that shape          14 calculation used Canny edge detection?          15 A. No, that's sketch.          16 Q. Oh, I'm sorry.          17 A. I'm just stating that originally I was          18 asked a question about standard edge operators. I          19 couldn't remember the name. The name was Canny.          20 Q. Canny. And Canny is used in the sketch          21 calculation?          22 A. Yeah, it's used in the sketch calculation.          23 Q. Understood. Okay. Let's go back to          24 shape.          25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.          2 Q. Can you say the name of the word again?          3 A. I think it's called perround.          4 Q. Per round?          5 A. Yeah.          6 Q. Those -- are those two words, p-e-r,          7 r-o-u-n-d?          8 A. P-e-r -- one word.          9 Q. Okay. Perround, one word.          10 A. It's basically the perimeter squared over          11 area.          12 (Reporter seeks clarification.)          13 A. Perimeter squared over area.          14 (Reporter seeks clarification.)          15 A. Length of the -- over area.          16 Q. Okay. So let's step back a little bit.          17 So it says -- the second paragraph says [as read],          18 "Our shape features are based on a combination of          19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features          20 area, circularity, eccentricity, major access          21 orientation and a set of algebraic moment          22 invariants," i-n-v-a-r-i-a-n-t-s.          23 Did I read that correctly?          24 A. Um-hum.          25 Q. Okay. For circularity, that is computed</p>
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.          2 To calculate the shape feature in a query          3 image or a stored database image, is the first step          4 to convert that image into a binary image?          5 A. I don't think so.          6 Q. So if you look at the second paragraph --          7 and the reason why I ask is -- it's the second          8 sentence in the second paragraph under "Shape          9 features." It says [as read], "All shapes are          10 assumed to be non-occluded planar shapes allowing          11 for each shape to be represented as a binary image."          12 See that?          13 A. Yeah.          14 Q. And then the next sentence says [as read],          15 "The area is computed as the number of pixels set in          16 the binary image."          17 A. Right.          18 Q. So that's why I ask is it the first step          19 in calculating shape to convert the image to binary?          20 A. Yes.          21 Q. And then once you convert it to binary          22 image, then what do you do next in order to          23 calculate the shape?          24 A. You're computing something called          25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?          2 A. Right.          3 Q. All right. Area is the number of pixels          4 in the binary image?          5 A. In the binary blob.          6 Q. In the binary what?          7 A. Blob.          8 Q. Blob. And when you say "blob," what does          9 that refer to?          10 A. The outline of the object that you're          11 doing a shape query on.          12 Q. And so are each of these, area,          13 circularity, eccentricity, major axis orientation          14 and algebraic moment invariants, are those each          15 different algorithms or is it all the same          16 algorithm?          17 A. It's different algorithms.          18 Q. Okay. And since you worked on the shape          19 feature the most, do you recall any other details          20 that are not disclosed in this paragraph?          21 A. Well, this evolved and we ended up doing          22 an implementation of something that's not in here.          23 Q. Okay. And what was that implementation?          24 A. Something called turning angle per round,          25 turning angle, which is -- it looks at the tangent</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So</p> <p>2 you're computing the turning angle. You're</p> <p>3 computing this angle that represents a shape in a</p> <p>4 very interesting way.</p> <p>5 They don't seem to be very good for</p> <p>6 human -- so if you asked a human whether these two</p> <p>7 shapes are similar, they would say "yes," but under</p> <p>8 that feature set.</p> <p>9 Q. And you call that something per round?</p> <p>10 What was the name of it? Started with a T.</p> <p>11 Turrent?</p> <p>12 A. Turning angle.</p> <p>13 Q. Oh, turning angle.</p> <p>14 A. Yeah.</p> <p>15 Q. Well, it said -- your answer -- you did</p> <p>16 say turning angle, but you said something called</p> <p>17 something per round, and it started with a T. I</p> <p>18 thought you said turrent, but maybe I misunderstood.</p> <p>19 MR. STRAUSSMAN: Tangent?</p> <p>20 THE WITNESS: Tangent angle, yeah.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Okay. So something called tangent per</p> <p>23 round, is that what you would call it, this --</p> <p>24 A. No.</p> <p>25 Q. -- this implementation?</p>	
		<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle.</p> <p>2 Q. Okay. So the name of the new</p> <p>3 implementation you're talking about for shape</p> <p>4 calculation is called turning angle?</p> <p>5 A. It used turning angle as a major feature.</p> <p>6 Q. Okay. Was there any other name it went</p> <p>7 by?</p> <p>8 A. I don't recall.</p> <p>9 Q. All right. And that was -- that</p> <p>10 methodology was implemented to calculate shape on a</p> <p>11 query image and an image stored in the database post</p> <p>12 this article?</p> <p>13 A. Yes.</p> <p>14 Q. Was that the -- did that -- did that</p> <p>15 implementation, the turning angle, did that replace</p> <p>16 the methodology in this article or was it</p> <p>17 supplementing the metho- --</p> <p>18 A. Supplementing.</p> <p>19 Q. Okay. Other than turning angle, were</p> <p>20 there any other methodologies used after this</p> <p>21 article?</p> <p>22 A. Not that I recall.</p> <p>23 Q. Okay. Okay. Let's go sketch features, if</p> <p>24 you take a look at that and then let me know when</p> <p>25 you're done reading it.</p>

		<p><i>Id.</i> at 119–128:</p> <table border="0"> <tr> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p> </td> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p> </td> </tr> </table>	<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>	<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>
<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>					
<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then          2 you're looking for blue water, white sand.          3 BY MR. EDWARDS:          4 Q. Do you recall what the methodologies          5 used -- that were used to calculate the orientation          6 of those colors in the image?          7 MR. HANSEN: Objection; lacks foundation.          8 THE WITNESS: There's no orientation per se.          9 It's just position.          10 BY MR. EDWARDS:          11 Q. Well, then position. Do you recall what          12 the methodologies are to calculate the position?          13 MR. HANSEN: Same objection.          14 THE WITNESS: Position is something the user          15 inputs.          16 BY MR. EDWARDS:          17 Q. Something you use what?          18 A. The user had to input.          19 Q. Okay. And then let's move on to the next          20 one, T. It says, "Click T to search images with          21 similar global texture."          22 A. Yeah.          23 Q. Do you recall, in your work on the QBIC          24 project, a feature called global texture that could          25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?          2 A. G-a-b-o-r.          3 Q. So switch over and look at the second page          4 of this Exhibit 6.          5 So -- well, first back -- go back to -- go          6 back to the first page. If you see on the left-hand          7 side it says, "Goto: IBM Image Search Demo," and a          8 little finger there is clicking it.          9 You see it's in red?          10 A. Yeah.          11 Q. Okay. So that's clicking on that link.          12 And then the second page is going to the IBM image          13 search demo.          14 A. Okay.          15 Q. Okay? On the second page it is showing          16 thumbnails with the different icons that we just          17 walked through, I, C, L, T, S, on each of those          18 icons.          19 Do you see that?          20 A. Yep.          21 Q. Do you recognize this as a similar layout          22 to the QBIC demos you hosted in the '90s?          23 A. I don't.          24 Q. You don't?          25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .          2 Q. Say again?          3 A. I missed one of your words. A feature          4 called what?          5 Q. I said do you recall in your work on the          6 QBIC project a feature called global texture that          7 was extracted from the image?          8 A. Yes.          9 Q. Okay. Is that -- is that akin to texture          10 that we looked at earlier?          11 A. Yes.          12 Q. Okay. And the last one is S. It's,          13 "Search images with special multipass filter."          14 Do you recall, in your work on the QBIC          15 project, being able to calculate a feature called          16 multipass filter?          17 A. Probably Gabor functions.          18 Q. Say again?          19 A. Gabor functions.          20 Q. One more time and louder.          21 A. Gabor functions.          22 Q. Gabor functions. Okay. What are Gabor          23 functions?          24 A. Gabor functions are a way of producing          25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM          2 website that was the AIX operating system in          3 Exhibit 3, that did not have a similar thumbnail          4 layout like this?          5 A. A thumbnail, yes. I don't recall it had          6 the buttons, the I, C, L, T, S.          7 Q. You don't recall it had all the buttons or          8 some of the buttons?          9 A. All the buttons.          10 Q. Okay. So you don't recall that it had any          11 buttons?          12 A. I don't -- yeah. I don't recall.          13 Q. It could have, it couldn't have, you just          14 don't remember?          15 A. I just don't remember, yeah.          16 Q. Okay. But the one that you hosted on          17 IBM's website, it did have thumbnails in a similar          18 format here?          19 A. Yeah, it had thumbnails.          20 Q. And these thumbnails represent the images          21 that are stored in the database?          22 A. Yes.          23 Q. Okay. Here, the 470 images would be          24 reflected at least -- one, two, three, four, five,          25 six, seven -- eight of them right here in this</p>

And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>
<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>					
<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>					

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 139–165:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>5 Q. And for the image that you use as a base</p> <p>6 for the query, the things we all talked about in</p> <p>7 terms of feature extraction for average color, color</p> <p>8 histogram, shape, texture, sketch, all of those</p> <p>9 things, the same algorithms would be used in order</p> <p>10 to extract those features from the image query?</p> <p>11 A. They're different algorithms. You would</p> <p>12 use an algorithm.</p> <p>13 Q. I'm sorry. Say that again?</p> <p>14 A. The algorithms are different between the</p> <p>15 shape features and the color features and sketch</p> <p>16 features.</p> <p>17 Q. Yeah. Understood. What I'm trying --</p> <p>18 what I'm trying to understand is, the process that</p> <p>19 we talked about before, when you populate the</p> <p>20 database and you extract the features from the</p> <p>21 images that are stored in the database.</p> <p>22 You know, we went through all those</p> <p>23 different algorithms that are used for shape, color,</p> <p>24 both average color and histogram, texture and</p> <p>25 sketch.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?  2 A. Yep.  3 Q. And then it would extract whatever feature  4 you want from that uncompressed image?  5 A. Correct.  6 Q. And then those extracted features from the  7 uncompressed JPEG image are used in the matching  8 process?  9 A. Correct.  10 Q. Okay. And you were using -- you were  11 doing this for JPEG image -- or the QBIC system was  12 doing this for JPEG images in the -- in the '90s?  13 A. Yes.  14 Q. Okay. So once the system -- now, we're  15 only talking about image-based queries, image using  16 as input for the queries.  17 Once you submit an image for the query, if  18 it's a -- you do your preprocessing that need to be  19 done. Features are extracted. So now we've got  20 just the extracted features, whatever those are.  21 What happens with those extracted features  22 next?  23 A. They're put in the database and then  24 potentially there are indexes built that help you do  25 fast search against those features.</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?  2 A. You say the matching algorithm?  3 Q. Correct.  4 A. Yes, they could be different.  5 Q. Well, let's talk about them. We can get  6 into detail here.  7 Well, before we -- before we get there, so  8 how does the QBIC system display the results of  9 matches to the user?  10 A. Typically just thumbnails in a window in  11 multiple ordered hits.  12 Q. Okay. And it displays them in the order  13 by which they're most similar. So the, you know,  14 best match to the next best match to the next best  15 match, so on and so forth?  16 A. Correct.  17 Q. Okay. And you said the system determines  18 similarity based on some distance measure between  19 the extracted features in the image query versus the  20 stored image?  21 A. The features of the stored image.  22 Q. But it's a -- it's some sort of distance  23 measure?  24 A. Yes.  25 Q. Okay. So let's go back to Exhibit 2.</p>
		<p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm  2 talking about for a query, so I'm taking an image  3 and submitting it to a system as a query.  4 A. Query by example.  5 Q. Query by example. Okay. Once those  6 features extracted for that image, what happens next  7 in the process?  8 A. You take the feature vector and you  9 present it to the database and say return the best  10 matches to this feature vector.  11 Q. Okay. So the system would compare -- the  12 QBIC system would compare the features that are  13 calculated from the input image to stored calculated  14 features of the images in the database and come up  15 with a match?  16 A. Yes.  17 Q. Okay. And those matches would be sorted  18 or arranged in order of most similar?  19 A. Yes.  20 Q. And would algorithms do these comparisons?  21 A. Yes.  22 Q. Would it be a different algorithm for each  23 of the features? So, for example, would there be an  24 algorithm that does the comparison for color  25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and  2 rolling over to IBM 2395, that's a discussion on the  3 image query. And so what I want to do -- I have a  4 couple high-level questions, but then I want to walk  5 through each one. Color starts on 2394, then  6 texture and then shape and sketch are on 2395.  7 So in terms of the -- in terms of the  8 distance measure, Mr. Flickner, if -- I know you  9 said that the results are termed based on those that  10 are most similar but it could come up with something  11 that's an exact match; is that right?  12 A. It's possible.  13 Q. Like the distance measure, the result  14 would be zero if it was an exact match; right?  15 A. Typically you'd get that only if you had  16 the query image the same as a result image.  17 Q. Right. But that's a possibility?  18 A. Yeah.  19 Q. Okay. So let's take a look at color --  20 it's on -- starting at the top of 2394. You know,  21 take your time and read that and then I want to ask  22 you some questions about it.  23 (Witness reviews document.)  24 A. Okay.  25 Q. Okay. So let's first start with average</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between                  2 the query image and the database image using                  3 weighted Euclidean distance; is that right?                  4 A. Yep.                  5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.                  6 And can you just tell us at a high level                  7 what -- if you can -- what Euclidean distance is?                  8 A. So if you have multiple features or                  9 multiple scaler features, you have to ask the                  10 question I'm trying to build a distance from that                  11 vector to a query vector.                  12 And as you build that -- the distance, you                  13 have -- you may want to weight different elements of                  14 the vector differently. And we found out that using                  15 variance normalization, where weights of the                  16 variance of the feature, gave good aesthetic                  17 results.                  18 (Reporter seeks clarification.)                  19 A. Aesthetic results.                  20 Q. And I apologize, I couldn't hear what you                  21 said. You said, "And we found out that using                  22 variance" . . .                  23 A. So you normalize each feature with its                  24 variance.                  25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)                  2 Q. Well, let me ask my -- let me get my                  3 question out first.                  4 So we talked about the features for                  5 average color before are RGB, Yiq, LAB and MTM.                  6 A. Correct.                  7 Q. And so, for example, for the RGB, you're                  8 saying that you would take the R and you would                  9 divide it by the variants of red and green, for                  10 example --                  11 A. Just variants of red.                  12 Q. Okay. And so you could do the same for                  13 the others, for Yiq or LAB?                  14 A. Exactly.                  15 Q. Okay. You do that for both the image                  16 input query and the stored image; correct?                  17 A. Correct.                  18 Q. And then you're calculating the distance                  19 between them, so determining how similar they are                  20 based on the distance?                  21 A. Yeah, or vector distance.                  22 Q. Understood.                  23 A. Two vectors of differences --                  24 (Reporter seeks clarification.)                  25 A. Two vectors with a distance calculation on</p>
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.                  2 Q. With its variance.                  3 A. And then compute the average.                  4 Q. Okay.                  5 A. Or, I'm sorry, compute the weighted sum.                  6 So red divided by the variants of red, plus green                  7 divided by the variants of green --                  8 (Reporter seeks clarification.)                  9 A. Red divided by the variants of red, green                  10 divided by the variants of green, L divided by the                  11 variants of L, that's how you combine the various                  12 features.                  13 Q. Understand. And L represents what?                  14 A. Luminance.                  15 Q. Okay. And this is -- you're talking                  16 specifically with respect to average color?                  17 A. Well, the variance normalization is well                  18 known in terms of multidimensional feature merging.                  19 Q. But for average color, you wouldn't use                  20 luminance, right, as a -- as a variant?                  21 A. Luminance would just -- you wouldn't use                  22 just luminance. You could use luminance . . .                  23 Q. Well, so the color features we talked                  24 about before would be RGB, Yiq, LAB --                  25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.                  2 Q. You're going to have to repeat that and be                  3 just a little bit louder, Mr. Flickner. Sorry.                  4 A. That's all right. Let me get my thoughts                  5 together.                  6 So we have multiple dimensional features.                  7 It's not unusual to take each dimension and                  8 normalize it by the variance because that gives                  9 you -- what that does is if you have tight variances                  10 you divide it by, you get bigger numbers. So you                  11 have more information close by.                  12 Q. What was the word you said before "close                  13 by"?                  14 A. I don't remember.                  15 THE REPORTER: Information?                  16 THE WITNESS: Information close by?                  17 BY MR. EDWARDS:                  18 Q. Okay. Okay. So now let's talk about                  19 color histograms.                  20 A. Okay.                  21 Q. Okay? Well, stop. Let's go back to                  22 average color. So is there -- you described the                  23 weighted Euclidean distance that's calculated                  24 between the query image and the database image for                  25 average color.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall          2 that's not disclosed in the paragraph at IBM 2394?          3 A. Not that I recall.          4 Q. Okay. Do you recall whether this distance          5 methodology changed after this article or it stayed          6 the same?          7 A. It changed.          8 Q. Are you certain or do you know?          9 A. I'm not certain, but I'm pretty certain.          10 Q. And how did it change?          11 A. Different features were shaped like an          12 inch in color. The algorithm evolved. It wasn't          13 static.          14 Q. And how did it evolve?          15 A. I don't recall all the details.          16 Q. Do you recall whether it supplemented the          17 weighted Euclidean distance or replaced it?          18 A. I don't recall.          19 Q. Is it fair to say there was always some          20 distance measurement to determine similarity for          21 average color in the QBIC system?          22 A. There's some measurement, yeah.          23 Q. Okay. Let's talk about color histogram.          24 So in order to determine the similarity          25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was          2 determined by weighted Euclidean distance; is that          3 right?          4 MR. HANSEN: Same objection.          5 THE WITNESS: Correct.          6 BY MR. EDWARDS:          7 Q. And how did -- how was that weighted          8 Euclidean distance determined?          9 A. It was inverse variance.          10 (Reporter seeks clarification.)          11 A. Variance.          12 Q. And it was inverse variance for components          13 like coarseness, contrast and directionality?          14 A. Correct.          15 Q. Okay. And do you recall if that          16 methodology changed or stayed the same after this          17 article for the QBIC system?          18 A. Most likely it evolved.          19 Q. Do you know for sure?          20 A. No.          21 Q. Do you recall any details?          22 A. No.          23 Q. All right. Let's talk about shape next.          24 The similarity between the query image and          25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines          2 distance between normalized histograms?          3 A. Correct.          4 Q. Do you recall any details of how that          5 worked?          6 A. Not off the top of my head.          7 Q. Do you recall whether that methodology          8 evolved for matching color histograms after this          9 article?          10 A. Not that I recall.          11 Q. Okay. All right. Let's talk about          12 texture next. And I don't know if you've read that,          13 but that's at the bottom of 2394 and it goes to just          14 barely at the top of 2395.          15 (Witness reviews document.)          16 A. Okay.          17 Q. So for texture, the similarity is          18 determined by the distance or the weighted Euclidean          19 distance between the query object and -- the query          20 object image and the database object image; is that          21 right?          22 MR. HANSEN: Objection; vague and ambiguous.          23 THE WITNESS: Can you repeat.          24 BY MR. EDWARDS:          25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?          2 A. Correct.          3 Q. And do you recall how that worked?          4 A. There's computing moments. And we used          5 the shape measure, which I mentioned earlier,          6 curvature and turning angle.          7 (Reporter seeks clarification.)          8 A. Curvature and turning angle.          9 Q. And the curvature and turning angle would          10 be compared between the image query and the database          11 image; correct?          12 A. Correct.          13 Q. And do you recall if that methodology          14 changed after this article came out in '93?          15 A. Yes, it did.          16 Q. How so?          17 A. Well, in the IEEE computer paper, we          18 described a different way of doing shape measures.          19 And they included the moment calculations.          20 Q. And you use the moment calculations to          21 determine a distance between the image query and          22 the -- and the database image?          23 A. Yes.          24 Q. Sorry?          25 A. Yeah. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?</p> <p>2 A. Given a binary blob, certain high-level</p> <p>3 moments and then you create -- compute the</p> <p>4 eigenvectors of certain matrices that are created --</p> <p>5 (Reporter seeks clarification.)</p> <p>6 A. Eigenvectors, e-i-g-e -- i-n -- to compute</p> <p>7 the eigenvectors of certain matrices. And that</p> <p>8 would give you translation and rotation and</p> <p>9 variance.</p> <p>10 Q. And so after the Exhibit 3 1995 IEEE</p> <p>11 article, did that methodology change to compute the</p> <p>12 distance for shape?</p> <p>13 A. I don't recall.</p> <p>14 Q. So the methodology for shape that you just</p> <p>15 described using moment calculations, that is</p> <p>16 different from what is described in the 1993 article</p> <p>17 for weighted Euclidean distance?</p> <p>18 A. We still might have used weighted</p> <p>19 Euclidean distance when the underlying features are</p> <p>20 different.</p> <p>21 Q. Understood.</p> <p>22 And the underlying features are different</p> <p>23 in the sense that in the 1995 article you're using</p> <p>24 what features?</p> <p>25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment</p> <p>2 invariants.</p> <p>3 (Witness reviews document.)</p> <p>4 A. Is there any other papers that we have</p> <p>5 here?</p> <p>6 Q. Nope.</p> <p>7 A. Everything else is screenshots?</p> <p>8 MR. STRAUSSMAN: I don't think you introduced</p> <p>9 any other papers.</p> <p>10 THE WITNESS: I saw it earlier today.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. Why don't we do it this way. In terms of</p> <p>13 the feature calculations that were -- for shape on</p> <p>14 page IBM 900 of Exhibit 3 versus page --</p> <p>15 A. So if you look at 2393.</p> <p>16 Q. What page are you directing me to?</p> <p>17 A. 2393.</p> <p>18 Q. Okay.</p> <p>19 A. So it talks about the moment invariants as</p> <p>20 well.</p> <p>21 Q. Okay.</p> <p>22 A. These are those matrices that you compute</p> <p>23 eigenvectors of.</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Matrices that you compute eigenvectors of.</p>
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)</p> <p>2 Q. I think the page you may be looking for is</p> <p>3 IBM 900 on the left side.</p> <p>4 (Witness reviews document.)</p> <p>5 A. What else do we have here?</p> <p>6 Q. So if you'll look at -- if you'll -- if</p> <p>7 you'll compare page IBM 900 from Exhibit 3 to page</p> <p>8 IBM 2393 from Exhibit 2, those are the descriptions</p> <p>9 in both articles about the features that are</p> <p>10 calculated.</p> <p>11 A. I'm trying to remember what --</p> <p>12 MR. STRAUSSMAN: Can you direct him a little</p> <p>13 closer?</p> <p>14 BY MR. EDWARDS:</p> <p>15 Q. Can I show you? Do you mind?</p> <p>16 I believe this is what you're looking for.</p> <p>17 So if you look right here (indicating).</p> <p>18 (Witness reviews document.)</p> <p>19 A. That's the same as this one (indicating).</p> <p>20 We had another -- there's another discussion about</p> <p>21 moments.</p> <p>22 Q. So if you look at -- under "Shape</p> <p>23 features" at 2393, right there, where you're looking</p> <p>24 at --</p> <p>25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment</p> <p>2 invariants in the 1993 SPIE article?</p> <p>3 A. Correct.</p> <p>4 Q. Right. And then if you go to the IEEE</p> <p>5 article that you primarily co-authored, on page 900,</p> <p>6 it refers to shape queries using area, circularity,</p> <p>7 eccentricity, major-axis direction and features</p> <p>8 derived from the object moments.</p> <p>9 A. Right.</p> <p>10 Q. Is that the same thing as algebraic moment</p> <p>11 invariants?</p> <p>12 A. Right.</p> <p>13 Q. So it looks like the methodologies are the</p> <p>14 same for the features that are extracted between the</p> <p>15 papers; is that right?</p> <p>16 A. I thought one paper had algebraic moments</p> <p>17 and one had turning angle. Maybe they both had</p> <p>18 turning angle.</p> <p>19 (Reporter seeks clarification.)</p> <p>20 A. Turning angle. Algebraic moments.</p> <p>21 Turning angles.</p> <p>22 Q. The 1993 paper refers to algebraic moment</p> <p>23 invariants. The IEEE paper, on IBM 900, refers to</p> <p>24 features derived from object moments.</p> <p>25 Are those the same thing?</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.</p> <p>2 Q. Okay. And so turning angles, which you've</p> <p>3 previously testified on, do you think that</p> <p>4 calculating shape features based on turning angles</p> <p>5 came after these papers?</p> <p>6 A. No. They're mentioned in these papers.</p> <p>7 Q. Okay. So they're included in these</p> <p>8 papers?</p> <p>9 A. Yes.</p> <p>10 Q. And so any distance measurement using</p> <p>11 weighted Euclidean distance would have taken into</p> <p>12 account turning angles?</p> <p>13 A. As a feature, yeah. Yes.</p> <p>14 Q. For both -- for both papers?</p> <p>15 A. For both papers.</p> <p>16 Q. Okay. Let's talk about sketch, which</p> <p>17 is -- if you'll just stick with 2395, which is</p> <p>18 Exhibit 2.</p> <p>19 MR. STRAUSSMAN: Can you direct him?</p> <p>20 THE WITNESS: I found it.</p> <p>21 MR. STRAUSSMAN: Okay.</p> <p>22 (Witness reviews document.)</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Let me know when you're finished reading</p> <p>25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p>16 Q. Okay. So the results of the query -- so</p> <p>17 we talked about before that the results of the</p> <p>18 queries display thumbnails of the database images</p> <p>19 based on similarity of which they match; correct?</p> <p>20 A. Correct.</p> <p>21 Q. And then those thumbnails can provide</p> <p>22 links to the original image or, if it was an</p> <p>23 r-frame, it could be -- you could provide a link to</p> <p>24 the video; correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.</p> <p>2 Q. For sketch, the similarity between the</p> <p>3 query image and the database image uses an algorithm</p> <p>4 that performs logical binary correlation of the</p> <p>5 binary image?</p> <p>6 A. Yes.</p> <p>7 Q. Are there any other details you recall for</p> <p>8 the sketch comparison beyond what's disclosed in</p> <p>9 this paragraph on IBM 2395?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Do you recall the methodology for</p> <p>12 determining similarity of the input image and the</p> <p>13 database image for sketch changing after this</p> <p>14 article?</p> <p>15 A. Not that I recall.</p> <p>16 Q. So if you go to the next page,</p> <p>17 Mr. Flickner, which is 2396, the Section 4.2 talks</p> <p>18 about performing queries.</p> <p>19 A. Um-hum.</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links</p> <p>2 to information about the image that was associated</p> <p>3 with the image in the database?</p> <p>4 A. Yes.</p> <p>5 Q. And, again, that can be that -- whatever</p> <p>6 information that the user inputted or was associated</p> <p>7 with the image from the source?</p> <p>8 A. Yes.</p> <p>9 Q. Could the results also display a matching</p> <p>10 score so the user could see how well the particular</p> <p>11 result matched to the -- to the query image?</p> <p>12 A. It could.</p> <p>13 Q. Okay.</p> <p>14 MR. EDWARDS: I'm going to hand you the next</p> <p>15 exhibit, Mr. Flickner.</p> <p>16 (Deposition Exhibit 10 was marked.)</p> <p>17 MR. EDWARDS: Handing you what's been marked as</p> <p>18 Exhibit 10.</p> <p>19 For the record, it's IBM Bates Nos. 002418</p> <p>20 to 2430.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. The title of this article is "Updates to</p> <p>23 the QBIC system."</p> <p>24 Do you see that?</p> <p>25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?</p> <p>2 A. Yes.</p> <p>3 Q. You are listed as a co-author of this</p> <p>4 article; is that correct?</p> <p>5 A. Yes.</p> <p>6 Q. And it is a paper that is published in the</p> <p>7 SPIE; correct?</p> <p>8 A. Correct.</p> <p>9 Q. In 1997; correct?</p> <p>10 A. Yes. It was 1997 or 1998.</p> <p>11 Q. No later than 1998; correct?</p> <p>12 A. Correct.</p> <p>13 Q. So just want to kind of orient you to the</p> <p>14 first page, which is IBM 2419.</p> <p>15 A. It's '98 because '97 is a different paper.</p> <p>16 Q. Well, if you turn the page, look at the</p> <p>17 footer on the right-hand side.</p> <p>18 Are you familiar that SPIE usually</p> <p>19 includes footers with the volume and the date at the</p> <p>20 bottom?</p> <p>21 A. Yeah.</p> <p>22 Q. And if you look at the footer kind of</p> <p>23 towards the right it says -786X-97-\$10 [sic]?</p> <p>24 A. Yeah.</p> <p>25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?</p> <p>2 A. Yep.</p> <p>3 Q. Okay. So let's -- I'm going to have you</p> <p>4 jump around, so I apologize in advance. Let's go to</p> <p>5 the -- kind of the back, IBM 2428.</p> <p>6 A. Okay.</p> <p>7 Q. Is that example of the stamps demo that</p> <p>8 was available on IBM's website?</p> <p>9 A. Yes.</p> <p>10 Q. All right. And if you look at the top in</p> <p>11 the location URL it has the almaden.ibm website</p> <p>12 address; correct?</p> <p>13 A. Correct.</p> <p>14 Q. All right. Let's flip forward to 2429.</p> <p>15 And is 2429 a screenshot of a trademark</p> <p>16 demo that was also available in the Almaden --</p> <p>17 excuse me -- almaden.ibm website?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. And that demo looks like the</p> <p>20 trademark query is based on shape; is that right?</p> <p>21 A. It uses shape as one similarity feature.</p> <p>22 Q. Right. So the trademarks are converted to</p> <p>23 a binary image, like we talked before -- talked</p> <p>24 about before, and then they're -- the matching</p> <p>25 process is done based on those binary images?</p>
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the</p> <p>2 conference was in '98.</p> <p>3 Q. Submission was in '97. So the paper was</p> <p>4 published in '97 and then the conference you</p> <p>5 presented it at was in 1998?</p> <p>6 A. That's possible.</p> <p>7 Q. Do you recall presenting this paper at a</p> <p>8 conference in 1998?</p> <p>9 A. No, I don't.</p> <p>10 Q. So the first page refers to the Photonics</p> <p>11 West 1999 -- excuse me. Photonics West 1998</p> <p>12 Electronic Imaging Conference in San Jose.</p> <p>13 Do you recall attending that conference?</p> <p>14 A. It's likely I did, but I don't recall.</p> <p>15 Q. Okay. But you would agree with me this</p> <p>16 paper was made available at least as early as 1998;</p> <p>17 correct?</p> <p>18 A. Yes.</p> <p>19 Q. Okay. So the first page, IBM 2419. Under</p> <p>20 "Introduction," at the time of this paper it says,</p> <p>21 last line on the first paragraph, "Several online</p> <p>22 demos of QBIC are available at</p> <p>23 <a href="http://www.qbic.almaden.ibm.com">http://www.qbic.almaden.ibm.com</a>."</p> <p>24 Do you see that?</p> <p>25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p>22 Q. Okay. So 39 would be the -- so the first</p> <p>23 image at the top left is a 39, the one next to it is</p> <p>24 a 46, so the 39 would be a closer match than the 46;</p> <p>25 correct?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference		
		<p><i>Id.</i> at 174–182:</p> <table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="width: 50%; vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>			

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?                  2 MR. HANSEN: Objection; lacks foundation.                  3 THE WITNESS: It points to the file that's the                  4 QBIC catalog.                  5 BY MR. EDWARDS:                  6 Q. Can you walk us through that one more                  7 time? And just be a little bit louder, sorry.                  8 MR. HANSEN: Same objection.                  9 THE WITNESS: So the QBIC catalog is a set of                  10 files that hold data about visual features in the                  11 image.                  12 (Reporter seeks clarification.)                  13 THE WITNESS: Visual features. The image                  14 extender lets you search against that database,                  15 against that object.                  16 BY MR. EDWARDS:                  17 Q. The image extender lets you search against                  18 that catalog, the name of that catalog?                  19 A. The catalog, yeah.                  20 Q. Okay. And it does so by using a pointer                  21 from the handle in the table?                  22 MR. HANSEN: Objection; lacks foundation.                  23 THE WITNESS: Correct.                  24 BY MR. EDWARDS:                  25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold                  2 data for the following image features: Average                  3 color, Histogram color, Positional color and                  4 Texture."                  5 Is that right?                  6 A. Yep.                  7 Q. Okay. We spoke about average color,                  8 histogram color and texture; correct?                  9 A. Right.                  10 Q. What is positional color?                  11 A. We talked about it briefly. It's color in                  12 particular locations in the image.                  13 Q. Ah. Understood.                  14 That is -- that is similar to L in the                  15 demo that we looked at, which is called color                  16 layout.                  17 A. Okay, yes.                  18 Q. Is that correct?                  19 A. I don't remember if it's called L. Sounds                  20 right.                  21 Q. If you look at --                  22 MR. EDWARDS: If you can show -- give him                  23 Exhibit 6.                  24 THE WITNESS: Oh, this L. Yes.                  25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.                  3 MR. HANSEN: Objection; lacks foundation, calls                  4 for speculation.                  5 MR. EDWARDS: You can put that enormous exhibit                  6 aside.                  7 THE WITNESS: Test 1, 2, 3.                  8 BY MR. EDWARDS:                  9 Q. Go back to Exhibit 3, please. If you                  10 could turn to the page Bates-labeled IBM 894 with                  11 the architecture picture.                  12 A. Okay.                  13 Q. So I just -- I just want to kind of walk                  14 the -- through this architecture, Mr. Flickner. But                  15 as a high level, I just want to understand, is                  16 this -- is this a high-level architecture that would                  17 generally be used for any implementation of QBIC?                  18 A. Yes.                  19 Q. All right. So first step is you submit                  20 still images or r-frames for feature extraction; is                  21 that correct?                  22 A. Correct.                  23 Q. Okay. Features are extracted, such as                  24 color, texture, shape, sketch and text; correct?                  25 A. Location, yep.</p>

*Nantworks, LLC v. Bank of America Corporation*

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 182</p> <p>1 Q. And location. Including the ones that I                  2 listed; correct?                  3 A. Yep.                  4 Q. Okay. After feature extraction is done,                  5 the images and those features for the database                  6 images are stored in the database; correct?                  7 A. Correct.                  8 Q. And then once those are stored, a user can                  9 query using some sort of a user interface; is that                  10 right?                  11 A. Correct.                  12 Q. And the user can query based on color,                  13 texture, shape, multi-object, sketch, location or                  14 text; is that right?                  15 A. Correct.                  16 Q. Okay. Those features are then decomposed                  17 and extracted from the query image and then a                  18 matching engine is used to compare those similarly                  19 extracted features from the stored images; is that                  20 correct?                  21 A. Correct.                  22 Q. And then the best matches are returned in                  23 similarity of order back to the user; is that right?                  24 A. Correct.                  25 Q. Okay. Thank you for that.</p> <p><i>Id.</i> at 190–191:                  22 Q. So [as read], "Once the image catalogs are                  23 created, you can use the Image Query component to                  24 find image and business information. Business                  25 information, such as character and numeric data, are</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p>Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 318</p> <p>1 correct?</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Correct.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And those calculations of features</p> <p>6 included color, shape and/or texture in all</p> <p>7 implementations that we looked at today, correct?</p> <p>8 MR. HANSEN: Same objections.</p> <p>9 THE WITNESS: I don't remember if all versions</p> <p>10 supported all features.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. If the 1995 article references calculating</p> <p>13 color, shape and texture, you would agree with me</p> <p>14 that the commercial embodiments implementing QBIC at</p> <p>15 the time would have been able to calculate color,</p> <p>16 shape and texture as part of feature extraction;</p> <p>17 correct?</p> <p>18 MR. HANSEN: Objection; lacks foundation.</p> <p>19 THE WITNESS: I don't remember exactly which</p> <p>20 products incorporated any subsets of the features.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Do you recall that all the products used</p> <p>23 color?</p> <p>24 MR. HANSEN: Objection; lacks foundation.</p> <p>25 THE WITNESS: I'm pretty sure they all did use</p>	<p style="text-align: right;">Page 320</p> <p>1 [as read] "Image Query allows searches by three</p> <p>2 methods: Image content, such as color, shape and</p> <p>3 texture."</p> <p>4 You see that?</p> <p>5 A. Yeah.</p> <p>6 Q. So Ultimedia Manager 1.1 was able to</p> <p>7 perform an image query using color, shape and</p> <p>8 texture, correct?</p> <p>9 MR. HANSEN: Objection; lacks foundation.</p> <p>10 THE WITNESS: And layout.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. And layout. But also color, shape and</p> <p>13 texture, correct?</p> <p>14 A. Yes.</p> <p>15 MR. HANSEN: Same objection.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. And then if you go to the last sentence it</p> <p>18 goes on -- and the bottom of the left column on that</p> <p>19 same page, going to the top of the right column, it</p> <p>20 says, "You can drag and drop visual samples into an</p> <p>21 image query."</p> <p>22 You see that?</p> <p>23 A. Yeah.</p> <p>24 Q. And that would include images, correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 319</p> <p>1 color.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. And color histograms specifically?</p> <p>4 MR. HANSEN: Same objection.</p> <p>5 (Reporter seeks clarification.)</p> <p>6 BY MR. EDWARDS:</p> <p>7 Q. Histograms specifically.</p> <p>8 (Reporter seeks clarification.)</p> <p>9 THE WITNESS: Most likely, yes.</p> <p>10 BY MR. EDWARDS:</p> <p>11 Q. Well, pick up Exhibit 12, please.</p> <p>12 And go to IBM 2264.</p> <p>13 A. Okay.</p> <p>14 Q. So the Ultimedia Manager 1.1 was able to</p> <p>15 perform an image query using color, shape and</p> <p>16 texture; correct?</p> <p>17 MR. HANSEN: Objection; lacks foundation.</p> <p>18 (Witness reviews document.)</p> <p>19 BY MR. EDWARDS:</p> <p>20 Q. Let me orient you a little more. If you</p> <p>21 go to the bottom of IBM 2264, where it says "Image</p> <p>22 Query,"</p> <p>23 You see that?</p> <p>24 A. Yeah.</p> <p>25 Q. Where the bullet points start, it says,</p>	<p style="text-align: right;">Page 321</p> <p>1 MR. HANSEN: Objection; lacks foundation.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. Okay?</p> <p>4 A. Correct.</p> <p>5 Q. Mr. Flickner, every commercial</p> <p>6 implementation of QBIC as of the Exhibit 3, IEEE</p> <p>7 1995 article, returned results of the matching</p> <p>8 process to the user in the form of a stored image</p> <p>9 and information associated with that image; is that</p> <p>10 fair?</p> <p>11 MR. HANSEN: Objection; lacks foundation.</p> <p>12 THE WITNESS: Yes.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Okay. And a thumbnail is an image;</p> <p>15 correct?</p> <p>16 A. Thumbnail is an image.</p> <p>17 Q. And for every commercial embodiment of</p> <p>18 QBIC as of the 1995 IEEE article in Exhibit 3, those</p> <p>19 implementations calculated a distance metric as a</p> <p>20 measure of similarity for each feature between an</p> <p>21 input image and a stored image; correct?</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 THE WITNESS: Correct.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. Okay. And a distance measure value</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference																																									
		<p style="text-align: right;"><b>Data structures</b></p> <p><b>Handles</b></p> <p>When you store an image, audio, or video object in a user table, the object is not actually stored in the table. Instead, an extender creates a character string called a <b>handle</b> to represent the object, and stores the handle in the table. The extender stores the object in an administrative support table, or stores a file identifier in an administrative support table if you keep the content of the object in a file. It also stores the object’s attributes and handle in administrative support tables. In this way, the extender can link the handle stored in a user table with the object information stored in the administrative support tables. Figure 8 illustrates the information stored for two images in a user table.</p> <p>User Table</p> <table border="1" data-bbox="842 591 1150 699"> <thead> <tr> <th>ID</th> <th>Name</th> <th>Picture</th> </tr> </thead> <tbody> <tr> <td></td> <td></td> <td>Handle 1</td> </tr> <tr> <td></td> <td></td> <td>Handle 2</td> </tr> </tbody> </table> <p>Administrative Support Tables</p> <table border="1" data-bbox="877 753 1339 873"> <thead> <tr> <th colspan="4">Common Attributes</th> </tr> <tr> <th>Handle</th> <th>Importer</th> <th>Updater</th> <th></th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> <td></td> </tr> </tbody> </table> <table border="1" data-bbox="842 878 1297 1003"> <thead> <tr> <th colspan="4">Unique Attributes</th> </tr> <tr> <th>Handle</th> <th>Width</th> <th>Height</th> <th>Numcolors</th> </tr> </thead> <tbody> <tr> <td>Handle 1</td> <td></td> <td></td> <td></td> </tr> <tr> <td>Handle 2</td> <td></td> <td></td> <td></td> </tr> </tbody> </table>  <p><i>Figure 8. Handles</i></p> <p><b>QBIC catalogs</b></p> <p>A <b>QBIC catalog</b> is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.</p> <p>You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p style="text-align: right;">Chapter 2. *Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the</p> <p>20 IBM® D82® Universal Database: Image, Audio, and Video Extenders</p> <p style="text-align: right;">IBM 000040</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot catalog file name</li> <li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li> <li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li> <li>• Shot number</li> <li>• Starting frame number</li> <li>• Ending frame number</li> <li>• Representative frame number</li> <li>• Name of a file that contains the contents of the representative frame</li> </ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"> <li>• Shot handle</li> <li>• Video table name</li> </ul> <p style="text-align: right;">Chapter 2. DB2 extender concepts <b>21</b>                  IBM 000041</p> <p>IBM0002263 at 2264</p>

Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: center;"><b>Description</b></p> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <p style="text-align: center;"><b>Image Classification</b></p> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <p style="text-align: center;"><b>Image Query</b></p> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <p style="text-align: center;"><b>Image Formats</b></p> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCX</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <p style="text-align: center;"><b>Product Positioning</b></p> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almaden Research Center. It provides functions not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="text-align: center;">205-642 <span style="float: right;">IBM 0002264</span></p>

		<p>person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Invalidation Contentions. A person of ordinary skill in the art would have been motivated to combine QBIC with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[1E]	<p>associate the object with information; and</p>	<p>QBIC discloses associate the object with information.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2396-97</p> <p>4.2. <b>Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (<i>R, G, B</i>) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p>5. <b>Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>(buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>IBM0002390 at 2391-92</p> <p><b>2.1. Database Population</b></p> <p>The first step in population is to simply load the images into the system. This involves adding the image to the database, preparing a reduced 100x100 “thumbnail”, and adding any available text information to the database. Object/element identification is an optional part of this step. It allows a user to manually or semi-automatically identify objects, areas, or significant edges in a scene using a mouse. Internally, each identified object or area becomes a binary mask. There can be an arbitrary number of objects per image, objects may overlap, and objects may consist of multiple disconnected components (e.g. the set of dots on a polka dot dress). Text (e.g. “baby on beach”) can be added to an outlined object, or to the scene as a whole. Ideally this step would be done automatically but current automatic methods to identify and outline image objects are not sufficiently robust so we allow this step to be done manually or semi-automatically. Because database population is the most labor intensive task in many QBIC applications, we try to automate it as much as possible. We call these semi-automatic methods interactive outlining or shrink-wrapping.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression</p> <p>containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>In interactive outlining, as in other parts of our system, we have attempted to build the functions in such a way as to carefully distribute the tasks between the human and machine. For example, the tasks of giving the starting outline for an object or of attaching semantic meaning to objects is left to the user since they are difficult for machines. On the other hand, computation of quantitative image/object features is ideally suited for machines and so is done automatically.</p>  <p>Figure 1: Original image, approximate user outline, and automatically refined outline of sun.</p>

		<p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects.                      For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.                      Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects-for example, a car moving across the screen.                      Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at p. 8.</p>

		<p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

		16 Q. And when it refers to "text information," 17 what is it referring to? 18 A. Anything that could be extracted in the 19 context of how the image was annotated. 20 Q. And when you say "annotated," annotated by 21 the user who was populating the database? 22 A. Could be. 23 Q. What else could it be? 24 A. It could be the supplier of the data. 25 Q. Okay. So you may have some annotations

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference				
		<table border="0"> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data</p> <p>2 supplied and then also the user populating the</p> <p>3 database could also enter text descriptions?</p> <p>4 A. Right.</p> <p>5 Q. Okay. And were there limitations to the</p> <p>6 text descriptions or -- in terms of character</p> <p>7 limits?</p> <p>8 A. Probably were -- there . . .</p> <p>9 Q. But essentially, other than the character</p> <p>10 limits, could a -- could a user essentially put</p> <p>11 anything in the text description?</p> <p>12 A. You're saying any text in the text</p> <p>13 description?</p> <p>14 Q. Correct.</p> <p>15 A. Sure.</p> <p>16 Q. So, for example, if it were for a product,</p> <p>17 you could put price?</p> <p>18 A. Yep.</p> <p>19 Q. If -- you could put the name of the</p> <p>20 product?</p> <p>21 A. Yeah.</p> <p>22 Q. You could put where you could purchase the</p> <p>23 product?</p> <p>24 A. Yep.</p> <p>25 Q. You -- could you put a URL where you could</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 56</p> <p>1 would do this?</p> <p>2 A. Or an annotator, yeah.</p> <p>3 Q. Okay. And how would they do that?</p> <p>4 A. They could do it manually or they could</p> <p>5 use tools to help identify objects.</p> <p>6 Q. And manually how would that work?</p> <p>7 A. You look at the image and specify what</p> <p>8 objects are in the image.</p> <p>9 Q. And how would they specify it?</p> <p>10 A. Typing in a text phrase.</p> <p>11 Q. Okay. So if it was an image of a dog,</p> <p>12 they could type in "dog." for example?</p> <p>13 A. Yeah, exactly.</p> <p>14 Q. What if there were multiple objects in the</p> <p>15 image, was there a way for the user to outline or</p> <p>16 demarcate those objects?</p> <p>17 A. Yes.</p> <p>18 Q. How would they do that?</p> <p>19 A. They could just put "German Shepherd" and</p> <p>20 "Retriever" to determine the type of dogs. So they</p> <p>21 could do it using annotations of text --</p> <p>22 Q. Was there a way --</p> <p>23 A. -- or they could use extracting tools</p> <p>24 where you could outline the object more accurately.</p> <p>25 Q. So you could outline the edges of the</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 55</p> <p>1 link to to go find the product?</p> <p>2 A. 1993, URLs were just starting to come on</p> <p>3 board, if I recall right. URLs weren't particularly</p> <p>4 popular yet.</p> <p>5 Q. Not in 1993, but the QBIC project lasted</p> <p>6 throughout the '90s; correct?</p> <p>7 A. Yeah.</p> <p>8 Q. So say a user closer to 2000, they could</p> <p>9 insert a URL in that description?</p> <p>10 A. Yeah. Yeah.</p> <p>11 Q. So in addition to uploading the images,</p> <p>12 associated thumbnail, text descriptions, did object</p> <p>13 identification also occur at this database</p> <p>14 population step?</p> <p>15 A. It could.</p> <p>16 Q. And what is object identification?</p> <p>17 A. It's to be taking a region of an image and</p> <p>18 putting a label on it.</p> <p>19 Q. Say the last part?</p> <p>20 A. Putting a label on it.</p> <p>21 Q. Taking a region of an image and putting a</p> <p>22 label on it?</p> <p>23 A. Yeah.</p> <p>24 Q. Okay. And how would you -- and back up.</p> <p>25 The user who was populating the database</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 57</p> <p>1 shape of the object?</p> <p>2 A. Right.</p> <p>3 Q. And you could do that with a manual -- the</p> <p>4 user could do that with a manual tool?</p> <p>5 A. Yeah.</p> <p>6 Q. Were there automatic tools that did --</p> <p>7 that did things like look for objects? So, for</p> <p>8 example, were there automatic tools that QBIC used,</p> <p>9 like edge detection or segmentation, that extracted</p> <p>10 object --</p> <p>11 A. You could --</p> <p>12 Q. -- shapes?</p> <p>13 A. You could use edge detection.</p> <p>14 Q. Okay. Did QBIC use edge detection?</p> <p>15 A. Yes, in certain aspects.</p> <p>16 Q. In what aspects?</p> <p>17 A. So on the annotation tool, if you compute</p> <p>18 gradients, you can make a better prediction of</p> <p>19 helping the person annotate.</p> <p>20 So it's very tedious to go through and</p> <p>21 annotate everything. Whereas if you have a tool,</p> <p>22 it'll tell you where it thinks the boundaries are.</p> <p>23 And you could speed up annotation quite a bit doing</p> <p>24 that.</p> <p>25 Q. So this tool that you're referring to, a</p> </td> </tr> </table>	<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data</p> <p>2 supplied and then also the user populating the</p> <p>3 database could also enter text descriptions?</p> <p>4 A. Right.</p> <p>5 Q. Okay. And were there limitations to the</p> <p>6 text descriptions or -- in terms of character</p> <p>7 limits?</p> <p>8 A. Probably were -- there . . .</p> <p>9 Q. But essentially, other than the character</p> <p>10 limits, could a -- could a user essentially put</p> <p>11 anything in the text description?</p> <p>12 A. You're saying any text in the text</p> <p>13 description?</p> <p>14 Q. Correct.</p> <p>15 A. Sure.</p> <p>16 Q. So, for example, if it were for a product,</p> <p>17 you could put price?</p> <p>18 A. Yep.</p> <p>19 Q. If -- you could put the name of the</p> <p>20 product?</p> <p>21 A. Yeah.</p> <p>22 Q. You could put where you could purchase the</p> <p>23 product?</p> <p>24 A. Yep.</p> <p>25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?</p> <p>2 A. Or an annotator, yeah.</p> <p>3 Q. Okay. And how would they do that?</p> <p>4 A. They could do it manually or they could</p> <p>5 use tools to help identify objects.</p> <p>6 Q. And manually how would that work?</p> <p>7 A. You look at the image and specify what</p> <p>8 objects are in the image.</p> <p>9 Q. And how would they specify it?</p> <p>10 A. Typing in a text phrase.</p> <p>11 Q. Okay. So if it was an image of a dog,</p> <p>12 they could type in "dog." for example?</p> <p>13 A. Yeah, exactly.</p> <p>14 Q. What if there were multiple objects in the</p> <p>15 image, was there a way for the user to outline or</p> <p>16 demarcate those objects?</p> <p>17 A. Yes.</p> <p>18 Q. How would they do that?</p> <p>19 A. They could just put "German Shepherd" and</p> <p>20 "Retriever" to determine the type of dogs. So they</p> <p>21 could do it using annotations of text --</p> <p>22 Q. Was there a way --</p> <p>23 A. -- or they could use extracting tools</p> <p>24 where you could outline the object more accurately.</p> <p>25 Q. So you could outline the edges of the</p>	<p style="text-align: right;">Page 55</p> <p>1 link to to go find the product?</p> <p>2 A. 1993, URLs were just starting to come on</p> <p>3 board, if I recall right. URLs weren't particularly</p> <p>4 popular yet.</p> <p>5 Q. Not in 1993, but the QBIC project lasted</p> <p>6 throughout the '90s; correct?</p> <p>7 A. Yeah.</p> <p>8 Q. So say a user closer to 2000, they could</p> <p>9 insert a URL in that description?</p> <p>10 A. Yeah. Yeah.</p> <p>11 Q. So in addition to uploading the images,</p> <p>12 associated thumbnail, text descriptions, did object</p> <p>13 identification also occur at this database</p> <p>14 population step?</p> <p>15 A. It could.</p> <p>16 Q. And what is object identification?</p> <p>17 A. It's to be taking a region of an image and</p> <p>18 putting a label on it.</p> <p>19 Q. Say the last part?</p> <p>20 A. Putting a label on it.</p> <p>21 Q. Taking a region of an image and putting a</p> <p>22 label on it?</p> <p>23 A. Yeah.</p> <p>24 Q. Okay. And how would you -- and back up.</p> <p>25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?</p> <p>2 A. Right.</p> <p>3 Q. And you could do that with a manual -- the</p> <p>4 user could do that with a manual tool?</p> <p>5 A. Yeah.</p> <p>6 Q. Were there automatic tools that did --</p> <p>7 that did things like look for objects? So, for</p> <p>8 example, were there automatic tools that QBIC used,</p> <p>9 like edge detection or segmentation, that extracted</p> <p>10 object --</p> <p>11 A. You could --</p> <p>12 Q. -- shapes?</p> <p>13 A. You could use edge detection.</p> <p>14 Q. Okay. Did QBIC use edge detection?</p> <p>15 A. Yes, in certain aspects.</p> <p>16 Q. In what aspects?</p> <p>17 A. So on the annotation tool, if you compute</p> <p>18 gradients, you can make a better prediction of</p> <p>19 helping the person annotate.</p> <p>20 So it's very tedious to go through and</p> <p>21 annotate everything. Whereas if you have a tool,</p> <p>22 it'll tell you where it thinks the boundaries are.</p> <p>23 And you could speed up annotation quite a bit doing</p> <p>24 that.</p> <p>25 Q. So this tool that you're referring to, a</p>
<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data</p> <p>2 supplied and then also the user populating the</p> <p>3 database could also enter text descriptions?</p> <p>4 A. Right.</p> <p>5 Q. Okay. And were there limitations to the</p> <p>6 text descriptions or -- in terms of character</p> <p>7 limits?</p> <p>8 A. Probably were -- there . . .</p> <p>9 Q. But essentially, other than the character</p> <p>10 limits, could a -- could a user essentially put</p> <p>11 anything in the text description?</p> <p>12 A. You're saying any text in the text</p> <p>13 description?</p> <p>14 Q. Correct.</p> <p>15 A. Sure.</p> <p>16 Q. So, for example, if it were for a product,</p> <p>17 you could put price?</p> <p>18 A. Yep.</p> <p>19 Q. If -- you could put the name of the</p> <p>20 product?</p> <p>21 A. Yeah.</p> <p>22 Q. You could put where you could purchase the</p> <p>23 product?</p> <p>24 A. Yep.</p> <p>25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?</p> <p>2 A. Or an annotator, yeah.</p> <p>3 Q. Okay. And how would they do that?</p> <p>4 A. They could do it manually or they could</p> <p>5 use tools to help identify objects.</p> <p>6 Q. And manually how would that work?</p> <p>7 A. It could.</p> <p>16 Q. And what is object identification?</p> <p>17 A. It's to be taking a region of an image and</p> <p>18 putting a label on it.</p> <p>19 Q. Say the last part?</p> <p>20 A. Putting a label on it.</p> <p>21 Q. Taking a region of an image and putting a</p> <p>22 label on it?</p> <p>23 A. Yeah.</p> <p>24 Q. Okay. And how would you -- and back up.</p> <p>25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?</p> <p>2 A. Right.</p> <p>3 Q. And you could do that with a manual -- the</p> <p>4 user could do that with a manual tool?</p> <p>5 A. Yeah.</p> <p>6 Q. Were there automatic tools that did --</p> <p>7 that did things like look for objects? So, for</p> <p>8 example, were there automatic tools that QBIC used,</p> <p>9 like edge detection or segmentation, that extracted</p> <p>10 object --</p> <p>11 A. You could --</p> <p>12 Q. -- shapes?</p> <p>13 A. You could use edge detection.</p> <p>14 Q. Okay. Did QBIC use edge detection?</p> <p>15 A. Yes, in certain aspects.</p> <p>16 Q. In what aspects?</p> <p>17 A. So on the annotation tool, if you compute</p> <p>18 gradients, you can make a better prediction of</p> <p>19 helping the person annotate.</p> <p>20 So it's very tedious to go through and</p> <p>21 annotate everything. Whereas if you have a tool,</p> <p>22 it'll tell you where it thinks the boundaries are.</p> <p>23 And you could speed up annotation quite a bit doing</p> <p>24 that.</p> <p>25 Q. So this tool that you're referring to, a</p>					

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 60 – 62:</p> <p>25 Q. Okay. And so let's say that objects were</p> <p style="text-align: right;">Page 61</p> <p>1 identified within a particular image, what were done                  2 with those objects? Were they stored, for example,                  3 as a separate image or were they somehow linked to                  4 or associated with the image from which they were                  5 extracted?                  6 A. Typically they were linked.                  7 Q. They were linked to the source image?                  8 A. Yeah.                  9 Q. Okay. And this was done in the database?                  10 A. Could be done in the database.                  11 Q. How was it done?                  12 A. It was probably done in a text database or                  13 some sort of key index pair database. So database                  14 has a lot of different meanings.</p> <p>14 Q. Yeah, that was a bad question.                  15 Once the objects are identified within a                  16 particular source image that's stored in the                  17 database, how are the objects linked to the source                  18 image in the key --                  19 A. The key would have been, like, the image                  20 name and the value would have been the definition of                  21 the -- of the objects.</p> <p><i>Id.</i> at 103:</p>

		<p><i>Id.</i> at 129 – 131:</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes.</p> <p>2 Q. Okay. And so when a user clicks the I,</p> <p>3 you can see the I is highlighted in red?</p> <p>4 A. Yeah.</p> <p>5 Q. Was there a -- was there a similar</p> <p>6 functionality on the one on the website, where you</p> <p>7 clicked something and it lit up to tell the user</p> <p>8 that they were actually clicking the button?</p> <p>9 A. Yeah.</p> <p>10 Q. Okay. And then you go to the second page,</p> <p>11 and that is the full image of the thumbnail; is that</p> <p>12 correct?</p> <p>13 A. It's not of the thumbnail, it's the</p> <p>14 full-size image.</p> <p>15 Q. Well, yeah, it's the -- it's the</p> <p>16 full-sized image representation of the thumbnail on</p> <p>17 the first page; right?</p> <p>18 A. I would phrase it as the thumbnail is a</p> <p>19 representation of the full-sized image.</p> <p>20 Q. Understood. The first page is a</p> <p>21 thumbnail. You click on "Info" and then it returns</p> <p>22 to you the full-sized image?</p> <p>23 A. Yeah.</p> <p>24 Q. And that's reflected on the second page?</p> <p>25 A. Yeah.</p>	
		<p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that?</p> <p>2 A. That would be the file name of the image.</p> <p>3 Q. Okay. And so if you go back to the first</p> <p>4 page, when the pointer is pointed to I and it clicks</p> <p>5 on that, that is actually directing -- is going to</p> <p>6 direct the user to a separate link, correct, where</p> <p>7 the full-sized image is?</p> <p>8 A. Yes.</p> <p>9 Q. And the address of that link's on the</p> <p>10 second page at the top that says "Location";</p> <p>11 correct?</p> <p>12 A. Yeah, the URL.</p> <p>13 Q. Right. And so that would be similar to</p> <p>14 how the demo is on the website, it would go to a</p> <p>15 specific URL that's linked to where that image is</p> <p>16 stored?</p> <p>17 A. Yes.</p> <p>18 Q. Right? And that's how it would work on</p> <p>19 any implementation, any commercial implementation;</p> <p>20 correct?</p> <p>21 A. Yeah.</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 MR. EDWARDS: So we've been going for about an</p> <p>24 hour. How do you -- how are you feeling?</p> <p>25 THE WITNESS: I'm all right.</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p> <hr/> <p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 305:</p> <p>7           So these articles describe various              8 features of various versions of QBIC; right?              9       A. Correct.              10       Q. Do they describe any features -- does the              11 demo you operated include any features that weren't              12 described in these articles?              13       A. That weren't described in the articles?              14       No.</p> <p><i>Id.</i> at 35:</p> <p>6       Q. Okay. And the analytics that you're              7 talking about, where you extract these characters              8 from the image, that is -- those run on both the              9 query image and the images that are stored in the              10 database; is that right?              11       A. Yeah. We call them features.              12       Q. Features. Okay.              13           So when you say "features," you're talking              14 about the features that we talked about before:              15 Color, texture, shape, sketch?              16       A. For example.              17       Q. Any other ones you can think of?              18       A. Nothing comes to mind.              19       Q. But when you refer to features they at              20 least include those four; is that correct?              21       A. Yes. Well, at least includes, yeah.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

		<p>(IBM 0002390–404) at 2395-96.</p> <p><b>4.2. Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (<i>R, G, B</i>) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p><b>5. Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>(buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape                      (IBM 0002390–404) at Figs. 7–9</p>

During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>

		<p>Flickner Depo at 41-42:</p> <p>18 Q. So if I'm understanding this right, you                      19 could take a query video, the system would extract                      20 frames, which would then extract features from it,                      21 and then the system would return either shot clips                      22 or key frames; is that right?</p> <p>1 A. Right.</p> <p>2 Q. Okay. And how many key frames would be                      3 returned?</p> <p>4 A. It depends how many you requested.</p> <p>5 Q. Could you alter how many you request?</p> <p>6 A. Probably.</p> <p>7 Q. Could you return key frames based on some                      8 defined threshold of the distance?</p> <p>9 A. Probably.</p> <p>Flickner Depo at 50:</p> <p>7 Q. And so if I clicked on this T, and it                      8 used the texture features, what would -- what would                      9 the system do?</p> <p>10 A. It would return the list of stamps based                      11 on similarity and texture.</p> <p>12 Q. And how would it decide which stamps were                      13 the most similar to that query image?</p> <p>14 A. It would use those texture features to                      15 compute it, and then it -- I think it was using L                      16 to distance.</p> <p>Flickner Depo at 162-163:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p>15 Q. How did the trade -- how did the                      16 technology implemented in the trademark demo decide                      17 how many results to return to the user?</p> <p>18 A. So it was -- it was an exact match or a                      19 binary search for the text fields using some                      20 metric, like string at a distance, or something                      21 like that, and that would give you a list and a                      22 rank by the image features.</p> <p>7 Q. Okay. What about the -- the stamps demo,                      8 going back to that, did the stamps demo return a                      9 set number of results for each query?</p> <p>10 For example, was it always the original                      11 image and 11 results?</p> <p>12 A. Again, the output -- the number of                      13 results output was probably a parameterized                      14 option -- option, and I don't recall having text                      15 ability on the stamp demo.</p> <p>16 Q. So you think that the user may have been                      17 able to indicate to the QBIC system how many                      18 results he wanted to see?</p> <p>19 A. The user could configure the -- the GUI                      20 to display a certain number of results.</p> <p><i>See also</i> Flickner Depo at 25-26, 54-55, 78-79, 131-132, 201-202, 209-210.</p> <p>Flickner 8/29/23 Depo at 68-72:</p>

*Nantworks, LLC v. Bank of America Corporation*

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p>22 Q. Okay. And in what form would those 23 results be displayed to me? For images would they 24 be displayed as a thumbnail? 25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those 2 be displayed to you? 3 A. It could be as a thumbnail or as a short 4 video clip or as a single representative frame. 5 Q. Okay. So they could be -- so for a video, 6 there's a video that matched the image query of an 7 r-frame, the results I could get back could include 8 three things. It could be a still image, it could 9 be a thumbnail, or it could be an r-frame 10 representation? 11 A. R-frame, I think, is representative frame. 12 So it was a key frame in that video sequence, 13 summary frame. 14 Q. Once I ran a query on an r-frame; right? 15 Well, let's stop there. 16 If I run a query on still images, 17 typically the results I would get back are 18 thumbnails that are most similar to the 19 characteristics which I queried from the query 20 image; right? 21 A. You could get thumbnails back. You could 22 also get the full-sized image back. 23 Q. Okay. 24 A. Thumbnail is a tool for helping you return 25 lots of results and quickly scan it.</p>

		<table border="0"> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I</p> <p>2 have to click on the thumbnail in order to bring up</p> <p>3 the full-sized image?</p> <p>4 A. You could.</p> <p>5 Q. Otherwise I could automatically receive</p> <p>6 the full-sized image as part of the result?</p> <p>7 A. You could.</p> <p>8 Q. Okay. So walk through that process if I'm</p> <p>9 using an r-frame of a video. If I do a -- if I run</p> <p>10 a query on an r-frame of a video as a -- an image</p> <p>11 query, how could I get the results back?</p> <p>12 MR. HANSEN: Objection; vague and ambiguous.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. In what form would I get the results back?</p> <p>15 MR. HANSEN: Same objection.</p> <p>16 THE WITNESS: You could get back the still</p> <p>17 r-frame, representative frame, you could get back</p> <p>18 the thumbnail, or you could get back the entire</p> <p>19 video clip that that r-frame represents, a few</p> <p>20 frames.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. If I received a thumbnail or the r-frame,</p> <p>23 would there be some sort of link I could click on to</p> <p>24 get the underlying full video?</p> <p>25 MR. HANSEN: Objection; vague and ambiguous,</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic</p> <p>2 units initially returned in a video query."</p> <p>3 Meaning the r-frames?</p> <p>4 A. Correct.</p> <p>5 Q. "For example, in a query for shots that</p> <p>6 are dominantly red, a set of r-frames will be</p> <p>7 displayed. To see the actual video shot, the user</p> <p>8 clicks on the displayed r-frame icon."</p> <p>9 A. Yep.</p> <p>10 Q. And that was one of the ways you were</p> <p>11 describing that the results of a r-frame query would</p> <p>12 be returned to the user?</p> <p>13 A. Right.</p> <p>14 Q. Do you know if that was the preferred way</p> <p>15 that was used in demos in commercial applications?</p> <p>16 MR. HANSEN: Objection; vague and ambiguous,</p> <p>17 lacks foundation.</p> <p>18 MR. STRAUSSMAN: You can answer.</p> <p>19 THE WITNESS: I don't know.</p> <p>20 BY MR. EDWARDS:</p> <p>21 Q. But, Mr. Flickner, this -- generally this</p> <p>22 article represents the status of the QBIC technology</p> <p>23 as of the date of this publication, which is</p> <p>24 September 1995; is that right?</p> <p>25 A. Actually a little before September 1995</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 71</p> <p>1 calls for speculation.</p> <p>2 THE WITNESS: As I recall -- I'm not sure</p> <p>3 definitely, but, yes, this is -- you could do that.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. So let's go to page IBM 898.</p> <p>6 So if you'll take -- just read that</p> <p>7 paragraph that starts with the header</p> <p>8 "Representative Frame Generation."</p> <p>9 MR. STRAUSSMAN: And if you need to read</p> <p>10 anything else to put it in context, feel free to do</p> <p>11 so.</p> <p>12 THE WITNESS: Okay.</p> <p>13 (Witness reviews document.)</p> <p>14 THE WITNESS: So what was your question, again?</p> <p>15 BY MR. EDWARDS:</p> <p>16 Q. If you go to the sentence that says,</p> <p>17 "First" -- it's the second sentence in that</p> <p>18 paragraph. It says, "First, during database</p> <p>19 population, r-frames are treated as still images."</p> <p>20 See that?</p> <p>21 A. Yeah.</p> <p>22 Q. And that's what you told me earlier;</p> <p>23 correct?</p> <p>24 A. Yeah.</p> <p>25 Q. And then if you go to the next sentence,</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 73</p> <p>1 because --</p> <p>2 Q. Okay.</p> <p>3 A. -- there's an editorial process.</p> <p>4 Q. Say that last part?</p> <p>5 A. There's an editorial process. You submit</p> <p>6 it, they edit and make changes and eventually it</p> <p>7 appears.</p> <p>8 Q. Right. So what you're saying is there's</p> <p>9 some lag between the time that you wrote the article</p> <p>10 and the time it was published?</p> <p>11 A. Yeah.</p> <p>12 Q. So this article -- but this article</p> <p>13 represents the state of the QBIC technology at least</p> <p>14 as of September 1995?</p> <p>15 A. Yeah. Yes.</p> <p>16 Q. And then let's go to IBM 900.</p> <p>17 And take your time to orient yourself on</p> <p>18 that page, but what I really want to ask you about</p> <p>19 is the last paragraph on the left-hand column going</p> <p>20 up to the top of the right-hand column.</p> <p>21 A. Yep.</p> <p>22 Q. So it says this paper describes [as read],</p> <p>23 "a prototype system that uses image and video</p> <p>24 content as the basis for retrievals."</p> <p>25 Is that right?</p> </td> </tr> </table>	<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I</p> <p>2 have to click on the thumbnail in order to bring up</p> <p>3 the full-sized image?</p> <p>4 A. You could.</p> <p>5 Q. Otherwise I could automatically receive</p> <p>6 the full-sized image as part of the result?</p> <p>7 A. You could.</p> <p>8 Q. Okay. So walk through that process if I'm</p> <p>9 using an r-frame of a video. STRAUSSMAN: And if you need to read</p> <p>10 anything else to put it in context, feel free to do</p> <p>11 so.</p> <p>12 THE WITNESS: Okay.</p> <p>13 (Witness reviews document.)</p> <p>14 THE WITNESS: So what was your question, again?</p> <p>15 BY MR. EDWARDS:</p> <p>16 Q. If you go to the sentence that says,</p> <p>17 "First" -- it's the second sentence in that</p> <p>18 paragraph. It says, "First, during database</p> <p>19 population, r-frames are treated as still images."</p> <p>20 See that?</p> <p>21 A. Yeah.</p> <p>22 Q. And that's what you told me earlier;</p> <p>23 correct?</p> <p>24 A. Yeah.</p> <p>25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --</p> <p>2 Q. Okay.</p> <p>3 A. -- there's an editorial process.</p> <p>4 Q. Say that last part?</p> <p>5 A. There's an editorial process. You submit</p> <p>6 it, they edit and make changes and eventually it</p> <p>7 appears.</p> <p>8 Q. Right. So what you're saying is there's</p> <p>9 some lag between the time that you wrote the article</p> <p>10 and the time it was published?</p> <p>11 A. Yeah.</p> <p>12 Q. So this article -- but this article</p> <p>13 represents the state of the QBIC technology at least</p> <p>14 as of September 1995?</p> <p>15 A. Yeah. Yes.</p> <p>16 Q. And then let's go to IBM 900.</p> <p>17 And take your time to orient yourself on</p> <p>18 that page, but what I really want to ask you about</p> <p>19 is the last paragraph on the left-hand column going</p> <p>20 up to the top of the right-hand column.</p> <p>21 A. Yep.</p> <p>22 Q. So it says this paper describes [as read],</p> <p>23 "a prototype system that uses image and video</p> <p>24 content as the basis for retrievals."</p> <p>25 Is that right?</p>
<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I</p> <p>2 have to click on the thumbnail in order to bring up</p> <p>3 the full-sized image?</p> <p>4 A. You could.</p> <p>5 Q. Otherwise I could automatically receive</p> <p>6 the full-sized image as part of the result?</p> <p>7 A. You could.</p> <p>8 Q. Okay. So walk through that process if I'm</p> <p>9 using an r-frame of a video. If I do a -- if I run</p> <p>10 a query on an r-frame of a video as a -- an image</p> <p>11 query, how could I get the results back?</p> <p>12 MR. HANSEN: Objection; vague and ambiguous.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. In what form would I get the results back?</p> <p>15 MR. HANSEN: Same objection.</p> <p>16 THE WITNESS: You could get back the still</p> <p>17 r-frame, representative frame, you could get back</p> <p>18 the thumbnail, or you could get back the entire</p> <p>19 video clip that that r-frame represents, a few</p> <p>20 frames.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. If I received a thumbnail or the r-frame,</p> <p>23 would there be some sort of link I could click on to</p> <p>24 get the underlying full video?</p> <p>25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic</p> <p>2 units initially returned in a video query."</p> <p>3 Meaning the r-frames?</p> <p>4 A. Correct.</p> <p>5 Q. "For example, in a query for shots that</p> <p>6 are dominantly red, a set of r-frames will be</p> <p>7 displayed. To see the actual video shot, the user</p> <p>8 clicks on the displayed r-frame icon."</p> <p>9 A. Yep.</p> <p>10 Q. And that was one of the ways you were</p> <p>11 describing that the results of a r-frame query would</p> <p>12 be returned to the user?</p> <p>13 A. Right.</p> <p>14 Q. Do you know if that was the preferred way</p> <p>15 that was used in demos in commercial applications?</p> <p>16 MR. HANSEN: Objection; vague and ambiguous,</p> <p>17 lacks foundation.</p> <p>18 MR. STRAUSSMAN: You can answer.</p> <p>19 THE WITNESS: I don't know.</p> <p>20 BY MR. EDWARDS:</p> <p>21 Q. But, Mr. Flickner, this -- generally this</p> <p>22 article represents the status of the QBIC technology</p> <p>23 as of the date of this publication, which is</p> <p>24 September 1995; is that right?</p> <p>25 A. Actually a little before September 1995</p>					
<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.</p> <p>2 THE WITNESS: As I recall -- I'm not sure</p> <p>3 definitely, but, yes, this is -- you could do that.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. So let's go to page IBM 898.</p> <p>6 So if you'll take -- just read that</p> <p>7 paragraph that starts with the header</p> <p>8 "Representative Frame Generation."</p> <p>9 MR. STRAUSSMAN: And if you need to read</p> <p>10 anything else to put it in context, feel free to do</p> <p>11 so.</p> <p>12 THE WITNESS: Okay.</p> <p>13 (Witness reviews document.)</p> <p>14 THE WITNESS: So what was your question, again?</p> <p>15 BY MR. EDWARDS:</p> <p>16 Q. If you go to the sentence that says,</p> <p>17 "First" -- it's the second sentence in that</p> <p>18 paragraph. It says, "First, during database</p> <p>19 population, r-frames are treated as still images."</p> <p>20 See that?</p> <p>21 A. Yeah.</p> <p>22 Q. And that's what you told me earlier;</p> <p>23 correct?</p> <p>24 A. Yeah.</p> <p>25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --</p> <p>2 Q. Okay.</p> <p>3 A. -- there's an editorial process.</p> <p>4 Q. Say that last part?</p> <p>5 A. There's an editorial process. You submit</p> <p>6 it, they edit and make changes and eventually it</p> <p>7 appears.</p> <p>8 Q. Right. So what you're saying is there's</p> <p>9 some lag between the time that you wrote the article</p> <p>10 and the time it was published?</p> <p>11 A. Yeah.</p> <p>12 Q. So this article -- but this article</p> <p>13 represents the state of the QBIC technology at least</p> <p>14 as of September 1995?</p> <p>15 A. Yeah. Yes.</p> <p>16 Q. And then let's go to IBM 900.</p> <p>17 And take your time to orient yourself on</p> <p>18 that page, but what I really want to ask you about</p> <p>19 is the last paragraph on the left-hand column going</p> <p>20 up to the top of the right-hand column.</p> <p>21 A. Yep.</p> <p>22 Q. So it says this paper describes [as read],</p> <p>23 "a prototype system that uses image and video</p> <p>24 content as the basis for retrievals."</p> <p>25 Is that right?</p>

		<p><i>Id.</i> at 129 – 131:</p> <p>9 Q. Okay? And if you want to compare, or you                      10 can take my word for it, the image in the top left                      11 corner, the querying image, is the same one that was                      12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I                      15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full                      22 resolution.</p> <p>23 Q. Okay. And was there a similar                      24 functionality on the demo app on the -- on the                      25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p> <p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

		<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.</p> <p>2 Q. Okay. And here we're showing the query</p> <p>3 image is a -- is a heart -- a heart pattern with</p> <p>4 Love's next to it. It's in the top part of the</p> <p>5 screenshot.</p> <p>6 A. Yep.</p> <p>7 Q. And the results are shown below that under</p> <p>8 "Shapes judged to be most similar"; is that right?</p> <p>9 A. Correct.</p> <p>10 Q. Okay. And the results also show</p> <p>11 underneath each one the trademark number followed by</p> <p>12 matching score after the colon.</p> <p>13 Do you see that?</p> <p>14 A. Yes.</p> <p>15 Q. And this is -- is this an example of what</p> <p>16 you told me before, that matching scores could be</p> <p>17 presented to the user?</p> <p>18 A. Yes.</p> <p>19 Q. And so is it the lower the score, the</p> <p>20 closer the match; is that correct?</p> <p>21 A. Typically, yes.</p> <p><i>Id.</i> at 180-181:</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p> <hr/> <p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 305:</p> <p>7           So these articles describe various              8 features of various versions of QBIC; right?              9       A. Correct.              10       Q. Do they describe any features -- does the              11 demo you operated include any features that weren't              12 described in these articles?              13       A. That weren't described in the articles?              14 No.</p> <p><i>Id.</i> at 35:</p> <p>6       Q. Okay. And the analytics that you're              7 talking about, where you extract these characters              8 from the image, that is -- those run on both the              9 query image and the images that are stored in the              10 database; is that right?              11       A. Yeah. We call them features.              12       Q. Features. Okay.              13           So when you say "features," you're talking              14 about the features that we talked about before:              15 Color, texture, shape, sketch?              16       A. For example.              17       Q. Any other ones you can think of?              18       A. Nothing comes to mind.              19       Q. But when you refer to features they at              20 least include those four; is that correct?              21       A. Yes. Well, at least includes, yeah.</p>

*Nantworks, LLC v. Bank of America Corporation*

		<p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p>2 Q. Exhibits 2, 3 and 10 are the papers that</p> <p>3 you co-authored. If your counsel can provide those</p> <p>4 to you just so that you have them in front of you.</p> <p>5 A. I have them here.</p> <p>6 MR. STRAUSSMAN: Okay.</p> <p>7 THE WITNESS: Okay.</p> <p>8 BY MR. EDWARDS:</p> <p>9 Q. And can you just confirm for me,</p> <p>10 Mr. Flickner, Exhibits 2, 3 and 10 were papers you</p> <p>11 co-authored?</p> <p>12 A. Yes.</p> <p>13 Q. You would have included accurate</p> <p>14 information in those -- in those papers at the time</p> <p>15 that you authored them; is that correct?</p> <p>16 MR. HANSEN: Objection; vague and ambiguous.</p> <p>17 THE WITNESS: Yes.</p> <p>18 BY MR. EDWARDS:</p> <p>19 Q. And the information in those papers</p> <p>20 accurately reflected the functionality of QBIC at</p> <p>21 the time those articles were published; is that</p> <p>22 correct?</p> <p>23 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for an input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>

		<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 8</p> <p>4.2. <b>Performing Queries</b></p> <p>Our user interface for query allows a user to specify color, texture, and shape properties visually by example. Each property has an associated “picker”. The color picker consists of a standard set of (<i>R, G, B</i>) sliders and a color patch showing the currently selected color. We have also used various color wheels and IHS color pickers. The texture picker presents patches of synthetically generated textures that span the space of the texture parameters, and the user selects the texture for a query. For shape, the picker is a blackboard drawing area in which the user draws a shape. The color and shape pickers are shown in Figure 5.</p> <p>All the above measures can be used individually or in any weighted combination (as selected by the user), allowing, for example, queries based on color only, on color and shape, and so on. When a query is run, results are displayed in order, from best match to <i>n</i>th best match (<i>n</i> is user-settable). Any returned hit can be used as the basis for subsequent queries of the form “Find images like this one”. We also have a variety of utility functions available for any returned image including display its similarity value to the query image, display the image full scale (only thumbnails are displayed directly as a result of a query), use it as the basis of the next query to allow iterated query refinement, place the image in a holding area for later processing, perform a user defined image operation or comparison, and so on.</p> <p>5. <b>Sample Query Results</b></p> <p>Sample query results are shown in the following figures. The reproductions are in black and white and do not show the color component which, for these images, is an important component. Figures 6 through 11 and 12 show a color query, a texture query, a combined color and texture query, a shape query, and a query by sketch. All queries are done on a database of about 1000 objects with a wide diversity of photo clip art subject matter (buildings, people, landscapes, animals, etc.). Formal experiments to access the recall and precision rate of QBIC queries are in progress.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at Figs. 7–9</p>

		<p>Flickner Depo at 63:</p> <p>13 Q. And what would the system return, once a 14 user searched an example image? 15 A. A list of images. Typically, thumbnails.</p> <p>Flickner 8/29/23 Depo at 68–72:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p>22 Q. Okay. And in what form would those 23 results be displayed to me? For images would they 24 be displayed as a thumbnail? 25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those 2 be displayed to you? 3 A. It could be as a thumbnail or as a short 4 video clip or as a single representative frame. 5 Q. Okay. So they could be -- so for a video, 6 there's a video that matched the image query of an 7 r-frame, the results I could get back could include 8 three things. It could be a still image, it could 9 be a thumbnail, or it could be an r-frame 10 representation? 11 A. R-frame, I think, is representative frame. 12 So it was a key frame in that video sequence, 13 summary frame. 14 Q. Once I ran a query on an r-frame; right? 15 Well, let's stop there. 16 If I run a query on still images, 17 typically the results I would get back are 18 thumbnails that are most similar to the 19 characteristics which I queried from the query 20 image; right? 21 A. You could get thumbnails back. You could 22 also get the full-sized image back. 23 Q. Okay. 24 A. Thumbnail is a tool for helping you return 25 lots of results and quickly scan it.</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I 2 have to click on the thumbnail in order to bring up 3 the full-sized image? 4 A. You could. 5 Q. Otherwise I could automatically receive 6 the full-sized image as part of the result? 7 A. You could. 8 Q. Okay. So walk through that process if I'm 9 using an r-frame of a video. If I do a -- if I run 10 a query on an r-frame of a video as a -- an image 11 query, how could I get the results back? 12 MR. HANSEN: Objection; vague and ambiguous. 13 BY MR. EDWARDS: 14 Q. In what form would I get the results back? 15 MR. HANSEN: Same objection. 16 THE WITNESS: You could get back the still 17 r-frame, representative frame, you could get back 18 the thumbnail, or you could get back the entire 19 video clip that that r-frame represents, a few 20 frames. 21 BY MR. EDWARDS: 22 Q. If I received a thumbnail or the r-frame, 23 would there be some sort of link I could click on to 24 get the underlying full video? 25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic 2 units initially returned in a video query." 3 Meaning the r-frames? 4 A. Correct. 5 Q. "For example, in a query for shots that 6 are dominantly red, a set of r-frames will be 7 displayed. To see the actual video shot, the user 8 clicks on the displayed r-frame icon." 9 A. Yep. 10 Q. And that was one of the ways you were 11 describing that the results of a r-frame query would 12 be returned to the user? 13 A. Right. 14 Q. Do you know if that was the preferred way 15 that was used in demos in commercial applications? 16 MR. HANSEN: Objection; vague and ambiguous, 17 lacks foundation. 18 MR. STRAUSSMAN: You can answer. 19 THE WITNESS: I don't know. 20 BY MR. EDWARDS: 21 Q. But, Mr. Flickner, this -- generally this 22 article represents the status of the QBIC technology 23 as of the date of this publication, which is 24 September 1995; is that right? 25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation. 2 THE WITNESS: As I recall -- I'm not sure 3 definitely, but, yes, this is -- you could do that. 4 BY MR. EDWARDS: 5 Q. So let's go to page IBM 898. 6 So if you'll take -- just read that 7 paragraph that starts with the header 8 "Representative Frame Generation." 9 MR. STRAUSSMAN: And if you need to read 10 anything else to put it in context, feel free to do 11 so. 12 THE WITNESS: Okay. 13 (Witness reviews document.) 14 THE WITNESS: So what was your question, again? 15 BY MR. EDWARDS: 16 Q. If you go to the sentence that says, 17 "First" -- it's the second sentence in that 18 paragraph. It says, "First, during database 19 population, r-frames are treated as still images." 20 See that? 21 A. Yeah. 22 Q. And that's what you told me earlier; 23 correct? 24 A. Yeah. 25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because -- 2 Q. Okay. 3 A. -- there's an editorial process. 4 Q. Say that last part? 5 A. There's an editorial process. You submit 6 it, they edit and make changes and eventually it 7 appears. 8 Q. Right. So what you're saying is there's 9 some lag between the time that you wrote the article 10 and the time it was published? 11 A. Yeah. 12 Q. So this article -- but this article 13 represents the state of the QBIC technology at least 14 as of September 1995? 15 A. Yeah. Yes. 16 Q. And then let's go to IBM 900. 17 And take your time to orient yourself on 18 that page, but what I really want to ask you about 19 is the last paragraph on the left-hand column going 20 up to the top of the right-hand column. 21 A. Yep. 22 Q. So it says this paper describes [as read], 23 "a prototype system that uses image and video 24 content as the basis for retrievals." 25 Is that right?</p>

*Nantworks, LLC v. Bank of America Corporation*

		<p><i>Id.</i> at 129 – 131:</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 130</p> <p>1 A. Yes. 2 Q. Okay. And so when a user clicks the I, 3 you can see the I is highlighted in red? 4 A. Yeah. 5 Q. Was there a -- was there a similar 6 functionality on the one on the website, where you 7 clicked something and it lit up to tell the user 8 that they were actually clicking the button? 9 A. Yeah. 10 Q. Okay. And then you go to the second page, 11 and that is the full image of the thumbnail; is that 12 correct? 13 A. It's not of the thumbnail, it's the 14 full-size image. 15 Q. Well, yeah, it's the -- it's the 16 full-sized image representation of the thumbnail on 17 the first page; right? 18 A. I would phrase it as the thumbnail is a 19 representation of the full-sized image. 20 Q. Understood. The first page is a 21 thumbnail. You click on "Info" and then it returns 22 to you the full-sized image? 23 A. Yeah. 24 Q. And that's reflected on the second page? 25 A. Yeah.</p> <p style="text-align: right;">Page 131</p> <p>1 Q. Image france50.jpg, what is that? 2 A. That would be the file name of the image. 3 Q. Okay. And so if you go back to the first 4 page, when the pointer is pointed to I and it clicks 5 on that, that is actually directing -- is going to 6 direct the user to a separate link, correct, where 7 the full-sized image is? 8 A. Yes. 9 Q. And the address of that link's on the 10 second page at the top that says "Location"; 11 correct? 12 A. Yeah, the URL. 13 Q. Right. And so that would be similar to 14 how the demo is on the website, it would go to a 15 specific URL that's linked to where that image is 16 stored? 17 A. Yes. 18 Q. Right? And that's how it would work on 19 any implementation, any commercial implementation; 20 correct? 21 A. Yeah. 22 MR. HANSEN: Objection; lacks foundation. 23 MR. EDWARDS: So we've been going for about an 24 hour. How do you -- how are you feeling? 25 THE WITNESS: I'm all right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:                  2 Q. So take a look at the bottom of IBM                  3 page 40 to the top of 41.                  4 So it says, "When you search for an image                  5 by content, your query identifies one or more                  6 features for the search (such as average color), a                  7 source for each feature (such as an example image),                  8 and a target set of cataloged images. The Image                  9 Extender computes the feature value of the source                  10 and compares it to the cataloged feature values for                  11 the target images. It then computes a score that                  12 indicates how similar the feature values of the                  13 target images are to the source. You can have the                  14 Image Extender return the images whose features are                  15 most similar to the source. The Image Extender will                  16 return the handle of each image and the image                  17 score."                  18 Did I read that correctly?                  19 A. Yes.                  20 Q. So if you were to use the image extender                  21 in the DB2 universal database when you search for an                  22 image by content using a query image, it will                  23 extract the features for whatever you want, compare                  24 that to the features of images in a database, return                  25 your results, which includes the score for the</p> <hr/> <p style="text-align: right;">Page 181</p> <p>1 match?                  2 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 305:</p> <p>7           So these articles describe various              8 features of various versions of QBIC; right?              9       A. Correct.              10       Q. Do they describe any features -- does the              11 demo you operated include any features that weren't              12 described in these articles?              13       A. That weren't described in the articles?              14 No.</p> <p><i>Id.</i> at 35:</p> <p>6       Q. Okay. And the analytics that you're              7 talking about, where you extract these characters              8 from the image, that is -- those run on both the              9 query image and the images that are stored in the              10 database; is that right?              11       A. Yeah. We call them features.              12       Q. Features. Okay.              13           So when you say "features," you're talking              14 about the features that we talked about before:              15 Color, texture, shape, sketch?              16       A. For example.              17       Q. Any other ones you can think of?              18       A. Nothing comes to mind.              19       Q. But when you refer to features they at              20 least include those four; is that correct?              21       A. Yes. Well, at least includes, yeah.</p>

2. Claim 4

Claim	'529 Claim Recitation	Exemplary Citations in Reference
4	<p>The system of claim 1, wherein the service is further programmed to identify the object by applying multiple algorithms to at least a portion of the image or of the data, and identify the object as a function of a confidence levels associated with results of the multiple algorithms.</p>	<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 3</p> <p>Querying image databases by their image content is an active area of research. Some examples include the system in [2], which has been used to retrieve images of electrical components and MRI images, the system in [3] which retrieves images based on a sketch or other image example, or by “sense retrieval” (e.g. “retrieve clear, bright and clean images”), [4] which retrieves images based on their color content, and [5] which retrieves MRI images based on the sizes and relative positions of multiple objects in the images. The QBIC system which we are developing allows images to be retrieved by a variety of image content descriptors including color, texture, and shape.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2391-92.</p> <p><i>Interactive Outlining:</i> In this operation, the user provides some starting information which the system uses, along with image analysis methods, to compute an object outline. An example is shown in Figure 1. One technique, described in these proceedings [6], uses “snakes” or active contours. The user enters an approximate object outline, and the method iteratively adjusts this outline using an algorithm that minimizes an expression containing two main terms: total image edge strength along the outline, and the outline curvature. Another method, flood fill, can take as starting information a single mouse-clicked image point. Starting from this object point, all adjacent pixels are included in the object whose color is within a specified color distance from the original point. The perimeter of all included points becomes the object boundary. For reasonably uniform objects that are distinct from the background, this operation provides a fast object outliner.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2392-93</p> <p><b>2.2. Feature Calculation</b></p> <p>The properties of color, texture, and shape have broad, intuitive applicability, and they were the first image content properties we selected on which to base our queries. Corresponding features are computed for all objects and full scenes and stored for use in subsequent queries. The computed features are:</p> <p><i>Color features:</i> We compute the average <math>(R, G, B)</math>, <math>(Y, i, q)</math>, <math>(L, a, b)</math>, and <math>MTM</math> (Mathematical Transform to Munsell [7]) coordinates of each object and image. We also compute a <math>k</math> element color histogram, where <math>k</math> is user-settable. (We currently run with <math>k = 64</math>.) Because the original color images may include any of</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Texture features:</i> Our texture features are based on modified versions of the coarseness, contrast, and directionality features proposed in [10]. The <i>coarseness</i> feature helps measure the scale of the texture (pebbles vs. boulders), and is calculated using moving windows of different sizes. The <i>contrast</i> feature describes the vividness of the pattern, and is a function of the variance of the gray-level histogram. The <i>directionality</i> feature describes whether or not the image has a favored direction (like grass), or whether it is isotropic (like a smooth</p> <p><i>Shape features:</i> One of the most challenging aspects to content based image retrieval is retrieval by shape. Shape similarity has proven to be a difficult problem [12, 13] in model based vision applications and the problem remains difficult in content based image retrieval applications.</p> <p><i>Sketch features:</i> We implemented the image retrieval method described in [17, 18] that allows images to be retrieved based on a rough user sketch. The feature needed to support this retrieval consists of a reduced resolution edge map of each image. To compute these edge maps, we (1) convert each color image to a single band luminance; (2) compute the binary edge image using a Canny edge operator; and (3) reduce the edge image to size 64 x 64. To do the reduction, for <math>w</math> the width of the image in pixels and <math>h</math> its height, we partition</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 5–6</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metrics such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p>similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <math>L</math> component of an <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue objects better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance, and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar colors (e.g. red and orange).</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):</p> <p>“QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.”</p> <p><i>Id.</i> at p. 3.</p>

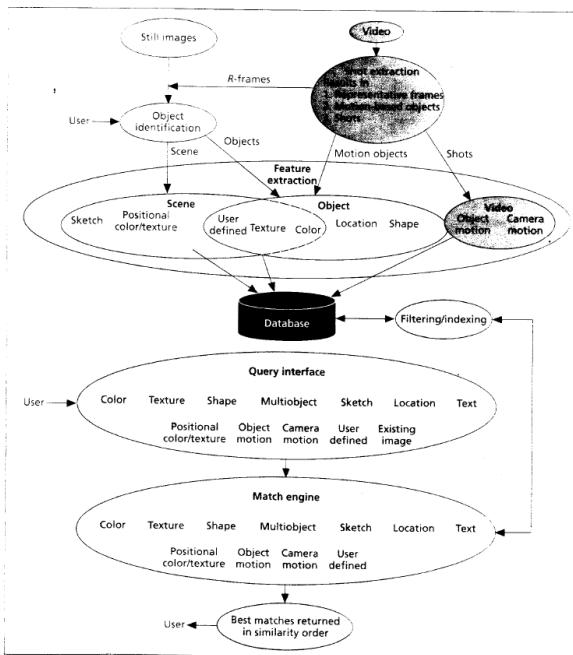

Figure 2. QBIC database population (top) and query (bottom) architecture.

*Id.* at Fig. 2.

“Ideally, object identification would be automatic, but this is generally difficult. The alternative-manual identification-is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums i and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.” *Id.* at pp. 3–4.

“ANNOTATION AND DATABASE POPULATION TOOLS. Automatic methods (such as our Positional Color query) that don't rely on object identification,

*Nantworks, LLC v. Bank of America Corporation*

		<p>methods that identify objects automatically as in the museum image example, fast and easy-to-use semiautomatic outlining tools, and motion-based segmentation algorithms will enable additional application areas.” <i>Id.</i> at p. 8.</p> <p>“INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at p. 8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog. When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source. You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu- -- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or          2 more of these features than the other?          3 A. Yes.          4 Q. Which one?          5 A. Shape.          6 Q. Okay.          7 (Witness reviews document.)          8 A. So one thing I can state is originally I          9 couldn't remember the name of the edge operator --          10 and the name is Canny, the Canny edge operator --          11 when we were talking about finding edges.          12 Q. Okay. So this -- the paragraph on          13 IBM 2393 refreshed your memory that shape          14 calculation used Canny edge detection?          15 A. No, that's sketch.          16 Q. Oh, I'm sorry.          17 A. I'm just stating that originally I was          18 asked a question about standard edge operators. I          19 couldn't remember the name. The name was Canny.          20 Q. Canny. And Canny is used in the sketch          21 calculation?          22 A. Yeah, it's used in the sketch calculation.          23 Q. Understood. Okay. Let's go back to          24 shape.          25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.          2 Q. Can you say the name of the word again?          3 A. I think it's called perround.          4 Q. Per round?          5 A. Yeah.          6 Q. Those -- are those two words, p-e-r,          7 r-o-u-n-d?          8 A. P-e-r -- one word.          9 Q. Okay. Perround, one word.          10 A. It's basically the perimeter squared over          11 area.          12 (Reporter seeks clarification.)          13 A. Perimeter squared over area.          14 (Reporter seeks clarification.)          15 A. Length of the -- over area.          16 Q. Okay. So let's step back a little bit.          17 So it says -- the second paragraph says [as read],          18 "Our shape features are based on a combination of          19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features          20 area, circularity, eccentricity, major access          21 orientation and a set of algebraic moment          22 invariants," i-n-v-a-r-i-a-n-t-s.          23 Did I read that correctly?          24 A. Um-hum.          25 Q. Okay. For circularity, that is computed</p>
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.          2 To calculate the shape feature in a query          3 image or a stored database image, is the first step          4 to convert that image into a binary image?          5 A. I don't think so.          6 Q. So if you look at the second paragraph --          7 and the reason why I ask is -- it's the second          8 sentence in the second paragraph under "Shape          9 features." It says [as read], "All shapes are          10 assumed to be non-occluded planar shapes allowing          11 for each shape to be represented as a binary image."          12 See that?          13 A. Yeah.          14 Q. And then the next sentence says [as read],          15 "The area is computed as the number of pixels set in          16 the binary image."          17 A. Right.          18 Q. So that's why I ask is it the first step          19 in calculating shape to convert the image to binary?          20 A. Yes.          21 Q. And then once you convert it to binary          22 image, then what do you do next in order to          23 calculate the shape?          24 A. You're computing something called          25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?          2 A. Right.          3 Q. All right. Area is the number of pixels          4 in the binary image?          5 A. In the binary blob.          6 Q. In the binary what?          7 A. Blob.          8 Q. Blob. And when you say "blob," what does          9 that refer to?          10 A. The outline of the object that you're          11 doing a shape query on.          12 Q. And so are each of these, area,          13 circularity, eccentricity, major axis orientation          14 and algebraic moment invariants, are those each          15 different algorithms or is it all the same          16 algorithm?          17 A. It's different algorithms.          18 Q. Okay. And since you worked on the shape          19 feature the most, do you recall any other details          20 that are not disclosed in this paragraph?          21 A. Well, this evolved and we ended up doing          22 an implementation of something that's not in here.          23 Q. Okay. And what was that implementation?          24 A. Something called turning angle per round,          25 turning angle, which is -- it looks at the tangent</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So 2 you're computing the turning angle. You're 3 computing this angle that represents a shape in a 4 very interesting way. 5 They don't seem to be very good for 6 human -- so if you asked a human whether these two 7 shapes are similar, they would say "yes," but under 8 that feature set. 9 Q. And you call that something per round? 10 What was the name of it? Started with a T. 11 Turrent? 12 A. Turning angle. 13 Q. Oh, turning angle. 14 A. Yeah. 15 Q. Well, it said -- your answer -- you did 16 say turning angle, but you said something called 17 something per round, and it started with a T. I 18 thought you said turrent, but maybe I misunderstood. 19 MR. STRAUSSMAN: Tangent? 20 THE WITNESS: Tangent angle, yeah. 21 BY MR. EDWARDS: 22 Q. Okay. So something called tangent per 23 round, is that what you would call it, this -- 24 A. No. 25 Q. -- this implementation?</p>	<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle. 2 Q. Okay. So the name of the new 3 implementation you're talking about for shape 4 calculation is called turning angle? 5 A. It used turning angle as a major feature. 6 Q. Okay. Was there any other name it went 7 by? 8 A. I don't recall. 9 Q. All right. And that was -- that 10 methodology was implemented to calculate shape on a 11 query image and an image stored in the database post 12 this article? 13 A. Yes. 14 Q. Was that the -- did that -- did that 15 implementation, the turning angle, did that replace 16 the methodology in this article or was it 17 supplementing the metho- -- 18 A. Supplementing.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 126</p> <p>1 screenshot?                  2 A. Right.                  3 Q. Right? And then the one that you hosted                  4 on the -- on the website that you said those --                  5 there would be on order of thousands of thumbnails;                  6 correct?                  7 A. Tens of thousands.                  8 Q. Tens of thousands. Okay. Let's put that                  9 aside.                  10 MR. EDWARDS: Mark another screenshot as                  11 Exhibit 7.                  12 (Deposition Exhibit 7 was marked.)                  13 BY MR. EDWARDS:                  14 Q. So for Exhibit 7, again, I'll represent to                  15 you this is another screenshot from the QBIC demo                  16 produced as IBM 747. And in this screenshot the                  17 icon C is being clicked on the first page.                  18 Do you see that?                  19 A. Yep.                  20 Q. And that's highlighted in red.                  21 Do you see that?                  22 A. Yep.                  23 Q. Okay. And the second page are the results                  24 of that color histogram query from the first page.                  25 A. Correct.</p> <p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on                  2 that image in the top left corner, what happens, in                  3 the second page?                  4 A. The database returned the top 10 -- or it                  5 ordered the images and it returned the top K based                  6 on the vector distance or the feature distance                  7 related to what was computed and stored in the                  8 database and what's recorded. This is an N database                  9 image. It represents -- it always matches itself                  10 perfectly.                  11 Q. Okay. So in the -- in the demo that you                  12 hosted on IBM's website in the '90s, did it have a                  13 similar functionality where you could click on the                  14 thumbnail and it would -- it would return matches?                  15 A. Yeah.                  16 Q. And what would you click on on the one on                  17 the website?                  18 A. I don't remember exactly how the user                  19 interface worked.                  20 Q. But you could have -- you could click                  21 something akin to color histogram --                  22 A. Yes.                  23 Q. -- or texture or things like that?                  24 A. Yes.                  25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?                  2 A. Yes.                  3 Q. Okay. So the querying image is the top                  4 left image; is that right?                  5 A. I think so, yeah.                  6 Q. Well, go back to the first page.                  7 A. It's the match, yeah.                  8 Q. So you click C on that first image, and                  9 when you -- when you do that, that image that's                  10 being queried for color histogram remains in the top                  11 left box; is that right?                  12 A. Yeah.                  13 Q. And then the image that's immediately to                  14 the right of that, is that the best match out of the                  15 images in the database?                  16 A. That would -- yes.                  17 Q. And then the image immediately to the                  18 right of that one is the second best match?                  19 A. Yes.                  20 Q. And so on and so forth?                  21 A. Yes.                  22 Q. And when we say "match" we're talking                  23 about in terms of the color histogram features?                  24 A. Yeah.                  25 Q. Okay. Okay. Last one.</p> <p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to                  2 mark it as Exhibit 8.                  3 (Deposition Exhibit 8 was marked.)                  4 BY MR. EDWARDS:                  5 Q. And, again, Mr. Flickner, I'll represent                  6 this is a screenshot from the QBIC demo on the CD                  7 IBM 747 produced by your counsel.                  8 A. Okay.                  9 Q. Okay? And if you want to compare, or you                  10 can take my word for it, the image in the top left                  11 corner, the querying image, is the same one that was                  12 on Exhibit 7.                  13 A. Yes.                  14 Q. Okay. And here the user's clicking the I                  15 icon, which stands for "Get Info."                  16 Do you see that?                  17 A. Um-hum.                  18 Q. On the first page?                  19 A. Yeah.                  20 Q. And the second page is doing what?                  21 A. Is presenting the image at full                  22 resolution.                  23 Q. Okay. And was there a similar                  24 functionality on the demo app on the -- on the                  25 website in the '90s?</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 134</p> <p>1 web.archive.org, which is also referred to as the                  2 Wayback Machine.                  3 Are you familiar with that website?                  4 A. Yes.                  5 Q. Okay. You can see at the top it's a                  6 capture from January 17th, 1999.                  7 Do you see that?                  8 A. Yeah, I see February 18th, 1998.                  9 Q. So if you look at the top right-hand box,                  10 it says July, January, February and then it says                  11 '98, '99, 2000.                  12 Do you see that?                  13 A. Yeah.                  14 Q. In the middle column it's January 17th,                  15 1999.                  16 Do you see that?                  17 A. Yeah.                  18 Q. Okay. And then the URL that it's                  19 capturing is <a href="http://www.qbic.almaden.ibm.com/cgi-bin--b-i-n--/stamps-demo">http://www.qbic.almaden.ibm.com/                  20 cgi-bin -- b-i-n -- /stamps-demo</a>.                  21 Do you see that?                  22 A. Yeah.                  23 Q. And does this look like a representation                  24 of the stamps demo that was on IBM's website in                  25 1999?</p>	<p style="text-align: right;">Page 136</p> <p>1 rank the feature vectors and you give an order, list                  2 of the top N images that have -- match the small --                  3 the closest distance.                  4 Q. You give an order list of the top --                  5 A. K or N. However many you request. It                  6 orders the entire database, but it only returns the                  7 top, the best matches.                  8 Q. Okay. Just so I understand, the database                  9 query, you extract feature vectors and then you rank                  10 the feature vectors and give an ordered list of the                  11 top results that match based on a distance                  12 measurement?                  13 A. So you take the queried image, you extract                  14 the feature vectors and now you're going to ask the                  15 database how many images do you have that are close                  16 in feature space to this query.                  17 And it'll return the top best -- the best                  18 hits.                  19 Q. Okay. So one way is to submit an image                  20 query, where you -- where you submit a -- as an                  21 input to the query an image, and that could be a                  22 still image or an r-frame; correct?                  23 A. Correct.                  24 Q. Is another way to do a query to use a                  25 keyword search?</p>
		<p style="text-align: right;">Page 135</p> <p>1 A. Yes.                  2 Q. And you would have hosted this demo?                  3 A. Yes.                  4 Q. And do you see here that it has similar                  5 icons that we looked at in our previous exhibits,                  6 Exhibits 5 through 8, icons I, C, L, T and S.                  7 Do you see that?                  8 A. Yeah. Yes.                  9 Q. Does that refresh your memory that the                  10 demos on the IBM's website in the '90s, but                  11 specifically on or around 1999, would have had these                  12 similar icons that a user could click on?                  13 A. Yes.                  14 Q. Okay. Let's put that aside.                  15 Okay. Now I want to talk about the last                  16 step in the process that we've talked about -- that                  17 we -- that we started on at the beginning of your                  18 deposition. And the last step is database query.                  19 Okay?                  20 Generally what is the database query                  21 process for the QBIC system?                  22 A. You extract feature vectors and then you                  23 rank --                  24 (Reporter seeks clarification.)                  25 A. You extract feature vectors and then you</p>	<p style="text-align: right;">Page 137</p> <p>1 A. Correct.                  2 Q. Is another -- yet another way to use                  3 something like a color picker?                  4 A. Yes.                  5 Q. What's a color picker?                  6 A. It's a way of specifying colors.                  7 Q. So you would -- you would, in a -- in some                  8 kind of a color wheel or some kind of graphical                  9 representation, you would select the colors you want                  10 to be searched against the database?                  11 A. Right. Correct.                  12 Q. And then another query methodology would                  13 be based on sketch, a shape?                  14 A. Sketch. Shape was typically on the                  15 object.                  16 Q. Okay. So shape's separate from sketch?                  17 A. Yeah.                  18 Q. Okay. Sketch would be a user would sketch                  19 some kind of figure that's in black and white and                  20 then a query would be run off of that sketch?                  21 A. Right.                  22 Q. Okay. And then the last one would be                  23 shape, a user could pick a particular shape -- a                  24 sample image of a particular shape, whether it's a                  25 circle or something like that.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Id.</i> at 143 – 149:</p> <p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?                  2 A. Yep.                  3 Q. And then it would extract whatever feature                  4 you want from that uncompressed image?                  5 A. Correct.                  6 Q. And then those extracted features from the                  7 uncompressed JPEG image are used in the matching                  8 process?                  9 A. Correct.                  10 Q. Okay. And you were using -- you were                  11 doing this for JPEG image -- or the QBIC system was                  12 doing this for JPEG images in the -- in the '90s?                  13 A. Yes.                  14 Q. Okay. So once the system -- now, we're                  15 only talking about image-based queries, image using                  16 as input for the queries.                  17 Once you submit an image for the query, if                  18 it's a -- you do your preprocessing that need to be                  19 done. Features are extracted. So now we've got                  20 just the extracted features, whatever those are.                  21 What happens with those extracted features                  22 next?                  23 A. They're put in the database and then                  24 potentially there are indexes built that help you do                  25 fast search against those features.</p> <p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm                  2 talking about for a query, so I'm taking an image                  3 and submitting it to a system as a query.                  4 A. Query by example.                  5 Q. Query by example. Okay. Once those                  6 features extracted for that image, what happens next                  7 in the process?                  8 A. You take the feature vector and you                  9 present it to the database and say return the best                  10 matches to this feature vector.                  11 Q. Okay. So the system would compare -- the                  12 QBIC system would compare the features that are                  13 calculated from the input image to stored calculated                  14 features of the images in the database and come up                  15 with a match?                  16 A. Yes.                  17 Q. Okay. And those matches would be sorted                  18 or arranged in order of most similar?                  19 A. Yes.                  20 Q. And would algorithms do these comparisons?                  21 A. Yes.                  22 Q. Would it be a different algorithm for each                  23 of the features? So, for example, would there be an                  24 algorithm that does the comparison for color                  25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?                  2 A. You say the matching algorithm?                  3 Q. Correct.                  4 A. Yes, they could be different.                  5 Q. Well, let's talk about them. We can get                  6 into detail here.                  7 Well, before we -- before we get there, so                  8 how does the QBIC system display the results of                  9 matches to the user?                  10 A. Typically just thumbnails in a window in                  11 multiple ordered hits.                  12 Q. Okay. And it displays them in the order                  13 by which they're most similar. So the, you know,                  14 best match to the next best match to the next best                  15 match, so on and so forth?                  16 A. Correct.                  17 Q. Okay. And you said the system determines                  18 similarity based on some distance measure between                  19 the extracted features in the image query versus the                  20 stored image?                  21 A. The features of the stored image.                  22 Q. But it's a -- it's some sort of distance                  23 measure?                  24 A. Yes.                  25 Q. Okay. So let's go back to Exhibit 2.</p> <p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and                  2 rolling over to IBM 2395, that's a discussion on the                  3 image query. And so what I want to do -- I have a                  4 couple high-level questions, but then I want to walk                  5 through each one. Color starts on 2394, then                  6 texture and then shape and sketch are on 2395.                  7 So in terms of the -- in terms of the                  8 distance measure, Mr. Flickner, if -- I know you                  9 said that the results are termed based on those that                  10 are most similar but it could come up with something                  11 that's an exact match; is that right?                  12 A. It's possible.                  13 Q. Like the distance measure, the result                  14 would be zero if it was an exact match; right?                  15 A. Typically you'd get that only if you had                  16 the query image the same as a result image.                  17 Q. Right. But that's a possibility?                  18 A. Yeah.                  19 Q. Okay. So let's take a look at color --                  20 it's on -- starting at the top of 2394. You know,                  21 take your time and read that and then I want to ask                  22 you some questions about it.                  23 (Witness reviews document.)                  24 A. Okay.                  25 Q. Okay. So let's first start with average</p>
--	--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between                  2 the query image and the database image using                  3 weighted Euclidean distance; is that right?                  4 A. Yep.                  5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.                  6 And can you just tell us at a high level                  7 what -- if you can -- what Euclidean distance is?                  8 A. So if you have multiple features or                  9 multiple scaler features, you have to ask the                  10 question I'm trying to build a distance from that                  11 vector to a query vector.                  12 And as you build that -- the distance, you                  13 have -- you may want to weight different elements of                  14 the vector differently. And we found out that using                  15 variance normalization, where weights of the                  16 variance of the feature, gave good aesthetic                  17 results.                  18 (Reporter seeks clarification.)                  19 A. Aesthetic results.                  20 Q. And I apologize, I couldn't hear what you                  21 said. You said, "And we found out that using                  22 variance" . . .                  23 A. So you normalize each feature with its                  24 variance.                  25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)                  2 Q. Well, let me ask my -- let me get my                  3 question out first.                  4 So we talked about the features for                  5 average color before are RGB, Yiq, LAB and MTM.                  6 A. Correct.                  7 Q. And so, for example, for the RGB, you're                  8 saying that you would take the R and you would                  9 divide it by the variants of red and green, for                  10 example --                  11 A. Just variants of red.                  12 Q. Okay. And so you could do the same for                  13 the others, for Yiq or LAB?                  14 A. Exactly.                  15 Q. Okay. You do that for both the image                  16 input query and the stored image; correct?                  17 A. Correct.                  18 Q. And then you're calculating the distance                  19 between them, so determining how similar they are                  20 based on the distance?                  21 A. Yeah, or vector distance.                  22 Q. Understood.                  23 A. Two vectors of differences --                  24 (Reporter seeks clarification.)                  25 A. Two vectors with a distance calculation on</p>
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.                  2 Q. With its variance.                  3 A. And then compute the average.                  4 Q. Okay.                  5 A. Or, I'm sorry, compute the weighted sum.                  6 So red divided by the variants of red, plus green                  7 divided by the variants of green --                  8 (Reporter seeks clarification.)                  9 A. Red divided by the variants of red, green                  10 divided by the variants of green, L divided by the                  11 variants of L, that's how you combine the various                  12 features.                  13 Q. Understand. And L represents what?                  14 A. Luminance.                  15 Q. Okay. And this is -- you're talking                  16 specifically with respect to average color?                  17 A. Well, the variance normalization is well                  18 known in terms of multidimensional feature merging.                  19 Q. But for average color, you wouldn't use                  20 luminance, right, as a -- as a variant?                  21 A. Luminance would just -- you wouldn't use                  22 just luminance. You could use luminance . . .                  23 Q. Well, so the color features we talked                  24 about before would be RGB, Yiq, LAB --                  25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.                  2 Q. You're going to have to repeat that and be                  3 just a little bit louder, Mr. Flickner. Sorry.                  4 A. That's all right. Let me get my thoughts                  5 together.                  6 So we have multiple dimensional features.                  7 It's not unusual to take each dimension and                  8 normalize it by the variance because that gives                  9 you -- what that does is if you have tight variances                  10 you divide it by, you get bigger numbers. So you                  11 have more information close by.                  12 Q. What was the word you said before "close                  13 by"?                  14 A. I don't remember.                  15 THE REPORTER: Information?                  16 THE WITNESS: Information close by?                  17 BY MR. EDWARDS:                  18 Q. Okay. Okay. So now let's talk about                  19 color histograms.                  20 A. Okay.                  21 Q. Okay? Well, stop. Let's go back to                  22 average color. So is there -- you described the                  23 weighted Euclidean distance that's calculated                  24 between the query image and the database image for                  25 average color.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p><i>Id.</i> at 159 – 160:</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p> <hr/> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in the --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p><i>Id.</i> at 305:</p>

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p>7           So these articles describe various 8 features of various versions of QBIC; right? 9       A. Correct. 10       Q. Do they describe any features -- does the 11 demo you operated include any features that weren't 12 described in these articles? 13       A. That weren't described in the articles? 14 No.</p> <p><i>Id.</i> at 35: 6       Q. Okay. And the analytics that you're 7 talking about, where you extract these characters 8 from the image, that is -- those run on both the 9 query image and the images that are stored in the 10 database; is that right? 11       A. Yeah. We call them features. 12       Q. Features. Okay. 13           So when you say "features," you're talking 14 about the features that we talked about before: 15 Color, texture, shape, sketch? 16       A. For example. 17       Q. Any other ones you can think of? 18       A. Nothing comes to mind. 19       Q. But when you refer to features they at 20 least include those four; is that correct? 21       A. Yes. Well, at least includes, yeah.</p> <p><i>Id.</i> at 109-110:</p>
--	--	---

		Page 313
1	A. Correct.	
2	Q. Exhibits 2, 3 and 10 are the papers that	
3	you co-authored. If your counsel can provide those	
4	to you just so that you have them in front of you.	
5	A. I have them here.	
6	MR. STRAUSSMAN: Okay.	
7	THE WITNESS: Okay.	
8	BY MR. EDWARDS:	
9	Q. And can you just confirm for me,	
10	Mr. Flickner, Exhibits 2, 3 and 10 were papers you	
11	co-authored?	
12	A. Yes.	
13	Q. You would have included accurate	
14	information in those -- in those papers at the time	
15	that you authored them; is that correct?	
16	MR. HANSEN: Objection; vague and ambiguous.	
17	THE WITNESS: Yes.	
18	BY MR. EDWARDS:	
19	Q. And the information in those papers	
20	accurately reflected the functionality of QBIC at	
21	the time those articles were published; is that	
22	correct?	
23	A. Correct.

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 314</p> <p>1 BY MR. EDWARDS: 2 Q. And each of those papers would have been 3 peer reviewed before being published; correct? 4 A. Yes. There was peer review. 5 Q. Okay. Let's pick up Exhibit 3, please. 6 A. Okay. 7 Q. You have it -- 8 A. Yeah. 9 Q. -- handy? 10 Okay. On the first page that is 11 Bates-labeled IBM 893, in the right-hand column -- 12 and as you're going down towards the bottom of the 13 right-hand column, before you get to the line that 14 crosses the middle of the page, there are three 15 bullet points. 16 Do you see those bullet points? 17 A. Yeah. 18 Q. It says, "QBIC allows queries on large 19 image and video databases based on," bullet point 20 one, "example images." 21 Do you see that? 22 A. Yeah. 23 Q. Okay. And then also if you go to 24 page 898. 25 A. Okay.</p> <hr/> <p style="text-align: right;">Page 315</p> <p>1 Q. On the right side it says, "Representative 2 Frame Generation." 3 You see that? 4 A. Yeah. 5 Q. And for database population you can use 6 r-frames of videos just as you can still image for 7 both database population and for feature extraction 8 for a input image; is that fair? 9 MR. HANSEN: Objection; vague and ambiguous, 10 lacks foundation. 11 THE WITNESS: Yes. 12 BY MR. EDWARDS: 13 Q. Let's go to IBM 900. The bottom of the 14 left-hand column to the top of the right-hand 15 column. The bottom of the left-hand column starts, 16 "We have described a prototype system." 17 Do you see that? 18 A. Yeah. 19 Q. Okay. You keep going down, that paragraph 20 refers to the technology described in this article 21 [as read], "has been moved into a commercial 22 standalone product, IBM's Ultrimedia Manager, and is 23 part of IBM's Digital Library and DB2 series of 24 products." 25 Do you agree with that?</p>
--	--	--

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 316</p> <p>1 A. Yeah.</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Yes.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. As of the date of this article, the QBIC</p> <p>6 functionality described in this article was in IBM's</p> <p>7 Ultimedia Manager, IBM's --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 Q. Described in this article was in IBM's</p> <p>10 Ultimedia Manager, IBM's Digital library and DB2</p> <p>11 series of products; correct?</p> <p>12 MR. HANSEN: Objection; lacks foundation.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Is that right, Mr. Flickner?</p> <p>15 A. Yes.</p> <p>16 MR. HANSEN: Same objection.</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Let's pick up Exhibit 10, please.</p> <p>19 Look at page IBM 2419. It's the same -- I want to</p> <p>20 ask you about the same sentence I asked you before,</p> <p>21 where it lists the commercial products in -- at the</p> <p>22 bottom of the second full paragraph.</p> <p>23 A. Yeah.</p> <p>24 Q. See that? It says, "QBIC was developed by</p> <p>25 IBM and moved into commercial products including a</p> <hr/> <p style="text-align: right;">Page 317</p> <p>1 licensable standalone software package, IBM Digital</p> <p>2 Library, Ultimedia Manager, the Image Extender in</p> <p>3 DB2 Universal, and the MediaMiner software tool</p> <p>4 series."</p> <p>5 Do you see that?</p> <p>6 A. Yeah.</p> <p>7 Q. So as of the date of this article in 1997,</p> <p>8 the features that were described in this article and</p> <p>9 previous articles were incorporated into commercial</p> <p>10 products listed -- that I just listed; is that</p> <p>11 correct?</p> <p>12 A. Yes.</p> <p><i>Id.</i> at 321 – 322:</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 7,881,529 based on the Query by Image and Video Content (“QBIC”) System

The QBIC system was implemented in IBM commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. All of the features referenced in this chart were incorporated into these commercial implementations before November 6, 2000, as reflected in a combination of scientific papers, IBM’s internal documentation, and the QBIC demo software applications. *See, e.g.*, Flickner 8/29/23 Depo Tr. at 33:9-24, 71:21-72:10, 164:21-166:2, 166:11-175:24, 178:5-186:17, 186:21-192:4, 192:14-194:1, 195:16-196:4, 194:1-308:1; IBM 000001-617; IBM 000747; IBM 000777-880; IBM 000893-902; IBM 0002315-320; IBM 0002390-404; IBM 0002418-430.

To the extent it is found that QBIC does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that QBIC does not anticipate this claim, QBIC renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,881,529 based on  
Invalidity Chart for U.S. Patent 7,881,529 based on Hewlett-Packard CoolTown System (“CoolTown”)

### **Exhibit G-31**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, CoolTown was made, known or used by others in the United States no later than July 10, 2000. *See generally* T. Kindberg et al., A Web-Based Nomadic Computing System; J. Barton et al., The Cooltown User Experience; cooltown developer’s network, coolbase overview; cooltown developer’s network, people, places, things: web presence for the real world. CoolTown is available as prior art at least under 35 U.S.C. § 102(a). On information and belief, HP was using CoolTown and made it available to the public in the United States by releasing the website on the Internet (and accessible to U.S. users) by at least March 2000, making the software available on the HP website by March 2000, and making available on the Internet (and accessible to U.S. users) the open source code, which reflects the functionality of CoolTown by at least March 2000. *See e.g.*, HP000043–044; HP000045–046; HP000060–061; *see also* <https://www.zdnet.com/article/hp-brings-open-source-to-cooltown/>. Therefore, HP Cooltown was at least known, used, and/or sold to the public by at least 2000. On information and belief, CoolTown is also available as prior art under 102(g). BofA is diligently investigating CoolTown and will supplement with additional information, if necessary.

As shown in the chart below, CoolTown anticipates asserted claims 4 and 20 of the ’529 Patent. To the extent CoolTown is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent CoolTown is found not to anticipate any asserted claims or claim elements of the ’529 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 7,881,529 based on

Invalidity Chart for U.S. Patent 7,881,529 based on Hewlett-Packard CoolTown System (“CoolTown”)

2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

		coolbase overview  The coolbase platform consists of several sub-projects which combine to form a coherent framework for bringing together all the elements necessary to build a cooltown service or application. These sub-projects include software for enabling smart, connected web devices; software for representing people, places and things and their contextual relationships; some supporting hardware and software elements; and sample applications that illustrate the use of these various elements.

		<p><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 24:</p>

		<p><b>3.4. Infrastructure for things; ChaiServer and eSquirt</b></p> <p>Given a URL from one of the lower-layer services, we</p>  <p><b>Figure 5. Devices (printer, light), with and without embedded web servers.</b></p> <p>Figure 5 shows interactions between two clients and their respective web devices. It shows a digital camera that interacts with a printer via HTTP operations on the printer's point of web presence. The URL for the printer resolves to its network address. The camera first interrogates the printer to find out the formats it accepts. The printer can supply this as an HTML page or as an XML document that describes it. Then the camera sends the image as, for example, JPEG encoded data. Figure 5 also shows lights connected to a home PC by a controller unit. The home PC acts as a gateway to the lighting unit. A remote user issues HTTP operations via a web browser on a PDA; the programs on the PC that handle HTTP operations directed to the light's URL manipulate the lighting unit accordingly.</p>

Element	'529 Claim Recitation	Exemplary Citations in Reference
		<p><b>3. Sensing</b></p> <p>In this section, we describe the bottom layer of our infrastructure, which enables the user to acquire URLs from their surroundings or from the physical entities in their surroundings. An obvious mechanism, with equally obvious drawbacks, is to write the URL on a label and attach it to the object. The user reads the label and types the URL into their browser.</p> <p>Rather than being forced to use that cumbersome method, users should be able to identify conveniently what it is that interests them in their surroundings and obtain the corresponding URL <i>automatically</i>. To achieve this, their PDA is equipped with at least one short-range device that allows them to read URLs and other identifiers associated with places and individual objects in their surroundings, by pointing or positioning the device. We call this URL <i>sensing</i>.</p> <p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>∇ <i>IR &amp; RF</i>. The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>∇ <i>Barcodes</i>. Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>∇ <i>Electronic tags</i>. A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>∇ <i>Optical recognition</i>. The user’s device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

To achieve this, their PDA is equipped with at least one short-range device that allows them to read URLs and other identifiers associated with places and individual objects in their surroundings, by pointing or positioning the device. We call this URL <i>sensing</i>.</p> <p>Some options for sensing include:</p> <ul style="list-style-type: none"> <li>∇ <i>IR &amp; RF</i>. The infrared transceiver available on most PDAs and laptops can sense by communicating with a small, low-power ‘beacon’ device mounted at the place or on the object. Our beacon emits the identifier in infrared packets in the form of XML specifying a URL [15]. IR beacons can be configured to have a range of several meters. Similarly, short-range RF could be used.</li> <li>∇ <i>Barcodes</i>. Barcode scanners are increasingly found integrated into PDAs, and are available as wands and other hand-held formats. Many objects are manufactured with barcodes – both generic ones and ones encoding their serial number; where they do not, barcodes can easily be printed and attached to objects.</li> <li>∇ <i>Electronic tags</i>. A variety of small electronic tags exist containing a unique identifier with ~100 bits. All are available at relatively low cost. RFID tags can be read from a distance of about 10 cm with a hand-held reader. There are also tags such as iButtons [18] that are read on contact, which can be advantageous if tags lie close together.</li> <li>∇ <i>Optical recognition</i>. The user’s device may have a camera attached, in which case the identifier can be encoded in a form such as a ‘glyph’ [23] or digital watermark that is amenable to recognition software.</li> </ul> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 4</b>                      In <i>direct sensing</i>, the beacon or tag directly presents the URL of a web resource. In <i>indirect sensing</i>, it presents an identifier such as an ISBN or a UPC barcode. Then to obtain a URL we need a <i>resolver</i>, a service that returns a URL when given an identifier.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 8</b>                      To accomplish direct content transfer we need only have a simple push interaction: the content source opens a connection to the sink and writes the content (See Figure 5a). The only agreement we need between sources and sinks is the format of the data. Many imaging devices support JPEG format: it serves as the common format for images today. Since devices may use other common formats and since formats do evolve, effective interaction requires some introductory content preceding the data that identifies its format. The format of this introductory or</p> <p><b>The Cooltown: People, Places, Things Web Presence for the Real World (HP000025 – 34) at 20:</b></p>

		<p><i>Ubiquitous access.</i> The Web derives its power from a design that has led to widespread accessibility. The rising quality and reach of the Web increases the probability of Web access in mobile venues. People use the Web at work and at home today; increasingly they will find it available when they shop or travel; eventually they will find adequate access "everywhere" they want electronic connections. The Web offers accessibility that supports mobility in two senses. First, resources on the Web can be accessed from any device that supports the standard HTTP protocol [18]. This includes devices that the user carries: general-purpose devices such as personal digital assistants (PDAs) and laptops, and information "appliances" dedicated to a specific function, such as digital cameras. Equally, it is a simple matter to put HTTP <i>server</i> support in devices [10] that nomadic users encounter, such as printers and projectors. Second, the Web supports mobile users by allowing them transparent access to resources outside their current environment. That is, the Web runs over the Internet, the Internet is widely accessible, and the Web runs the same way at all points of the Internet. We shall discuss ways of bridging devices that are <i>not</i> IP-capable to the Web.</p> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success</p>

		<p>To get an idea of some of the issues in defining place contexts, imagine that Acme Software Inc. sets up a stand the Wireless Web World exhibition (Figure 4). Acme has to define its own context within the exhibition, which uses to provide information, printing, purchasing and other services to users who walk up to the stand. Visitors may be able to discover the Acme context when they walk up, distinguish it from that of neighboring exhibits, and through their devices, these visitors must be able to browse and access the resources that Acme provides within the context. We are mainly interested here in resources that are based around the physical entities found at the exhibition stand. When the visitor reads a barcode attached, say, to a printer or a guest book on display, they are automatically shown the Acme web page offering them a service connected with it.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b></p> <p><b>Place Managers</b></p> <p>Our implementation of place context is as a web server with appropriate content describing the place [6]. The point of web presence of the designated objects will appear as links in the place’s web pages. They will also be discoverable programmatically, using lookup by identifier, and lookup by service type and other attributes. The ‘local resolver’ that we described in the previous section is an example of a resource that can be looked up automatically from the place’s context.</p> <p>A <i>place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"> <li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li> <li>• It acts as a resolver for each place, for looking up resources from their identifier.</li> </ul> <p><b>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 8</b></p> <p><b>Indirect Sensing</b></p> <p>In the case of indirect sensing, the user’s client device obtains a value that it has to look up to obtain a URL. 		<p><b>Discovery:</b> Discovery is the acquisition of contexts and resources within contexts. Places are discovered in much the same way as individual physical objects, although they are typically extended and so may require several beacons or tags. Prominent “You Are Here” beacons or barcodes (or any other type of tag) attached to the Acme exhibition stand enable the user to pick up that place’s context. The user points the device at the beacon or scans the barcode. The result is the URL of the place: a set of web pages containing information and services that the user can browse on their device, and which devices can query.</p> <p><b>A Web-Based Nomadic Computing System (HP000074 – 87) at 6</b></p> <p><b>Place Managers</b></p> <p>Our implementation of place context is as a web server with appropriate content describing the place [6]. The points of web presence of the designated objects will appear as links in the place’s web pages. They will also be discoverable programatically, using lookup by identifier, and lookup by service type and other attributes. The 'local resolver' that we described in the previous section is an example of a resource that can be looked up automatically from the place's context.</p> <p>A <i>place manager</i> provides access to and configuration of the data associated with one or more places. In the example of the exhibition hall, we shall assume that there is one place manager, which holds data about all the places within the exhibition hall. Different places are managed as separate objects. If this is not satisfactory from a security point of view, then the operators of a stand can supply their own manager for their place.</p> <p>The place manager has the following functions:</p> <ul style="list-style-type: none"> <li>• It maintains directories of the resources in each place, and provides an interface by which resources may be added, queried and removed.</li> <li>• It acts as a resolver for each place, for looking up resources from their identifier.</li> </ul> <p><b>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 20 – 21</b></p> <p><b>2.1. Visiting the Cooltown Museum.</b></p> <p>The Cooltown Museum and Bookstore offers visitors a Web-enhanced experience. As visitors tour the museum, their portable digital assistant (PDA) can receive Web URLs from wireless "beacons". These beacons are small infrared transceivers located close to pictures or</p>

		<p><b>Direct sensing.</b> In our "art gallery" implementation, we laid out a room with pictures on the walls and situated the "bookstore" nearby. We implemented web presence for these entities using active, URL-emitting devices (beacons). We call this form of discovery <i>direct sensing</i>. Next to each painting and in the bookstore we placed infra-red beacons that supply PDAs with the URL of the corresponding point of web presence. The paintings' URLs are those of pages supplied by the Van Gogh museum. The URL of the bookstore resolves to a "place manager" server (discussed in Section 3.2.3), which provides the bookstore's web portal and which runs service discovery and registration services.</p> <p><b>Indirect sensing.</b> In the case of indirect sensing, the user's client device obtains a value that it has to look up to obtain a URL. There are many types of value that can be 'sensed' as the user travels through the physical world. For example, the device could obtain latitude and longitude coordinates from a GPS sensor, which could then be translated into a zip code and hence into the URL of a place's web portal provided by Yahoo, for example. The device could even perform image recognition against a database of tourist sites to provide the URL of a corresponding web page.</p> <p>We have been experimenting with indirect sensing where the sensed value is obtained from a <i>tag</i>. There are electronic tags like RFID tags [33] and iButtons [22] – small devices that supply a unique identification string to a sensor placed near them or in contact with them.</p>

The typical user experience we seek with web presence is that of collecting links to points of web presence as they are encountered them in the physical world. One could even think of the physical world as a web page, with links at certain physical points. Of course the links are URLs presented on the user’s client device and the result of clicking on such a link will be a real web page, delivered to the user’s screen. The user can then travel through the virtual space of the web page with normal Web techniques or the user can travel through the physical space to find a different point of web presence. The user understands URLs as pointers to meta-information about objects at the same level that users of Web browsers now understand URLs as bookmarks for Web content. While this physical/virtual browsing is a typical scenario, we imagine other usage scenarios for web present things, in the same way that the Web supports many usage scenarios in addition to Web browsing.</p> <p>Cooltown Developer’s Network, People, Place, and Things: web presence for the real world (HP000025–34) (HP000025–34) at 23</p>

		<p>Barcodes can be used instead of an electronic tag.</p> <p>Figure 4 shows a different art gallery demonstrator in which a PDA client senses a painting’s tag. A correlated web page is resolved from the tag identifier and the client presents it to the user.</p> <p>We have produced a prototype implementation for sensing tagged things and displaying a corresponding context-dependent web page. The sensing device knows the URL of a <i>resolver</i>. When the client senses a tag, it sends the identifier to the resolver. If the resolver has an entry for the identifier, it sends back the corresponding URL. The user may choose a resolver that reflects his or her personal requirements, or those of a group of users with interests or tasks in common. For example, visitors to an art gallery could be offered resolvers that provide the URLs of pages in their native language, or pages provided by the art school at which they study.</p> <p>.....</p> <p>To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

20	The system of claim 1, wherein the data processing operation is selected from the group consisting of contrast enhancement, noise removal, and de-blurring.	To the extent it is found that CoolTown does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that CoolTown does not anticipate this claim, CoolTown renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine CoolTown with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,520,897 based on  
U.S. Patent No. 6,947,417 to Rhoads (“Rhoads”)

### **Exhibit H-3**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Rhoads was filed on May 15, 2000, claiming the priority date of May 19, 1999. Rhoads published at least as of September 20, 2005, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Rhoads anticipates asserted claims 25, 30, 33–34, and 39 of the ’897 Patent. To the extent Rhoads is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Rhoads is found not to anticipate any asserted claims or claim elements of the ’897 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiff’s “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiff’s “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiff’s Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiff’s proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiff is permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs’ of BofA’s invalidity theories and are not meant to be exhaustive.

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>Rhoads at 9:35–10:10</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object's boundaries.</p> <p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p>

	<p>association of the target with target information pertinent to the target, and performance of a transaction based on the target information.</p>	<p>Rhoads at Fig. 2 (and accompanying description)</p> <p><b>FIG. 2</b></p> <p>Rhoads at 9:35–10:21</p> <ul style="list-style-type: none"> <li>• “The Steganographic decoding process may entail three Steps. In the first, the object is located. In the Second, the objects orientation is discerned. In the third, the Bedoop data is extracted from the image data corresponding to the Bedoop object.</li> </ul> <p>The first step, object location, can be assisted by various clues. One is the placement of the object; typically the center of the image field will be a point on the object. The surrounding data can then be analyzed to try and discern the object’s boundaries.</p>

 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,520,897 based on  
 U.S. Patent No. 6,947,417 to Rhoads (“Rhoads”)

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>Another location technique is slight movement. Although the user will typically try to hold the object still, there will usually be some jitter of the Bedoop object within the image frame (e.g., a few pixels back and forth). Background visual clutter, in contrast, will typically be stationary. Such movement may thus be sensed and used to identify the Bedoop object from within the image data.</p> <p>Still another object-location clue is object shape. Many Bedoop objects are rectangular in shape (or trapezoidal as viewed by the camera). Straight edge boundaries can thus be used to define an area of likely Bedoop data. Color is a further object identification clue that may be useful in some contexts.</p> <p>Yet another object location clue is spatial frequency. In imaging systems with well defined focal zones, undesired visual clutter may be at focal distances that results in blurring. The Bedoop object, in contrast, will be in focus and may be characterized by fine detail. Analyzing the image data for the high frequencies associated with fine detail can be used to distinguish the intended object from others.</p> <p>Characteristic markings on the object (as discussed below in connection with determining object orientation) can also be sensed and used in locating the object.</p> <p>Once the Bedoop object has been located within the image data, masking can be applied (if desired) to eliminate image data not corresponding to the intended object.</p> <p>The next step in the decoding process, determining orientation of the Bedoop data, can likewise be discerned by reference to visual clues. For example, some objects include subliminal graticule data, or other</p>

Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,520,897 based on  
U.S. Patent No. 6,036,086 to Sizer (“Sizer”)

### **Exhibit H-5**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Sizer was filed on March 28, 1997. Sizer published at least as of March 14, 2000, and is available as prior art at least under 35 U.S.C. § 102(a), (b) and (e).

As shown in the chart below, Sizer anticipates asserted claims 25, 30, 33, 34, and 39 of the ’897 Patent. To the extent Sizer is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Sizer is found not to anticipate any asserted claims or claim elements of the ’897 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

 Invalidity Chart for U.S. Patent 8,520,897 based on  
 U.S. Patent No. 6,036,086 to Sizer (“Sizer”)

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>subliminally inserted in a video signal by adding to the video signal an amplitude shift keyed (ASK) or frequency shift keyed (FSK) carrier signal, and the digital information can later be recovered using ASK or FSK decoding. Encoded data can also be inserted in a television signal and recovered by a received that responds to the picture displayed on the television, in the manner described in U.S. Pat. No. 4,807,031 cited above.”</p> <p>Sizer at 5:23-26</p> <ul style="list-style-type: none"> <li>• “If any non-discernible encoded data is part of a video signal, such sensing takes the form of light from display area being collected by an optical lens 117.”</li> </ul> <p>Sizer at 6:41-62</p> <ul style="list-style-type: none"> <li>• “If the encoded non-perceptible data is inserted in the video portion of a television signal, the images displayed on a visual display area a monitor or television are captured by optical lens 117 and an associated photo-detector 203, which is arranged to supply an electrical signal to a filter/receiver 215 representing the image.</li> </ul> <p>On the other hand, if the encoded non-perceptible data is inserted in the audio portion of a television signal, e.g. the output from a speaker is captured by a microphone 211 and an associated amplifier 213, which is arranged to supply an electrical signal to filter/receiver 215 representing the sound energy. In either event, the encoded non-perceptible data is decoded in the filter/receiver 215 in a manner consistent with the manner in which the original data was encoded. Thus, filter/receiver 215 can be arranged to perform the same functionality as the elements illustrated in FIG. 4 of the above referenced Broughton et al. patent, or, alternatively, the operation of filter/receiver 215 can be as described in conjunction with FIGS. 4 or 7 in the copending application of T. Sizer.”</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872  
 Invalidity Chart for U.S. Patent 8,520,897 based on  
 U.S. Patent No. 6,036,086 to Sizer (“Sizer”)

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>Sizer at 9:33-53</p> <ul style="list-style-type: none"> <li>• “For background purposes, a televised advertisement for a product could include additional ordering or "coupon" information embedded in a subliminal visual pattern within the video image displayed on a television. The coupon information describes the item(s) offered for sale, the regular price, the coupon value, and contains additional information needed for ordering. This embedded information could be transmitted between a television and capture device at a rate of about 60 bits per second, that is sufficient such that the necessary information can be transmitted in a very brief period of time. In the application just described, the embedded product information, dialing number, coupon information and necessary checkbits together comprise approximately 2,000 bits of information, so that between three and four seconds would be required for transmission. Once the coupon information is stored in capture device 110, the user of the capture device can supplement the coupon information with user entered data which can be entered using keypad 247. This supplemental information may include credit card or other billing information pertaining to the user, as an example.”</li> </ul> <p>Sizer at 10:27-37</p> <ul style="list-style-type: none"> <li>• In the active mode, a user operates capture device 110 in real time, typically while scanning a product or bar code, or in more complicated devices viewing a video display or listening to an audio presentation. Scanning a product or bar code, or in more complicated devices the user activates the SAVE button 241. When button 241 is activated, a positive result occurs in step 503, thereby capturing the encoded data, displaying all or a portion of the data on display 225, and storing same in memory 221, all in step 507. Until the SAVE button is activated, capture device 110 may be in a "wait state" 505.”</li> </ul>

		<p>effectuate a transaction.”</p> <p>Sizer at 12:62-13:12</p> <p>In accordance with the present invention, a capture device now can initiate a transaction by capturing transaction data from marks contained on an object, such as a magazine advertisement, where the marks have embedded therein a code corresponding to transaction data for initiating a transaction. The capture device includes a scanner, operable by a user, for reading marks contained on the object and a controller for interpreting the marks and retrieving transaction data embedded in the marks. Through associated apparatus as described above, a telephone call can be originated by information contained in the transaction data in at least a portion of the transaction data transferred to a desired destination for initiating a transaction. As a result, it is now possible now for magazines, newspapers, printed media and many other objects to contain marks relating to an advertisement or solicitation which can be easily scanned and a transaction completed to the vendor of the advertisement or solicitation. This saves much time and allows easier access to services and products.</p> <p>To the extent it is found that Sizer does not expressly disclose this limitation, the limitation is inherent. And to the extent it is found that Sizer does not anticipate this claim, Sizer renders it obvious, either alone, in combination with the knowledge of a person of ordinary skill in the art, and/or in combination with other prior art references identified herein or in the cover pleading of BofA’s Final Invalidity Contentions. A person of ordinary skill in the art would have been motivated to combine Sizer with any of the other prior art references identified in the cover pleading or herein with a reasonable expectation of success for the reasons identified in the cover pleading, including because each of these references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>

U.S. Patent No. 6,666,377 to Harris (“Harris”)

### **Exhibit H-6**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Harris was filed on July 18, 2000. Harris published at least as of December 23, 2003, and is available as prior art at least under 35 U.S.C. § 102(e).

As shown in the chart below, Harris anticipates asserted claims 25, 30,, 33, 34, and 39 of the ’897 Patent. To the extent Harris is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Harris is found not to anticipate any asserted claims or claim elements of the ’897 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cover pleading. These Final Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

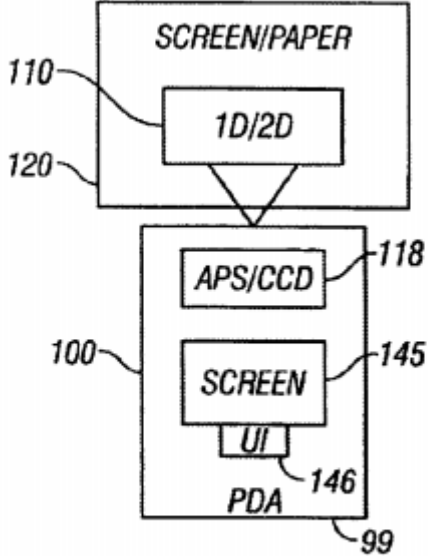

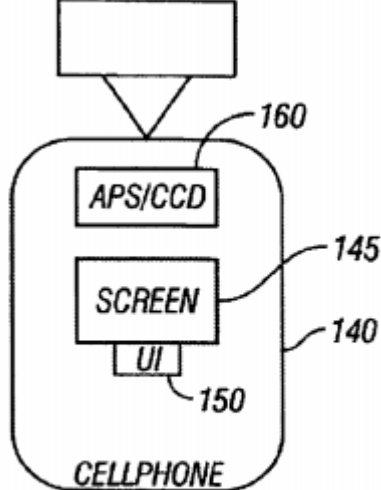

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872  
Invalidity Chart for U.S. Patent 8,520,897 based on  
U.S. Patent No. 6,097,834 to Krouse (“Krouse”)

### **Exhibit H-18**

Bank of America Corporation (“BofA” or “Defendant”) provides this chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety.

On information and belief, the application that matured into Krouse was filed on June 13, 1997, claiming the priority date of June 13, 1997. Krouse published at least as of August 1, 2000, and is available as prior art at least under 35 U.S.C. § 102(a) and (e).

As shown in the chart below, Krouse anticipates asserted claims 25, 30, 31, 33, 34, 39 of the ’897 Patent. To the extent Krouse is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent Krouse is found not to anticipate any asserted claims or claim elements of the ’897 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Invalidity Contentions, for the reasons identified in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed to have that same scope when considering whether they are invalid.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

### Exhibit H-23

Bank of America Corporation (“BofA” or “Defendant”) provides this second supplemental chart subject to all reservations, objections, statements, and disclaimers set forth herein and in BofA’s Final Invalidity Contentions Cover Pleading, as well as any amendment, supplement, or modification thereof, which are incorporated herein by reference in their entirety. A statement of reasons and good cause for each supplement in this chart is identified in the cover pleading.

QBIC was known or used by others in the United States and publicly used or on sale in the United States by November 5, 2000. *See generally* W. Niblack et al., *The QBIC Project: Querying Images By Content Using Color, Texture, and Shape*, SPIE Vol. 1908 (1993), pp. 173–187 (IBM0002390–404); M. Flickner et al., *Query by Image and Video Content: The QBIC System (“QBIC”)*, IEEE Sept. 1995, pp. 23–32 (IBM0000893–902); W. Niblack et al., *Updates to the QBIC System*, SPIE Vol. 3312 (1997), pp. 150–161 (IBM 0002419–430); and *Query By Image Content QBIC Demonstration Program*, IBM Research, Sept. 1998 (IBM000747). QBIC is available as prior art at least under 35 U.S.C. § 102(a), (b), and (g), having been known or used by others in the United States and publicly used or on sale in the United States by at least 1995 and certainly by November 5, 2000, including, for example, at <http://libra.uc.davis.edu> through the Art History Department at U.C. Davis; at [www.thinker.org/imagebase/indox-2 .htm3](http://www.thinker.org/imagebase/indox-2.htm3) through the Fine Arts Museum of San Francisco; through demos at <http://www.qbic.almaden.ibm.com>; and through IBM’s commercial products, including in IBM’s Ultimedia Manager, the DB2 series of products such as the Image Extender in DB2 Universal Database, and the Enterprise Information Portal. *See generally* Deposition of IBM Corporate Representative Myron Flickner, *Nantworks, LLC and Nant Holdings IP, LLC v. Bank of America Corporation and Bank of America, N.A.*, 2:20-cv-07872-GW-PVC (C.D.C.A. 2020) (“Flickner 8/29/23 Depo”) at e.g., 32–33, 39–40, 44, 62–63, 66–67, 72–74, 103–107, 110–112, 127, 163–174, 183–189, 191–195, 215, 219–220, 241, 307–309, 311–317, Exs. 3–13; *see also* Deposition of IBM Corporate Representative Myron Flickner, *Network-1 Technologies, Inc., v. Google LLC and Youtube LLC*, 1:14-cv-09558-PGG (S.D.N.Y. 2019) (“Flickner Depo”), including, e.g., at 13, 14, 15–18, 29–30, 34, 36, 37, 43–46, 48, 58, 60, 61–62, 67–69, 72, 74–76, 84–86, 88–89, 98–100, 102, 106, 113, 125, 135, 152–154, 160–161, 170–172, 180–181, 194, 198–201, 203–205, 215–216, 220–221, and Exs. 1–16. As shown in the chart below, QBIC anticipates asserted claims 25, 30, 33, 34, and 39 of the ’897 Patent. The disclosures/exemplary citations for each element incorporate the disclosures/exemplary citations of the proceeding limitations. To the extent QBIC is found not to expressly disclose certain limitations in the asserted claims, such limitations are inherent. To the extent QBIC is found not to anticipate any asserted claims or claim elements of the ’897 Patent, the reference nevertheless renders those claims or claim elements obvious under 35 U.S.C. § 103, either alone or in combination with other art identified herein or in the cover pleading of BofA’s Final Invalidity Contentions, for the reasons identified in the cited references and/or in the cover pleading. These Invalidity Contentions are not an admission by BofA that the accused products, including any current or past versions of the accused products, are covered by, or infringe the asserted claims, but are based instead on the recognition that if the claims are interpreted to be broad enough to encompass the accused products, the claims must also be construed

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

to have that same scope when considering whether they are invalid. The following chart incorporates by reference the analysis from Exhibit H-21 for each limitation.

The following chart is based on the Court’s claim construction rulings (Dkt. Nos. 145, 153, 236), and to the extent not contradictory, Plaintiffs’ apparent interpretations of the claims in Plaintiffs’ “Preliminary” Final Infringement Contentions. BofA notes that in many instances, Plaintiffs’ “Preliminary” Final Infringement Contentions ignore and/or contradict the Court’s claim construction rulings. BofA does not accept the assumptions concerning the scope and meaning implicit in Plaintiffs’ Preliminary Final Infringement Contentions, to the extent those assumptions are discernible, and reserves the right to challenge Plaintiffs’ proposed (or implied) constructions. Furthermore, Plaintiffs’ “Preliminary” Final Contentions fail to comply with the level of specificity required by SPR 2.1.2 and 2.1.3, and include improper reservation of rights to supplement with “additional ways in which BoA Accused Products infringe.” Any alleged deficient discovery is of Plaintiffs own making. Most if not all of the deficiencies in Plaintiffs’ Preliminary Final Contentions have been documented by Defendants through multiple letters since at least May 18, 2021 and up to Bank of America’s most recent letter of August 19, 2023. Plaintiffs’ shifting infringement contentions, deficiencies in its infringement contentions, and changing claim scope have prejudiced BofA from being able to reasonably prepare its defenses, including its invalidity contentions. BofA also reserves the right to revise and supplement these charts if and when Plaintiffs are permitted to provide revised or supplemental Infringement Contentions. Citations given in the chart below are merely representative of the respective elements to provide notice to Plaintiffs of BofA’s invalidity theories and are not meant to be exhaustive.

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>1 Q. And you mentioned that you would extract</p> <p>2 features from the images?</p> <p>3 A. We did.</p> <p>4 Q. How would you do that?</p> <p>5 A. We ran algorithms on the pixels of the</p> <p>6 image and from that we created a feature.</p> <p>7 Q. What sort of features would you extract</p> <p>8 from the images?</p> <p>9 A. A QBIC system did color, shape and</p> <p>10 texture.</p> <p>11 Q. Okay. So let's take color.</p> <p>12 How would you, say, extract a color</p> <p>13 feature from an image?</p> <p>14 A. We typically would compute -- compute a</p> <p>15 color histogram.</p> <p>16 Q. And what's a color histogram?</p> <p>17 A. It's a measure of -- it's an estimate of</p> <p>18 the probability density of a color being in an</p> <p>19 image.</p> <p>20 Q. So you would take an image and extract</p> <p>21 that color histogram from it?</p> <p>22 A. Yup.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p>11 Q. How would one with the Ultimedia Manager 12 use the query by image search functionality of the 13 QBIC system? 14 A. I don't remember the details. And it's 15 basically rank -- giving you a rank list of images 16 based on a query. 17 Q. And where would the images being searched 18 come from? 19 A. The file system on the -- on the 20 computer. 21 Q. So would the user themselves supply the 22 images?</p> <hr/> <p>1 A. They could, yeah. 2 Q. And how many images could the user 3 search? 4 A. I don't remember specific numbers. 5 Whatever the file system supports. 6 Q. Was there any cap on the amount of images 7 that the user could search? 8 A. I don't know. 9 Q. Could the user search an example image 10 based on the extraction of features from that 11 example image? 12 A. I think so.</p>

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. So let's just start at a high level. Tell 5 me generally what is QBIC? 6 A. QBIC was a technology -- stands for query 7 by image content. It was a way of extracting 8 features of various types, putting those features in 9 a database and then searching the database to get 10 images that looked visually similar or semantically 11 similar. 12 Q. And when you say "semantically similar," 13 what do you mean? 14 A. You could query based on semantics. You 15 could ask for what does a microphone look like and 16 you get various incantations of visual microphones.</p> <p><i>Id.</i> at 205–206</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>10 Q. All right. I want to -- you've been                      11 testifying about different systems today. We've                      12 heard about Ultimedia Manager. We've heard about                      13 DB2. We've heard about image extender. I want to                      14 ask you about QBIC piece of things, just to make                      15 sure I have the delineation --                      16 A. Okay.                      17 Q. -- straight, okay?                      18 QBIC stood for query by image content;                      19 right?                      20 (Reporter seeks clarification.)                      21 Q. QBIC stands for query by image content?                      22 A. Yes.                      23 Q. Okay. And there are essentially three                      24 logical steps associated with QBIC, one of which is                      25 database population?</p> <p style="text-align: right;">Page 206</p> <p>1 A. Yes.                      2 Q. Another one of which is called feature                      3 calculation?                      4 A. Feature extraction.                      5 Q. Okay. Feature extraction. And then image                      6 query; is that right?                      7 A. Yeah.                      8 Q. Okay. So basically all the steps involved                      9 in QBIC fall into one of those three categories; is                      10 that right?                      11 A. Sounds about right.</p> <p><i>Id.</i> at 197–198</p>

		<p>references contains familiar elements within the similar fields of endeavor to address similar known problems, according to known methods which would yield predictable results.</p>
[25D]	<p>enabling, via the interactive system, identification of features from the displayed image, recognition of a target based on the features, association of the target with target information pertinent to the target, and performance of a transaction based on the target information.</p>	<p>QBIC discloses enabling, via the interactive system, identification of features from the displayed image, recognition of a target based on the features, association of the target with target information pertinent to the target, and performance of a transaction based on the target information.</p> <p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2395-96</p> <p>Retrievals on image features are done based on similarity, not exact match, and we have defined one or more similarity functions for each feature or feature set. The easiest similarity functions are distance metric such as cityblock, Euclidean, or weighted Euclidean distance. (Similarity functions typically range from 1 for perfect similarity to 0 for no similarity, whereas a distance function is 0 for perfect similarity and large for low similarity, so we must convert as necessary to obtain consistent measures.) Different similarity measures may be used, and they may vary from application to application.</p> <p>The matching methods and similarity functions for the different feature types are described below:</p> <p><i>Color:</i> For average color, the distance between a query object and database object is weighted Euclidean distance. The weights are user adjustable so that we may, for example, downweight the <i>L</i> component of a <math>(L, a, b)</math> query. Best results, as judged by our subjective evaluation in on-going experiments, are obtained by representing the average color in the MTM color space, and by inversely weighting each component by its standard deviation over the samples in the database.</p> <p>Improved results are obtained when color matching is done not on average color, but on the distribution of colors that occur in an object or image. In this way, a red and blue object matches other red and blue object better than to a purple object. To match color histograms, we use a method similar to the one described in [8]. Let <math>X</math> be the query histogram and <math>Y</math> the histogram of an item in the database, both normalized. We compute the element by element difference histogram <math>Z</math>. Then the similarity between <math>X</math> and <math>Y</math> is given by <math>\ Z\  = Z^T A Z</math>, where <math>A</math> is a symmetric color similarity matrix with</p> $a(i, j) \equiv 1 - d(c_i, c_j) / d_{max}$ <p>where <math>c_i</math> and <math>c_j</math> are the <math>i</math>th and <math>j</math>th colors in the color histograms, and <math>d(c_i, c_j)</math> is the <i>MTM</i> color distance and <math>d_{max}</math> is the maximum distance between any two colors ([8] used <i>Luv</i> distance.) This metric gives the (weighted) length of the difference vector between <math>X</math> and <math>Y</math>, weighted by <math>A</math>, which accounts for the perceptual distance between different pairs of colors. The result is a measure that accounts for both the difference between the amounts in any given color (e.g. a particular shade of red), as well as differences between similar color (e.g. red and orange).</p>

		<p>The QBIC Project: Querying Images by Content Using Color, Texture, and Shape (IBM 0002390–404) at 2396</p> <p style="text-align: center;"><b>3. Indexing and Database Issues</b></p> <p>Currently, we store computed feature values for objects and images in either flat files or in a Starburst database [19]. Starburst, a research prototype developed at IBM Research, is an extensible relational database with numerous extensions such as triggers and support for long fields (up to 1.5 gigabytes). Our current database schema using Starburst is shown in Figure 3. Because we are still defining and experimenting with the set of features, we most frequently use the flat file format.</p> <p>...</p> <p>Given the above feature extraction functions, each image corresponds to a point in a multi-dimensional feature space; similarity queries correspond to nearest-neighbor or range queries. For example “ Find all images that are similar to a given image, within a user-specified tolerance” (a range query), or “Given an image, find the 5 most similar images” (a nearest neighbor query). Also, we need a multidimensional indexing method that can work for large, disk-based databases. The prevailing multidimensional indexing methods form three classes: (a) <i>R*</i>-trees [20] and the rest of the R-tree family [21, 22]; (b) linear quadtrees [23]; and (c) grid-files [24].</p> <p>QBIC (Query by Image Content) at 1</p>

		<p>Query by example using <i>color histograms</i></p> <ul style="list-style-type: none"> <li>• Example image:                     <div data-bbox="1304 358 1486 500" data-label="Image"> </div> </li> <li>• One of the colour histograms for the example image is shown in Fig. 28.1.                     <div data-bbox="989 570 1797 935" data-label="Figure"> </div> </li> </ul> <p><b>Colour Histogram of Image</b></p> <ul style="list-style-type: none"> <li>• Store a histogram vector for each image in the database.                      compare images using mean squared difference.                      return images sorted by this metric.</li> </ul> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

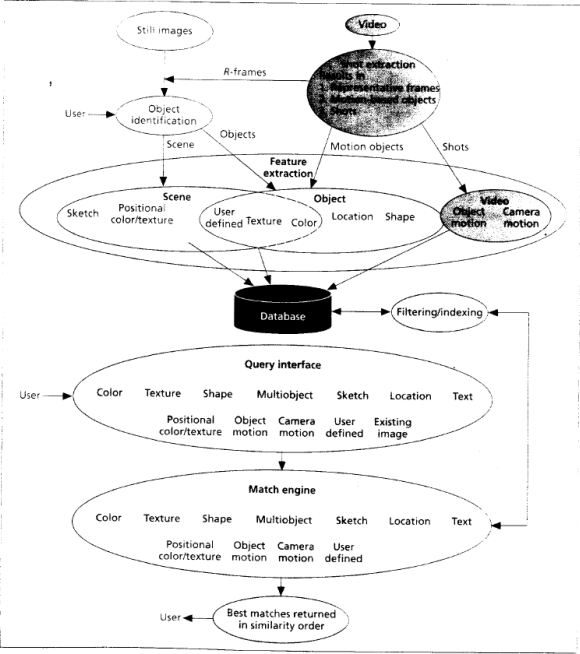

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>  <p>The diagram illustrates the QBIC system architecture, divided into two main parts: database population (top) and query (bottom).  <b>Database Population (Top):</b> This section shows the process of creating the database. It starts with 'Still images' and 'Video' as inputs. 'Video' is processed through 'Frame extraction' to produce 'Representative frames' and 'Motion objects'. 'Still images' are processed through 'Object identification' (which also receives input from a 'User') to produce 'Objects'. 'Objects' and 'Motion objects' are then processed through 'Feature extraction' to generate 'Scene' and 'Object' features. 'Scene' features include 'Sketch', 'Positional color/texture', and 'User defined'. 'Object' features include 'Texture', 'Color', 'Location', and 'Shape'. 'Video' also contributes 'Shots' and 'Object motion' features. All these features are stored in a central 'Database'. A 'Filtering/indexing' step is also shown connected to the database.  <b>Query (Bottom):</b> This section shows how a user queries the database. A 'User' interacts with a 'Query interface' to input various features: 'Color', 'Texture', 'Shape', 'Multiobject', 'Sketch', 'Location', and 'Text'. The interface also lists 'Positional color/texture', 'Object motion', and 'Camera motion' as available query options. The 'Query interface' sends these inputs to a 'Match engine', which performs the search using the same feature set. The 'Match engine' returns 'Best matches returned in similarity order' to the 'User'.</p>

Figure 2. QBIC database population (top) and query (bottom) architecture.

*Id.* at Fig. 2.

“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video

		<p>shots that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene—for example, the fox in Figure 3—or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p> <p>Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen.</p> <p>Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p><b>“DATABASE POPULATION</b></p> <p>In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. Internally, each object is represented as a binary mask. There may be an arbitrary number of objects per image. Objects can overlap and can consist of multiple disconnected components like the set of dots on a polka-dot dress. Text, like ‘baby on beach,’ can be associated with an outlined object or with the scene as a whole.</p> <p><b>Object-outlining tools</b></p> <p>Ideally, object identification would be automatic, but this is generally difficult. The alternative—manual identification—is tedious and can inhibit query-by-content applications. As a result, we have devoted considerable effort to</p>

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>developing tools to aid in this step. In recent work, we have successfully used fully automatic unsupervised segmentation methods along with a foreground/background model to identify objects in a restricted class of images. The images, typical of museums and retail catalogs, have a small number of foreground objects on a generally separable background. Figure 4 shows example results. Even in this domain, robust algorithms are required because of the textured and variegated backgrounds.</p> <p>We also provide semiautomatic tools for identifying objects. One is an enhanced flood-fill technique. Flood-fill methods, found in most photo-editing programs, start from a single object pixel and repeatedly add adjacent pixels whose values are within some given threshold of the original pixel. Selecting the threshold, which must change from image to image and object to object, is tedious. We automatically calculate a dynamic threshold by having the user click on background as well as object points. For reasonably uniform objects that are distinct from the background, this operation allows fast object identification without manually adjusting a threshold. The example in Figure 3 shows an object, a fox, identified by using only a few clicks.</p> <p>We designed another outlining tool to help users track object edges. This tool takes a user-drawn curve and automatically aligns it with nearby image edges. Based on the ‘snakes’ concept developed in recent computer vision research, the tool finds the curve that maximizes the image gradient magnitude along the curve.</p> <p>The spline snake formulation we use allows for smooth solutions to the resulting nonlinear minimization problem. The computation is done at interactive speeds so that, as the user draws a curve, it is ‘rubber-banded’ to lie along object boundaries. . . .</p> <p><b>Video data</b></p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using</p>

		<p>an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p><b>“SAMPLE QUERIES</b></p> <p>For each full-scene image, identified image object, r-frame, and identified video object resulting from the above processing, a set of features is computed to allow content-based queries. The features are computed and stored during database population. We present a brief description of the features and the associated queries. Mathematical details on the features and matching methods can be found in Ashley et al. and Niblack et al.</p> <p>Average color queries let users find images or objects that are similar to a selected color, say from a color wheel, or to the color of an object. The feature used in the query is a 3D vector of Munsell color coordinates. Histogram color queries return items with matching color distributions—say, a fabric pattern with approximately 40 percent red and 20 percent blue. For this case, the underlying feature is a 256-element histogram computed over a quantized version of the color space.</p> <p>Figure 7 shows a histogram query on still images and a color query on video r-frames. Note that in the query specification for the histogram query of Figure 7, the user has selected percentages of two colors (blue and white) by adjusting sliders. Using such a query, an advertising agent could, for example, search for a picture of a beach scene, one predominantly blue (for sky and water) and white (for sand and clouds); or find images with similar color spreads for a uniform ad campaign. The average color query demonstrates a query against a video shot database where the user is searching for red r-frames. Again, the query specification is on the left and the best hits are on the right.</p> <p>Figure 8 shows an example texture query. In this case, the query is specified by selecting from a sampler—a set of prestored example images. The underlying texture features are mathematical representations of coarseness, contrast, and directionality features. Coarseness measures the scale of a texture</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>(pebbles versus boulders), contrast describes its vividness, and directionality describes whether it has a favored direction (like grass) or not (like a smooth object).</p> <p>An object shape query is shown in Figure 8. In this case, the query specification is the drawn shape on the left. Area, circularity, eccentricity, major-axis direction, features derived from the object moments, and a set of tangent angles around the object perimeter are the features used to characterize and match shapes.</p> <p>Figure 9 illustrates query by sketch. In this case, the query specification is a freehand drawing of the dominant lines and edges in the image. The sketch feature is an automatically extracted reduced-resolution ‘edge map.’ Matching is done by using a template-matching technique.</p> <p>A multiobject query asking for images that contain both a red round object and a green textured object is shown in the bottom of Figure 9. The features are standard color and texture. The matching is done by combining the color and texture distances. Combining distances is applied to arbitrary sets of objects and features to implement logical And semantics.</p> <p>....</p> <p><b>ANNOTATION AND DATABASE POPULATION TOOLS.</b> Automatic methods (such as our Positional Color query) that don't rely on object identification, methods that identify objects automatically as in the museum image example, fast and easy-to-use semiautomatic outlining tools, and motion-based segmentation algorithms will enable additional application areas.</p> <p><b>FEATURE EXTRACTION AND MATCHING METHODS.</b> New mathematical representations of video, image, and object attributes that capture ‘interesting’ features for retrieval are needed. Features that describe new image properties such as alternate texture measures or that are based on fractals or wavelet representations, for example, may offer advantages of representation, indexability, and ease of similarity matching.</p> <p><b>INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION.</b></p>

*Nantworks, LLC v. Bank of America Corporation*

		<p>Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at pp. 7–8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“DB2 (DB2) Universal Database (UDB) is a powerful, object-relational database manager. It stores and protects traditional numeric and character data, as well as large, complex objects (LOBs). DB2 extenders help you exploit DB2 ’s object-relational features. The extenders define distinct data types and special functions for image, audio, video, and text objects. ... Because of that, the extenders give your applications a single point of access to any or all of these types of data, along with traditional numeric and character data.” <i>Id.</i> at p. 3.</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p> <p>“A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content. You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.</p> <p>A QBIC catalog can hold data for the following image features:</p>

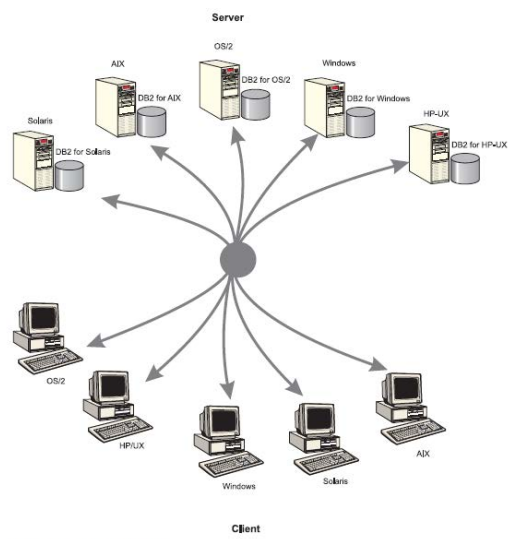

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p><b>Average color</b>                      The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b>                      Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b>                      The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b>                      Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by</p>

		<p>6 Q. How would the Db2 universal search a                      7 query image using QBIC technology?                      8 A. You would create a -- create a manager                      9 QB- -- or create a QBIC catalog.                      10 Q. What's a QBIC catalog?                      11 A. It's an instance of a table that has a                      12 bunch of images in it.                      13 Q. And forgive me, what's an instance of a                      14 table?                      15 A. You create a table -- create a database,                      16 and then in the database you create a table and you                      17 have maybe like a file name, and then the actual                      18 image bits into it.                      19 Q. And how would you search for images using                      20 that table?                      21 A. You could search -- you could use                      22 whatever you wanted to for the -- the SQL query</p> <p style="text-align: right;">Page 78</p> <hr/> <p>1 to -- to filter, and then that would give you a                      2 list of results. And then you'd rank all of those                      3 results based on the QBIC distance measures.</p> <p>Flickner Depo at 201-202</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

	<p>1 Q. Okay. And what would you do with the                  2 image after you hit and extracted the color                  3 histogram from it?                  4 A. Nothing.                  5 Q. Would those features be stored in any                  6 database or --                  7 A. Yes.                  8 Q. Okay. And let's do -- what about                  9 texture, could you extract texture features from an                  10 image?                  11 A. We did.                  12 Q. And how would you do that?                  13 A. I don't remember exact features we were                  14 using. There were -- we published some papers on                  15 them.                  16 Q. Okay. Was there any reasoning behind                  17 picking the features that you chose?                  18 A. Yes.                  19 Q. And what was that reasoning?                  20 A. We wanted to make it so that the results                  21 were perceptually good.                  22 Q. What do you mean by perceptually good?</p> <p style="text-align: right;">Page 22</p>		<p>1 want to look for all of the images that have a red                  2 color in it or some sort red color histogram, is                  3 that right?                  4 A. Well, you -- you take specific -- you                  5 search for a red color. You'd compute the                  6 histogram and then basically match the histogram,                  7 which would give you images that had more colors in                  8 the reds. This is not -- it's not a unique thing.                  9 Q. Were you always searching for a                  10 particular feature, or could you just search some                  11 sort of example image?                  12 A. We could search an example image.                  13 Q. And how would that process work?                  14 A. Just extract the features from it.                  15 Q. So let's break that down.                  16 So you would submit an example image to                  17 the -- to the system, right?                  18 A. Uh-huh.                  19 Q. And then how do the -- how -- how does                  20 the system select which features to extract?                  21 A. It would compute them all, typically, or                  22 all that were based from the query.</p> <p style="text-align: right;">Page 24</p>
	<p>1 A. That people would get -- would agree that                  2 this is a better match, that the ordering was                  3 reasonable and...                  4 Q. So by that, do you mean that people would                  5 view the results returned as the closest or close                  6 matches to your -- to your image?                  7 A. It was -- it would satisfy their query.                  8 Q. Okay. So -- so you would have this set                  9 of features in your database.                  10 How would you search for those features?                  11 A. Typically, we -- initially, we did linear                  12 scan where you just actually evaluate the -- the                  13 distance metric against all the features.                  14 Q. So in linear scan, you would compare some                  15 sort of search term against all the features in the                  16 database?                  17 A. Well, it depends on which features you're                  18 using. You didn't have to use all the features.                  19 You could use just color features or just texture                  20 features or just...                  21 Q. So to make sure I'm understanding this                  22 right, you could have a color, say, red, and you</p> <p style="text-align: right;">Page 23</p>		<p>1 Q. Okay. And then what would it do with                  2 those features that it had extracted from that                  3 example?                  4 A. Then it became the reference point to the                  5 search.                  6 Q. And by reference point to the search, what                  7 do you mean?                  8 A. So you have a vector in -- in the                  9 individual space.                  10 (Reporter clarification.)                  11 A. That -- that query represents a point in                  12 that space, and you're looking for other things                  13 near that space or ordered by that space.                  14 Q. And by other things near that space, is                  15 that the other features that are in the -- in the                  16 database?                  17 A. Yes.                  18 Q. Okay. So at bottom then, you would --                  19 you would take the image, the system would extract                  20 features from it, and then those features would be                  21 searched against the reference database -- the                  22 features within the referenced database; is that</p> <p style="text-align: right;">Page 25</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>1 Q. And you mentioned that you would extract                  2 features from the images?                  3 A. We did.                  4 Q. How would you do that?                  5 A. We ran algorithms on the pixels of the                  6 image and from that we created a feature.                  7 Q. What sort of features would you extract                  8 from the images?                  9 A. A QBIC system did color, shape and                  10 texture.                  11 Q. Okay. So let's take color.                  12 How would you, say, extract a color                  13 feature from an image?                  14 A. We typically would compute -- compute a                  15 color histogram.                  16 Q. And what's a color histogram?                  17 A. It's a measure of -- it's an estimate of                  18 the probability density of a color being in an                  19 image.                  20 Q. So you would take an image and extract                  21 that color histogram from it?                  22 A. Yup.</p> <p>Flickner Depo at 36</p> <p>10 Q. So underlying this paper, you mentioned                  11 you did more work on the shape side of things; is                  12 that right?                  13 A. I did.                  14 Q. And what would that work have entailed?                  15 A. We wanted to query by shape.                  16 Q. Okay. And how would that have worked?                  17 A. We created features related to the shape                  18 of a -- the object of -- as it populated the                  19 database, and then we would query against those                  20 features.</p>

*Nantworks, LLC v. Bank of America Corporation*

		Flickner Depo at 38-41	
		<p>1 project at this time?</p> <p>2 A. I don't know that.</p> <p>3 Q. Okay. Would reviewing -- let's see.</p> <p>4 Let's turn to page -- let's turn to page -- this</p> <p>5 one is Bates-stamped, so the page ending in</p> <p>6 Network1_007316.</p> <p>7 Would reviewing this page refresh your</p> <p>8 recollection as to whether --</p> <p>9 A. Yes.</p> <p>10 Q. Okay. Perfect. Feel free.</p> <p>11 MR. DeCLERCK: Just give him a chance to</p> <p>12 finish his question before you respond.</p> <p>13 MR. DANG: Thank you.</p> <p>14 THE DEPONENT: Is there a question</p> <p>15 standing?</p> <p>16 Q. (By Mr. Dang) Sure. Yeah.</p> <p>17 So was there any video search</p> <p>18 functionality included as part of the QBIC system</p> <p>19 at this time?</p> <p>20 A. Evidently, yes.</p> <p>21 Q. Okay. And how did that video search</p> <p>22 functionality work?</p> <p style="text-align: right;">Page 38</p>	<p>1 A. You just populate image database using</p> <p>2 those images.</p> <p>3 Q. Okay. Could you take as -- as you did in</p> <p>4 the query by image search system, could you just</p> <p>5 search a video using this system?</p> <p>6 A. You could search for a key frame and that</p> <p>7 could point you to a video.</p> <p>8 Q. As an input into the system, could you</p> <p>9 search -- could you input a whole video and then</p> <p>10 the system would extract the key frames and then --</p> <p>11 A. Yes.</p> <p>12 Q. -- search that using that?</p> <p>13 A. If I recall correctly, yes.</p> <p>14 Q. Okay. And the way -- the method by which</p> <p>15 it did so, as you mentioned, was -- would it</p> <p>16 extract key frames from the video, extract features</p> <p>17 from those key frames, and then search those</p> <p>18 features; is that right?</p> <p>19 A. Correct.</p> <p>20 Q. Okay. Other than the use of shots and</p> <p>21 key frames, is there any difference between the</p> <p>22 video search functionality disclosed here and the</p> <p style="text-align: right;">Page 40</p>
		<p>1 A. You detect shots in -- transitions in</p> <p>2 video and then treat -- treat those as still images</p> <p>3 in the QBIC system.</p> <p>4 Q. So to break that down, you -- what do you</p> <p>5 mean by detecting shots?</p> <p>6 A. You try to find some key frame in a video</p> <p>7 sequence or multiple key frames in a video</p> <p>8 sequence, to give you a summarization of the video.</p> <p>9 Q. And how would you detect those key</p> <p>10 frames?</p> <p>11 A. There were algorithms to do it. I didn't</p> <p>12 personally work on any of those algorithms.</p> <p>13 Q. Are you otherwise aware of any of those</p> <p>14 algorithms?</p> <p>15 A. Well, they used histogram methodologies.</p> <p>16 I remember that.</p> <p>17 Q. Okay. So you would take -- you would use</p> <p>18 a histogram methodology to extract key frames from</p> <p>19 the video; is that what -- is that right?</p> <p>20 A. That's one way to do it.</p> <p>21 Q. Okay. And then what would you do with</p> <p>22 those key frames?</p> <p style="text-align: right;">Page 39</p>	<p>1 query by image search system?</p> <p>2 A. There may have been.</p> <p>3 Q. Can you think of any now?</p> <p>4 A. No.</p> <p>5 Q. When you searched for -- or when you</p> <p>6 searched a video using this system, what would</p> <p>7 the -- or what would the system return?</p> <p>8 A. I don't remember if we returned the</p> <p>9 stills or a small -- small video clip.</p> <p>10 Q. Say it returned the stills, could you use</p> <p>11 those stills to point you to a video?</p> <p>12 A. Yeah.</p> <p>13 Q. And how would you do that?</p> <p>14 A. Well, the -- each -- each key frame</p> <p>15 typically represents a frame in the video. So</p> <p>16 there's a -- the key frame is -- is one frame of</p> <p>17 the video so you just seek to that point.</p> <p>18 Q. So if I'm understanding this right, you</p> <p>19 could take a query video, the system would extract</p> <p>20 frames, which would then extract features from it,</p> <p>21 and then the system would return either shot clips</p> <p>22 or key frames; is that right?</p> <p style="text-align: right;">Page 41</p>

		<p>1 similarity queries on image data -- on image                  2 datasets.                  3 Q. Did the image extender incorporate QBIC                  4 technology?                  5 A. I believe it did.                  6 Q. Did the image extender allow a user of                  7 the Db2 universal database to search images by                  8 their content?                  9 A. I believe it did.</p> <p>Flickner Depo at 131-132                  14 Q. An action that the QBIC system would                  15 automatically take based on the results it would                  16 return.                  17 A. So you're saying as you return results,                  18 you do some post-filtering on the image or the --                  19 what -- what kind of --                  20 Q. Perhaps not -- not post-filtering.                  21 But, for example, displaying a hyperlink                  22 along with the results for a specific result.</p> <p>1 A. Yeah, you could do that.</p> <p>Flickner 8/29/23 Depo at 33-37</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>4 Q. And the second thing you mentioned was you</p> <p>5 were responsible for the architecture interface for</p> <p>6 running analytics. What did that detail?</p> <p>7 A. You wanted -- you're writing programs to</p> <p>8 determine similarity. And to do that you would take</p> <p>9 the image and you'd transform -- you'd extract</p> <p>10 features from the image, then you would put the</p> <p>11 features in the database and you'd query the</p> <p>12 database for the features.</p> <p>13 Q. And when you say you are determining</p> <p>14 similarity, you mean similarity between features</p> <p>15 from one image to another image; is that right?</p> <p>16 A. Correct.</p> <p>17 Q. Okay. And what features were you looking</p> <p>18 at?</p> <p>19 A. We had features in color, in texture, in</p> <p>20 shape. A few other categories.</p> <p>21 Q. Sketch?</p> <p>22 A. Yep.</p> <p>23 Q. What's sketch?</p> <p>24 A. You could draw a sketch -- a rough sketch</p> <p>25 of an image and query. And so you could draw a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 34</p> <p>1 circle for a sun, a line and maybe some trees and                  2 then you could send that sketch in and you'd get                  3 images of a sun in the trees.                  4 Q. And if I refer to images, can I -- let                  5 me -- let me back up.                  6 Earlier you talked about both still images                  7 and video were part of your responsibilities for                  8 these architecture interfaces; correct?                  9 A. Correct.                  10 Q. Okay. If I refer to "images," do you                  11 understand that is including both a still image or,                  12 for example, a frame of a video image?                  13 A. Sure.                  14 Q. Okay. So when I say "image," I'm                  15 including both in my questions from now on out.                  16 A. Okay.                  17 Q. Okay?                  18 A. Okay.                  19 Q. In terms of running analytics, that would                  20 include both extracting these characteristics from a                  21 query image and from an image that you're storing in                  22 a database; correct?                  23 A. Can you rephrase.                  24 Q. Yes. So the comparison that you're doing                  25 between two images; right, is it correct that that</p>	<p style="text-align: right;">Page 36</p> <p>1 clean answer.                  2 When you refer to features, does it                  3 include at least color, texture, shape and sketch?                  4 A. Or a subset thereof.                  5 (Reporter seeks clarification.)                  6 A. Or a subset thereof.                  7 So you could do just color queries, you                  8 could do just shape queries, you could do just --                  9 you didn't need to have all the feature sets in                  10 all -- in every query.                  11 Q. Understood. But would a user have the                  12 option to query at least those four features?                  13 A. Yes.                  14 Q. Okay.                  15 A. For their QBIC system, that's true.                  16 Q. And then I believe the last area you                  17 indicated you were responsible for was architecture                  18 interface for saving images; is that right?                  19 A. Correct.                  20 Q. And what did that entail?                  21 A. It's both saving images and saving                  22 features. That was to define the API, so you would                  23 give it a feature, and it would write the feature in                  24 a database or into a file.                  25 Q. Would that also include saving any</p>
		<p style="text-align: right;">Page 35</p> <p>1 comparison is for purposes of a query? You're                  2 querying image 1 to determine if there are images in                  3 the database that have similar features; is that                  4 right?                  5 A. Correct.                  6 Q. Okay. And the analytics that you're                  7 talking about, where you extract these characters                  8 from the image, that is -- those run on both the                  9 query image and the images that are stored in the                  10 database; is that right?                  11 A. Yeah. We call them features.                  12 Q. Features. Okay.                  13 So when you say "features," you're talking                  14 about the features that we talked about before:                  15 Color, texture, shape, sketch?                  16 A. For example.                  17 Q. Any other ones you can think of?                  18 A. Nothing comes to mind.                  19 Q. But when you refer to features they at                  20 least include those four; is that correct?                  21 A. Yes. Well, at least includes, yeah.                  22 Q. Is that correct? I'm sorry, I didn't --                  23 you trailed off, so I -- that's why I reasked it.                  24 A. Yeah.                  25 Q. Let me reask it and then you can give me a</p>	<p style="text-align: right;">Page 37</p> <p>1 information associated with the images, for example                  2 like any text description about the image?                  3 A. Yeah. Text is just another feature here.                  4 Q. Text is another feature?                  5 A. Yeah.                  6 Q. I understand when the images were saved,                  7 thumbnails were saved of those images; is that                  8 correct?                  9 A. Typically, yeah.                  10 Q. And was that a part of your                  11 responsibilities, to architect the interface for                  12 saving images?                  13 A. Saving . . . hmm. Can you rephrase.                  14 Q. What's -- what was confusing about my                  15 question?                  16 A. I just need you to repeat it.                  17 Q. Oh. One of the areas you mentioned that                  18 you were responsible for was to architect the                  19 interface for saving images.                  20 My question is, as part of that                  21 responsibility, did that include architecting the                  22 features related to saving thumbnails associated                  23 with those images?                  24 A. The thumbnail is an extracted feature.                  25 Q. Okay. So is that a "yes"?</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 52–53</p> <p>12 Q. Underneath there's a sentence that says,                      13 "There are three logical steps in a QBIC                      14 application: Database population, feature                      15 calculation, and image query."                      16 Do you see that?                      17 A. Yeah.                      18 Q. You agree with that?                      19 A. Yeah.                      20 Q. All right. Well, let's talk about the                      21 first step, database population.                      22 What is database population?                      23 A. It's taking a set of images, extracting                      24 the features and putting them in a database.                      25 Q. Okay. Is part of the database population</p> <hr/> <p style="text-align: right;">Page 53</p> <p>1 step to create or prepare a thumbnail and store that                      2 in the database as well?                      3 A. Could be.                      4 Q. So if you look at -- under 2.1 Database                      5 Population, it says, "The first step in population                      6 is to simply load the images into the system."                      7 Is that right?                      8 A. Yep.                      9 Q. And the next sentence says then you can                      10 also add the image to the database, preparing a                      11 reduced thumbnail and adding any available text                      12 information to the database.                      13 A. Yep.                      14 Q. Is that correct?                      15 A. Yep.</p>

		<p><i>Id.</i> at 77–78</p> <p>22 Q. Mr. Flickner, we're back from a break.</p> <p>23 Next thing I want to talk about is the next step in</p> <p>24 the process that we talked about earlier in your</p> <p>25 deposition, which is feature calculation.</p> <p>1 A. Okay.</p> <p>2 Q. And feature calculation is where you break</p> <p>3 down the image individual features?</p> <p>4 A. Features. Not necessarily just visual</p> <p>5 features.</p> <p>6 Q. Things like color and shape and texture,</p> <p>7 though, would be visual features; correct?</p> <p>8 A. Yes. Yes.</p> <p>9 Q. And this step of feature calculation can</p> <p>10 be done on both a query image and images that are</p> <p>11 used to populate the database?</p> <p>12 A. Needs to be done on both.</p> <p><i>Id.</i> at 85–99</p> <p>20 Q. So for each of color, texture, shape,</p> <p>21 sketch, there are algorithms that are performing</p> <p>22 some mathematical computation to calculate those</p> <p>23 features; is that right?</p> <p>24 A. Yes.</p> <p>25 Q. Okay. So let's talk about the color</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 86</p> <p>1 section. As I understand it, there are two                  2 different color computations that are done. One is                  3 average color, the other is color histogram; is that                  4 right?                  5 A. There certainly are those two.                  6 Q. Say again.                  7 A. There certainly are those two.                  8 Q. Okay. And for average color, let's talk                  9 about that first, it says [as read], "We compute the                  10 average," and it lists four things, "(R, G, B), (Y,                  11 i, q), (L, a, b), and MTM coordinates of each object                  12 and image."                  13 You see that?                  14 A. Yep.                  15 Q. So does that mean that it does -- every                  16 time it -- if it computes average color, it computes                  17 all four of those things? Or are those optional,                  18 meaning that it can compute one as opposed -- or                  19 some combination of those four?                  20 A. Some combination of those four.                  21 Q. Okay. Are there different algorithms for                  22 each of those four or is it the same algorithm?                  23 A. RGB, Yiq and LAB are all linear                  24 transformations.                  25 Q. Okay.</p>	<p style="text-align: right;">Page 88</p> <p>1 Q. Do you know if those methodologies changed                  2 over time going forward from 1993?                  3 A. Most likely they did.                  4 Q. Do you recall any details for how they may                  5 have changed?                  6 A. No.                  7 Q. Do you know if functionality was added to                  8 compute average color?                  9 A. No.                  10 Q. Do you -- do you recall any other                  11 algorithms or methodologies that were used besides                  12 the four that are listed here?                  13 A. No.                  14 Q. Okay. Second methodology to compute color                  15 is referred to as color histogram here; is that                  16 correct?                  17 A. Yes.                  18 Q. And so at a high level can you explain to                  19 me what a color histogram is?                  20 A. A histogram is a count of each value. And                  21 so, for example, if you have 1, 2, 3 as a value and                  22 you say 1, 2, 3 again, the histogram would say 2                  23 because there are two 1s, two 2s, and two 3s. So                  24 it's a count of the number of values across the                  25 image.</p>
		<p style="text-align: right;">Page 87</p> <p>1 A. I don't remember MTM off the top of my                  2 head.                  3 Q. That's something different from a linear                  4 transformation?                  5 A. It might be a different linear                  6 transformation. I don't recall.                  7 Q. Okay. So for average color, the                  8 algorithms will compute that based on some                  9 combination of those four methodologies?                  10 A. Yes.                  11 Q. Okay. Do you know if those methodologies                  12 evolved over time? So this -- so, for example, this                  13 argu- -- excuse me -- article was written in 1993.                  14 Do you know if the way in which QBIC computed                  15 average color changed over time or did it stay the                  16 same?                  17 MR. STRAUSSMAN: Objection; compound.                  18 MR. EDWARDS: Let me rephrase.                  19 THE WITNESS: I don't recall.                  20 MR. EDWARDS: Let me rephrase.                  21 BY MR. EDWARDS:                  22 Q. So this article was written in 1993, and                  23 it lists four methodologies for computing average                  24 color features.                  25 A. Um-hum.</p>	<p style="text-align: right;">Page 89</p> <p>1 Q. And what do the values 1, 2, 3 represent?                  2 A. Pixels, color.                  3 Q. So is it measuring the probability                  4 density --                  5 A. It's a --                  6 Q. -- of a color being in an image?                  7 A. It's a PDF estimator.                  8 Q. And what does PDF stand for?                  9 A. Probability density function.                  10 Q. Okay. Once the color histogram is                  11 computed, is it normalized after that?                  12 A. Yes, it was normalized.                  13 Q. And why did you normalize the color                  14 histogram?                  15 A. Because different images would have                  16 different color balances.                  17 (Reporter seeks clarification.)                  18 A. Balances, yeah.                  19 Q. Is a -- is a reason why you normalize the                  20 color histogram in -- for stored images -- well,                  21 strike that.                  22 Did you -- did you normalize color                  23 histograms when you extract -- strike that.                  24 When you calculated the color histogram                  25 features from a query image and a stored image, is</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 90</p> <p>1 one reason why you normalize it so you're comparing                  2 apples to apples?                  3 A. Yes.                  4 Q. And then going back to average color, just                  5 for the record, what does RGB stand for?                  6 A. Red, green, blue.                  7 Q. And Yiq?                  8 A. Luminance and chrominance. Y is --                  9 (Reporter seeks clarification.)                  10 A. The Y is luminance and the IQ is                  11 chrominance.                  12 Q. And LAB?                  13 A. I think LAB -- the L is luminance. AB are                  14 different chrominance transformations.                  15 Q. And AB, you say chrominance?                  16 A. Chrominance.                  17 Q. C-h-r-o-m-a-n-c-e [sic]?                  18 A. Sounds about right.                  19 Q. Okay. And then the MTM, mathematical                  20 transform to Munsell, is that what that stands for?                  21 A. Yeah. That was a particular color space                  22 that was visually appealing.                  23 Q. Okay. And then for -- so, for example,                  24 for RGB, that's red, green, blue; correct?                  25 A. Correct.</p>	<p style="text-align: right;">Page 92</p> <p>1 you're done.                  2 (Witness reviews document.)                  3 A. Okay.                  4 Q. So for texture, it looks like the                  5 calculations were based on coarseness, contrast and                  6 directionality; is that right?                  7 A. Correct.                  8 Q. Are those three different algorithms that                  9 are used to calculate those, or is it the same                  10 algorithm?                  11 A. It's three different algorithms.                  12 Q. And I think earlier you mentioned that                  13 gray scaling was used in the texture calculation.                  14 For which of those three features is the image                  15 converted to gray scale?                  16 A. Probably all three.                  17 Q. Okay. So coarseness is a measure of the                  18 scale of the textures, such as pebbles versus                  19 boulders?                  20 A. Correct.                  21 Q. Contrast is the vividness of a pattern?                  22 A. Correct.                  23 Q. And then this says that contrast is a                  24 function of the variance of the gray-level                  25 histogram; is that right?</p>
		<p style="text-align: right;">Page 91</p> <p>1 Q. Those are different color features that                  2 are -- that are decomposed or broken down from the                  3 image?                  4 A. Yeah, the value of each pixel.                  5 Q. Okay. And then going back to the color                  6 histogram, so the color histogram's calculated, it's                  7 normalized. After it's normalized, is there                  8 anything else done to it?                  9 A. Sounds like they're computing MTM                  10 coordinates of each cell and then clustering. This                  11 is to help quantize the color space.                  12 Q. Okay. And that would be -- you would do                  13 that both for a query image and a stored image?                  14 A. Yes.                  15 Q. Are there any details about color                  16 histogramming that you recall that are not disclosed                  17 in this paragraph?                  18 A. Not that I recall.                  19 Q. Do you recall if the methodology changed                  20 over time?                  21 A. Most likely it did, but I don't recall                  22 specifics.                  23 Q. Okay. Okay. Let's go on to texture, and                  24 that's at the bottom of 2392 and goes to the top of                  25 2393. Take a look at that and then let me know when</p>	<p style="text-align: right;">Page 93</p> <p>1 A. Correct.                  2 Q. So at least for contrast that's converted                  3 to a gray scale histogram; correct?                  4 A. Correct.                  5 Q. And directionality describes whether or                  6 not the image has a direction, like grass; is that                  7 right?                  8 A. Correct.                  9 (Reporter seeks clarification.)                  10 Q. Do you recall any other details about the                  11 texture feature calculation that is not disclosed in                  12 this paragraph?                  13 A. No.                  14 Q. Do you recall if the texture feature                  15 calculation changed over time after this article?                  16 A. Most likely it did.                  17 Q. Do you recall any specifics?                  18 A. No.                  19 Q. All right. Let's go on to shape. Take a                  20 look at that paragraph and then let me know when                  21 you're done. It's on 2393.                  22 (Witness reviews document.)                  23 Q. And while you're looking at that,                  24 Mr. Flickner, for any of these four features that                  25 we're talking about, did you -- did your work on the</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 94</p> <p>1 QBIC project -- were you more involved in one or                  2 more of these features than the other?                  3 A. Yes.                  4 Q. Which one?                  5 A. Shape.                  6 Q. Okay.                  7 (Witness reviews document.)                  8 A. So one thing I can state is originally I                  9 couldn't remember the name of the edge operator --                  10 and the name is Canny, the Canny edge operator --                  11 when we were talking about finding edges.                  12 Q. Okay. So this -- the paragraph on                  13 IBM 2393 refreshed your memory that shape                  14 calculation used Canny edge detection?                  15 A. No, that's sketch.                  16 Q. Oh, I'm sorry.                  17 A. I'm just stating that originally I was                  18 asked a question about standard edge operators. I                  19 couldn't remember the name. The name was Canny.                  20 Q. Canny. And Canny is used in the sketch                  21 calculation?                  22 A. Yeah, it's used in the sketch calculation.                  23 Q. Understood. Okay. Let's go back to                  24 shape.                  25 And for shape, is it a first step -- well,</p>	<p style="text-align: right;">Page 96</p> <p>1 of the object, of the blob.                  2 Q. Can you say the name of the word again?                  3 A. I think it's called perround.                  4 Q. Per round?                  5 A. Yeah.                  6 Q. Those -- are those two words, p-e-r,                  7 r-o-u-n-d?                  8 A. P-e-r -- one word.                  9 Q. Okay. Perround, one word.                  10 A. It's basically the perimeter squared over                  11 area.                  12 (Reporter seeks clarification.)                  13 A. Perimeter squared over area.                  14 (Reporter seeks clarification.)                  15 A. Length of the -- over area.                  16 Q. Okay. So let's step back a little bit.                  17 So it says -- the second paragraph says [as read],                  18 "Our shape features are based on a combination of                  19 heuristic" -- h-e-u-r-i-s-t-i-c -- "shape features                  20 area, circularity, eccentricity, major access                  21 orientation and a set of algebraic moment                  22 invariants," i-n-v-a-r-i-a-n-t-s.                  23 Did I read that correctly?                  24 A. Um-hum.                  25 Q. Okay. For circularity, that is computed</p>
		<p style="text-align: right;">Page 95</p> <p>1 back up, strike that.                  2 To calculate the shape feature in a query                  3 image or a stored database image, is the first step                  4 to convert that image into a binary image?                  5 A. I don't think so.                  6 Q. So if you look at the second paragraph --                  7 and the reason why I ask is -- it's the second                  8 sentence in the second paragraph under "Shape                  9 features." It says [as read], "All shapes are                  10 assumed to be non-occluded planar shapes allowing                  11 for each shape to be represented as a binary image."                  12 See that?                  13 A. Yeah.                  14 Q. And then the next sentence says [as read],                  15 "The area is computed as the number of pixels set in                  16 the binary image."                  17 A. Right.                  18 Q. So that's why I ask is it the first step                  19 in calculating shape to convert the image to binary?                  20 A. Yes.                  21 Q. And then once you convert it to binary                  22 image, then what do you do next in order to                  23 calculate the shape?                  24 A. You're computing something called                  25 perround, which is perimeter squared over the area,</p>	<p style="text-align: right;">Page 97</p> <p>1 as perimeter squared over area; correct?                  2 A. Right.                  3 Q. All right. Area is the number of pixels                  4 in the binary image?                  5 A. In the binary blob.                  6 Q. In the binary what?                  7 A. Blob.                  8 Q. Blob. And when you say "blob," what does                  9 that refer to?                  10 A. The outline of the object that you're                  11 doing a shape query on.                  12 Q. And so are each of these, area,                  13 circularity, eccentricity, major axis orientation                  14 and algebraic moment invariants, are those each                  15 different algorithms or is it all the same                  16 algorithm?                  17 A. It's different algorithms.                  18 Q. Okay. And since you worked on the shape                  19 feature the most, do you recall any other details                  20 that are not disclosed in this paragraph?                  21 A. Well, this evolved and we ended up doing                  22 an implementation of something that's not in here.                  23 Q. Okay. And what was that implementation?                  24 A. Something called turning angle per round,                  25 turning angle, which is -- it looks at the tangent</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 98</p> <p>1 angle as you go through the edge of the shape. So</p> <p>2 you're computing the turning angle. You're</p> <p>3 computing this angle that represents a shape in a</p> <p>4 very interesting way.</p> <p>5 They don't seem to be very good for</p> <p>6 human -- so if you asked a human whether these two</p> <p>7 shapes are similar, they would say "yes," but under</p> <p>8 that feature set.</p> <p>9 Q. And you call that something per round?</p> <p>10 What was the name of it? Started with a T.</p> <p>11 Turrent?</p> <p>12 A. Turning angle.</p> <p>13 Q. Oh, turning angle.</p> <p>14 A. Yeah.</p> <p>15 Q. Well, it said -- your answer -- you did</p> <p>16 say turning angle, but you said something called</p> <p>17 something per round, and it started with a T. I</p> <p>18 thought you said turrent, but maybe I misunderstood.</p> <p>19 MR. STRAUSSMAN: Tangent?</p> <p>20 THE WITNESS: Tangent angle, yeah.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Okay. So something called tangent per</p> <p>23 round, is that what you would call it, this --</p> <p>24 A. No.</p> <p>25 Q. -- this implementation?</p>	
		<p style="text-align: right;">Page 99</p> <p>1 A. It's called turning angle.</p> <p>2 Q. Okay. So the name of the new</p> <p>3 implementation you're talking about for shape</p> <p>4 calculation is called turning angle?</p> <p>5 A. It used turning angle as a major feature.</p> <p>6 Q. Okay. Was there any other name it went</p> <p>7 by?</p> <p>8 A. I don't recall.</p> <p>9 Q. All right. And that was -- that</p> <p>10 methodology was implemented to calculate shape on a</p> <p>11 query image and an image stored in the database post</p> <p>12 this article?</p> <p>13 A. Yes.</p> <p>14 Q. Was that the -- did that -- did that</p> <p>15 implementation, the turning angle, did that replace</p> <p>16 the methodology in this article or was it</p> <p>17 supplementing the metho- --</p> <p>18 A. Supplementing.</p> <p>19 Q. Okay. Other than turning angle, were</p> <p>20 there any other methodologies used after this</p> <p>21 article?</p> <p>22 A. Not that I recall.</p> <p>23 Q. Okay. Okay. Let's go sketch features, if</p> <p>24 you take a look at that and then let me know when</p> <p>25 you're done reading it.</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference				
		<p><i>Id.</i> at 119–128</p> <table border="0"> <tr> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p> </td> <td style="vertical-align: top; width: 50%;"> <p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p> </td> </tr> <tr> <td style="vertical-align: top;"> <p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p> </td> <td style="vertical-align: top;"> <p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p> </td> </tr> </table>	<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>	<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR. HANSEN: Objection; lacks foundation.</p> <p>21 THE WITNESS: We had -- the sketch tools would</p> <p>22 let you select a region and paint a color. And then</p> <p>23 you'd paint a crude map and then you would go search</p> <p>24 for color images that have the blue sky and the</p> <p>25 white sand. That's a different query than if you</p>
<p style="text-align: right;">Page 118</p> <p>1 Do you see that?</p> <p>2 A. Yeah.</p> <p>3 Q. And then it describes different icons: I,</p> <p>4 C, L, T and S.</p> <p>5 Do you see that?</p> <p>6 A. Um-hum.</p> <p>7 Q. Are those icons similar to the QBIC demo</p> <p>8 that you hosted on the IBM's website?</p> <p>9 A. I don't recall the specific details. Most</p> <p>10 likely, yes.</p> <p>11 Q. Okay. So it says, "Click I to view the</p> <p>12 full image."</p> <p>13 Do you see that?</p> <p>14 A. Um-hum.</p> <p>15 Q. Was there a similar capability on the demo</p> <p>16 that was hosted on IBM's website?</p> <p>17 A. I don't recall.</p> <p>18 Q. So do you know what happens if you clicked</p> <p>19 I?</p> <p>20 A. Yeah, you -- pops the window up and you</p> <p>21 see the full image.</p> <p>22 Q. Okay.</p> <p>23 (Reporter seeks clarification.)</p> <p>24 A. It pops the window up.</p> <p>25 Q. And how do you know that?</p>	<p style="text-align: right;">Page 120</p> <p>1 sand.</p> <p>2 Q. Does that correspond to the four features</p> <p>3 we looked at earlier, so for -- well, strike that.</p> <p>4 For color earlier we looked at two</p> <p>5 different flavors. We looked at average color and</p> <p>6 we looked at color histogram. So you said --</p> <p>7 A. Right.</p> <p>8 Q. -- C was color histogram.</p> <p>9 Does L correspond to average color or</p> <p>10 something different?</p> <p>11 A. Well, L has space embedded into it. So</p> <p>12 where the color appears in the image matters.</p> <p>13 Q. Okay.</p> <p>14 A. So C would be the whole image, what was</p> <p>15 the color percentage, and L would be I want a</p> <p>16 certain percentage in this region and a certain</p> <p>17 percentage in this region.</p> <p>18 Q. Okay. So what -- if you recall, so to</p> <p>19 calculate a color layout feature, do you recall the</p> <p>20 details of how that was done?</p> <p>21 MR. HANSEN: Objection; foundation.</p> <p>22 THE WITNESS: I don't recall.</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Do you recall if that used -- for the</p> <p>25 color component, do you recall if that used</p>					
<p style="text-align: right;">Page 119</p> <p>1 A. That's how we want to implement such</p> <p>2 a . . .</p> <p>3 MR. STRAUSSMAN: You got to speak up.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. That's how you implemented what?</p> <p>6 A. You implement what the instructions say.</p> <p>7 Q. Okay. Is that a similar implementation</p> <p>8 for the other demos that you worked on?</p> <p>9 A. Most likely, yes.</p> <p>10 Q. Okay. So you click on I and then I would</p> <p>11 take you to a link that showed the full image?</p> <p>12 A. Um-hum.</p> <p>13 Q. Okay. And it says, "Click C to search</p> <p>14 images with similar color percentage."</p> <p>15 Do you see that?</p> <p>16 A. Yep.</p> <p>17 Q. Is that the color histogram?</p> <p>18 A. Most likely.</p> <p>19 Q. Okay. And it says, "Click L to search</p> <p>20 images with similar color layout."</p> <p>21 What does "color layout" mean?</p> <p>22 A. So now you're asking for color in</p> <p>23 different positions of the image.</p> <p>24 Q. Okay.</p> <p>25 A. So you might want a blue sky with white</p>	<p style="text-align: right;">Page 121</p> <p>1 something akin to average color?</p> <p>2 A. Average color or histogram --</p> <p>3 (Reporter seeks clarification.)</p> <p>4 MR. HANSEN: Objection; foundation.</p> <p>5 THE WITNESS: Average color or histogram color.</p> <p>6 So histogram as a space a position in the image.</p> <p>7 BY MR. EDWARDS:</p> <p>8 Q. Right. And color layout, is that</p> <p>9 something that you recall being developed by the</p> <p>10 QBIC team as a feature that can be extracted?</p> <p>11 A. Right.</p> <p>12 Q. Okay. And so it is color in a specific</p> <p>13 position?</p> <p>14 A. Yes.</p> <p>15 Q. Do you recall any of the algorithms that</p> <p>16 were used to calculate that?</p> <p>17 A. I think we were using color histogram.</p> <p>18 Q. Color histogram. Okay. And then how</p> <p>19 would you calculate the position aspect of it?</p> <p>20 MR.  Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 122</p> <p>1 had white on top and blue on the bottom. Then                  2 you're looking for blue water, white sand.                  3 BY MR. EDWARDS:                  4 Q. Do you recall what the methodologies                  5 used -- that were used to calculate the orientation                  6 of those colors in the image?                  7 MR. HANSEN: Objection; lacks foundation.                  8 THE WITNESS: There's no orientation per se.                  9 It's just position.                  10 BY MR. EDWARDS:                  11 Q. Well, then position. Do you recall what                  12 the methodologies are to calculate the position?                  13 MR. HANSEN: Same objection.                  14 THE WITNESS: Position is something the user                  15 inputs.                  16 BY MR. EDWARDS:                  17 Q. Something you use what?                  18 A. The user had to input.                  19 Q. Okay. And then let's move on to the next                  20 one, T. It says, "Click T to search images with                  21 similar global texture."                  22 A. Yeah.                  23 Q. Do you recall, in your work on the QBIC                  24 project, a feature called global texture that could                  25 be extracted from the image?</p>	<p style="text-align: right;">Page 124</p> <p>1 Q. Okay. And how do you spell Gabor?                  2 A. G-a-b-o-r.                  3 Q. So switch over and look at the second page                  4 of this Exhibit 6.                  5 So -- well, first back -- go back to -- go                  6 back to the first page. If you see on the left-hand                  7 side it says, "Goto: IBM Image Search Demo," and a                  8 little finger there is clicking it.                  9 You see it's in red?                  10 A. Yeah.                  11 Q. Okay. So that's clicking on that link.                  12 And then the second page is going to the IBM image                  13 search demo.                  14 A. Okay.                  15 Q. Okay? On the second page it is showing                  16 thumbnails with the different icons that we just                  17 walked through, I, C, L, T, S, on each of those                  18 icons.                  19 Do you see that?                  20 A. Yep.                  21 Q. Do you recognize this as a similar layout                  22 to the QBIC demos you hosted in the '90s?                  23 A. I don't.                  24 Q. You don't?                  25 A. No.</p>
		<p style="text-align: right;">Page 123</p> <p>1 A. A feature called . . .                  2 Q. Say again?                  3 A. I missed one of your words. A feature                  4 called what?                  5 Q. I said do you recall in your work on the                  6 QBIC project a feature called global texture that                  7 was extracted from the image?                  8 A. Yes.                  9 Q. Okay. Is that -- is that akin to texture                  10 that we looked at earlier?                  11 A. Yes.                  12 Q. Okay. And the last one is S. It's,                  13 "Search images with special multipass filter."                  14 Do you recall, in your work on the QBIC                  15 project, being able to calculate a feature called                  16 multipass filter?                  17 A. Probably Gabor functions.                  18 Q. Say again?                  19 A. Gabor functions.                  20 Q. One more time and louder.                  21 A. Gabor functions.                  22 Q. Gabor functions. Okay. What are Gabor                  23 functions?                  24 A. Gabor functions are a way of producing                  25 multiple resolution closed contours.</p>	<p style="text-align: right;">Page 125</p> <p>1 Q. This was not -- so the link to the IBM                  2 website that was the AIX operating system in                  3 Exhibit 3, that did not have a similar thumbnail                  4 layout like this?                  5 A. A thumbnail, yes. I don't recall it had                  6 the buttons, the I, C, L, T, S.                  7 Q. You don't recall it had all the buttons or                  8 some of the buttons?                  9 A. All the buttons.                  10 Q. Okay. So you don't recall that it had any                  11 buttons?                  12 A. I don't -- yeah. I don't recall.                  13 Q. It could have, it couldn't have, you just                  14 don't remember?                  15 A. I just don't remember, yeah.                  16 Q. Okay. But the one that you hosted on                  17 IBM's website, it did have thumbnails in a similar                  18 format here?                  19 A. Yeah, it had thumbnails.                  20 Q. And these thumbnails represent the images                  21 that are stored in the database?                  22 A. Yes.                  23 Q. Okay. Here, the 470 images would be                  24 reflected at least -- one, two, three, four, five,                  25 six, seven -- eight of them right here in this</p>

		<table border="1"> <tr> <td data-bbox="932 261 1297 792"> <p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p> </td> <td data-bbox="1297 261 1663 792"> <p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p> </td> </tr> <tr> <td data-bbox="932 792 1297 1323"> <p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p> </td> <td data-bbox="1297 792 1663 1323"> <p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p> </td> </tr> </table>	<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>	<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>
<p style="text-align: right;">Page 126</p> <p>1 screenshot?</p> <p>2 A. Right.</p> <p>3 Q. Right? And then the one that you hosted</p> <p>4 on the -- on the website that you said those --</p> <p>5 there would be on order of thousands of thumbnails;</p> <p>6 correct?</p> <p>7 A. Tens of thousands.</p> <p>8 Q. Tens of thousands. Okay. Let's put that</p> <p>9 aside.</p> <p>10 MR. EDWARDS: Mark another screenshot as</p> <p>11 Exhibit 7.</p> <p>12 (Deposition Exhibit 7 was marked.)</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. So for Exhibit 7, again, I'll represent to</p> <p>15 you this is another screenshot from the QBIC demo</p> <p>16 produced as IBM 747. And in this screenshot the</p> <p>17 icon C is being clicked on the first page.</p> <p>18 Do you see that?</p> <p>19 A. Yep.</p> <p>20 Q. And that's highlighted in red.</p> <p>21 Do you see that?</p> <p>22 A. Yep.</p> <p>23 Q. Okay. And the second page are the results</p> <p>24 of that color histogram query from the first page.</p> <p>25 A. Correct.</p>	<p style="text-align: right;">Page 128</p> <p>1 shown here?</p> <p>2 A. Yes.</p> <p>3 Q. Okay. So the querying image is the top</p> <p>4 left image; is that right?</p> <p>5 A. I think so, yeah.</p> <p>6 Q. Well, go back to the first page.</p> <p>7 A. It's the match, yeah.</p> <p>8 Q. So you click C on that first image, and</p> <p>9 when you -- when you do that, that image that's</p> <p>10 being queried for color histogram remains in the top</p> <p>11 left box; is that right?</p> <p>12 A. Yeah.</p> <p>13 Q. And then the image that's immediately to</p> <p>14 the right of that, is that the best match out of the</p> <p>15 images in the database?</p> <p>16 A. That would -- yes.</p> <p>17 Q. And then the image immediately to the</p> <p>18 right of that one is the second best match?</p> <p>19 A. Yes.</p> <p>20 Q. And so on and so forth?</p> <p>21 A. Yes.</p> <p>22 Q. And when we say "match" we're talking</p> <p>23 about in terms of the color histogram features?</p> <p>24 A. Yeah.</p> <p>25 Q. Okay. Okay. Last one.</p>					
<p style="text-align: right;">Page 127</p> <p>1 Q. Okay. And so when the user clicks C on</p> <p>2 that image in the top left corner, what happens, in</p> <p>3 the second page?</p> <p>4 A. The database returned the top 10 -- or it</p> <p>5 ordered the images and it returned the top K based</p> <p>6 on the vector distance or the feature distance</p> <p>7 related to what was computed and stored in the</p> <p>8 database and what's recorded. This is an N database</p> <p>9 image. It represents -- it always matches itself</p> <p>10 perfectly.</p> <p>11 Q. Okay. So in the -- in the demo that you</p> <p>12 hosted on IBM's website in the '90s, did it have a</p> <p>13 similar functionality where you could click on the</p> <p>14 thumbnail and it would -- it would return matches?</p> <p>15 A. Yeah.</p> <p>16 Q. And what would you click on on the one on</p> <p>17 the website?</p> <p>18 A. I don't remember exactly how the user</p> <p>19 interface worked.</p> <p>20 Q. But you could have -- you could click</p> <p>21 something akin to color histogram --</p> <p>22 A. Yes.</p> <p>23 Q. -- or texture or things like that?</p> <p>24 A. Yes.</p> <p>25 Q. And would it sort similarly to what's</p>	<p style="text-align: right;">Page 129</p> <p>1 MR. EDWARDS: Last screenshot. I'm going to</p> <p>2 mark it as Exhibit 8.</p> <p>3 (Deposition Exhibit 8 was marked.)</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And, again, Mr. Flickner, I'll represent</p> <p>6 this is a screenshot from the QBIC demo on the CD</p> <p>7 IBM 747 produced by your counsel.</p> <p>8 A. Okay.</p> <p>9 Q. Okay? And if you want to compare, or you</p> <p>10 can take my word for it, the image in the top left</p> <p>11 corner, the querying image, is the same one that was</p> <p>12 on Exhibit 7.</p> <p>13 A. Yes.</p> <p>14 Q. Okay. And here the user's clicking the I</p> <p>15 icon, which stands for "Get Info."</p> <p>16 Do you see that?</p> <p>17 A. Um-hum.</p> <p>18 Q. On the first page?</p> <p>19 A. Yeah.</p> <p>20 Q. And the second page is doing what?</p> <p>21 A. Is presenting the image at full</p> <p>22 resolution.</p> <p>23 Q. Okay. And was there a similar</p> <p>24 functionality on the demo app on the -- on the</p> <p>25 website in the '90s?</p>

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p>14 Q. Okay. Let's put that aside.</p> <p>15 Okay. Now I want to talk about the last</p> <p>16 step in the process that we've talked about -- that</p> <p>17 we -- that we started on at the beginning of your</p> <p>18 deposition. And the last step is database query.</p> <p>19 Okay?</p> <p>20 Generally what is the database query</p> <p>21 process for the QBIC system?</p> <p>22 A. You extract feature vectors and then you</p> <p>23 rank --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. You extract feature vectors and then you</p> <p>1 rank the feature vectors and you give an order, list</p> <p>2 of the top N images that have -- match the small --</p> <p>3 the closest distance.</p> <p>4 Q. You give an order list of the top --</p> <p>5 A. K or N. However many you request. It</p> <p>6 orders the entire database, but it only returns the</p> <p>7 top, the best matches.</p> <p>8 Q. Okay. Just so I understand, the database</p> <p>9 query, you extract feature vectors and then you rank</p> <p>10 the feature vectors and give an ordered list of the</p> <p>11 top results that match based on a distance</p> <p>12 measurement?</p> <p>13 A. So you take the queried image, you extract</p> <p>14 the feature vectors and now you're going to ask the</p> <p>15 database how many images do you have that are close</p> <p>16 in feature space to this query.</p> <p>17 And it'll return the top best -- the best</p> <p>18 hits.</p> <p><i>Id.</i> at 139–165</p>

		<p>5 Q. And for the image that you use as a base                      6 for the query, the things we all talked about in                      7 terms of feature extraction for average color, color                      8 histogram, shape, texture, sketch, all of those                      9 things, the same algorithms would be used in order                      10 to extract those features from the image query?                      11 A. They're different algorithms. You would                      12 use an algorithm.                      13 Q. I'm sorry. Say that again?                      14 A. The algorithms are different between the                      15 shape features and the color features and sketch                      16 features.                      17 Q. Yeah. Understood. What I'm trying --                      18 what I'm trying to understand is, the process that                      19 we talked about before, when you populate the                      20 database and you extract the features from the                      21 images that are stored in the database.                      22 You know, we went through all those                      23 different algorithms that are used for shape, color,                      24 both average color and histogram, texture and                      25 sketch.</p>

		<p>1 A. Um-hum.</p> <p>2 Q. Do you remember that?</p> <p>3 A. Yep.</p> <p>4 Q. Okay. That same process -- that exact</p> <p>5 same process for each of those features is used to</p> <p>6 extract those features from an image query?</p> <p>7 A. Correct.</p> <p>8 Q. Okay. And those similar -- so the</p> <p>9 algorithm, for example, for average color, that</p> <p>10 algorithm that's used to extract features for a</p> <p>11 database image is the same algorithm that's used to</p> <p>12 extract image for an image query?</p> <p>13 A. Yes.</p> <p>14 Q. Same for color histogram; correct? Same</p> <p>15 algorithm's used for both?</p> <p>16 A. It should be, yeah.</p> <p>17 Q. Same for shape and texture as well;</p> <p>18 correct?</p> <p>19 A. Right.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 142</p> <p>1 QBIC system would uncompress it?                  2 A. Yep.                  3 Q. And then it would extract whatever feature                  4 you want from that uncompressed image?                  5 A. Correct.                  6 Q. And then those extracted features from the                  7 uncompressed JPEG image are used in the matching                  8 process?                  9 A. Correct.                  10 Q. Okay. And you were using -- you were                  11 doing this for JPEG image -- or the QBIC system was                  12 doing this for JPEG images in the -- in the '90s?                  13 A. Yes.                  14 Q. Okay. So once the system -- now, we're                  15 only talking about image-based queries, image using                  16 as input for the queries.                  17 Once you submit an image for the query, if                  18 it's a -- you do your preprocessing that need to be                  19 done. Features are extracted. So now we've got                  20 just the extracted features, whatever those are.                  21 What happens with those extracted features                  22 next?                  23 A. They're put in the database and then                  24 potentially there are indexes built that help you do                  25 fast search against those features.</p>	<p style="text-align: right;">Page 144</p> <p>1 that does a comparison for say texture?                  2 A. You say the matching algorithm?                  3 Q. Correct.                  4 A. Yes, they could be different.                  5 Q. Well, let's talk about them. We can get                  6 into detail here.                  7 Well, before we -- before we get there, so                  8 how does the QBIC system display the results of                  9 matches to the user?                  10 A. Typically just thumbnails in a window in                  11 multiple ordered hits.                  12 Q. Okay. And it displays them in the order                  13 by which they're most similar. So the, you know,                  14 best match to the next best match to the next best                  15 match, so on and so forth?                  16 A. Correct.                  17 Q. Okay. And you said the system determines                  18 similarity based on some distance measure between                  19 the extracted features in the image query versus the                  20 stored image?                  21 A. The features of the stored image.                  22 Q. But it's a -- it's some sort of distance                  23 measure?                  24 A. Yes.                  25 Q. Okay. So let's go back to Exhibit 2.</p>
		<p style="text-align: right;">Page 143</p> <p>1 Q. I'm not talking about a stored image, I'm                  2 talking about for a query, so I'm taking an image                  3 and submitting it to a system as a query.                  4 A. Query by example.                  5 Q. Query by example. Okay. Once those                  6 features extracted for that image, what happens next                  7 in the process?                  8 A. You take the feature vector and you                  9 present it to the database and say return the best                  10 matches to this feature vector.                  11 Q. Okay. So the system would compare -- the                  12 QBIC system would compare the features that are                  13 calculated from the input image to stored calculated                  14 features of the images in the database and come up                  15 with a match?                  16 A. Yes.                  17 Q. Okay. And those matches would be sorted                  18 or arranged in order of most similar?                  19 A. Yes.                  20 Q. And would algorithms do these comparisons?                  21 A. Yes.                  22 Q. Would it be a different algorithm for each                  23 of the features? So, for example, would there be an                  24 algorithm that does the comparison for color                  25 histogram and then there's a different algorithm</p>	<p style="text-align: right;">Page 145</p> <p>1 So if you turn to page IBM 2393 and                  2 rolling over to IBM 2395, that's a discussion on the                  3 image query. And so what I want to do -- I have a                  4 couple high-level questions, but then I want to walk                  5 through each one. Color starts on 2394, then                  6 texture and then shape and sketch are on 2395.                  7 So in terms of the -- in terms of the                  8 distance measure, Mr. Flickner, if -- I know you                  9 said that the results are termed based on those that                  10 are most similar but it could come up with something                  11 that's an exact match; is that right?                  12 A. It's possible.                  13 Q. Like the distance measure, the result                  14 would be zero if it was an exact match; right?                  15 A. Typically you'd get that only if you had                  16 the query image the same as a result image.                  17 Q. Right. But that's a possibility?                  18 A. Yeah.                  19 Q. Okay. So let's take a look at color --                  20 it's on -- starting at the top of 2394. You know,                  21 take your time and read that and then I want to ask                  22 you some questions about it.                  23 (Witness reviews document.)                  24 A. Okay.                  25 Q. Okay. So let's first start with average</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 146</p> <p>1 color. Average color determines similarity between</p> <p>2 the query image and the database image using</p> <p>3 weighted Euclidean distance; is that right?</p> <p>4 A. Yep.</p> <p>5 Q. And Euclidean is E-u-c-l-i-d-e-a-n.</p> <p>6 And can you just tell us at a high level</p> <p>7 what -- if you can -- what Euclidean distance is?</p> <p>8 A. So if you have multiple features or</p> <p>9 multiple scaler features, you have to ask the</p> <p>10 question I'm trying to build a distance from that</p> <p>11 vector to a query vector.</p> <p>12 And as you build that -- the distance, you</p> <p>13 have -- you may want to weight different elements of</p> <p>14 the vector differently. And we found out that using</p> <p>15 variance normalization, where weights of the</p> <p>16 variance of the feature, gave good aesthetic</p> <p>17 results.</p> <p>18 (Reporter seeks clarification.)</p> <p>19 A. Aesthetic results.</p> <p>20 Q. And I apologize, I couldn't hear what you</p> <p>21 said. You said, "And we found out that using</p> <p>22 variance" . . .</p> <p>23 A. So you normalize each feature with its</p> <p>24 variance.</p> <p>25 Q. Normalize each feature with . . .</p>	<p style="text-align: right;">Page 148</p> <p>1 (Reporter seeks clarification.)</p> <p>2 Q. Well, let me ask my -- let me get my</p> <p>3 question out first.</p> <p>4 So we talked about the features for</p> <p>5 average color before are RGB, Yiq, LAB and MTM.</p> <p>6 A. Correct.</p> <p>7 Q. And so, for example, for the RGB, you're</p> <p>8 saying that you would take the R and you would</p> <p>9 divide it by the variants of red and green, for</p> <p>10 example --</p> <p>11 A. Just variants of red.</p> <p>12 Q. Okay. And so you could do the same for</p> <p>13 the others, for Yiq or LAB?</p> <p>14 A. Exactly.</p> <p>15 Q. Okay. You do that for both the image</p> <p>16 input query and the stored image; correct?</p> <p>17 A. Correct.</p> <p>18 Q. And then you're calculating the distance</p> <p>19 between them, so determining how similar they are</p> <p>20 based on the distance?</p> <p>21 A. Yeah, or vector distance.</p> <p>22 Q. Understood.</p> <p>23 A. Two vectors of differences --</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Two vectors with a distance calculation on</p>
		<p style="text-align: right;">Page 147</p> <p>1 A. With its variance.</p> <p>2 Q. With its variance.</p> <p>3 A. And then compute the average.</p> <p>4 Q. Okay.</p> <p>5 A. Or, I'm sorry, compute the weighted sum.</p> <p>6 So red divided by the variants of red, plus green</p> <p>7 divided by the variants of green --</p> <p>8 (Reporter seeks clarification.)</p> <p>9 A. Red divided by the variants of red, green</p> <p>10 divided by the variants of green, L divided by the</p> <p>11 variants of L, that's how you combine the various</p> <p>12 features.</p> <p>13 Q. Understand. And L represents what?</p> <p>14 A. Luminance.</p> <p>15 Q. Okay. And this is -- you're talking</p> <p>16 specifically with respect to average color?</p> <p>17 A. Well, the variance normalization is well</p> <p>18 known in terms of multidimensional feature merging.</p> <p>19 Q. But for average color, you wouldn't use</p> <p>20 luminance, right, as a -- as a variant?</p> <p>21 A. Luminance would just -- you wouldn't use</p> <p>22 just luminance. You could use luminance . . .</p> <p>23 Q. Well, so the color features we talked</p> <p>24 about before would be RGB, Yiq, LAB --</p> <p>25 A. Y is luminance.</p>	<p style="text-align: right;">Page 149</p> <p>1 them. So simply just -- in our product.</p> <p>2 Q. You're going to have to repeat that and be</p> <p>3 just a little bit louder, Mr. Flickner. Sorry.</p> <p>4 A. That's all right. Let me get my thoughts</p> <p>5 together.</p> <p>6 So we have multiple dimensional features.</p> <p>7 It's not unusual to take each dimension and</p> <p>8 normalize it by the variance because that gives</p> <p>9 you -- what that does is if you have tight variances</p> <p>10 you divide it by, you get bigger numbers. So you</p> <p>11 have more information close by.</p> <p>12 Q. What was the word you said before "close</p> <p>13 by"?</p> <p>14 A. I don't remember.</p> <p>15 THE REPORTER: Information?</p> <p>16 THE WITNESS: Information close by?</p> <p>17 BY MR. EDWARDS:</p> <p>18 Q. Okay. Okay. So now let's talk about</p> <p>19 color histograms.</p> <p>20 A. Okay.</p> <p>21 Q. Okay? Well, stop. Let's go back to</p> <p>22 average color. So is there -- you described the</p> <p>23 weighted Euclidean distance that's calculated</p> <p>24 between the query image and the database image for</p> <p>25 average color.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 150</p> <p>1 Is there any other detail that you recall                  2 that's not disclosed in the paragraph at IBM 2394?                  3 A. Not that I recall.                  4 Q. Okay. Do you recall whether this distance                  5 methodology changed after this article or it stayed                  6 the same?                  7 A. It changed.                  8 Q. Are you certain or do you know?                  9 A. I'm not certain, but I'm pretty certain.                  10 Q. And how did it change?                  11 A. Different features were shaped like an                  12 inch in color. The algorithm evolved. It wasn't                  13 static.                  14 Q. And how did it evolve?                  15 A. I don't recall all the details.                  16 Q. Do you recall whether it supplemented the                  17 weighted Euclidean distance or replaced it?                  18 A. I don't recall.                  19 Q. Is it fair to say there was always some                  20 distance measurement to determine similarity for                  21 average color in the QBIC system?                  22 A. There's some measurement, yeah.                  23 Q. Okay. Let's talk about color histogram.                  24 So in order to determine the similarity                  25 between a query image and a database image, the QBIC</p>	<p style="text-align: right;">Page 152</p> <p>1 the query image and the database image was                  2 determined by weighted Euclidean distance; is that                  3 right?                  4 MR. HANSEN: Same objection.                  5 THE WITNESS: Correct.                  6 BY MR. EDWARDS:                  7 Q. And how did -- how was that weighted                  8 Euclidean distance determined?                  9 A. It was inverse variance.                  10 (Reporter seeks clarification.)                  11 A. Variance.                  12 Q. And it was inverse variance for components                  13 like coarseness, contrast and directionality?                  14 A. Correct.                  15 Q. Okay. And do you recall if that                  16 methodology changed or stayed the same after this                  17 article for the QBIC system?                  18 A. Most likely it evolved.                  19 Q. Do you know for sure?                  20 A. No.                  21 Q. Do you recall any details?                  22 A. No.                  23 Q. All right. Let's talk about shape next.                  24 The similarity between the query image and                  25 the database image also used weighted Euclidean</p>
		<p style="text-align: right;">Page 151</p> <p>1 system would use an algorithm that determines                  2 distance between normalized histograms?                  3 A. Correct.                  4 Q. Do you recall any details of how that                  5 worked?                  6 A. Not off the top of my head.                  7 Q. Do you recall whether that methodology                  8 evolved for matching color histograms after this                  9 article?                  10 A. Not that I recall.                  11 Q. Okay. All right. Let's talk about                  12 texture next. And I don't know if you've read that,                  13 but that's at the bottom of 2394 and it goes to just                  14 barely at the top of 2395.                  15 (Witness reviews document.)                  16 A. Okay.                  17 Q. So for texture, the similarity is                  18 determined by the distance or the weighted Euclidean                  19 distance between the query object and -- the query                  20 object image and the database object image; is that                  21 right?                  22 MR. HANSEN: Objection; vague and ambiguous.                  23 THE WITNESS: Can you repeat.                  24 BY MR. EDWARDS:                  25 Q. Yeah. For texture, the similarity between</p>	<p style="text-align: right;">Page 153</p> <p>1 distance for shape; correct?                  2 A. Correct.                  3 Q. And do you recall how that worked?                  4 A. There's computing moments. And we used                  5 the shape measure, which I mentioned earlier,                  6 curvature and turning angle.                  7 (Reporter seeks clarification.)                  8 A. Curvature and turning angle.                  9 Q. And the curvature and turning angle would                  10 be compared between the image query and the database                  11 image; correct?                  12 A. Correct.                  13 Q. And do you recall if that methodology                  14 changed after this article came out in '93?                  15 A. Yes, it did.                  16 Q. How so?                  17 A. Well, in the IEEE computer paper, we                  18 described a different way of doing shape measures.                  19 And they included the moment calculations.                  20 Q. And you use the moment calculations to                  21 determine a distance between the image query and                  22 the -- and the database image?                  23 A. Yes.                  24 Q. Sorry?                  25 A. Yeah. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 154</p> <p>1 Q. And what are moment calculations?</p> <p>2 A. Given a binary blob, certain high-level</p> <p>3 moments and then you create -- compute the</p> <p>4 eigenvectors of certain matrices that are created --</p> <p>5 (Reporter seeks clarification.)</p> <p>6 A. Eigenvectors, e-i-g-e -- i-n -- to compute</p> <p>7 the eigenvectors of certain matrices. And that</p> <p>8 would give you translation and rotation and</p> <p>9 variance.</p> <p>10 Q. And so after the Exhibit 3 1995 IEEE</p> <p>11 article, did that methodology change to compute the</p> <p>12 distance for shape?</p> <p>13 A. I don't recall.</p> <p>14 Q. So the methodology for shape that you just</p> <p>15 described using moment calculations, that is</p> <p>16 different from what is described in the 1993 article</p> <p>17 for weighted Euclidean distance?</p> <p>18 A. We still might have used weighted</p> <p>19 Euclidean distance when the underlying features are</p> <p>20 different.</p> <p>21 Q. Understood.</p> <p>22 And the underlying features are different</p> <p>23 in the sense that in the 1995 article you're using</p> <p>24 what features?</p> <p>25 A. I'd have to review the article again.</p>	<p style="text-align: right;">Page 156</p> <p>1 Q. -- it talks about algebraic moment</p> <p>2 invariants.</p> <p>3 (Witness reviews document.)</p> <p>4 A. Is there any other papers that we have</p> <p>5 here?</p> <p>6 Q. Nope.</p> <p>7 A. Everything else is screenshots?</p> <p>8 MR. STRAUSSMAN: I don't think you introduced</p> <p>9 any other papers.</p> <p>10 THE WITNESS: I saw it earlier today.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. Why don't we do it this way. In terms of</p> <p>13 the feature calculations that were -- for shape on</p> <p>14 page IBM 900 of Exhibit 3 versus page --</p> <p>15 A. So if you look at 2393.</p> <p>16 Q. What page are you directing me to?</p> <p>17 A. 2393.</p> <p>18 Q. Okay.</p> <p>19 A. So it talks about the moment invariants as</p> <p>20 well.</p> <p>21 Q. Okay.</p> <p>22 A. These are those matrices that you compute</p> <p>23 eigenvectors of.</p> <p>24 (Reporter seeks clarification.)</p> <p>25 A. Matrices that you compute eigenvectors of.</p>
		<p style="text-align: right;">Page 155</p> <p>1 (Witness reviews document.)</p> <p>2 Q. I think the page you may be looking for is</p> <p>3 IBM 900 on the left side.</p> <p>4 (Witness reviews document.)</p> <p>5 A. What else do we have here?</p> <p>6 Q. So if you'll look at -- if you'll -- if</p> <p>7 you'll compare page IBM 900 from Exhibit 3 to page</p> <p>8 IBM 2393 from Exhibit 2, those are the descriptions</p> <p>9 in both articles about the features that are</p> <p>10 calculated.</p> <p>11 A. I'm trying to remember what --</p> <p>12 MR. STRAUSSMAN: Can you direct him a little</p> <p>13 closer?</p> <p>14 BY MR. EDWARDS:</p> <p>15 Q. Can I show you? Do you mind?</p> <p>16 I believe this is what you're looking for.</p> <p>17 So if you look right here (indicating).</p> <p>18 (Witness reviews document.)</p> <p>19 A. That's the same as this one (indicating).</p> <p>20 We had another -- there's another discussion about</p> <p>21 moments.</p> <p>22 Q. So if you look at -- under "Shape</p> <p>23 features" at 2393, right there, where you're looking</p> <p>24 at --</p> <p>25 A. Yeah.</p>	<p style="text-align: right;">Page 157</p> <p>1 Q. Okay. And this is referring to the moment</p> <p>2 invariants in the 1993 SPIE article?</p> <p>3 A. Correct.</p> <p>4 Q. Right. And then if you go to the IEEE</p> <p>5 article that you primarily co-authored, on page 900,</p> <p>6 it refers to shape queries using area, circularity,</p> <p>7 eccentricity, major-axis direction and features</p> <p>8 derived from the object moments.</p> <p>9 A. Right.</p> <p>10 Q. Is that the same thing as algebraic moment</p> <p>11 invariants?</p> <p>12 A. Right.</p> <p>13 Q. So it looks like the methodologies are the</p> <p>14 same for the features that are extracted between the</p> <p>15 papers; is that right?</p> <p>16 A. I thought one paper had algebraic moments</p> <p>17 and one had turning angle. Maybe they both had</p> <p>18 turning angle.</p> <p>19 (Reporter seeks clarification.)</p> <p>20 A. Turning angle. Algebraic moments.</p> <p>21 Turning angles.</p> <p>22 Q. The 1993 paper refers to algebraic moment</p> <p>23 invariants. The IEEE paper, on IBM 900, refers to</p> <p>24 features derived from object moments.</p> <p>25 Are those the same thing?</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p style="text-align: right;">Page 158</p> <p>1 A. At a high level, yes.</p> <p>2 Q. Okay. And so turning angles, which you've</p> <p>3 previously testified on, do you think that</p> <p>4 calculating shape features based on turning angles</p> <p>5 came after these papers?</p> <p>6 A. No. They're mentioned in these papers.</p> <p>7 Q. Okay. So they're included in these</p> <p>8 papers?</p> <p>9 A. Yes.</p> <p>10 Q. And so any distance measurement using</p> <p>11 weighted Euclidean distance would have taken into</p> <p>12 account turning angles?</p> <p>13 A. As a feature, yeah. Yes.</p> <p>14 Q. For both -- for both papers?</p> <p>15 A. For both papers.</p> <p>16 Q. Okay. Let's talk about sketch, which</p> <p>17 is -- if you'll just stick with 2395, which is</p> <p>18 Exhibit 2.</p> <p>19 MR. STRAUSSMAN: Can you direct him?</p> <p>20 THE WITNESS: I found it.</p> <p>21 MR. STRAUSSMAN: Okay.</p> <p>22 (Witness reviews document.)</p> <p>23 BY MR. EDWARDS:</p> <p>24 Q. Let me know when you're finished reading</p> <p>25 that paragraph on sketch.</p>	<p style="text-align: right;">Page 160</p> <p>1 histogram, as an example, and I get a return, the</p> <p>2 best matches based on order of similarity?</p> <p>3 A. Um-hum.</p> <p>4 Q. Does iterated query refinement mean that I</p> <p>5 can further refine that query to search for things</p> <p>6 like shape, like a -- you know, some shape in the --</p> <p>7 in the query image, like a logo or an icon, and that</p> <p>8 will further refine the results to give me things</p> <p>9 that have that similar shape inside the results of</p> <p>10 the color histogram?</p> <p>11 A. Yes.</p> <p>12 Q. And then I can -- I can keep doing that, I</p> <p>13 can further even refine that result by using a</p> <p>14 keyword, for example?</p> <p>15 A. Yes. Or you could do it all at once.</p> <p>16 Q. Okay. So the results of the query -- so</p> <p>17 we talked about before that the results of the</p> <p>18 queries display thumbnails of the database images</p> <p>19 based on similarity of which they match; correct?</p> <p>20 A. Correct.</p> <p>21 Q. And then those thumbnails can provide</p> <p>22 links to the original image or, if it was an</p> <p>23 r-frame, it could be -- you could provide a link to</p> <p>24 the video; correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 159</p> <p>1 A. Okay.</p> <p>2 Q. For sketch, the similarity between the</p> <p>3 query image and the database image uses an algorithm</p> <p>4 that performs logical binary correlation of the</p> <p>5 binary image?</p> <p>6 A. Yes.</p> <p>7 Q. Are there any other details you recall for</p> <p>8 the sketch comparison beyond what's disclosed in</p> <p>9 this paragraph on IBM 2395?</p> <p>10 A. Not that I recall.</p> <p>11 Q. Do you recall the methodology for</p> <p>12 determining similarity of the input image and the</p> <p>13 database image for sketch changing after this</p> <p>14 article?</p> <p>15 A. Not that I recall.</p> <p>16 Q. So if you go to the next page,</p> <p>17 Mr. Flickner, which is 2396, the Section 4.2 talks</p> <p>18 about performing queries.</p> <p>19 A. Um-hum.</p> <p>20 Q. And in the last sentence it refers to</p> <p>21 something called iterated query refinement.</p> <p>22 A. Yes.</p> <p>23 Q. And what does that refer to?</p> <p>24 A. It's a way you can refine the query.</p> <p>25 Q. So if I submit an image query for color</p>	<p style="text-align: right;">Page 161</p> <p>1 Q. And does the thumbnail also provide links</p> <p>2 to information about the image that was associated</p> <p>3 with the image in the database?</p> <p>4 A. Yes.</p> <p>5 Q. And, again, that can be that -- whatever</p> <p>6 information that the user inputted or was associated</p> <p>7 with the image from the source?</p> <p>8 A. Yes.</p> <p>9 Q. Could the results also display a matching</p> <p>10 score so the user could see how well the particular</p> <p>11 result matched to the -- to the query image?</p> <p>12 A. It could.</p> <p>13 Q. Okay.</p> <p>14 MR. EDWARDS: I'm going to hand you the next</p> <p>15 exhibit, Mr. Flickner.</p> <p>16 (Deposition Exhibit 10 was marked.)</p> <p>17 MR. EDWARDS: Handing you what's been marked as</p> <p>18 Exhibit 10.</p> <p>19 For the record, it's IBM Bates Nos. 002418</p> <p>20 to 2430.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. The title of this article is "Updates to</p> <p>23 the QBIC system."</p> <p>24 Do you see that?</p> <p>25 A. Yes.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 162</p> <p>1 Q. Do you recognize this article?                  2 A. Yes.                  3 Q. You are listed as a co-author of this                  4 article; is that correct?                  5 A. Yes.                  6 Q. And it is a paper that is published in the                  7 SPIE; correct?                  8 A. Correct.                  9 Q. In 1997; correct?                  10 A. Yes. It was 1997 or 1998.                  11 Q. No later than 1998; correct?                  12 A. Correct.                  13 Q. So just want to kind of orient you to the                  14 first page, which is IBM 2419.                  15 A. It's '98 because '97 is a different paper.                  16 Q. Well, if you turn the page, look at the                  17 footer on the right-hand side.                  18 Are you familiar that SPIE usually                  19 includes footers with the volume and the date at the                  20 bottom?                  21 A. Yeah.                  22 Q. And if you look at the footer kind of                  23 towards the right it says -786X-97-\$10 [sic]?                  24 A. Yeah.                  25 Q. What does that indicate to you?</p>	<p style="text-align: right;">Page 164</p> <p>1 Q. And you agree with that statement?                  2 A. Yep.                  3 Q. Okay. So let's -- I'm going to have you                  4 jump around, so I apologize in advance. Let's go to                  5 the -- kind of the back, IBM 2428.                  6 A. Okay.                  7 Q. Is that example of the stamps demo that                  8 was available on IBM's website?                  9 A. Yes.                  10 Q. All right. And if you look at the top in                  11 the location URL it has the almaden.ibm website                  12 address; correct?                  13 A. Correct.                  14 Q. All right. Let's flip forward to 2429.                  15 And is 2429 a screenshot of a trademark                  16 demo that was also available in the Almaden --                  17 excuse me -- almaden.ibm website?                  18 A. Yes.                  19 Q. Okay. And that demo looks like the                  20 trademark query is based on shape; is that right?                  21 A. It uses shape as one similarity feature.                  22 Q. Right. So the trademarks are converted to                  23 a binary image, like we talked before -- talked                  24 about before, and then they're -- the matching                  25 process is done based on those binary images?</p>	
		<p style="text-align: right;">Page 163</p> <p>1 A. Probably the submission was in '97 and the                  2 conference was in '98.                  3 Q. Submission was in '97. So the paper was                  4 published in '97 and then the conference you                  5 presented it at was in 1998?                  6 A. That's possible.                  7 Q. Do you recall presenting this paper at a                  8 conference in 1998?                  9 A. No, I don't.                  10 Q. So the first page refers to the Photonics                  11 West 1999 -- excuse me. Photonics West 1998                  12 Electronic Imaging Conference in San Jose.                  13 Do you recall attending that conference?                  14 A. It's likely I did, but I don't recall.                  15 Q. Okay. But you would agree with me this                  16 paper was made available at least as early as 1998;                  17 correct?                  18 A. Yes.                  19 Q. Okay. So the first page, IBM 2419. Under                  20 "Introduction," at the time of this paper it says,                  21 last line on the first paragraph, "Several online                  22 demos of QBIC are available at                  23 <a href="http://wwwqbic.almaden.ibm.com">http://wwwqbic.almaden.ibm.com</a>."                  24 Do you see that?                  25 A. Yep.</p>	<p style="text-align: right;">Page 165</p> <p>1 A. I think that's correct.                  2 Q. Okay. And here we're showing the query                  3 image is a -- is a heart -- a heart pattern with                  4 Love's next to it. It's in the top part of the                  5 screenshot.                  6 A. Yep.                  7 Q. And the results are shown below that under                  8 "Shapes judged to be most similar"; is that right?                  9 A. Correct.                  10 Q. Okay. And the results also show                  11 underneath each one the trademark number followed by                  12 matching score after the colon.                  13 Do you see that?                  14 A. Yes.                  15 Q. And this is -- is this an example of what                  16 you told me before, that matching scores could be                  17 presented to the user?                  18 A. Yes.                  19 Q. And so is it the lower the score, the                  20 closer the match; is that correct?                  21 A. Typically, yes.                  22 Q. Okay. So 39 would be the -- so the first                  23 image at the top left is a 39, the one next to it is                  24 a 46, so the 39 would be a closer match than the 46;                  25 correct?</p>

		<p><i>Id.</i> at 174–182</p> <table border="0" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 50%; vertical-align: top; border-right: 1px solid black; padding-right: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p> </td> <td style="width: 50%; vertical-align: top; padding-left: 10px;"> <p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p> </td> </tr> </table>	<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. EDWARDS:                  21 Q. Okay. So there's a handle in the -- in                  22 the table --                  23 A. Yeah.                  24 Q. -- that points to a file in the database                  25 that includes all the metadata that could include</p>
<p style="text-align: right; margin-bottom: 0;">Page 174</p> <p>1 "Extender data structures."                  2 Do you see that?                  3 A. Yeah.                  4 Q. And the second line under that says, "The                  5 Image Extender also creates and uses QBIC catalogs                  6 to access images by content."                  7 A. Yes.                  8 Q. Do you see that? Are you familiar with                  9 the image extender?                  10 A. Yes.                  11 Q. What is an image extender?                  12 A. It was an add-on we put to DB2 to give it                  13 the QBIC text search capabilities.                  14 Q. Okay. So let's go to 39. It talks about                  15 "Handles" at the top of page 39.                  16 Do you see that?                  17 A. Yeah.                  18 Q. And it says, "When you store an image,                  19 audio, or video object in a user table, the object                  20 is not actually store in the table. Instead, an                  21 extender creates a character string called a handle                  22 to represent the object, and stores the handle in                  23 the table."                  24 Did I read that correctly?                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 175</p> <p>1 Q. Do you understand what it means when it                  2 refers to "object"?                  3 A. Yes.                  4 Q. What does "object" mean?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: "Object" in this context is an                  7 entity you're going to insert into the database.                  8 BY MR. EDWARDS:                  9 Q. It's an entity you're going to insert in                  10 the database?                  11 A. Yeah.                  12 Q. And what are the possibilities for that                  13 entity?                  14 MR. HANSEN: Objection; lacks foundation, calls                  15 for speculation.                  16 MR. EDWARDS: Counsel, he said he recognized                  17 the document.                  18 MR. HANSEN: You're asking him substance about                  19 what the contents of the document are. He                  20 recognized this document.                  21 MR. EDWARDS: I mean, you're fine to make the                  22 objection, it's just lack -- it's ill-founded.                  23 BY MR. EDWARDS:                  24 Q. Go ahead. So "object" can include what?                  25 A. "Object" includes data that you want to</p>	<p style="text-align: right; margin-bottom: 0;">Page 176</p> <p>1 put in the database.                  2 Q. Data that you want to put in the database.                  3 And what's the scope of the data that you could put                  4 in the database?                  5 MR. HANSEN: Objection; lacks foundation.                  6 THE WITNESS: It's quite wide.                  7 BY MR. EDWARDS:                  8 Q. Does that include an image?                  9 A. Yes. But it says here that the image is                  10 not put in the database. It's put external to the                  11 database and the pointer, the handle, goes to -- the                  12 handle goes to the database and use the extender to                  13 put the object in the file system.                  14 Q. So the image itself is not put into a                  15 database. A handle is put in the database that                  16 points to the image?                  17 A. Correct.                  18 MR. HANSEN: Objection; lacks foundation.                  19 BY MR. EDWARDS:                  20 Q. And if you go down to "QBIC Catalogs."                  21 Do you see that?                  22 A. Yeah.                  23 Q. It says, "A QBIC catalog is a set of files                  24 that hold data about the visual features of images."                  25 A. Yep.</p> <p style="text-align: right; margin-top: 0;">Page 177</p> <p>1 Q. Correct?                  2 A. Correct.                  3 Q. And, "The Image Extender uses this data to                  4 search for images by content."                  5 Is that right?                  6 A. Correct.                  7 MR. HANSEN: Objection; lacks foundation.                  8 BY MR. EDWARDS:                  9 Q. How is the -- how is the catalog different                  10 from the table?                  11 MR. HANSEN: Objection; lacks foundation.                  12 BY MR. EDWARDS:                  13 Q. That we talked about that has the handle                  14 that points to the image?                  15 MR. HANSEN: Same objection.                  16 THE WITNESS: The QBIC catalog is the file in                  17 the file system or in the database system that                  18 contains all the metadata and the handle points to                  19 all the metadata.                  20 BY MR. Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 178</p> <p>1 the image as well?</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: It points to the file that's the</p> <p>4 QBIC catalog.</p> <p>5 BY MR. EDWARDS:</p> <p>6 Q. Can you walk us through that one more</p> <p>7 time? And just be a little bit louder, sorry.</p> <p>8 MR. HANSEN: Same objection.</p> <p>9 THE WITNESS: So the QBIC catalog is a set of</p> <p>10 files that hold data about visual features in the</p> <p>11 image.</p> <p>12 (Reporter seeks clarification.)</p> <p>13 THE WITNESS: Visual features. The image</p> <p>14 extender lets you search against that database,</p> <p>15 against that object.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. The image extender lets you search against</p> <p>18 that catalog, the name of that catalog?</p> <p>19 A. The catalog, yeah.</p> <p>20 Q. Okay. And it does so by using a pointer</p> <p>21 from the handle in the table?</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 THE WITNESS: Correct.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. And then if we turn to the next page on</p>	<p style="text-align: right;">Page 180</p> <p>1 BY MR. EDWARDS:</p> <p>2 Q. So take a look at the bottom of IBM</p> <p>3 page 40 to the top of 41.</p> <p>4 So it says, "When you search for an image</p> <p>5 by content, your query identifies one or more</p> <p>6 features for the search (such as average color), a</p> <p>7 source for each feature (such as an example image),</p> <p>8 and a target set of cataloged images. The Image</p> <p>9 Extender computes the feature value of the source</p> <p>10 and compares it to the cataloged feature values for</p> <p>11 the target images. It then computes a score that</p> <p>12 indicates how similar the feature values of the</p> <p>13 target images are to the source. You can have the</p> <p>14 Image Extender return the images whose features are</p> <p>15 most similar to the source. The Image Extender will</p> <p>16 return the handle of each image and the image</p> <p>17 score."</p> <p>18 Did I read that correctly?</p> <p>19 A. Yes.</p> <p>20 Q. So if you were to use the image extender</p> <p>21 in the DB2 universal database when you search for an</p> <p>22 image by content using a query image, it will</p> <p>23 extract the features for whatever you want, compare</p> <p>24 that to the features of images in a database, return</p> <p>25 your results, which includes the score for the</p>
		<p style="text-align: right;">Page 179</p> <p>1 data structures. It says, "A QBIC catalog can hold</p> <p>2 data for the following image features: Average</p> <p>3 color, Histogram color, Positional color and</p> <p>4 Texture."</p> <p>5 Is that right?</p> <p>6 A. Yep.</p> <p>7 Q. Okay. We spoke about average color,</p> <p>8 histogram color and texture; correct?</p> <p>9 A. Right.</p> <p>10 Q. What is positional color?</p> <p>11 A. We talked about it briefly. It's color in</p> <p>12 particular locations in the image.</p> <p>13 Q. Ah. Understood.</p> <p>14 That is -- that is similar to L in the</p> <p>15 demo that we looked at, which is called color</p> <p>16 layout.</p> <p>17 A. Okay, yes.</p> <p>18 Q. Is that correct?</p> <p>19 A. I don't remember if it's called L. Sounds</p> <p>20 right.</p> <p>21 Q. If you look at --</p> <p>22 MR. EDWARDS: If you can show -- give him</p> <p>23 Exhibit 6.</p> <p>24 THE WITNESS: Oh, this L. Yes.</p> <p>25 MR. EDWARDS: Thank you.</p>	<p style="text-align: right;">Page 181</p> <p>1 match?</p> <p>2 A. Correct.</p> <p>3 MR. HANSEN: Objection; lacks foundation, calls</p> <p>4 for speculation.</p> <p>5 MR. EDWARDS: You can put that enormous exhibit</p> <p>6 aside.</p> <p>7 THE WITNESS: Test 1, 2, 3.</p> <p>8 BY MR. EDWARDS:</p> <p>9 Q. Go back to Exhibit 3, please. If you</p> <p>10 could turn to the page Bates-labeled IBM 894 with</p> <p>11 the architecture picture.</p> <p>12 A. Okay.</p> <p>13 Q. So I just -- I just want to kind of walk</p> <p>14 the -- through this architecture, Mr. Flickner. But</p> <p>15 as a high level, I just want to understand, is</p> <p>16 this -- is this a high-level architecture that would</p> <p>17 generally be used for any implementation of QBIC?</p> <p>18 A. Yes.</p> <p>19 Q. All right. So first step is you submit</p> <p>20 still images or r-frames for feature extraction; is</p> <p>21 that correct?</p> <p>22 A. Correct.</p> <p>23 Q. Okay. Features are extracted, such as</p> <p>24 color, texture, shape, sketch and text; correct?</p> <p>25 A. Location, yep.</p>

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p>1 stored in the database tables using normal table 2 population methods. Image Query is provided in 3 Ultimedia Manager and Client Search Feature. Image 4 Query allows searches by three methods." Excuse me. 5 "One, image content, such as color, shape, 6 texture, or layout; two, data description, such as 7 business data stored in the database (character or 8 numeric) or descriptive text (category); and, three, 9 combinations of image content and data description." 10 Did I read that right? 11 A. Yep. 12 Q. And is that all QBIC functionality? 13 A. Yep. 14 Q. And with respect to image content, if you 15 continue to go on at the bottom of that paragraph 16 and at the top it says [as read], "You can drag and 17 drop visual samples into an image query and select a 18 color from the color wheel or sketch a shape." 19 A. Correct. 20 Q. So the dragging and dropping image samples 21 into an image query, that is a -- an image query 22 search that we talked about before? 23 A. Right. 24 Q. If you go to "Image Formats," are those 25 typical image formats that a QBIC system would use?</p> <hr/> <p style="text-align: right;">Page 191</p> <p>1 A. Yep. 2 Q. But it would understand formats beyond 3 those? 4 A. Yes. 5 Q. Would r-frames be represented as these 6 types of formats or certain of these types of 7 formats? 8 A. R-frames can be represented in these 9 formats, yes. 10 Q. Okay. 11 A. R-frame is just saying there's an image. 12 It's just a particular frame in a video.</p>

 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 198 – 199</p> <p>15 Q. Okay. And then if we can go to IBM 849.</p> <p>16 There?</p> <p>17 A. Yeah.</p> <p>18 Q. Top of the page says, "Adding image search</p> <p>19 to your Content Manager."</p> <p>20 Do you see that?</p> <p>21 A. Yeah. Yeah.</p> <p>22 Q. And the first paragraph starts -- talks</p> <p>23 about QBIC.</p> <p>24 Do you see that?</p> <p>25 A. Yeah.</p> <hr/> <p style="text-align: right;">Page 199</p> <p>1 Q. It says, "The image search server uses</p> <p>2 IBM's QBIC (query by image content) technology to</p> <p>3 help you search for objects by certain visual</p> <p>4 properties, such as color and texture."</p> <p>5 Did I read that correctly?</p> <p>6 A. Yes.</p> <p>7 Q. It says [as read], "The image search</p> <p>8 server analyzes images and stores the image</p> <p>9 information in a database. Then users can run image</p> <p>10 queries, which use the visual properties of image,</p> <p>11 to match colors, textures, and their positions</p> <p>12 without describing them -- describing them in</p> <p>13 words."</p> <p>14 Did I read that correctly?</p> <p>15 A. Yes.</p> <p>16 Q. And that's consistent with the features</p> <p>17 and functionalities that we have talked about in the</p> <p>18 1993 SPIE and 1995 IEEE article; correct?</p> <p>19 A. Correct.</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 312 – 313</p> <p>21 Q. For every implementation of QBIC, if an                      22 input image has an object and the object has colors,                      23 the color histogram feature would match those stored                      24 image that include objects with similar colors;                      25 correct?</p> <hr/> <p style="text-align: right;">Page 313</p> <p>1 A. Correct.</p> <p><i>Id.</i> at 317–322</p> <p>22 Q. Okay. So for every commercial                      23 implementation of QBIC as of the IEEE 1995 article                      24 in Exhibit 3, those implementation calculated                      25 features of a query image and stored image; is that</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 318</p> <p>1 correct?</p> <p>2 MR. HANSEN: Objection; lacks foundation.</p> <p>3 THE WITNESS: Correct.</p> <p>4 BY MR. EDWARDS:</p> <p>5 Q. And those calculations of features</p> <p>6 included color, shape and/or texture in all</p> <p>7 implementations that we looked at today, correct?</p> <p>8 MR. HANSEN: Same objections.</p> <p>9 THE WITNESS: I don't remember if all versions</p> <p>10 supported all features.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. If the 1995 article references calculating</p> <p>13 color, shape and texture, you would agree with me</p> <p>14 that the commercial embodiments implementing QBIC at</p> <p>15 the time would have been able to calculate color,</p> <p>16 shape and texture as part of feature extraction;</p> <p>17 correct?</p> <p>18 MR. HANSEN: Objection; lacks foundation.</p> <p>19 THE WITNESS: I don't remember exactly which</p> <p>20 products incorporated any subsets of the features.</p> <p>21 BY MR. EDWARDS:</p> <p>22 Q. Do you recall that all the products used</p> <p>23 color?</p> <p>24 MR. HANSEN: Objection; lacks foundation.</p> <p>25 THE WITNESS: I'm pretty sure they all did use</p>	<p style="text-align: right;">Page 320</p> <p>1 [as read] "Image Query allows searches by three</p> <p>2 methods: Image content, such as color, shape and</p> <p>3 texture."</p> <p>4 You see that?</p> <p>5 A. Yeah.</p> <p>6 Q. So Ultimedia Manager 1.1 was able to</p> <p>7 perform an image query using color, shape and</p> <p>8 texture, correct?</p> <p>9 MR. HANSEN: Objection; lacks foundation.</p> <p>10 THE WITNESS: And layout.</p> <p>11 BY MR. EDWARDS:</p> <p>12 Q. And layout. But also color, shape and</p> <p>13 texture, correct?</p> <p>14 A. Yes.</p> <p>15 MR. HANSEN: Same objection.</p> <p>16 BY MR. EDWARDS:</p> <p>17 Q. And then if you go to the last sentence it</p> <p>18 goes on -- and the bottom of the left column on that</p> <p>19 same page, going to the top of the right column, it</p> <p>20 says, "You can drag and drop visual samples into an</p> <p>21 image query."</p> <p>22 You see that?</p> <p>23 A. Yeah.</p> <p>24 Q. And that would include images, correct?</p> <p>25 A. Correct.</p>
		<p style="text-align: right;">Page 319</p> <p>1 color.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. And color histograms specifically?</p> <p>4 MR. HANSEN: Same objection.</p> <p>5 (Reporter seeks clarification.)</p> <p>6 BY MR. EDWARDS:</p> <p>7 Q. Histograms specifically.</p> <p>8 (Reporter seeks clarification.)</p> <p>9 THE WITNESS: Most likely, yes.</p> <p>10 BY MR. EDWARDS:</p> <p>11 Q. Well, pick up Exhibit 12, please.</p> <p>12 And go to IBM 2264.</p> <p>13 A. Okay.</p> <p>14 Q. So the Ultimedia Manager 1.1 was able to</p> <p>15 perform an image query using color, shape and</p> <p>16 texture; correct?</p> <p>17 MR. HANSEN: Objection; lacks foundation.</p> <p>18 (Witness reviews document.)</p> <p>19 BY MR. EDWARDS:</p> <p>20 Q. Let me orient you a little more. If you</p> <p>21 go to the bottom of IBM 2264, where it says "Image</p> <p>22 Query,"</p> <p>23 You see that?</p> <p>24 A. Yeah.</p> <p>25 Q. Where the bullet points start, it says,</p>	<p style="text-align: right;">Page 321</p> <p>1 MR. HANSEN: Objection; lacks foundation.</p> <p>2 BY MR. EDWARDS:</p> <p>3 Q. Okay?</p> <p>4 A. Correct.</p> <p>5 Q. Mr. Flickner, every commercial</p> <p>6 implementation of QBIC as of the Exhibit 3, IEEE</p> <p>7 1995 article, returned results of the matching</p> <p>8 process to the user in the form of a stored image</p> <p>9 and information associated with that image; is that</p> <p>10 fair?</p> <p>11 MR. HANSEN: Objection; lacks foundation.</p> <p>12 THE WITNESS: Yes.</p> <p>13 BY MR. EDWARDS:</p> <p>14 Q. Okay. And a thumbnail is an image;</p> <p>15 correct?</p> <p>16 A. Thumbnail is an image.</p> <p>17 Q. And for every commercial embodiment of</p> <p>18 QBIC as of the 1995 IEEE article in Exhibit 3, those</p> <p>19 implementations calculated a distance metric as a</p> <p>20 measure of similarity for each feature between an</p> <p>21 input image and a stored image; correct?</p> <p>22 MR. HANSEN: Objection; lacks foundation.</p> <p>23 THE WITNESS: Correct.</p> <p>24 BY MR. EDWARDS:</p> <p>25 Q. Okay. And a distance measure value</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p style="text-align: right;">Page 322</p> <p>1 indicates how confident the system is that the                  2 features of the stored image match the features of                  3 the input image; correct?                  4 A. Correct.</p> <p><i>Id.</i> at 53–56</p> <p>16 Q. And when it refers to "text information,"                  17 what is it referring to?                  18 A. Anything that could be extracted in the                  19 context of how the image was annotated.                  20 Q. And when you say "annotated," annotated by                  21 the user who was populating the database?                  22 A. Could be.                  23 Q. What else could it be?                  24 A. It could be the supplier of the data.                  25 Q. Okay. So you may have some annotations</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference	
		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

Element	'897 Claim Recitation	Exemplary Citations in Reference
		<p><i>Id.</i> at 60 – 62</p> <div style="border: 1px solid black; padding: 5px;"> <p>25 Q. Okay. And so let's say that objects were</p> <p style="text-align: right;">Page 61</p> <p>1 identified within a particular image, what were done</p> <p>2 with those objects? Were they stored, for example,</p> <p>3 as a separate image or were they somehow linked to</p> <p>4 or associated with the image from which they were</p> <p>5 extracted?</p> <p>6 A. Typically they were linked.</p> <p>7 Q. They were linked to the source image?</p> <p>8 A. Yeah.</p> <p>9 Q. Okay. And this was done in the database?</p> <p>10 A. Could be done in the database.</p> <p>11 Q. How was it done?</p> <p>12 A. It was probably done in a text database or</p> <p>13 some sort of key index pair database. So database</p> <p>14 has a lot of different meanings.</p> </div> <div style="border: 1px solid black; padding: 5px;"> <p>14 Q. Yeah, that was a bad question.</p> <p>15 Once the objects are identified within a</p> <p>16 particular source image that's stored in the</p> <p>17 database, how are the objects linked to the source</p> <p>18 image in the key --</p> <p>19 A. The key would have been, like, the image</p> <p>20 name and the value would have been the definition of</p> <p>21 the -- of the objects.</p> </div> <p><i>Id.</i> at 103</p>

*Nantworks, LLC v. Bank of America Corporation*

**2. Claim 30**

Claim	'897 Claim Recitation	Exemplary Citations in Reference
30	<p>The method of claim 25, wherein the step of displaying the displayed image includes displaying a time varying image.</p>	<p>QBIC discloses the method of claim 25, wherein the step of displaying the displayed image includes displaying a time varying image.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “We have developed the QBIC (Query by Image Content) system to explore content-based retrieval methods. QBIC allows queries on large image and video databases based on • example images, • user-constructed sketches and drawings, • selected color and texture patterns, • camera and object motion, and • other graphical information.” <i>Id.</i> at pp. 1–3.</p> <p>“To achieve this functionality, QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content-colors, textures, shapes, and camera and object motion-and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p> <p>“For both population and query, the QBIC data model has • still images or scenes (full images) that contain objects (subsets of an image), and • video shots that consist of sets of contiguous frames and contain motion objects. For still images, the QBIC data model distinguishes between ‘scenes’ (or images) and ‘objects.’ A scene is an image or single representative frame of video. An object is a part of a scene-for example, the fox in Figure 3-or a moving entity in a video. For still image database population, features are extracted from images and objects and stored in a database as shown in the top left part of Figure 2.</p>

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p>Videos are broken into clips called shots. Representative frames, or r-frames, are generated for each extracted shot. R-frames are treated as still images, and features are extracted and stored in the database. Further processing of shots generates motion objects—for example, a car moving across the screen. Queries are allowed on objects (‘Find images with a red, round object’), scenes (‘Find images that have approximately 30-percent red and IS-percent blue colors’), shots (‘Find all shots panning from left to right’), or any combination (‘Find images that have 30 percent red and contain a blue textured object’).” <i>Id.</i> at p. 3.</p> <p>“In still image database population, the images are reduced to a standard-sized icon called a thumbnail and annotated with any available text information. Object identification is an optional but key part of this step. It lets users manually, semiautomatically, or fully automatically identify interesting regions—which we call objects—in the images. . . .</p> <p>For video data, database population has three major components: • shot detection, • representative frame creation for each shot, and • derivation of a layered representation of coherently moving structures/ objects. . . .</p> <p>Once the shot boundaries have been detected, each shot is represented using an r-frame. R-frames are used for several purposes. First, during database population, r-frames are treated as still images in which objects can be identified by using the previously described methods.” <i>Id.</i> at pp. 3–6.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):</p> <p>“Your applications can even search for images by content. Imagine an application that uses visual examples to search for images. With such an application, users could select an example image and have the application find other images that have colors or textures similar to those in the example. With DB2 extenders’ Query by Image Content (QBIC) capability, you can create applications that search for images in this visual way.” <i>Id.</i> at p. 4.</p>
--	--	---

*Nantworks, LLC v. Bank of America Corporation*  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p>“To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source. You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.” <i>Id.</i> at pp. 20–21.</p>

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

### Flickner Depo at 214-215

1 videos were indexed by shot boundaries?

2 A. Correct -- well, the images of shot  
3 boundaries were indexed.

4 Q. What do you mean by the images of shot  
5 boundaries were indexed?

6 A. Each -- each shot -- the shot -- the shot  
7 boundary detection is trying to extract key frames  
8 or break the video into small subsec --  
9 subsections -- hang on. Let me think here a  
10 second.

11 So the shot boundary here is different  
12 than key framing. So I'll -- I'll retract what I  
13 said earlier. This -- while similar, they're not  
14 the same.

15 Q. What are the differences?

16 A. Shot boundaries are typically detected at  
17 fade to black, and key frames are supposed to be a  
18 representative still image of the video segment.

19 Q. How would a shot boundary index allow one  
20 to query a video by content?

21 A. It gives you semantical information as  
22 related to what the -- that -- that -- that is a --

Page 214

1 a reasonable amount of return video. It's -- it's  
2 breaking it into small snippets.

3 Q. Does it extract features from the key  
4 frames?

5 A. If there are key frames extracted, it --  
6 it will reference key frames.

7 Q. But how do you know that there are -- are  
8 other features extracted from the video --

9 A. I'm sorry. It does -- it does represent  
10 key frames as well, because it says it's -- it's  
11 getting both the -- the boundaries as well as  
12 indi- -- indicative key frame.

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content ("QBIC") System

		<p>2 Q. Do you see that, "Videos are broken into"? 3 A. "Clips called shots." 4 Q. Yes. Well, it says, "Videos are broken 5 into clips called shots. Representative frames, or 6 r-frames, are generated for each extracted shot. 7 R-frames are treated as still images, and features 8 are extracted and stored in the database." 9 Did I read that correctly? 10 A. Um-hum. 11 Q. Okay. So for purposes of database 12 population and queries for video, r-frames were 13 used, and those were treated as still images? 14 A. Right. 15 Q. So what would happen if I queried using an 16 r-frame image? What results would I get back? 17 Could I get back both still images and r-frames, or 18 would it just return r-frame images back? 19 A. You could get both back. 20 Q. Say it again, louder. 21 A. You could get both back. 22 Q. Okay. And in what form would those 23 results be displayed to me? For images would they 24 be displayed as a thumbnail? 25 A. It could be.</p> <hr/> <p style="text-align: right;">Page 69</p> <p>1 Q. And what about r-frames, how would those 2 be displayed to you? 3 A. It could be as a thumbnail or as a short 4 video clip or as a single representative frame. 5 Q. Okay. So they could be -- so for a video, 6 there's a video that matched the image query of an 7 r-frame, the results I could get back could include 8 three things. It could be a still image, it could 9 be a thumbnail, or it could be an r-frame 10 representation? 11 A. R-frame, I think, is representative frame. 12 So it was a key frame in that video sequence, 13 summary frame. 14 Q. Once I ran a query on an r-frame; right? 15 Well, let's stop there. 16 If I run a query on still images, 17 typically the results I would get back are 18 thumbnails that are most similar to the 19 characteristics which I queried from the query 20 image; right? 21 A. You could get thumbnails back. You could 22 also get the full-sized image back. 23 Q. Okay. 24 A. Thumbnail is a tool for helping you return 25 lots of results and quickly scan it.</p>	
--	--	---	--

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I  2 have to click on the thumbnail in order to bring up  3 the full-sized image?  4 A. You could.  5 Q. Otherwise I could automatically receive  6 the full-sized image as part of the result?  7 A. You could.  8 Q. Okay. So walk through that process if I'm  9 using an r-frame of a video. If I do a -- if I run  10 a query on an r-frame of a video as a -- an image  11 query, how could I get the results back?  12 MR. HANSEN: Objection; vague and ambiguous.  13 BY MR. EDWARDS:  14 Q. In what form would I get the results back?  15 MR. HANSEN: Same objection.  16 THE WITNESS: You could get back the still  17 r-frame, representative frame, you could get back  18 the thumbnail, or you could get back the entire  19 video clip that that r-frame represents, a few  20 frames.  21 BY MR. EDWARDS:  22 Q. If I received a thumbnail or the r-frame,  23 would there be some sort of link I could click on to  24 get the underlying full video?  25 MR. HANSEN: Objection; vague and ambiguous,</p> <p style="text-align: right;">Page 71</p> <p>1 calls for speculation.  2 THE WITNESS: As I recall -- I'm not sure  3 definitely, but, yes, this is -- you could do that.  4 BY MR. EDWARDS:  5 Q. So let's go to page IBM 898.  6 So if you'll take -- just read that  7 paragraph that starts with the header  8 "Representative Frame Generation."  9 MR. STRAUSSMAN: And if you need to read  10 anything else to put it in context, feel free to do  11 so.  12 THE WITNESS: Okay.  13 (Witness reviews document.)  14 THE WITNESS: So what was your question, again?  15 BY MR. EDWARDS:  16 Q. If you go to the sentence that says,  17 "First" -- it's the second sentence in that  18 paragraph. It says, "First, during database  19 population, r-frames are treated as still images."  20 See that?  21 A. Yeah.  22 Q. And that's what you told me earlier;  23 correct?  24 A. Yeah.  25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic  2 units initially returned in a video query."  3 Meaning the r-frames?  4 A. Correct.  5 Q. "For example, in a query for shots that  6 are dominantly red, a set of r-frames will be  7 displayed. To see the actual video shot, the user  8 clicks on the displayed r-frame icon."  9 A. Yep.  10 Q. And that was one of the ways you were  11 describing that the results of a r-frame query would  12 be returned to the user?  13 A. Right.  14 Q. Do you know if that was the preferred way  15 that was used in demos in commercial applications?  16 MR. HANSEN: Objection; vague and ambiguous,  17 lacks foundation.  18 MR. STRAUSSMAN: You can answer.  19 THE WITNESS: I don't know.  20 BY MR. EDWARDS:  21 Q. But, Mr. Flickner, this -- generally this  22 article represents the status of the QBIC technology  23 as of the date of this publication, which is  24 September 1995; is that right?  25 A. Actually a little before September 1995</p> <p style="text-align: right;">Page 73</p> <p>1 because --  2 Q. Okay.  3 A. -- there's an editorial process.  4 Q. Say that last part?  5 A. There's an editorial process. You submit  6 it, they edit and make changes and eventually it  7 appears.  8 Q. Right. So what you're saying is there's  9 some lag between the time that you wrote the article  10 and the time it was published?  11 A. Yeah.  12 Q. So this article -- but this article  13 represents the state of the QBIC technology at least  14 as of September 1995?  15 A. Yeah. Yes.  16 Q. And then let's go to IBM 900.  17 And take your time to orient yourself on  18 that page, but what I really want to ask you about  19 is the last paragraph on the left-hand column going  20 up to the top of the right-hand column.  21 A. Yep.  22 Q. So it says this paper describes [as read],  23 "a prototype system that uses image and video  24 content as the basis for retrievals."  25 Is that right?</p>

**3. Claim 33**

Claim	'897 Claim Recitation	Exemplary Citations in Reference
33	The method of claim 25, wherein the step of enabling performance of the transaction includes initiating a verification.	<p>QBIC discloses the method of claim 25, wherein the step of enabling performance of the transaction includes initiating a verification.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “INTEGRATION WITH TEXT AND PARAMETRIC ANNOTATION. Query by visual content complements and extends existing query methods. Systems must be able to integrate queries combining date, subject matter, price, and availability with content properties such as color, texture, and shape.” <i>Id.</i> at p. 8.</p> <p>Image, Audio, and Video Extenders Administration and Programming (IBM 000001–617):                      “DB2 (DB2) Universal Database (UDB) is a powerful, object-relational database manager. It stores and protects traditional numeric and character data, as well as large, complex objects (LOBs). DB2 extenders help you exploit DB2 ’s object-relational features. The extenders define distinct data types and special functions for image, audio, video, and text objects. ... Because of that, the extenders give your applications a single point of access to any or all of these types of data, along with traditional numeric and character data.” <i>Id.</i> at p. 3.</p> <p>“A trigger defines a set of actions that are activated by a change to a table. Triggers can be used to perform actions such as validating input data, automatically generating a value for a newly inserted row, reading from other tables for cross-referencing purposes, or writing to other tables for auditing purposes. Triggers are often used for integrity checking or to enforce business rules.” <i>Id.</i> at 16–17.</p> <p>Managing Enterprise Information Portal (IBM 000777–880):</p>

Nantworks, LLC v. Bank of America Corporation  
Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

“Many paper-intensive enterprises, such as insurance companies and financial institutions, administer large volumes of business-related content. The need for an enterprise solution for managing and accessing business information spans many industries. A content server is a software system that stores multimedia, business forms, documents, and related data, along with metadata that allows employees to process and work with the content.” *Id.* at p. 3.

“The image search server uses IBM’s QBIC (query by image content) technology to help you search for objects by certain visual properties, such as color and texture. The image search server analyzes images and stores the image information in a database. Then users can run image queries, which use the visual properties of images, to match colors, textures, and their positions without describing them in words. You can combine content-based queries with text and keyword searches for more powerful retrieval of image and multimedia data.” *Id.* at p. 63.

#### QBIC Demo (IBM000747)

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 54</p> <p>1 about an image that the supplier of the data                  2 supplied and then also the user populating the                  3 database could also enter text descriptions?                  4 A. Right.                  5 Q. Okay. And were there limitations to the                  6 text descriptions or -- in terms of character                  7 limits?                  8 A. Probably were -- there . . .                  9 Q. But essentially, other than the character                  10 limits, could a -- could a user essentially put                  11 anything in the text description?                  12 A. You're saying any text in the text                  13 description?                  14 Q. Correct.                  15 A. Sure.                  16 Q. So, for example, if it were for a product,                  17 you could put price?                  18 A. Yep.                  19 Q. If -- you could put the name of the                  20 product?                  21 A. Yeah.                  22 Q. You could put where you could purchase the                  23 product?                  24 A. Yep.                  25 Q. You -- could you put a URL where you could</p>	<p style="text-align: right;">Page 56</p> <p>1 would do this?                  2 A. Or an annotator, yeah.                  3 Q. Okay. And how would they do that?                  4 A. They could do it manually or they could                  5 use tools to help identify objects.                  6 Q. And manually how would that work?                  7 A. You look at the image and specify what                  8 objects are in the image.                  9 Q. And how would they specify it?                  10 A. Typing in a text phrase.                  11 Q. Okay. So if it was an image of a dog,                  12 they could type in "dog," for example?                  13 A. Yeah, exactly.                  14 Q. What if there were multiple objects in the                  15 image, was there a way for the user to outline or                  16 demarcate those objects?                  17 A. Yes.                  18 Q. How would they do that?                  19 A. They could just put "German Shepherd" and                  20 "Retriever" to determine the type of dogs. So they                  21 could do it using annotations of text --                  22 Q. Was there a way --                  23 A. -- or they could use extracting tools                  24 where you could outline the object more accurately.                  25 Q. So you could outline the edges of the</p>
		<p style="text-align: right;">Page 55</p> <p>1 link to go find the product?                  2 A. 1993, URLs were just starting to come on                  3 board, if I recall right. URLs weren't particularly                  4 popular yet.                  5 Q. Not in 1993, but the QBIC project lasted                  6 throughout the '90s; correct?                  7 A. Yeah.                  8 Q. So say a user closer to 2000, they could                  9 insert a URL in that description?                  10 A. Yeah. Yeah.                  11 Q. So in addition to uploading the images,                  12 associated thumbnail, text descriptions, did object                  13 identification also occur at this database                  14 population step?                  15 A. It could.                  16 Q. And what is object identification?                  17 A. It's to be taking a region of an image and                  18 putting a label on it.                  19 Q. Say the last part?                  20 A. Putting a label on it.                  21 Q. Taking a region of an image and putting a                  22 label on it?                  23 A. Yeah.                  24 Q. Okay. And how would you -- and back up.                  25 The user who was populating the database</p>	<p style="text-align: right;">Page 57</p> <p>1 shape of the object?                  2 A. Right.                  3 Q. And you could do that with a manual -- the                  4 user could do that with a manual tool?                  5 A. Yeah.                  6 Q. Were there automatic tools that did --                  7 that did things like look for objects? So, for                  8 example, were there automatic tools that QBIC used,                  9 like edge detection or segmentation, that extracted                  10 object --                  11 A. You could --                  12 Q. -- shapes?                  13 A. You could use edge detection.                  14 Q. Okay. Did QBIC use edge detection?                  15 A. Yes, in certain aspects.                  16 Q. In what aspects?                  17 A. So on the annotation tool, if you compute                  18 gradients, you can make a better prediction of                  19 helping the person annotate.                  20 So it's very tedious to go through and                  21 annotate everything. Whereas if you have a tool,                  22 it'll tell you where it thinks the boundaries are.                  23 And you could speed up annotation quite a bit doing                  24 that.                  25 Q. So this tool that you're referring to, a</p>

*Nantworks, LLC v. Bank of America Corporation*  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;">Page 70</p> <p>1 Q. So I would receive the thumbnail. Would I          2 have to click on the thumbnail in order to bring up          3 the full-sized image?          4 A. You could.          5 Q. Otherwise I could automatically receive          6 the full-sized image as part of the result?          7 A. You could.          8 Q. Okay. So walk through that process if I'm          9 using an r-frame of a video. If I do a -- if I run          10 a query on an r-frame of a video as a -- an image          11 query, how could I get the results back?          12 MR. HANSEN: Objection; vague and ambiguous.          13 BY MR. EDWARDS:          14 Q. In what form would I get the results back?          15 MR. HANSEN: Same objection.          16 THE WITNESS: You could get back the still          17 r-frame, representative frame, you could get back          18 the thumbnail, or you could get back the entire          19 video clip that that r-frame represents, a few          20 frames.          21 BY MR. EDWARDS:          22 Q. If I received a thumbnail or the r-frame,          23 would there be some sort of link I could click on to          24 get the underlying full video?          25 MR. HANSEN: Objection; vague and ambiguous,</p>	<p style="text-align: right;">Page 72</p> <p>1 it says, "Secondly, during query, they are the basic          2 units initially returned in a video query."          3 Meaning the r-frames?          4 A. Correct.          5 Q. "For example, in a query for shots that          6 are dominantly red, a set of r-frames will be          7 displayed. To see the actual video shot, the user          8 clicks on the displayed r-frame icon."          9 A. Yep.          10 Q. And that was one of the ways you were          11 describing that the results of a r-frame query would          12 be returned to the user?          13 A. Right.          14 Q. Do you know if that was the preferred way          15 that was used in demos in commercial applications?          16 MR. HANSEN: Objection; vague and ambiguous,          17 lacks foundation.          18 MR. STRAUSSMAN: You can answer.          19 THE WITNESS: I don't know.          20 BY MR. EDWARDS:          21 Q. But, Mr. Flickner, this -- generally this          22 article represents the status of the QBIC technology          23 as of the date of this publication, which is          24 September 1995; is that right?          25 A. Actually a little before September 1995</p>
		<p style="text-align: right;">Page 71</p> <p>1 calls for speculation.          2 THE WITNESS: As I recall -- I'm not sure          3 definitely, but, yes, this is -- you could do that.          4 BY MR. EDWARDS:          5 Q. So let's go to page IBM 898.          6 So if you'll take -- just read that          7 paragraph that starts with the header          8 "Representative Frame Generation."          9 MR. STRAUSSMAN: And if you need to read          10 anything else to put it in context, feel free to do          11 so.          12 THE WITNESS: Okay.          13 (Witness reviews document.)          14 THE WITNESS: So what was your question, again?          15 BY MR. EDWARDS:          16 Q. If you go to the sentence that says,          17 "First" -- it's the second sentence in that          18 paragraph. It says, "First, during database          19 population, r-frames are treated as still images."          20 See that?          21 A. Yeah.          22 Q. And that's what you told me earlier;          23 correct?          24 A. Yeah.          25 Q. And then if you go to the next sentence,</p>	<p style="text-align: right;">Page 73</p> <p>1 because --          2 Q. Okay.          3 A. -- there's an editorial process.          4 Q. Say that last part?          5 A. There's an editorial process. You submit          6 it, they edit and make changes and eventually it          7 appears.          8 Q. Right. So what you're saying is there's          9 some lag between the time that you wrote the article          10 and the time it was published?          11 A. Yeah.          12 Q. So this article -- but this article          13 represents the state of the QBIC technology at least          14 as of September 1995?          15 A. Yeah. Yes.          16 Q. And then let's go to IBM 900.          17 And take your time to orient yourself on          18 that page, but what I really want to ask you about          19 is the last paragraph on the left-hand column going          20 up to the top of the right-hand column.          21 A. Yep.          22 Q. So it says this paper describes [as read],          23 "a prototype system that uses image and video          24 content as the basis for retrievals."          25 Is that right?</p>

**6. Claim 39**

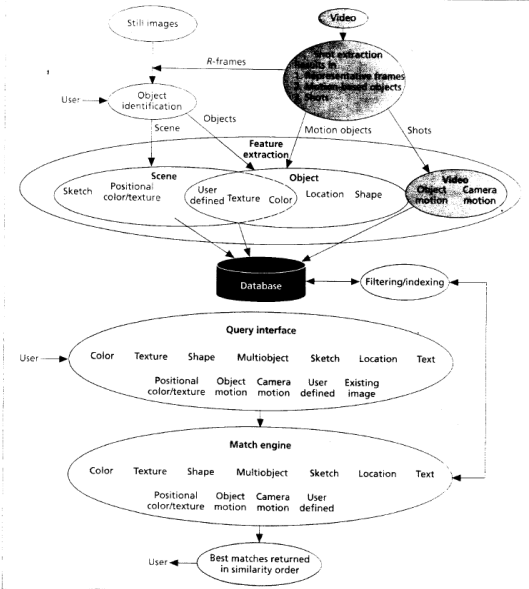

Claim	'897 Claim Recitation	Exemplary Citations in Reference
39	<p>The method of claim 25, wherein the step of enabling performance of the interaction includes initiating a transaction with an account.</p>	<p>QBIC discloses the method of claim 25, wherein the step of enabling performance of the interaction includes initiating a transaction with an account.</p> <p>Query by Image and Video Content: The QBIC System (IBM 0000893–902):                      “QBIC has two main components: database population (the process of creating an image database) and database query. During the population, images and videos are processed to extract features describing their content—colors, textures, shapes, and camera and object motion—and the features are stored in a database. During the query, the user composes a query graphically. Features are generated from the graphical query and then input to a matching engine that finds images or videos from the database with similar features. Figure 2 shows the system architecture.” <i>Id.</i> at p. 3.</p>  <p>The diagram illustrates the QBIC system architecture, divided into two main parts: database population (top) and query (bottom).  <b>Database Population (Top):</b> A user provides 'Still images' and 'Video'. 'Still images' are processed into 'R-frames', which are then used for 'Object identification'. 'Video' is processed into 'R-frames in representation frames' and 'Motion objects'. Both 'Object identification' and 'Motion objects' feed into 'Feature extraction', which identifies 'Scene', 'Object', and 'Shots'. 'Feature extraction' also identifies 'Positional color/texture', 'User defined Texture Color', 'Location Shape', and 'Object Camera motion'. These features are stored in the 'Database'.  <b>Query (Bottom):</b> A user interacts with a 'Query interface' to define a query using 'Color', 'Texture', 'Shape', 'Multiobject', 'Sketch', 'Location', and 'Text'. The 'Query interface' also includes 'Positional color/texture', 'Object motion', 'Camera motion', 'User defined', and 'Existing image'. The query is processed by a 'Match engine' which uses the same feature categories as the population stage. The 'Match engine' outputs 'Best matches returned in similarity order' to the user. A 'Filtering/indexing' step is also shown between the database and the match engine.</p>

Figure 2. QBIC database population (top) and query (bottom) architecture.

21 enterprise solution for managing and accessing  
22 business information spans many industries."

23 Did I read that correctly?

24 A. Yes.

25 Q. Okay. For -- is it -- is it your

1 experience and understanding that QBIC is something  
2 that would be beneficial for businesses that have  
3 large volumes of business-related content?

4 A. Yes.

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

**Data structures**

**Handles**

When you store an image, audio, or video object in a user table, the object is not actually stored in the table. Instead, an extender creates a character string called a **handle** to represent the object, and stores the handle in the table. The extender stores the object in an administrative support table, or stores a file identifier in an administrative support table if you keep the content of the object in a file. It also stores the object’s attributes and handle in administrative support tables. In this way, the extender can link the handle stored in a user table with the object information stored in the administrative support tables. Figure 8 illustrates the information stored for two images in a user table.

User Table

ID	Name	Picture
		Handle 1
		Handle 2

Administrative Support Tables

Common Attributes				
Handle	Importer	Updater		
Handle 1				
Handle 2				

Unique Attributes				
Handle	Width	Height	Numcolors	
Handle 1				
Handle 2				

Figure 8. Handles

**QBIC catalogs**

A QBIC catalog is a set of files that hold data about the visual features of images. The Image Extender uses this data to search for images by content.

You create a QBIC catalog for each column of images in a user table that you want to make available for searching by content. When you create a QBIC catalog you identify the features for which you want the Image Extender to analyze, store, and later query data. You can also add or drop features from a QBIC catalog after the catalog is created.

Chapter 2. DB2 extender concepts 19  
 IBM 000039

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p><b>Data structures</b></p> <p>A QBIC catalog can hold data for the following image features:</p> <p><b>Average color</b> The sum of the color values for all pixels in an image divided by the number of pixels in the image. (A pixel is the smallest element of an image that can be assigned color and intensity.) For example, if 50% of an image consists of blue pixels and the other 50% red pixels, the image has an average color value of purple. Average color is used to search for images that have a predominant color. If an image has a predominant color, the average color will be similar to the predominant color.</p> <p><b>Histogram color</b> Measures the distribution of colors in an image against a spectrum of 64 colors. For each of the 64 colors, histogram color identifies the percentage of pixels in an image that have that color. For example, the histogram color of an image might be 40% white pixels, 50% blue, and 10% red; none of the pixels in the image have any of the remaining colors in the histogram spectrum. Histogram color is used to search for images that have a variety of colors.</p> <p><b>Positional color</b> The average color value for the pixels in a specified area in an image. For example, the upper right-hand corner of an image might show a bright yellow sun; the positional color of this area of the image is bright yellow. Positional color is used to search for images that have a predominant color in a particular area.</p> <p><b>Texture</b> Measures the coarseness, contrast, and directionality of an image. Coarseness indicates the size of repeating items in an image (for example, pebbles versus boulders). Contrast identifies the brightness variations in an image (light versus dark). Directionality indicates whether a direction predominates in an image (as in the vertical direction of a picket fence) or does not predominate (as in an image of sand). Texture is used to search for images that have a particular pattern.</p> <p>To make an image available for searching by content, you catalog the image. When you catalog an image, the Image Extender analyzes the image, by computing the feature values for the image, and stores the values in a QBIC catalog.</p> <p>When you search for an image by content, your query identifies one or more features for the search (such as average color), a source for each feature (such as an example image), and a target set of cataloged images. The Image Extender computes the feature value of the source and compares it to the</p> <p>20 IBM® DB2® Universal Database: Image, Audio, and Video Extenders</p> <p>IBM 000040</p>

*Nantworks, LLC v. Bank of America Corporation*

Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<p style="text-align: right;"><b>Data structures</b></p> <p>cataloged feature values for the target images. It then computes a score that indicates how similar the feature values of the target images are to the source.</p> <p>You can have the Image Extender return the images whose features are most similar to the source. The Image Extender will return the handle of each image and the image score. You can also have the Image Extender return only the score of a single image.</p> <p><b>Video indexes</b></p> <p>A <b>video index</b> is a file that the Video Extender uses to find a specific shot or frame in a video clip.</p> <p>The Video Extender can detect scene changes in a video. A <b>scene change</b> is a point in a video clip where there is a significant difference between two successive frames. This happens, for example, when a camera changes its point of view while recording a video. The frames between two scene changes constitute a <b>shot</b>.</p> <p>You can use the Video Extender’s scene detection capabilities to find a shot, or even an individual frame, in a video clip. To do this, the extender needs indexing information for the shot or frame. This indexing information is stored in an <b>index file</b>.</p> <p><b>Shot catalogs</b></p> <p>A <b>shot catalog</b> is used to store data about shots in a video clip. The shot catalog can be stored in a database or in a file.</p> <p>A shot catalog stored in a file contains the following shot-related data:</p> <ul style="list-style-type: none"><li>• Shot catalog file name</li><li>• Values that control how the Video Extender detects a shot, for example, the minimum number of frames in a shot</li><li>• Values that control how many frames and which frames will be stored as representative frames for a shot</li><li>• Shot number</li><li>• Starting frame number</li><li>• Ending frame number</li><li>• Representative frame number</li><li>• Name of a file that contains the contents of the representative frame</li></ul> <p>You can access the data in the shot catalog file or access a view of the shot catalog stored in a database. The view contains columns for the following shot-related data:</p> <ul style="list-style-type: none"><li>• Shot handle</li><li>• Video table name</li></ul> <p style="text-align: right;">Chapter 2. Nantworks, LLC v. Bank of America Corporation  
 Central District of California, No. 2:20-cv-7872

Invalidity Chart for U.S. Patent 8,520,897 based on the Query by Image and Video Content (“QBIC”) System

		<div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"><b>Description</b></div> <p>Ultimedia Manager 1.1 opens new dimensions in visual queries, helping you manage your image database more efficiently. With its easy-to-use interface, even entry-level users can perform sophisticated searches. You can search by image content, data description, or a combination of both. Once the images are found, you can view the images in full resolution, use the images in another application, or read the associated textual comments.</p> <p>You can use Ultimedia Manager 1.1 either as a stand-alone product or in a LAN environment. As a stand-alone product, Ultimedia Manager 1.1 employs full image classification and image query capabilities. Within the LAN environment, the Ultimedia Manager image catalogs can be sorted on a DB2 for OS/2 or DB2 for AIX database server. The image catalogs can be accessed by Windows or OS/2 clients using the Client Search Feature or the Visualizer Ultimedia Query.</p> <p>Ultimedia Manager runs as an OS/2 application to a DB2 for OS/2 or DB2 for AIX database server in a LAN, or as a stand-alone application with a local DB2 for OS/2 database. The Client Search Feature runs on DOS or Windows, and accesses files in dBASE flat file format. A database manager is not required to access catalogs in dBASE file format.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"><b>Image Classification</b></div> <p>With the Image Classifier, you can create visual indexes based on color, shape, category, and layout elements, which are areas of the image containing the patterns you want to use for searches. You can store these elements in catalogs in DB2 for OS/2 databases. The catalogs can be used locally or, through the use of utility programs, be transferred to DB2 for OS/2 or AIX servers. In addition, you can convert the catalog data into dBASE flat file format for access by Windows client applications.</p> <p>The Image Classifier and Analyzer allows automatic or interactive classification of images for later image queries, flexibility in storage of catalog information, and access to multiple users. You can organize large image catalogs so that later searches for images can be performed easily. You can classify automatically using a batch program, or interactively by specifying areas of interest in an image and indicating the visual cue (color, shape, or texture) to be saved for later queries.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"><b>Image Query</b></div> <p>Once the image catalogs are created, you can use the Image Query component to find image and business information. Business information, such as character and numeric data, are stored in the database tables using normal table population methods. Image Query is provided in Ultimedia Manager and Client Search Feature.</p> <p>Image Query allows searches by three methods:</p> <ul style="list-style-type: none"> <li>• Image content, such as color, shape, texture, or layout</li> <li>• Data description, such as business data stored in the database (character or numeric) or descriptive text (category)</li> <li>• Combinations of image content and data description.</li> </ul> <p><b>Image Content:</b> To search by image content, specify the attributes (color, shape, texture, or layout). You can drag</p> <p>and drop visual samples into an image query, select a color from the color wheel, or sketch a shape.</p> <p><b>Data Description:</b> To search by data description, enter character and numeric data values in the database tables using the simple fill-in-the-blanks query panel. You can enter data such as name, number, date, or a range of dates. You can integrate character or numeric data as part of the image query, enabling a more effective search for better results. The simple fill-in-the-blanks method for specifying desired conditions is so easy even non-programmers can use database table information as part of their searches.</p> <p><b>Combinations:</b> Image queries using either image content or data description, or combinations of both, allow you to search through thousands of images more quickly and effectively than the traditional text and keyword search methods.</p> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"><b>Image Formats</b></div> <p>Ultimedia Manager 1.1 understands these image formats:</p> <ul style="list-style-type: none"> <li>• Audio Visual Connection (AVC) images</li> <li>• OS/2 bitmap</li> <li>• Windows 3.x bitmap</li> <li>• PCK</li> <li>• Intel and Motorola TIFF</li> <li>• TARGA TGA</li> <li>• TIFF (FAX)</li> <li>• GIF</li> <li>• Kodak Photo-CD</li> </ul> <div style="text-align: center; border-bottom: 1px solid black; margin-bottom: 10px;"><b>Product Positioning</b></div> <p>The advanced image search technology in Ultimedia Manager, query by image content, was developed in conjunction with the IBM Almeden Research Center. It provides function not available with conventional, text-only image management systems.</p> <p>Ultimedia Manager fulfills image search and retrieval needs of business users and creative professionals through use of online image libraries or collections. It is intended for users who have large image libraries and need fast, flexible access to their image data, users who may also want to add character or numeric data to their image queries, and users who feel limited by text-based systems.</p> <p>Ultimedia Manager 1.1 works with the DB2 Family of products and the Visualizer Ultimedia Query product. Catalogs created by Ultimedia Manager can be stored in DB2 for OS/2 database tables. Image catalogs also can be stored in DB2 for OS/2 or DB2 for AIX database servers in client/server environments.</p> <p>OS/2 and Windows clients in a LAN environment using the Client Search Feature and the Visualizer Ultimedia Query can access catalogs created with Ultimedia Manager 1.1. Visualizer Ultimedia Query provides users with the capability to:</p> <ul style="list-style-type: none"> <li>• Add multimedia columns (such as image, video, audio, and formatted text) to DB2 for OS/2 database tables</li> <li>• Query and display images</li> <li>• View or listen to video and audio information</li> <li>• Display formatted text</li> </ul> <p>Users of Ultimedia Manager 1.1 and Client Search Feature are focused on image management and query applications. Visualizer Ultimedia Query users are</p> <p style="font-size: small; margin-top: 20px;">205-042 -2-</p> <p style="text-align: right; margin-top: 20px;">IBM 0002264</p>
