

Exhibit 26

AMC-01-004P

This application is submitted in the name of inventor Erling H. Wold.

SPECIFICATION

METHOD AND APPARATUS FOR
IDENTIFYING AN UNKNOWN WORK

BACKGROUND OF THE INVENTION

Field of the Invention

10 The present invention relates to data communications. In particular, the present invention relates to a novel method and apparatus for identifying an unknown work.

The Prior Art

Background

Digital audio technology has greatly changed the landscape of music and entertainment. Rapid increases in computing power coupled with decreases in cost have

AMC-01-004P

made it possible for individuals to generate finished products having a quality once available only in a major studio. One consequence of modern technology is that legacy media storage standards, such as reel-to-reel tapes, are being rapidly replaced by digital storage media, such as the Digital Versatile Disk (DVD), and Digital Audio Tape (DAT).

5 Additionally, with higher capacity hard drives standard on most personal computers, home users may now store digital files such as audio or video tracks on their home computers.

Furthermore, the Internet has generated much excitement, particularly among those who see the Internet as an opportunity to develop new avenues for artistic expression and communication. The Internet has become a virtual gallery, where artists may post their works on a Web page. Once posted, the works may be viewed by anyone having access to the Internet.

One application of the Internet that has received considerable attention is the ability to transmit recorded music over the Internet. Once music has been digitally encoded, the audio may be both downloaded by users for play, or broadcast (“streamed”) 15 over the Internet. When audio is streamed, it may be listened to by Internet users in a manner much like traditional radio stations.

techniques known in the art; essentially computing the full Euclidean distance between the entire signatures' feature vectors. A match can then be declared when one of these comparisons yields a score or distance that is above or below some threshold, respectively.

5 However, when an audio signature or fingerprint contains a large number of features such a brute-force search becomes too expensive computationally for real-world databases which typically have several hundred thousand to several million signatures.

 Many researchers have worked on methods for multi-dimensional indexing, although the greatest effort has gone into geographical (2-dimensional) or spatial (3-dimensional) data. Typically, all of these methods order the elements of the database based on their proximity to each other.

 For example, the elements of the database can be clustered into hyper-spheres or hyper-rectangles, or the space can be organized into a tree form by using partitioning planes. However, when the number of dimensions is large (on the order of 15 or more), it
15 can be shown mathematically that more-or-less uniformly distributed points in the space all become approximately equidistant from each other. Thus, it becomes impossible to cluster the data in a meaningful way, and comparisons can become both lengthy and inaccurate.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
