

Bloomberg Server Infrastructure
 Bloomberg Trade Data for NYSE/NASDAQ
 Bloomberg Chart Data for NYSE/NASDAQ

M-A Real Time Technical Analytics Scanning Server infrastructure

Bloomberg Terminals

This proposed model is a transactional system that relies on close integration of the markets-alert platform and Bloomberg's existing infrastructure.

In essence the Markets-Alert system will utilize Bloomberg Securities trading data, and historical chart data, on which it will then conduct real time technical analysis scanning, and then serve back to users of the Bloomberg Terminal.

This will require the addition/modification of the current M-A client technical query parameter library, into the Bloomberg Terminal, to allow users to generate Analytic queries to send to the Markets-Alert server platform, and then to display the results.
