

Ex. PGS 1021

EIGHTH EDITION

Modern Control Systems

RICHARD C. DORF

University of California, Davis

ROBERT H. BISHOP

The University of Texas at Austin

 **ADDISON-WESLEY**

An imprint of Addison Wesley Longman, Inc.

Menlo Park, California • Reading, Massachusetts • Harlow, England
Berkeley, California • Don Mills, Ontario • Sydney • Bonn • Amsterdam • Tokyo • Mexico City

Additional Addison Wesley Longman Control Engineering titles:

Feedback Control of Dynamic Systems,

Third Edition, 0-201-52747-2

Gene F. Franklin and J. David Powell

Digital Control of Dynamic Systems,

Third Edition, 0-201-82054-4

Gene F. Franklin, J. David Powell,
and Michael L. Workman

The Art of Control Engineering,

0-201-17545-2

Ken Dutton, Steve Thompson,
and Bill Barraclough

Introduction to Robotics,

Second Edition, 0-201-09529-9

John J. Craig

Fuzzy Control, 0-201-18074-X

Kevin M. Passino and Stephen Yurkovich

Adaptive Control,

Second Edition, 0-201-55866-1

Karl J. Åström and Björn Wittenmark

Control Systems Engineering,

Second Edition, 0-8053-5424-7

Norman S. Nise

Computer Control of Machines and Processes,

0-201-10645-0

John G. Bollinger and Neil A. Duffie

Multivariable Feedback Design

0-201-18243-2

Jan Maciejowski

Assistant Editor, Laura Cheu

Editorial Assistant, Royden Tonomura

Senior Production Editor, Teri Hyde

Art and Design Supervisor, Kevin Berry

Composition and Film Buyer, Vivian McDougal

Manufacturing Supervisor, Janet Weaver

Copyeditor, Nick Murray

Proofreader, Anna Reynolds-Trabucco

Illustrations, Scientific Illustrators & Karl Miyajima

Cover Design, Yvo Riezebos

Finally, we introduce the Sequential Design Example: Disk Drive Read System. This example will be considered sequentially in each chapter of this book. It represents a very important and practical control system design problem while simultaneously serving as a useful learning tool.

1.1 INTRODUCTION

Engineering is concerned with understanding and controlling the materials and forces of nature for the benefit of humankind. Control system engineers are concerned with understanding and controlling segments of their environment, often called **systems**, to provide useful economic products for society. The twin goals of understanding and control are complementary because effective systems control requires that the systems be understood and modeled. Furthermore, control engineering must often consider the control of poorly understood systems such as chemical process systems. The present challenge to control engineers is the modeling and control of modern, complex, interrelated systems such as traffic control systems, chemical processes, and robotic systems. Simultaneously, the fortunate engineer has the opportunity to control many very useful and interesting industrial automation systems. Perhaps the most characteristic quality of control engineering is the opportunity to control machines and industrial and economic processes for the benefit of society.

Control engineering is based on the foundations of feedback theory and linear system analysis, and it integrates the concepts of network theory and communication theory. Therefore control engineering is not limited to any engineering discipline but is equally applicable to aeronautical, chemical, mechanical, environmental, civil, and electrical engineering. For example, quite often a control system includes electrical, mechanical, and chemical components. Furthermore, as the understanding of the dynamics of business, social, and political systems increases, the ability to control these systems will increase also.

A **control system** is an interconnection of components forming a system configuration that will provide a desired system response. The basis for analysis of a system is the foundation provided by linear system theory, which assumes a cause–effect relationship for the components of a system. Therefore a component or **process** to be controlled can be represented by a block, as shown in Fig. 1.1. The input–output relationship represents the cause-and-effect relationship of the process, which in turn represents a processing of the input signal to provide an output signal variable, often with a power amplification. An **open-loop control system** utilizes a controller or control actuator to obtain the desired response, as shown in Fig. 1.2. An open-loop system is a system without feedback.

An open-loop control system utilizes an actuating device to control the process directly without using feedback.

FIGURE 1.1
Process to be controlled.

FIGURE 1.2

system (without
feedback).

FIGURE 1.3
Closed-loop
feedback control
system (with
feedback).

In contrast to an open-loop control system, a closed-loop control system utilizes an additional measure of the actual output to compare the actual output with the desired output response. The measure of the output is called the **feedback signal**. A simple **closed-loop feedback control system** is shown in Fig. 1.3. A feedback control system is a control system that tends to maintain a prescribed relationship of one system variable to another by comparing functions of these variables and using the difference as a means of control.

A feedback control system often uses a function of a prescribed relationship between the output and reference input to control the process. Often the difference between the output of the process under control and the reference input is amplified and used to control the process so that the difference is continually reduced. The feedback concept has been the foundation for control system analysis and design.

A closed-loop control system uses a measurement of the output and feedback of this signal to compare it with the desired input (reference or command).

Due to the increasing complexity of the system under control and the interest in achieving optimum performance, the importance of control system engineering has grown in the past decade. Furthermore, as the systems become more complex, the interrelationship of many controlled variables must be considered in the control scheme. A block diagram depicting a **multivariable control system** is shown in Fig. 1.4.

control system.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
