The interface between the BSS and the mobile station is the already introduced radio interface, whereas the interface between the BSS and the NSS has been named the *A interface* in the *Specifications*. The MS, BSS and NSS form the operational part of the system, whereas the OSS provides means for the operator to control them. This model is shown in figure 2.4.

On this scale, the interactions between the subsystems can be grouped in two main categories. The bottom part of the figure corresponds to a chain:

external networks  $\Leftrightarrow$  NSS  $\Leftrightarrow$  BSS  $\Leftrightarrow$  MS  $\Leftrightarrow$  users

whose business as a whole is to provide transmission paths and means to establish them. This is the operational part of the system, handling the telecommunications traffic. Above it we find the control part, composed of the OSS and the operator, which interacts with the traffic handling part by observing and modifying it so as to maintain or improve its functioning.

---

## 2.1. SUB-SYSTEMS

This section will deal with each subsystem in turn. The main purpose is to introduce a number of terms, not to exhaust the subject. The level of detail here is just sufficient to get a general idea of the functional splits. More complete architectural considerations will be found in each of the other chapters of the book, where a more thorough description of the required functions will be found.

### 2.1.1. THE MOBILE STATION (MS)

The mobile station usually represents the only equipment the user ever sees from the whole system. Examples taken from the first types of GSM mobile stations to be on the market are shown in figures 2.5 and 2.6. Mobile station types include not only vehicle-mounted and portable equipment, but also handheld stations, which will probably make up most of the market.

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

## API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

## LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

## FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

## E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
