

# eSpeed's Copying - STATIC

In playing with the futures views, I have more than once clicked on a size, only to have the order entered for an unintended price - because in the time it has taken to click the size after I focus on it, the prices have shifted up or down in the grid. This is maybe why the TT view requires a specific user command to re-center the prices, and instead moves the center line up and down with the market.
