PHILIPS

Single pole double throw (SPDT) switch SA630

DESCRIPTION

The SA630 is a wideband RF switch fabricated in BiCMOS technology and incorporating on-chip CMOS/TTL compatible drivers. Its primary function is to switch signals in the frequency range DC - 1GHz from one 50Ω channel to another. The switch is activated by a CMOS/TTL compatible signal applied to the enable channel 1 pin (ENCH1).

The extremely low current consumption makes the SA630 ideal for portable applications. The excellent isolation and low loss makes this a suitable replacement for PIN diodes.

The SA630 is available in an 8-pin dual in-line plastic package and an 8-pin SO (surface mounted miniature) package.

FEATURES

- Wideband (DC - 1GHz)
- Low through loss (1dB typical at 200MHz)

- Low DC power (170∞A from 5V supply)
- Fast switching (20ns typical)
- Good isolation (off channel isolation 60dB at 100MHz)

PIN CONFIGURATION

APPLICATIONS

The typical applications schematic and printed circuit board layout of the SA630 evaluation board is shown in Figure 4. The layout of the board is simple, but a few cautions need to be observed. The input and output traces should be 50Ω. The placement of the AC bypass capacitor is *extremely critical* if a symmetric isolation between the two channels is desired. The trace from Pin 7 should be drawn back towards the package and then be routed downwards. The capacitor should be placed straight down as close to the device as practical. For better isolation between the two channels at higher frequencies, it is also advisable to run the two output/input traces at an angle. This also minimizes any inductive coupling between the two traces. The power supply bypass capacitor should be placed close to the device. Figure 10 shows the frequency response of the SA630. The loss matching between the two channels is excellent to 1.2GHz as shown in Figure 13.
