

Windows Sockets

An Open Interface for Network Programming under Microsoft Windows

Version 1.1
20 January 1993

Note

This HTML version of the Windows Socket 1.1 Specification is provided by Mark Towfiq. It may be freely redistributed, either as provided or in modified form. Winsock providers may integrate it into their product documentation without incurring any obligation.

Acknowledgements

I am indebted and thankful to:

- [Joel Golberger](#) of InfoMagic, Inc. for the work he did on the [Windows Help version of the Windows Sockets Specification](#). I used [his .RTF file](#) as the source file for this document.
- [Chris Hector](#) of Cray Research Inc. for his package [rtftohtml](#), which was used to generate this document.

Mark Towfiq (towfiq@East.Sun.Com)

Table of Contents

- [Authors and Copyright](#)
- [Acknowledgments](#)
- [Introduction](#)
 - [What is Windows Sockets](#)
 - [Berkeley Sockets](#)
 - [Microsoft Windows and Windows-specific extensions](#)
 - [The Status of this Specification](#)
 - [Revision History](#)
 - [Windows Sockets Version 1.0](#)
 - [Windows Sockets Version 1.1](#)
- [Programming with Sockets](#)
 - [Windows Sockets Stack Installation Checking](#)
 - [Sockets](#)
 - [Basic concepts](#)
 - [Client-server model](#)

- Out-of-band data
- Broadcasting
- Byte Ordering
- Socket Options
- Database Files
- Deviation from Berkeley Sockets
 - socket data type and error values
 - select() and FD *
 - Error codes - errno, h_errno & WSAGetLastError()
 - Pointers
 - Renamed functions
 - Blocking routines & EINPROGRESS
 - Maximum number of sockets supported
 - Include files
 - Return values on API failure
- Raw Sockets
- Windows Sockets in Multithreaded Versions of Windows
- Socket Library Overview
 - Socket Functions
 - Blocking/Non blocking & Data Volatility
 - Database Functions
 - Microsoft Windows-specific Extension Functions
 - Asynchronous select() Mechanism
 - Asynchronous Support Routines
 - Hooking Blocking Methods
 - Error Handling
 - Accessing a Windows Sockets DLL from an Intermediate DLL
 - Internal use of Messages by Windows Sockets Implementations
 - Private API Interfaces
- Socket Library Reference
 - Socket Routines
 - accept()
 - bind()
 - closesocket()
 - connect()
 - getpeername()
 - getsockname()
 - getsockopt()
 - htonl()
 - htons()
 - inet_addr()
 - inet_ntoa()
 - ioctlsocket()
 - listen()
 - ntohl()
 - ntohs()
 - recv()
 - recvfrom()
 - select()
 - send()
 - sendto()
 - setsockopt()

- [shutdown\(\)](#)
- [socket\(\)](#)
- [Database Routines](#)
 - [gethostbyaddr\(\)](#)
 - [gethostbyname\(\)](#)
 - [gethostname\(\)](#)

This document may be freely redistributed in any form, electronic or otherwise, provided that it is distributed in its entirety and that the copyright and this notice are included. Comments or questions may be submitted via electronic mail to WinSock@MailBag.Intel.Com. Requests to be added to the Windows Sockets mailing list should be addressed to MajorDomo@MailBag.Intel.Com. This specification, archives of the mailing list, and other information on Windows Sockets are available via anonymous FTP from the host [SunSite.UNC.Edu, directory /pub/micro/pc-stuff/ms-windows/winsock](ftp://SunSite.UNC.Edu/directory/pub/micro/pc-stuff/ms-windows/winsock). Questions about products conforming to this specification should be addressed to the vendors of the products.

Acknowledgments

The authors would like to thank their companies for allowing them the time and resources to make this specification possible: JSB Corporation, Microdyne Corporation, FTP Software, Sun Microsystems, and Microsoft Corporation.

Special thanks should also be extended to the other efforts contributing to the success of Windows Sockets. The original draft was heavily influenced by existing specifications offered and detailed by JSB Corporation and NetManage, Inc. The "version 1.0 debate" hosted by Microsoft in Seattle allowed many of the members of the working group to hash out final details for 1.0 vis-a-vis.

Sun Microsystems was kind enough to allow first time implementors to "plug and play" beta software during the first Windows Sock-A-Thon of Windows Sockets applications and implementations at Interop Fall '92. Microsoft has shared WSAT (the Windows Sockets API Tester) with other Windows Sockets implementors as a standard Windows Sockets test suite to aid in testing their implementations. Finally, Sun Microsystems and FTP Software plan to host the Windows Sock-A-Thon II in Boston February '93.

Without the contributions of the individuals and corporations involved in the working group, Windows Sockets would never have been as thoroughly reviewed and completed as quickly. In just one year, several competitors in the networking business developed a useful specification with something to show for it! Many thanks to all which participated, either in person or on e-mail to the Windows Sockets effort. The authors would like to thank everyone who participated in any way, and apologize in advance for anyone we have omitted.

Introduction

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
