A number of entered words in which we have reason to believe trademark, service mark or other proprietary rights may exist have been designated as such by use of initial capitalization. However, no attempt has been made to designate as trademarks or service marks all personal computer words or terms in which proprietary rights might exist. The inclusion, exclusion or definition of a word or term is not intended to affect, or to express any judgment on, the validity or legal status of any proprietary rights which may be claimed in that word or term.

data: (1) Information, usually formatted in a special way. All software is divided into two general categories: *data* and *programs*. Programs are collections of instructions for manipulating data.

Data can exist in a variety of forms—as numbers or text on pieces of paper, as bits and bytes stored in electronic memory, or as facts stored in a person's mind.

Strictly speaking, data is the plural of *datum*, a single piece of information. In practice, however, people use *data* as both the singular and plural form of the word.

• See also *program*; *software*.

(2) The term *data* is often used to distinguish binary machine-readable information from textual human-readable information. For example, some applications make a distinction between *data files* (files that contain binary data) and *text files* (files that contain ASCII data).

• See also *binary*; *ASCII*.

(3) In database management systems, data files are the files that contain the database information, whereas other files, such as index files and data dictionaries, store administrative information.

• See also *database management system*; *data dictionary*.

database: (1) A collection of information organized in such a way that a computer program can quickly select desired pieces of data. You can think of a database as an electronic filing system.

Traditional databases are organized by *fields*, *records*, and *files*. A *field* is a single piece of information; a *record* is one complete set of fields; and a *file* is a collection of records. For example, a telephone book is analogous to a file. It contains a list of records, each of which consists of three fields: name, address, and telephone number (see page 21).

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
