Overview of the '284 Patent

1. Imaging apparatus comprising:

at least one imager that moves relative to a scene so as to acquire a plurality of optical images of at least portions of the scene, each of at least two of said optical images being viewed from a different respective viewing position;

a processor that receives image data representative of said at least two of the optical images and processes the data to divide each image into a plurality of segments and to generate a plurality of mosaics of the scene, such that: each mosaic contains segments taken from different ones of said optical images;

segments relating to at least one part of the scene are derived from at least two optical images and appear in at least two mosaics;

the different segments of the two optical images in a given mosaic represent different parts of the scene; and

a display that receives a plurality of the mosaics and displays them so as to provide a sense of depth of the scene.
