

Claim Charts for U.S. Patent 9,600,842

EXHIBIT U

Claim Charts for U.S. Patent 9,600,842

The following claim charts are preliminary in nature. e-Numerate reserves the right to amend and supplement these proceeds.

29. A computer program product embodied on at least one non-transitory computer readable medium and connected to at least one hardware processor to operate, the computer program product comprising:

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one hardware processor to identify at least one computer-readable Extensible Markup Language (XML)-compliant data document and at least one Business Reporting Language (XBRL)-compliant and includes:

a plurality of line items with a plurality of data values, and

a plurality of computer-readable semantic tags that describe a semantic meaning of the data values; the at least one computer-readable XML-compliant data document is capable of including multiple hierarchical relationships between the plurality of line items;

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one hardware processor to parse the at least one computer-readable XML-compliant data document, by:

receiving the at least one computer-readable XML-compliant data document,

identifying the multiple hierarchical relationships between the two line items, and at least one of the semantic tags that describes the semantic meaning of at least one of the data values included in the at least one computer-readable XML-compliant data document;

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one hardware processor to access a plurality of computer-readable rules including:

a computer-readable datatype rule for validation of a type of data values,

a computer-readable calculation rule for validation of a calculation involving data values, and

a computer-readable unit rule for validation of a unit of data values;

Claim Charts for U.S. Patent 9,600,842

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one processor to process the at least one computer-readable XML-compliant data document, by:

identifying at least a subset of the computer-readable rules including at least one of:

the computer-readable datatype rule for validation of the type of data values,

the computer-readable calculation rule for validation of the calculation involving data values,

the computer-readable unit rule for validation of the unit of data values; and

processing at least a portion of the data values of at least a portion of the plurality of line items of the at least one computer-readable XML-compliant data document, utilizing the at least subset of the computer-readable rules, and at least one computer-readable semantic tags of the at least one computer-readable XML-compliant data document;

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one processor to display a result of a validation of the at least one computer-readable XML-compliant data document;

code stored on the at least one non-transitory computer readable medium and configured to cause the at least one processor to develop a report, by:

identifying the at least one computer-readable semantic tag that describes the semantic meaning of the at least one data value included in the at least one computer-readable XML-compliant data document, and

retrieving data from one or more sources to represent the at least one data value in the report.

Claim 29 Elements	Applicability
<p>A computer program product embodied on at least one non-transitory computer readable medium and configured to cause at least one hardware processor to operate, the computer program product comprising:</p>	<p>Users of an XBRL validator use <i>a computer program product embodied on at least one non-transitory computer readable medium and configured to cause at least one hardware processor to operate, the computer program product.</i></p> <p>Note: Any entity using XBRL on an official basis requires use of an XBRL validator. An XBRL document complies with relevant rules set forth by the XBRL standard.</p> <p>Upon information and belief, the Securities and Exchange Commission (SEC) has used the '842 Patent in violation of 35 U.S.C. § 271(a) by using the patented invention <i>in alia</i>, process multiple XBRL-compliant filings with the SEC. See pertinent excerpts illustrating applicability to the SEC EDGAR Renderer, for example: https://www.sec.gov/structureddata/edgarvalandrender.</p> <p>EDGAR Renderer is available as an open source application to include within so-called "viewer" applications. As of September 28, 2015, the viewer and previewer on the SEC website (www.sec.gov/spotlight/xbrl/viewers.shtml), as well as rendering related error messages, rely on EDGAR Renderer 3.3.0.814. The EDGAR Renderer standalone application and source code are available for download at www.arelle.org/applications and the standalone application version 3.2.0.727 is available at https://github.com/Arelle/EdgarRenderer/blob/3.3.0.814/change_log.md.</p> <p>https://www.sec.gov/structureddata/announcement/osd-announcement-1106-renderer-and-validation-engine.html</p> <p>EDGAR® Renderer enables investors to view via the SEC website the interactive data submitted under the SEC's rules that require the use of XBRL.</p> <p>The Previewer provides the capability to test how an interactive data submission will appear on the SEC's website when submitted via EDGAR; the Previewer is only a test mechanism and does not constitute an official filing. Once a company completes its interactive data submission via EDGAR, the rendering will be presented with the official filing on the SEC website.</p>

Claim Charts for U.S. Patent 9,600,842

	<p>The version of EDGAR Renderer in use on the SEC website is available for download at www.arelle.org/applications as a standalone program. A link to the source code and other versions of EDGAR Renderer are also available at that site. https://www.sec.gov/xbrl</p> <p>“instance or instance document XML file that contains business reporting information that represents a collection of financial facts and report-specific information using taxonomies and more XBRL taxonomies.”</p> <p>Hierarchical relationships such as parent-child are a well-known feature of XBRL.</p> <p>“line item Elements that conventionally appear on the vertical axis (rows) of a table.</p> <p>“tag (noun) Identifying information that describes a unit of data in an instance document. A tag encloses it in angle brackets (<> and). All facts in an instance document are enclosed in angle brackets that identify the element of the fact.”</p> <p>“validation Process of checking that instance documents and taxonomies conform to the rules of the XBRL specification.” http://www.sec.gov/spotlight/xbrl/glossary.shtml</p> <p>By way of a non-limiting example, EDGARLink also develops and displays a report validation as described in section 7.4.2 of the SEC’s <i>Filer Manual– Volume II EDGARLink</i> document, March 2021. https://www.sec.gov/info/edgar/specifications/edgarfm-vol2-v57.pdf</p>
<p>code stored on the at least one non-transitory computer readable medium and configured to cause the at least one hardware processor to identify at least one computer-readable Extensible Markup Language (XML)-compliant data</p>	<p>Users of an XBRL validator use <i>code stored on the at least one non-transitory computer readable medium and configured to cause the at least one hardware processor to identify at least one computer-readable Extensible Markup Language (XML)-compliant data document that includes: a plurality of data values, and a plurality of computer-readable semantic tags that identify the semantic meaning of the data values, where the at least one computer-readable data document is capable of including multiple hierarchical relationships between a plurality of line items.</i> See excerpt(s) below, for example (emphasis added):</p>

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
