

- 41 -

included in client programs that wish to contact handle servers.

Caches are used by clients to reduce the load on the other handle servers, particularly the global handle server, G. Resolution of handles using caches is, in  
5 general, faster than resolution without caches. The caching server is a shared cache to be used by a group of clients. The architecture also allows a cache to be incorporated within an individual client.

10 The recommended configuration is for any client, C, to have an assigned cache, C1. This can be integrated into the client or can be caching server shared by several clients. C1, itself, may be connected to a higher order caching server, C2. To avoid resolution involving  
15 many steps, the recommended configuration is to have no more than two levels of caches, C1 and C2.

A proxy server 1246 has been developed that acts as a client to the handle system for use with World Wide Web browsers and other clients. The client passes a  
20 handle to the proxy server which attempts to resolve it. If the handle can be resolved into one or more URLs, a URL is returned to the client.

The proxy server is configured as a separate server to be used by a group of clients. The recommended  
25 configuration is that every organization that wishes to use the handle system should provide both a caching and proxy server for its community.

A proxy server has been developed in consultation with the National Center for Supercomputing Applications,  
30 the developer of Mosaic, but is intended to work with other clients that support proxies. Mosaic will be configured to use the proxy when a handle is specified in place of a URL. The proxy server will be supported by future releases of Mosaic. It is also compatible with  
35 the earlier proxy server developed by CERN.

- 42 -

We now describe how a client, C, resolves any handle, h. Note that (a) each handle server can be implemented as one or more server computers; (b) checks are required to prevent looping through indirect handles; (c) the client may not have access permissions for all local handle servers; (d) the client request may ask for all the data in a handle record or data of specified types only; (e) because the local handle servers are independently managed, the client may encounter inconsistent data or unacceptably poor response from a server.

If the client, C, is not attached to any caching server, it uses the following steps to resolve a handle, h.

1. C sends a query to G.

If the handle record for h is stored in G, G resolves h.

Otherwise, G returns the address of P, the primary handle server of naming authority, n.

2. If h is not yet resolved, C sends h to P.

If h is stored in P and C has the correct access permissions, P resolves h.

Otherwise, if there is an indirect handle to another handle server, M, which stores h, P sends the client the address of M.

3. If h is not yet resolved, the client, C, sends h to M.

If the client has the correct access permissions, M resolves h. (If C does not have permission, it should try other handle servers that hold the handle.)

If the client, C, is connected to a cache, C1, resolution of h follows these steps:

1. The client, C, asks C1 to resolve h.

If the handle record of h is in the cache, the handle record is returned to C.

- 43 -

2. Otherwise, if the identity of P, the primary handle server of naming authority n, is stored in C1, C1 resolves the handle following steps 2 and 3 above in the description of resolution without caching.

5           3. If the handle has not been resolved, and C1 is connected to a higher cache, C2, C1 asks C2 to resolve both h and P, and pass the results to C1 to be saved in C1's cache.

10           If h and P are not in C2's cache, the request is passed to the next higher cache, until the handle is resolved until the highest cache is reached. (The recommended configuration is to have no more than two levels of cache.)

15           4. If there is no higher cache, then the cache sends a request to G asking for the resolution of h and P. The resolution algorithm then continues as in the description of resolution without caching.

          The handle server system is intended to be a means of universal basic access to registered digital objects.  
20 In the worst case, a user can present a handle to a handle server and be advised of some repository which an authorized party has asserted contains the digital object designated by the handle. The handle server is not meant to be the only, or even primary, means, to locate  
25 repositories. Primary access may be provided locally and also by value-added service providers, likely in a variety of different and possibly incompatible ways. Users interacting with such services may not encounter handles; and such services may interact with repositories  
30 via RAP or via protocols that do not involve handles.

          Handle servers provide a number of services, three of which are RESOLVE, INSERT, and DELETE. A party that is authorized to insert, delete and otherwise change handle entries for a particular naming authority is  
35 called a handle administrator. A naming authority will

- 44 -

generally designate one or more repositories to act as handle administrators on its behalf. This designation will be made known by the naming authority to the handle server system.

5 RESOLVE

A handle is sent to a handle server to locate network addresses of repositories containing that object. The handle is first mapped to locate the handle server from the handle directory server table but is not  
10 otherwise interpreted. One can also supply a handle to a separate system, which invokes the above procedures to find the stated object. Local handle servers may use any technique to do the mapping. The handle servers maintained as part of the infrastructure map the handles  
15 by hashing them.

To resolve a handle, a handle server receives as input a handle and returns some or all of the fields of typed data in the corresponding handle record. The client can request that all data fields in the handle  
20 record be returned or only those fields that contain data of a given type.

No guarantee is made that the identified repositories will provide the designated object. Rather, the user is assured only that the specified repositories  
25 are where authorized maintainers of repository services have indicated particular digital objects reside.

Since a handle is just a unique string, it can be mapped to an actual repository by any of several mechanisms, including a mechanism that attempts to  
30 interpret the string. Repository names are not actual network addresses; they must first be mapped to network locations. The method for accomplishing these mappings is not specified. The handle service is one available means for both kinds of mappings; it would specify at  
35 least the location of the interface that supports the RAP

- 45 -

protocol for a given repository. There may also be a need to explicitly provide a country identifier for repositories, naming authorities and/or originators. For the present, however, country identifiers are be omitted.

5           When a repository is identified by a handle server, it will be most efficient to map the handle directly into the network address (or addresses) of the repository. This mapping avoids having to do a double lookup from repository name to repository location.  
10 However, if the location of the repository were to change, the handle server would have to be notified so it could make the corresponding changes. It is possible that certain repository names may resolve to broadcast addresses to locate specific machines. This might be the  
15 case where a single repository consists of multiple machines on a local area network at a given site. The handle administrator may determine whether to store IP addresses or domain names or other information in the handle server. The entries are typed and therefore one  
20 or more of the above information types may be provided by the administrator for retention in the handle server.

INSERT (DELETE)

Information associating handles with network services are inserted into (deleted from) the handle  
25 server system by the handle administrator or other parties authorized by it. Such authorized parties include repositories of record. The repository of record is presumed to make known to the handle server system that it contains (or no longer contains) a particular  
30 digital object some reasonable time after the digital object is deposited in (withdrawn from) it. Similarly, the repository of record would make known to the handle server system the identity of other repositories which it authorizes to store a given digital object. The handle  
35 server system may perform certain administrative

- 46 -

functions upon receipt of unauthorized requests. In addition, some form of reporting may be desirable to insure that entities that misbehave can be detected.

The handle server system is intended as a safety net of information about where digital objects reside. There will no doubt be other, valuable services that provide information to users about the location of digital objects in repositories.

We do not require repositories to provide a description of their contents. Repositories may not house coherent collections, and hence, querying or searching a repository may be a service appropriate only to the repository administrator, not to a user. Presumably, such capabilities will exist in the form of value-added services. It is such services, rather than repositories per se, that users would interrogate to identify digital objects of a certain nature. Such services may, of course, be offered by repositories themselves, especially in the case when one is intended to house a coherent collection. However, such a server is not a requirement of a well-behaved repository.

In one example, the handle server directory holds a table which associates hash ranges with domain names of handle servers (Figure 7).

#### 25 Obtaining Pointers from a Handle

Given a handle, the following steps, shown in Figure 8, are followed to obtain a set of pointers associated with the handle.

In a first step 170, a client system downloads the table that associates hash ranges with handle server domain names from the handle server directory for future use. The client also can omit this step if it has previously stored the table; frequent changes in the table may necessitate doing this every time. In a later step 172, assume the system obtains a handle for which

- 47 -

pointers are desired. The system then generates the hash code for the handle using a predetermined hashing algorithm (step 174) and consults the hash range/handle-server-domain-name table to determine the domain name of the appropriate handle server (step 176). The system subsequently sends the handle to the handle server as part of a request pointer information UDP packet (step 178).

The handle server then returns its response to the requesting system. If the handle server found the pointers, a list of pointers is returned (step 180). This could include pointers to use one or more repositories and one or more RMS's. If the handle was sent to the wrong handle server, it returns a not-responsible-for-handle message (step 182). In this case, the client system should download the hash range/handle-server-domain-name table from the handle server directory again and attempt the mapping again. The requester will determine how many times to try before giving up (and this same approach is used in other similar situations described below).

If the request was sent to the correct handle server, but the requested handle could not be found, the handle server returns a handle-not-found message (step 184).

#### Overview of Application for Rights Registration

There are two mechanisms used to register rights: an applicant may apply for a rights registration on an object which is located on his own system 42 or on an object which has been stored in a repository 36.

In order to submit and process a rights registration application the following general steps (described in more detail later) must occur.

First, as seen in Figure 9, the rights registration application is created, and the application

- 48 -

and the associated object are submitted to the registration system. The steps required to perform this depend on the location of the digital object. In registering an object which is located on the applicant's own system, the applicant first makes the object available to his own system (if it was created somewhere else) (step 60). The applicant then runs a rights registration program in a step 62, and he fills in a rights registration application template. The application and the associated object are electronically mailed (as a PEM message) to the registration system (step 64), which performs simple syntactic checking on the application (step 66), and verifies that the associated object has not been corrupted (step 68).

If the object has not yet been placed in the repository, the applicant first places the object in the repository (step 70). The applicant then runs the rights registration program, and he fills in the copyright registration application template (step 62). The application and the object's handle are electronically mailed (PEM) to the registration system (step 64), which performs simple syntactic checking on the application (step 66). The registration system then retrieves the object from the repository in a step 72 and verifies that the retrieved associated object has not been corrupted (step 68).

After the registration system has checked the object, it creates an initial Receipt In Progress (RIP) record and sends it to the tracking system (step 74). The tracking system verifies that the account number presented in the record is valid and that sufficient funds exist in the account to process the application (step 76).

The application and the associated object can now be accessed by the rights examiner, by running an

- 49 -

examiner's user interface program on the examiner's workstation (step 78). Once the examiner approves the application, the registration system assigns a registration number, and the system creates the rights  
5 registration certificate (step 80). A copy of the certificate is mailed electronically to the rights registrant. An updated RIP record which shows the registration application's final status is subsequently sent to the tracking system (step 82).

10 Registering an Object not in a Repository

The detailed steps for registering without first depositing a copy in a repository are shown in Figures 10 through 13.

First, the user 42 (the rights applicant)  
15 generates a digital signature for the object (step 250) using a private key and makes the object 43 (in one file), digital signature 45 (in a second file), and public key certificate chain 47 (in a third file) available to the UA system 34 (step 252). The UA user  
20 supplies rights registration application information 49 by filling out a form on the screen. If the user does not fill in the publication date field, then the object is considered unpublished by the rights registrar. If the field is filled in, then the object is treated like a  
25 published work. The UA user digitally signs the rights application information in a step 254.

The UA then sends a PEM/MIME message 202 to the registration system 40. (MIME is a multimedia electronic mail specification to allow for multimedia objects to be  
30 handled.) The message contains the object, the user's digital signature 45 over the object, the public key certificate chain 47 for the user, the rights registration application 49 information, a digital signature (not shown) over the rights registration  
35 application information, and the UA user's public key

- 50 -

certificate chain (not shown) (step 256). The entire message is signed by the UA user.

The registration system 40 receives the PEM/MIME message. An entry recording the receipt of the message  
5 is placed into a log file in a step 258.

The registration system verifies that it accepts rights applications from the distinguished name of the UA user (step 260). If not, it returns a message to the UA user, and the verification failure is recorded in the log  
10 file (step 262).

The registration system attempts to validate the digital signature over the entire message in step 264. If validation fails (i.e., the decrypted hash value does not match the computed message hash or one of the  
15 certificates in the public key certificate chain has been revoked), a message is returned to the UA user. The validation failure is recorded in the log file (step 262). If the validation succeeds, then an application received message is sent to the UA user (step 266).

20 The registration system attempts to validate the rights registration information (only simple checks are performed) in step 268. If validation fails, a message is returned to the UA user. The validation failure is recorded in the log file (step 262).

25 If the object was included in the PEM/MIME message (step 270), the registration system attempts to validate the digital signature over the object (step 272). If validation fails, a message is returned to the UA user. The validation failure is recorded in the log file (step  
30 262).

If the validations of the application information and the object (if it was included in the PEM/MIME message) were successful, then the following are entered in step 274 into the registration system's work in  
35 progress database: the application information; the

- 51 -

digital signatures; the public key certificate chains; and the object (if available). The entry into the work in progress database is recorded in the log file.

If the PEM/MIME message did not include the object  
5 (step 276), the registration system attempts to retrieve a copy of it in step 278. If the attempt fails, a message is sent to the UA user (step 280). The application information, digital signatures, and public key certificates are removed from the work in progress  
10 database. Entries are made in the log file recording the retrieval failure and the removal of the information from the work in progress database in step 282.

If the retrieval attempt succeeds, then the registration system attempts to validate the digital  
15 signature over the object in step 284. If validation fails, a message is sent to the UA user (step 280). The application information, digital signatures, and public key certificates are removed from the work in progress database. Entries are made in the log file recording the  
20 validation failure and the removals from the work in progress database (step 282).

If the object has been published (the rights user filled in the published date field) (step 286), then the object is placed in the acquisition queue in step 288.

25 The registration system now prepares an initial Receipt In Progress (RIP) record (step 290). The registration system converts the information located in the title and claimant name fields in the registration request into the title and claimant name fields in the  
30 RIP record. The following conversions are performed: title words that are located in a stop word list are deleted and title words that are located in an abbreviated terms list are abbreviated.

A bar-code number (or other identifier) is  
35 assigned to the registration request (step 290). A

- 52 -

verify and debit request, which contains the bar-code number (and other RIP record information) is formatted and sent to the tracking system via the File Transfer Protocol (FTP) in step 292.

5           The tracking system verifies the account (step 294) and debits the requested amount from the account. If the account is not valid, the tracking system will send an invalid account number presented message to the registration system (step 296). If the account is valid,  
10 but insufficient funds exist for this transaction (step 298), then the tracking system will send an insufficient funds message to the registration system (step 296). In either error case, the validation failure is recorded in the registration system's log file; and the rights  
15 registration application is removed from the works in progress database (step 282). If the object was unpublished, it is deleted from the registration system in step 300. If a published object and registration request is resubmitted, it is possible that a object  
20 might be placed in the acquisition queue multiple times. Manual procedures catch the duplicate entries.

If the tracking system 46 (Figure 10) successfully performed the account verification and debit processing, it sends an account is OK message to the registration  
25 system in step 302. the tracking system prepares an initial RIP record and places it in it's database. If the object was unpublished, a copy of it is placed into the acquisition queue.

The registration system moves the registration  
30 request to the examiner queue database in step 304. The registrar user's workstation 50 (Figure 10) now has access to the registration request. The examiner uses workstation 50 to view the object on the screen, to add his name to the examined by line on the application form  
35 and to record the class designation for the rights

- 53 -

registration (step 306). The converted form of the author and title (as stored in the RIP record) are also shown to the examiner.

If the examiner approves the application (step 5 308), an examination-is-approved message is sent from the workstation to the registration system in a step 310. The registration system assigns a registration number (step 312), and the system creates and digitally signs the rights registration certificate, which includes the 10 registration number and the date on which registration was granted (step 314). The rights registration certificate is sent in a PEM message to the UA user in a step 314. The certificate may be sent directly to the UA or indirectly via the repository. The certificate is 15 archived on the registration system (step 312). The certificate also could be stored on a system that retains the scanned images of the manually created certificates.

If the examination results in the rights registration application being rejected, the examiner 20 uses the workstation to send a rights registration rejection PEM message via the UA to the applicant explaining the rejection (step 318).

If the registration was approved or denied, an updated RIP record is forwarded to the tracking system in 25 a step 320. Once the tracking system has added the record to its database, it sends a RIP-record-update-OK message to the registration system (step 322).

In step 324, the registration system moves the registration request to the cataloging system. The 30 cataloger's workstation 57 (Figure 10) now has access to this registration request.

Using a connection to the cataloging system, the cataloger creates the cataloging information in step 326. When the task is finished, the workstation sends a 35 finished catalog message to the registration system (step

- 54 -

328). The registration system places a registration-application-processing-complete message in the log file (step 330).

#### Placing an Object into a Repository

5 Alternatively, the rights holder may choose first to place an object into a repository, as shown in Figures 14 through 17.

In a first step 350, the user 42 makes the object (object) available to the UA 34. The UA then sends a  
10 request for a handle to a handle generator system 36 (step 352).

The handle generator system sends a handle to the UA system (udp) in step 354.

The UA sends a PEM message to the rights manage-  
15 ment system 38 containing the handle, any non-simple terms and conditions for obtaining a copy of the object (which must include free access to the object for the registrar), and the list of distinguished names of those who are allowed to make changes to the information  
20 (stored in the RMS) which is associated with the handle (step 356). The PEM message is signed by the UA user.

The RMS verifies that it accepts new submissions from the distinguished name of the UA user in step 358. If not, the RMS sends an invalid-distinguished-name PEM  
25 message to the UA user and discards the contents of the received message (step 360).

The RMS validates the digital signature on the received PEM message (step 362). If the validation fails, the RMS sends an invalid-digital-signature PEM to  
30 the UA user and discards the contents of the received message (step 360).

The RMS verifies that it does not already have a set of terms and conditions stored for the handle (step 364). If it does, it sends a terms-and-conditions-

- 55 -

already-registered PEM to the UA user and discards the contents of the received message (step 360).

The RMS stores the handle and the associated terms and conditions (step 366) and sends a confirming PEM to  
5 the UA user (step 368).

In a step 370, the UA system computes the digital signature over: the object's handle; a date/time group (the nominal date/time of submission of the object to the repository); and the object.

10 The UA system sends a PEM/MIME message to the repository 36 (Figure 14) containing the object's handle, the submission date/time group, the object (or the information needed to retrieve a copy of the object), the UA user's digital signature over the above, the UA user's  
15 public key certificate chain, the simple terms and conditions for the object, if any, and the distinguished name or names of the RMS(s) holding the non-simple terms and conditions for the object, if applicable. The entire message is signed by the UA user (step 372).

20 The repository verifies that it accepts object submissions from the distinguished name of the UA user in a step 374. If not, it sends an invalid-distinguished-name PEM message to the UA user and discards the received message (step 376).

25 The repository validates the digital signature over the entire message in step 378. If the validation fails, the repository sends an invalid-digital-signature PEM message to the UA user and discards the received message (step 376).

30 If the object was not included in the received PEM/MIME message (step 380), the repository attempts to retrieve a copy of the object (e.g., via anonymous FTP) in a step 382. If retrieval fails, the repository sends an object-retrieval-failed PEM message to the UA user and  
35 discards the received message (step 376).

- 56 -

The repository validates the UA user's digital signature over the handle, nominal submission date/time group, the object (step 384), and the reasonableness of the submission date/time group (not in the future, not  
5 too far in the past) (step 386). If either of these validations fail, the repository sends an invalid-submission PEM to the UA user and discards the received message (step 376).

In step 388, the repository stores the object's  
10 handle, the submission date/time group, the object, the UA user's digital signature over the above, the UA user's public key certificate chain, the simple terms and conditions for the object, if any, the distinguished name of RMS, if applicable, and other properties. The  
15 repository then computes its own digital signature over the handle, the submission date/time group from the received message and the object (step 390). In step 392, the repository sends a PEM to the UA user containing the handle, the repository's digital signature, and the  
20 repository's public key certificate chain.

In step 394, the UA system verifies the repository's digital signature over the handle, date/time group, and object. The UA system then stores the handle, the nominal submission date/time group, the object, the  
25 repository's digital signature, and the repository's public key certificate chain (step 396).

The UA system computes the hash of the object's handle using the handle system hashing function (step 398). The UA system then looks up the domain name of the  
30 handle server 38 responsible for the handle in its cached copy of the hash value/handle server table (step 400).

In step 402, the UA system sends a PEM to the handle server containing the handle, and one or more pairs of domain name of repository and domain name of the  
35 RMS, and a list of distinguished names of persons who are

- 57 -

permitted to change the pairs of domain names associated with the handle. The message is signed by the UA user.

The handle server receives the PEM message and verifies that it is responsible for the handle in step 5 404. If not, it sends an invalid-handle-server-selected PEM to the UA user and discards the other information (step 406). If the UA system receives an invalid-handle-server-selected rejection message from the handle server, it downloads a new copy of the hash value/handle server 10 table from the handle server directory 59 (Figure 15) (step 408) and repeats steps 398 through 404.

If the handle server is responsible for the handle submitted by the UA system, it validates the digital signature over the PEM message in step 410. If the 15 validation fails, the handle server sends an invalid-digital-signature PEM message to the UA user and discards the other information (step 412).

The handle server verifies that it accepts submissions from the distinguished name of the UA user in 20 step 414. If not, the handle server sends an invalid-distinguished-name PEM message to the UA user and discards the other information (step 412).

The handle server verifies the syntax of the pairs of domain names submitted with the handle in step 416. 25 If it detects any errors, it sends an invalid-handle-submission-record syntax PEM message to the UA user and discards the other information (step 412).

The handle server stores the handle, the pairs of domain names, and the list of distinguished names (step 30 418) and sends a PEM acceptance message to the UA user (step 420).

#### Registering an Object Already in a Repository

After the object has been deposited, an application to register may be submitted (Figures 18 35 through 22).

- 58 -

The user (the rights applicant) 42 first generates a digital signature for the object (step 450) and makes the digital signature (in a file), and public key certificate chain (in a second file) available to the UA system 34 (step 452).

The UA user supplies the rights registration application information by filling out a form on the screen in step 454. This includes the handle 203 for the object already stored in a repository. Any object stored in a repository is considered published by the rights registrar. Therefore, the publication date field must be entered in the application form. The UA user digitally signs the rights application information.

In step 456, the UA system sends a PEM/MIME message to the registration system 40 containing the object's handle, the user's digital signature over the object, the public key certificate chain for the user, the rights registration application information, the digital signature over the rights registration application information, and the UA user's public key certificate chain. The entire message is signed by the UA user.

The registration system receives the PEM message. An entry recording the receipt of the message is placed into a log file in step 458. The registration system then verifies that it accepts rights applications from the distinguished name of the UA user (step 460). If not, it returns an unknown-account PEM to the UA user, and the verification failure is recorded in the log file (step 462).

The registration system attempts to validate the digital signature over the entire message in step 464. If validation fails (i.e., the decrypted hash value does not match the computed message hash or one of the certificates in the public key certificate chain has been

- 59 -

revoked), a received-corrupted-application PEM is returned to the UA user. The validation failure is recorded in the log file in step 462.

If the validation succeeds, then an application-  
5 received PEM is sent to the UA user in step 466.

The registration system attempts to validate the rights registration information (only simple checks are performed) in step 468. If validation fails, a rights-application-is-formatted-incorrectly PEM is returned to  
10 the UA user. The validation failure is recorded in the log file (step 462).

If the validation of the application information was successful, then the following are entered into the registration system's work in progress database: the  
15 application information, the digital signatures, and the public key certificate chains. The entry into the work in progress database is recorded in the log file in step 470.

The registration system hashes the object's handle  
20 in step 472. It uses this hash to perform a table lookup in the hash code/handle server table (step 474), which was previously obtained from the handle server directory. The registration system then sends a request-for-pointer-information UDP packet to a handle server 58 (Figure 18)  
25 in step 476.

In step 478, the handle server verifies that the handle falls within the set of handles for which hash values it is responsible. If it is not in this set, the handle server sends an invalid-handle-server-selected  
30 response UDP packet to the registration system (step 480).

If the registration system receives an invalid-handle-server-selected response UDP packet, it refreshes its hash code/handle server table from the handle server

- 60 -

directory (step 482), and the registration system repeats steps 472 and 474.

If the handle server is responsible for the handle, it verifies that the handle is present in its database in step 484. If not, it sends a handle-not-found response UDP packet to the registration system (step 486).

If the registration system receives a handle-not-found response UDP packet, it returns a requested-object-is-unavailable PEM message to the UA user (step 488), and the handle lookup failure is recorded in the log file. The registration system removes the entry for the registration request from the work in progress database in step 490.

If the handle server has the handle in its database, it returns the pointers associated with the handle in a UDP packet to the registration system in step 492.

For each pointer returned by the handle server, the registration system tries to obtain a copy of the object. If a copy is successfully obtained from one repository 36 (Figure 18), then the rest of the pointers are ignored. If the registration system cannot obtain the object from any of the repositories, the registration system returns an unable-to-obtain-a-copy-of-the-object PEM to the UA user (step 494). The failure to retrieve the object is recorded in the registration system's log file, and the rights registration entry is removed from the work in progress database (step 496).

If a pointer does not indicate that RMS 38 (Figure 18) negotiation is required, the registration system ignores the object pointer. If a pointer does indicate that RMS negotiation is required (step 498), the registration system attempts to obtain the object via the

- 61 -

RMS. First, in step 500, the registration system connects to the RMS.

The RMS returns a random-value tag to the registration system in step 502. In step 504, the  
5 registration system sends the following information to the RMS: the object's handle, the registrar's digital signature over the RMS generated random-value tag, the registrar's public key certificate chain, the domain name and the port number which will be used by the  
10 registration system to receive the object.

The RMS validates the digital signature over the random-value tag in step 506. If the signature is not correct, the RMS sends an invalid-random-value-tag response to the registration system in step 494. The  
15 registration system logs this error and removes the rights registration information from the work in progress database (step 496).

The RMS verifies in step 508 that the registration system meets the terms and conditions for the object. If  
20 the registration system does not meet the terms and conditions, a requester-unauthorized-rejection response is returned to the registration system (step 494). The registration system logs this error and removes the rights registration information from the work-in-progress  
25 database (step 496).

The RMS connects to the repository in step 510, and the repository returns a random-value tag to the RMS (step 512).

The RMS sends the following information to the  
30 repository in step 514: the object's handle; the RMS digital signature over the repository generated random-value tag; the RMS public key certificate chain; and the domain name and the port number which are used by the registration system to receive the object.

- 62 -

The repository verifies the digital signature of the RMS over the random-value tag in step 516. If the signature is not correct, the repository sends an invalid-random-value-tag response to the RMS (step 518).

5 The RMS logs the error and sends a remote-RMS-error-invalid-random-value-tag error to the registration system in step 520. The registration system then logs this error and removes the rights registration information from the work in progress database (step 522).

10 In step 524, the repository verifies that the RMS is allowed to request object transfers for the object. If the transfer is not allowed, the repository sends an invalid-RMS response to the RMS (step 518), which forwards the response to the registration system (step  
15 520). The registration system logs the error in its log file, and the rights registration information is removed from the work in progress database (step 522).

The repository sends a object-retrieval-is-allowed response to the RMS (step 526), and the repository  
20 disconnects from the RMS (step 528).

The RMS forwards the object-retrieval-is-allowed response to the registration system (step 530), and the RMS disconnects from the registration system (step 532).

25 The repository connects to the address/port specified in the original request, and it transmits to the registration system the object's handle and the object, signed by the repository in step 534. The repository then sends a object-has-been-delivered confirmation to the RMS (step 536).

30 The registration system validates the user's digital signature over the object in step 538. If validation fails, an invalid-object-digital-signature-presented PEM message is returned to the UA user in step 540. In step 542, the validation failure is recorded in

- 63 -

the log file, and the rights registration is removed from the works in progress database.

Steps 286 et seq. (Figure 11) are then followed. The registration system prepares an initial receipt in  
5 progress (RIP) record (step 290). The registration system converts the information located in the title and claimant name fields in the registration request into the title and claimant name fields in the RIP record. The following conversions are performed: title words that are  
10 located in a stop word list are deleted and title words that are located in an abbreviated terms list are abbreviated.

The object is placed into the work in progress database. A bar-code number is assigned to the  
15 registration request (step 290). A verify-and-debit request, which contains the bar-code number (and other RIP record information) is formatted and sent to the tracking system in step 292.

The tracking system verifies the account and  
20 debits the requested amount from the account in step 294. If the account is not valid, the tracking system will send an invalid-account-number presented message to the registration system (step 296). If the account is valid, but insufficient funds exist for this transaction (step  
25 298), then the tracking system will send an insufficient-funds message to the registration system (step 296). In either error case, the validation failure is recorded in the registration system's log file; the rights registration is removed from the works in progress  
30 database (step 282).

If the tracking system successfully performed the account verification and debit processing, it sends a  
account-is-OK message to the registration system in step  
302. the tracking system prepares an initial RIP record  
35 and places it in its database.

- 64 -

The registration system then moves the registration request to the examiner queue database in step 304. The examiner's workstation now has access to this registration request. The examiner uses the workstation 50 (Figure 18) to view the object on the screen, to add his name to the examined by line on the application form and to record the class designation for the rights registration (step 306). The converted form of the author and title (as stored in the RIP record) are also shown to the examiner.

If the examiner approves the application in step 308, an examination-is-approved message is sent from the workstation to the registration system (step 310). The registration system assigns a registration number (step 312), and the system creates and digitally signs the rights registration certificate, which includes the registration number and the date on which registration was granted (step 314). The rights registration certificate" is sent in a PEM message to the UA user in step 316. The certificate is archived on the registration system.

If the examination results in the rights registration application being rejected, the examiner uses the workstation to send a rights-registration-rejection PEM message to the applicant explaining the rejection (step 318).

If the registration was approved or denied, an updated RIP record is forwarded to the tracking system in step 320. Once the tracking system has added the record to its database, it sends a RIP-record-update-OK message to the registration system (step 322).

The registration system moves the registration request to the catalog queue database in step 324. The cataloger's workstation 57 (Figure 19) now has access to this registration request. Using a telnet window

- 65 -

connected to the cataloging system, the cataloger creates the cataloging information (step 326). When he is finished, the workstation sends a finished catalog message to the registration system in a step 328. In  
 5 step 330, the registration system places a registration-application-processing-complete message in the log file.

Once the registrar has completed its work, the object itself may be purged from the files of the registrar because the digital signature and the existence  
 10 of the full object at a repository are sufficient to assure that a valid copy of the object may be obtained at any time. This significantly reduces the storage requirements at the registrar.

#### Software Organization

15           The following software packages run on workstation 42:

MH w/PEM and MIME extensions	MH is a full featured user agent for handling Internet mail. Rather than being a single comprehensive program, MH consists of a collection of fairly simple single-purpose programs to send, receive, save, and retrieve messages. MH is extensible, other user agents may be layered on top of the MH executables. The MIME extensions provide multiple part multiple body type message capabilities (e.g., for multimedia mail).
------------------------------	--

20 PEM administrative tools	These tools are used to generate private and public keys and user certificates.
-----------------------------	---

The following executables run on the rights user's workstation 42:

- 66 -

`submit_registration` This tool is used to create and submit a rights registration application.

`install_ipms` This tool will install the MH/PEM and `submit_registration` tools on the rights user's workstation.

The registration and recordation system (RRS) must perform the following activities: the RRS must provide  
5 the user interface (as an X-windows client) for rights office personnel to view, edit, approve, reject or defer rights registration applications; the RRS must provide the user interface (as an X-windows client) for rights office personnel to view digital objects; the RRS must  
10 support electronic mail transmission and reception; the RRS must maintain several queues of the rights registration application as it passes through the various states of reception, examining and approval/disapproval; until the repository is completed, the RRS must save all  
15 of the digital objects received (as a temporary repository; until another storage facility is created/found, the RRS must retain all of the registration certificates that have been generated.

The following software packages run on the UA  
20 host:

`MH w/PEM and MIME extensions` MH is a full featured user agent for handling internet mail. Rather than being a single comprehensive program, MH consists of a collection of fairly simple single-purpose programs to send, receive, save, and retrieve messages. MH is extensible, other user agents may be layered on top of the MH executables.

- 67 -

PEM administrative tools These tools are used to generate private and public keys and user certificates.

The following executables run on the rights user's workstation:

5 Program/Daemon	Performs
receive_application	When <b>sendmail</b> receives a message addressed to "submit_registration", it will pass the message to <b>receive_application</b> , which will perform the initial verifications on the message.
retrieve_object	If the object was not included in the original message, this program attempts to retrieve the object. This program is executed periodically by <b>cron</b> . This program is also responsible for performing time-out functions (for retrieving the object).
prepare_init_RIP_record	This program, which is started by <b>receive_application</b> or <b>retrieve_object</b> is used to create and queue the initial RIP record, which will be sent to the tracking system.
10 xmit_files_to_the tracking system	This program, started by <b>cron</b> , is used to send already formatted files to the tracking system.

- 68 -

- get\_files\_from\_the tracking system** This program, started by **cron**, is used to retrieve response files from the tracking system.
- process\_init\_RIP\_response** If **get\_files\_from\_the tracking system** receives an initial RIP record response, it invokes this program to handle the response from the tracking system.
- view\_application** This user application is invoked by the Examiner to view, edit, accept or reject the rights application. This program also displays the digital objects to the Examiner. The Cataloger may also use this program to view the application and associated digital object.
- 5 **application\_queue\_server** This is the "back-end" process that manages application/object requests received from user programs (i.e. **view\_application**.)
- send\_resp\_to\_applicant** This program, which is invoked by **view\_application**, is used to send the application approval and certificate or the application rejection to the rights applicant.

- 69 -

- update\_RIP\_record** This program, which is invoked by **view\_application**, is used to create an updated RIP record, which will be transmitted to the tracking system, using **xmit\_files\_to\_the\_tracking\_system**.
- process\_update\_RIP\_resp** If **get\_files\_from\_the\_tracking\_system** receives an updated RIP record response, it invokes this program to handle the response from the tracking system.
- install\_rrs** This program is used to install the additional configuration files and software required for the RRS system.
- retrieve\_object**
- 5 **prepare\_init\_RIP\_record**  
**xmit\_files\_to\_the\_tracking\_system**  
**get\_files\_from\_the\_tracking\_system**  
**process\_init\_RIP\_response**  
**view\_application**
- 10 **application\_queue\_server**  
**send\_resp\_to\_applicant**  
**update\_RIP\_record**  
**process\_update\_RIP\_resp**  
**install\_rrs**

### Obtaining a Digital Object from a Repository

This section describes how a user may obtain an account and retrieve digital objects from repositories.

Before a user can retrieve any objects for which  
5 payment is required, the user must first establish an  
account with a payment server system 702 on the network  
(Figure 25). This system will be used to create new  
accounts, debit and credit user accounts, and interface  
with one or more credit service centers 704. Payment  
10 servers have the following attributes:

Payment servers must be qualified; it must be  
possible to verify that a payment server is valid.  
This may be accomplished by establishing payment  
server distinguished names; if a signed message is  
15 received from a server with a payment server  
distinguished name, then the payment server is  
valid.

Payment servers may charge users for establishing  
accounts.

20 Users may request server information (including  
establishing account charges) from a server before  
attempting to set up a new account.

The following steps (Figure 26) illustrate how a  
user can establish a new account with a payment server.  
25 A user must have a certificate and a valid credit card  
number in order to establish an account.

The user (or his software agent) formats (706) a  
setup-new-account message containing the  
following:

30 The user's credit card number or other credit  
information;  
Other identifying information, such as a  
street address, phone number;  
Requested credit amount;

- 71 -

A list of valid signatures (either public key certificates and their associated certificate chains or distinguished names) for people allowed to charge to the account.

5 Optional category of use (e.g. this account is used to retrieve video objects only.)  
Optional time limit (e.g. this account will be valid until December 31, 1995.) The payment server will normally keep an account  
10 active as long as a minimum line of credit is available.

The setup-new-account message is digitally signed by the person establishing the account, and the signed message is sent (708) to the payment server  
15 with the above information.

The payment server verifies the signature on the received message (710). If the signature is invalid, the payment server sends an invalid-signature message to the user's system (712).  
20 Optionally, it may identify a maximum allowed credit limit.

If the signature is valid, using standard electronic credit card checking protocols or other methods as appropriate, the payment server  
25 electronically verifies the credit card number or other credit information, and requested credit line with a credit card service center or other credit authority (714).

If the credit card number or other credit  
30 information is not valid (718), the payment server will send an invalid-credit-card message to the user's system (720).

If the requested credit limit is too high, the payment server will send a requested-credit-limit-is-too-high message to the user's system.  
35

- 72 -

The payment server will verify that the other authorized user's identities are valid (722). If any are invalid, an invalid-authorized-user-specified message is sent (724) to the user's system.

5

The payment server assigns an account number to the user (726) and stores the account information in a database for later use.

The payment server formats a new-account-response message (728) containing the following:

10

Account Number

Credit Limit Amount

Time Limit

Categories of Use

15

List of authorized users (public key certificates plus the certificate chains.)

The requesting system or user's public key certificate chain, which will be used to verify the requestor's identity. Other less

20

efficient methods can also be used, e.g. the payment server could be given sufficient information (the distinguished name) about the user to obtain the certificate chain from another database.

25

The payment server signs the formatted message and sends it to the user's system. Optionally, the user may be charged a fee for establishing this account and for maintaining it.

30

The user's system encrypts and stores (730) the received signed message. This account data will be submitted with any activity that may be billed.

Retrieving from a Repository (Simple Terms and Conditions)

- 73 -

Once an account is established, the user may retrieve an object from the repository by the following steps (Figures 25 and 27).

5           The system requesting the digital object obtains (740) the hash code/handle server table from the handle server directory 59. This is done during the system's initialization.

10           A user (or more likely, his software agent) obtains a handle 743 for an object (742). The handle may be obtained as part of a result of a bibliographic search or be provided by some other electronic means such as an electronic reference list in another object, or by scanning a barcoded sequence on paper. The system that is retrieving the digital object is referred to as the  
15           requesting system 745.

20           Once the handle is obtained, the system that retrieves the object "hashes" the object's handle and uses this hashed value to perform a table lookup in the hash code/handle server table 744. The requesting system sends a request-for-pointer-information UDP packet 748 to the handle server. One or more pointers, once returned, identifies the network location of the one or more  
25           repositories (if one is associated with the object) and one or more rights management system, if one is associated with the object. This strategy assures a random distribution of handle server requests among many handle servers  
30           distributed on a network without a central nodal point in the system (for reliability). The handle server verifies that the handle falls within the set of handles for whose hash values it is responsible 750.

- 74 -

If it is not in this set, due to some dynamic system change or error condition, the handle server sends an invalid-handle-server-selected response UDP packet to the requestor 752.

5 If the requesting system receives an invalid-handle-server-selected response UDP packet, it refreshes its hash code/handle server table from the handle server directory, and the requesting system repeats prior steps. This will typically  
10 be needed only if the table has changed between the time the table was downloaded and the actual request was made.

If the handle server is responsible for the handle, it verifies that the handle is present in  
15 its database 756. If not, it sends a handle-not-found response UDP packet to the requesting system 758.

If the requesting system receives a handle-not-found response UDP packet, it informs (760) the  
20 user that it is unable to retrieve the object. An object may be stored in several repositories. Multiple pointers to these repositories may be returned to the requesting system. For each pointer returned by the handle server, the  
25 requesting system uses the pointer to attempt to obtain a copy of the digital object 762. If a copy is successfully obtained from one repository, the rest of the pointers will generally be ignored. If the requesting system cannot obtain  
30 the object from any of the repositories, it informs the user that it is unable to retrieve the object 764.

For retrieval purposes, the requesting system establishes a connection to the repository 766,

- 75 -

which takes the form of a small set of transactions.

5 The repository may examine the calling network address or the requesting system in order to determine if the repository is being inundated with requests from one system. If the repository determines that it is being bombarded, the repository may disconnect from the requesting system and refuse to accept additional requests  
10 for a period of time 768.

Normally, however, the repository returns a random-value tag to the requesting system 770. A flag indicating if payment is required to obtain "Terms and Conditions" is included.

15 The requesting system needs the object's "Terms and Conditions" before the object can be retrieved. The requesting system signs and sends the following request-terms-and-conditions message 772 to the repository:

20 the object's handle;  
the requesting system or user's digital signature over the repository generated random-value tag;  
the requesting system or user's public key  
25 certificate chain, which will be used to verify the requestor's identity. Other less efficient methods can also be used, e.g. the repository could be given sufficient information (the distinguished name) about  
30 the user to obtain the certificate chain from another database. This is needed in the event the repository needs to bill for providing the Terms and Conditions;  
a unique tag, assigned by the requesting  
35 system;

- 76 -

account information, previously signed by the payment server.

The repository verifies the digital signature of the requestor over the repository generated  
5 random-value tag 774. If the signature is not correct, the repository sends an invalid-random-value-tag response to the requesting system. The requesting system should log this error.

The repository verifies the payment server's  
10 signature over the account information 778. If the signature is not correct, the repository sends an invalid-account-information response to the requesting system. The requesting system should log this error.

The repository retrieves the Terms and Conditions associated with the specified handle 790. If no object is associated with the handle, the repository sends an object-not-found message to  
15 the requesting system. The requesting system should log this error.

Otherwise, the repository signs the "Terms and Condition" message and sends 792 it to the requesting system, including:

The objectized list of  
25 terms/conditions/rights, along with the charge associated with each object and a status flag showing if the term/condition/right is mandatory;  
The user-assigned unique key, which was  
30 received in the request-terms-and-conditions message;  
Either the original random-value tag or possible a new random-value tag, generated by the repository. This is to avoid play back

- 77 -

protection in the event the object identified by the handle is retrieved later.

The requesting system verifies the repository's signature over the received "Terms and Conditions" message 794. If the signature is invalid, the error is logged.

The user selects the terms and conditions desired 796, including the number of terms (e.g., A user may buy the right to make 5 copies of the object or to perform it ten times). The requesting system uses this information to create the retrieve-object message, including:

- the object's handle 798;
- the repository generated random value tag;
- a list of the accepted "Terms and Conditions", including the quantity of each, where applicable;
- the user's account information, which was originally signed by the payment server;
- the requesting system or user's public key certificate chain, which will be used to verify the requestor's identity. Other less efficient methods can also be used, e.g. the repository could be given sufficient information (the distinguished name) about the user to obtain the certificate chain from another database.
- the domain name and the port number which are used by the requesting system to receive the object.
- limitations, if any, on the object by the requesting system (e.g. maximum object size it can receive)

The entire message is signed by the requestor.

This is similar to signing a credit card slip.

- 78 -

The repository verifies the digital signature of the requestor over the random-value tag 800. If the signature is not correct, the repository sends an invalid-random-value-tag response to the requesting system 802. The requesting system should log this error.

The repository establishes a connection to the payment server, 804.

The payment server returns a random-value tag to the repository 806.

The repository formats a debit-account message 808, including:

The retrieve-object message, as received by the repository and signed by the requestor;

The random value tag received from the payment server;

The repository's public key certificate chain, which will be used to verify the repository's identity. Other less efficient methods can also be used, e.g. the payment server could be given sufficient information (the distinguished name) about the user to obtain the certificate chain from another database.

The repository signs the retrieve-object and random-value portion of the message. The repository sends the debit-account message to the payment server system.

The payment server system validates the repository's signature over the debit-account message 810. If the signature is invalid, the payment server logs the error and sends a invalid-vendor-signature message to the repository.

The payment server system then validates the requestor's signature over the contained retrieve-

- 79 -

object message 812. If the signature is invalid, an invalid-requestor-signature message is sent to the repository.

5 The payment server validates the account information sent to it and verifies that the account is valid. If the requestor is not a valid user of the account, a invalid-user-for-account message is sent to the repository, and the payment server logs the event.

10 Otherwise, the payment server, using already existing electronic credit verification methods, verifies that the amount may be charged to the account 816.

15 If the credit check is not successful, the appropriate error message (e.g. "Credit Line is insufficient", "Credit Card has Expired") is logged and sent to the repository.

20 Otherwise an account-has-been-debited message is signed by the payment server and sent to the repository 818.

The repository connects to the address/port specified in the request, and it transmits 820 to the requesting system:

25 the object's handle;  
the total amount debited from the account;  
the object, signed by the repository;  
portions of the relevant terms and conditions, if appropriate.

#### Retrieving Under Non-Simple Terms and Conditions

30 The following steps are followed for retrieving an object under non-simple terms and conditions.

If the user does not know the current terms and conditions associated with the object, steps 740 through 794 (Figures 27 and 28) are first performed. If the user  
35 determines that the terms and conditions returned by the

- 80 -

repository are not appropriate by themselves, then additional negotiations with the RMS associated with the digital object are required.

If a user already knows that negotiations are  
5 required with an RMS, but the RMS associated with the digital object is not yet known, then the user's system must perform steps 740 through 764 (Figure 27).

Otherwise, referring to Figure 29, the requesting system establishes a connection to the RMS 830.

10 The RMS returns a random-value tag to the requesting system 832.

The requesting system sends the following information to the RMS:

15 the object's handle;  
the requestor's digital signature over the RMS generated random-value tag;  
the requestor's public key certificate chain;  
the domain name and the port number which will be used by the requesting system to  
20 receive the object;  
a random value tag, assigned by the requesting system;  
the accounting data previously signed by the payment server.

25 The RMS validates the digital signature over the signed random-value tag 836. If the signature is not correct, the RMS sends an invalid-random-value-tag response to the requesting system. The requesting system logs this error.

30 The repository verifies the payment server's signature over the account information 838. If the signature is not correct, the repository sends an invalid-account-information response to the requesting system. The requesting system should  
35 log this error.

- 81 -

The RMS enters into a mixed initiative dialog 840 with the user to determine what terms and conditions are mutually acceptable, if any. This may also entail human interaction.

5 The RMS connects to the repository 842, and the repository returns a random-value tag to the RMS 844.

The RMS sends 846 the following information to the repository:

10           the object's handle;  
            the RMS's digital signature over the  
            repository generated random-value tag;  
            the RMS public key certificate chain;  
            the domain name and the port number which are  
15           used by the requesting system to receive the  
            object;  
            the account information, previously signed by  
            the payment server.

20 The repository verifies the digital signature of the RMS over the random-value tag 848. If the signature is not correct, the repository sends an invalid-random-value-tag response to the RMS. The RMS logs the error and sends a remote-RMS-error-invalid-random-value-tag error to the requesting  
25 system. The requesting system logs this error. The repository verifies that the RMS is allowed to request object transfers for the object. If the transfer is not allowed, the repository sends an "invalid RMS" response to the RMS, which forwards  
30 the response to the requesting system. The requesting system logs the error in its log file. The repository establishes a connection to the payment server 850.

35 The payment server returns a random-value tag to the repository 852.

- 82 -

The repository formats a debit-account message  
854, including:

5           The retrieve-object message, as received by  
          the repository and signed by the requestor;  
          The random value tag received from the  
          payment server;

10           The repository's public key certificate  
          chain, which will be used to verify the  
          repository's identity. Other less efficient  
          methods can also be used, e.g. the payment  
          server could be given sufficient information  
          (the distinguished name) about the user to  
          obtain the certificate chain from another  
          database.

15           The repository signs the retrieve-object and  
          random-value portion of the message.

          The repository sends the debit-Account message to  
          the payment server system.

20           The payment server system validates the  
          repository's signature over the debit-account  
          message. If the signature is invalid, the payment  
          server logs the error and sends a invalid-vendor-  
          signature-message to the repository.

25           The payment server system then validates the  
          requestor's signature over the contained retrieve-  
          object message. If the signature is invalid, an  
          invalid-requestor-signature message is sent to the  
          repository.

30           The payment server validates the account  
          information sent to it and verifies that the  
          account is valid. If the requestor is not a valid  
          user of the account, a invalid-user-for-account  
          message is sent to the repository, and the payment  
          server logs the event.

- 83 -

Otherwise, the payment server, using already existing electronic credit verification, verifies that the amount may be charged to the credit card associated with the account 860.

5 If the credit check is not successful, the appropriate error message (e.g. "Credit Line is insufficient", "Credit Card has Expired") is logged and sent to the repository.

10 Otherwise an account-has-been-debited message is signed by the payment server and sent to the repository 862.

The repository sends 864 a object-retrieval-is-allowed response to the RMS, and the repository disconnects from the RMS.

15 The RMS forwards 866 the object-retrieval-is-allowed response to the requesting system, and the RMS disconnects from the system.

The repository connects to the address/port specified in the request, and it transmits to the requesting system 868:

the object's handle;  
the total amount debited from the account;  
the object, signed by the repository.

20 The repository sends a object-has-been-delivered confirmation to the RMS 870.

25 All of the transactions tracked and recorded in the above system could be used to feed an automated accounting system for a variety of purposes.

#### Retrieving Registration Information

30 The public access system will be based on a commercial DBMS. Queries to this system will be performed using standard database techniques via a direct connection or over a network.

Other embodiments are within the scope of the following claims.

- 84 -

What is claimed is:

1. A method of managing digital objects in a network, each of the digital objects comprising a set of sequences of digits and having an associated identifier  
5 which is unique across the network, the method comprising storing the digital objects at locations accessible in the network using a storage technique which renders the digital objects secure against unauthorized access,  
10 storing pointer information which associates each digital object identifier with a pointer indicating the location of the stored digital object in the network, and for each of the digital objects, storing, separately from the digital object, validation  
15 information sufficient to permit a determination whether a purported instance of a digital object is identical to the original instance.
2. The method of claim 1 further comprising  
20 permitting an authorized user to have access to the validation information, using the digital object identifier, to determine whether a purported instance of a digital object is identical to the original instance.
3. The method of claim 1 wherein the validation  
25 information comprises a digital signature over the digital object.

- 85 -

4. A method of managing reference information about digital objects in a network, each of the digital objects comprising a set of sequences of digits and having an associated identifier which is unique across  
5 the network, the method comprising  
    storing the digital objects,  
    storing reference information for each of the digital objects, and  
    storing validation information for each of the  
10 digital objects which is substantially smaller in size than the corresponding digital object and which enables a determination of whether a purported instance of a digital object is identical to the original instance.

5. The method of claim 4 further comprising  
15       permitting authorized users to have access to the reference information using the unique identifier.

6. The method of claim 4 wherein the reference information comprises information concerning at least one of the following: registration of rights in digital  
20 objects; accesses to and uses of digital objects; the terms and conditions for access and use of digital objects; the ownership and licensing of rights to digital objects; links between different digital objects.

- 86 -

7. A method of storing digital objects in a network, each of the digital objects comprising a set of sequences of digits, the method comprising

5 generating an identifier for each of the digital objects which is unique across the network,

storing the digital objects in the network,

storing pointer information that associates each identifier of a digital object with the location of the digital object in the network,

10 generating verification information for each of the digital objects, the verification information being sufficient to determine whether a purported instance of the digital object is identical to the original instance, and

15 storing the verification information separately from the digital object.

8. The method of claim 7 wherein the pointer versus identifier information is stored in multiple servers on the network, and the identifiers are generated

20 in a manner to distribute the pointer versus unique identifier information relatively evenly among the servers.

9. The method of claim 8 wherein the distribution of pointer versus unique identifiers to the multiple

25 servers is based on a hashing algorithm.

- 87 -

10. A method for enabling users of a network to access digital objects stored in the network, each of the digital objects comprising a set of sequences of digits and having an associated identifier which is unique  
5 across the network, the method comprising

providing multiple pointer servers each of which accepts identifiers of a subset of the digital objects and returns corresponding pointers to the locations of the digital objects in the network, and

10 providing a directory server which accepts identifiers of any of the digital objects and returns the locations of the pointer servers which accept those identifiers.

11. A method of applying for registration of  
15 rights in digital objects comprising  
storing the digital objects in a network,  
generating validation information for each of the digital objects sufficient to determine whether a purported instance of a digital object is identical to  
20 the original,

generating a unique identifier for each of the digital objects,

associating with each of the unique identifiers a pointer to the location of the digital object in the  
25 network, and

submitting to a registering authority, an application for registration of rights including the validation information and the unique identifier.

- 88 -

12. A method of enabling holders of rights in digital objects to control terms and conditions under which they are accessed by users in a network, comprising storing the digital objects in the network in a manner that permits only authorized access, storing, in the network, information about terms and conditions for access to each digital object, making the information about terms and conditions available to a user in connection with a request for access to a digital object, enabling the user to indicate assent to the terms and conditions, and permitting access to the user only upon the user indicating assent to the terms and conditions.

13. A method of enabling holders of rights in digital objects to control terms under which rights in the digital objects may be granted to others, comprising storing, in the network, terms and conditions for licensing rights, providing information on terms and conditions pertaining to works or other information or material that the digital object may be based on or incorporate, making the terms and conditions available to potential rights holders and users, as appropriate, upon request via the network, enabling the potential rights holder and the current rights holder to interact via the network to reach agreement on terms and conditions for grant of rights, storing, in a recordation server on the network, information identifying grants of rights for digital objects on the network.

- 89 -

14. A method to permit a user to comply with terms and conditions of access to digital objects stored in a network, each of the digital objects comprising a set of sequences of digits and having an associated  
5 identifier which is unique across the network, the method comprising

storing in the network information which associates with each of the unique identifiers, a pointer to a rights management system including a terms and  
10 conditions server containing terms and conditions,

providing to the user in response to presentation of a unique identifier the pointer to the terms and conditions server,

15 providing to the user in response to presentation of the pointer, terms and conditions information,

enabling the user to indicate assent to the terms and conditions,

20 in response to the assent, permitting the user to access the digital object including performance of the object.

- 90 -

15. A method for maintaining a record of information concerning digital objects stored on a network, each of the digital objects comprising a set of digits and having an associated identifier which is  
5 unique across the network, the method comprising  
storing the digital objects on the network in a manner that restricts unauthorized access to and transactions associated with the digital objects,  
providing a reference service on the network,  
10 separate from the storage of the digital objects, for recording information about accesses to and transactions associated with the digital objects,  
recording in the reference service information about accesses to and transactions associated with the  
15 digital objects, and  
permitting access to the records of the reference service to authorized users.

- 91 -

16. A method for managing registration of claims to rights in digital objects and any works or other information or material that the object may be based on or incorporate, comprising

5 storing, in a repository which is accessible on a wide area network, copies of the digital objects, in a manner that enables only authorized accesses to the digital objects and permits verification that the stored digital objects have not been subjected to unauthorized  
10 alteration,

at an information and reference server which is accessible on the network at a different network address from the repository, providing registration services including receipt via the network of registration  
15 requests and delivery via the network of registration certifications, and

accessing, from the repository via the network, the objects for use in providing the registration services.

20 17. The method of claim 16 further comprising enabling owners of rights in digital objects to deposit copies of the digital objects in the repository, via the network.

25 18. The method of claim 17 further comprising providing a service, accessible on the network, for generating a unique handle for each digital object.

19. The method of claim 18 wherein the handle for a digital object is unique both across the network and over time.

- 92 -

20. The method of claim 18 further comprising providing a service, accessible on the network, for generating the handle and locating the pointer associated with the handle for a digital object.

5 21. The method of claim 18 wherein the handle is used to obtain a pointer to the network location of an accessible copy of the digital object.

22. The method of claim 18 wherein the handle comprises a pointer to the network location of  
10 information concerning obtaining authorization to use the digital object.

23. The method of claim 18 wherein the service is provided at multiple different locations on the network.

24. The method of claim 20 wherein the service is  
15 provided at multiple different locations on the network.

25. The method of claim 18 wherein the handles comprise character strings associated with the servers which generated them.

26. The method of claim 21 further comprising  
20 providing a service, accessible on the network, for providing the pointer in response to a handle.

27. The method of claim 26 wherein there are multiple servers providing the service, each serving a portion of the handle space.

- 93 -

28. The method of claim 18 wherein there are multiple handle generation servers that may generate handles independently.

29. The method of claim 16 further comprising  
5 storing information concerning terms and conditions for access to and use of the digital objects.

30. The method of claim 29 wherein information concerning simple terms and conditions is stored in the repository.

10 31. The method of claim 16 wherein additional information concerning non-simple terms is held in a rights management system.

32. The method of claim 18 wherein each of the handles may be used to obtain one or more pointers to a  
15 location or locations on the network where a copy of the digital object to which the handle is assigned is accessible.

33. The method of claim 32 wherein each of the handles may be used to obtain one or more pointers to one  
20 or more rights management system in which information concerning non-simple terms is held and where rights negotiation may be carried out.

34. The method of claim 18 wherein hash values are computed on the handles and the hash values are  
25 distributed among multiple handle servers, each handle server having a table which associates handles with pointers.

- 94 -

35. The method of claim 16 further comprising responding to requests, received via the network, for copies of the stored digital objects.

36. The method of claim 35 further comprising  
5 determining whether the requests for copies are authorized.

37. The method of claim 16 further comprising providing multiple repositories.

38. A method for providing a repository for use  
10 in network based regulation of claims in rights in digital objects comprising  
storing copies of the digital objects in a repository accessible on the network, the copies being stored in a secure manner that precludes other than  
15 authorized access and that permits subsequent verification that there have been no unauthorized changes to the objects,  
providing handles for the digital objects, each handle being unique across the network and over time,  
20 each handle including information sufficient to locate a copy of the digital object on the network, and  
in connection with actions pertaining to regulation of claims in rights in the digital objects, using the handles to obtain authorized access to the  
25 digital objects.

39. The method of claim 38 wherein the actions include registration of claims in the rights.

- 95 -

40. The method of claim 39 wherein the actions include obtaining copies of the digital objects in exchange for compensation.

41. A network-based method for managing  
5 compensation for licensing of rights and other operations in digital objects, comprising  
storing, in a recordation system available to authorized access on the network, information identifying the ownership of rights in digital objects,  
10 receiving, at a rights management system available on the network, requests for rights in digital objects where the terms and conditions have not been stipulated in the properties record, and  
in response to the requests for rights, issuing,  
15 from the rights management system to the recordation system via the network, requests to record information or transfers of rights in and other information pertaining to the digital objects and in works or other information or material on which the object may be based or  
20 incorporate.

42. The method of claim 41 wherein the rights comprise exclusive rights.

43. The method of claim 41 further comprising recording the transfer of rights in the recordation  
25 system in a manner which is secure against alteration.

44. The method of claim 41 wherein the request for transfer of rights is associated with a commitment to compensate the owner of the rights.

- 96 -

45. A method for compensating owners of rights in digital objects stored in a network for access to the digital objects by users via the network, comprising storing on the network information associated with the digital objects and identifying the terms and conditions on which a user may have access to the digital objects via the network,  
5 in connection with a request by a user for access to a digital object, fetching and providing to the user the terms and conditions, and  
10 construing an action taken by the user in connection with requesting access to the digital object as agreement with the terms, and charging the user accordingly.

15 46. A method for managing handles for digital objects in a computer network comprising including in the handle an indication of a local naming authority having control over generation of a subset of all global generated handles, and  
20 including in the handle a string which is locally unique with respect to digital objects for which generation of handles are controlled by the local naming authority.

25 47. A method for managing generation of handles for digital objects in a computer network comprising maintaining local naming authorities that control generation of handles for digital objects, the handles being a subset of all of the handles generated globally, and  
30 maintaining a global naming authority that controls the naming of the local naming authorities.

- 97 -

48. A method for managing handles for digital objects in a computer network comprising managing some of the handles to be globally publicly accessible, and  
5 managing some of the handles to be only locally and privately accessible.

49. A method of managing access to digital objects in repositories comprising managing deposit of a digital object by accepting  
10 and storing the digital object and arranging for the generation and storage of an associated handle for the object, and  
managing access to the digital object by a accepting and receiving a service request which includes  
15 a handle.

50. A system of managing digital objects in a network comprising  
a system of repositories which accept, store, and make disseminations of digital objects and portions of  
20 digital objects in response to requests received from any arbitrary location in the network,  
a system of handle servers which provide services in connection with handles for digital objects stored in the repositories,  
25 a system of naming authorities which controls generation of handles on a global and local basis to assure locally unique and globally unique handles for digital objects.

(54) **Data communication network**

(57) To minimise traffic over an expensive transmission link (6), data obtained from an information provider (1, 2) in response to a request by a user (11, 12) is semi-permanently stored in the cache memory (10) of a node (8) local to the users whence it can be supplied to another user. When a user (11) requests data, its local node (8) checks its directory to see if the data is held by itself or by another node (38, Fig. 2). Only if neither node has it, is the data obtained from an information provider (1) via the expensive line 6, the information then becoming stored in the node's cache memory (10) as well as being supplied to the user who requested it. The directories of any other nodes are updated accordingly to inform them that fresh data is available. Transaction information for chargeable data may be exchanged between nodes and between nodes and information providers. An electronic funds transfer message may accompany the request for data.

Nodes may cooperate to cache data (28, 38 in Fig. 2). Node 8 may charge users 11, 12 on behalf of information providers 1, 2, so that the users need not have an account with the information provider.

**GB 2 294 132 A**

Fig 1

Data Communication Networks

This invention relates to data communication networks.

5 There are many different types of data communications networks. Some networks make no charge for any data which is accessed by a user. An example of such a network is the World-Wide Web, commonly known as "The Web", which utilises the Internet. In general, users of the Web only pay a  
10 connection charge which allows them unlimited access to the Web, information being available from information providers at no extra cost. To reduce loading on long distance transmission links, it has latterly been the practice to provide "cache sites", otherwise known as "proxy servers".  
15 A proxy server comprises a cache store in which more frequently-used data is stored. This avoids the need to repetitively send the same data over long distance links.

Other networks make a charge for information provided. In  
20 order to access the data held by these networks it is in general necessary to register with the data provider and pay a subscription fee before any data can be obtained, in addition a fee may be charged for each record accessed. While this may be satisfactory for regular users, it can be  
25 inconvenient for the occasional user, who needs to register in advance, and for the data provider, who may find it uneconomic to provide billing for an occasional user.

This invention arose from an attempt to provide an improved  
30 data communications network.

A first aspect of the invention provides a communications network for providing communication between at least one provider of data and a plurality of users, the network  
35 comprising a plurality of nodes, each node being arranged to receive a request for data from a user and to supply a copy

of the data requested to that user, at least one first node comprising memory means arranged to store, in a semi-permanent manner, a copy of data requested by a user, at least one node comprising index means arranged to store  
5 information indicating the contents of its own memory means and at least part of the contents of the memory means of at least one other node, and means for providing communication between the nodes and the at least one provider of data.

10 A second aspect of the invention provides a communications network for providing communication between at least one provider of data and a plurality of users, the network comprising a node arranged to receive requests for data from  
said users,

15 the node comprising memory means arranged to store, in a semi-permanent manner, a copy of data requested by a user, and index means arranged to store an indication of the contents of the memory means,

20 request processing means arranged to process a request for data from a user, the request being accompanied by an authorisation to pay for the data requested, the request processing means being arranged to:

25 supply the user with the requested data from the memory means and transfer the authorisation to pay to the provider of the data requested, in the event of data requested being present in the memory means; and

30 in the event of the data requested not being present in the memory means, obtain the data requested from a provider of data, store that data in the memory means, update its index, supply the user with the data requested, and transfer  
35 the authorisation to pay to the provider of that data.

Embodiments of the invention will now be described by way of non-limiting example only, with reference to the drawings in which:

5 Figure 1 shows a first data communications network in accordance with the invention; and

Figure 2 shows a second data communications network in accordance with the invention.

10

Referring now to Fig 1, a plurality of information providers (IPs) 1,2 in region A are coupled via respective relatively inexpensive communications links 3,4 to a first packet switching exchange 5 which is coupled via a relatively expensive communications link 6 to a second packet switching exchange 7 in region B. A proxy server 8 is coupled to the second packet switching exchange 7 via inexpensive communications lines 9. First and second users 11,12 are coupled to the first proxy server 8 via respective inexpensive lines 13,14. Proxy server 8 has a cache store 10 in region C. Similarly a second relatively expensive link 16 couples the first exchange 5 in region A to a third exchange 17 in region C. A second proxy server 18 having a cache memory 100 is coupled to the third exchange 17 via an inexpensive link 19. Third and fourth users 111,112 are coupled to the second proxy server 18 via inexpensive lines 113,114.

The precise nature of regions A,B and C is not important. Regions A,B and C may be any regions connected via relatively expensive communications links. They may for example comprise different states, different regions within a single state, or different companies or organisations.

35 A proxy server stores a subset of all the information available on the network. When a network user requests an

item of data, which for convenience will be referred to as a page of information, the system operates as follows:

5 Say user 11 requests a page of information. This request is transmitted to its associated proxy server 8.

Proxy server 8 checks its store 10. If it has the page then it returns it to the user.

10 If the proxy server does not have the page then it forwards the request to the IP identified in the request. Say the page is available from IP1. IP1 then transmits the page to proxy server 8.

15 Proxy server 8 then forwards the page to user 11, and also places a copy of the page in its own store 10.

20 Once the store 10 is full, the proxy server throws away the least-recently-used pages to make room for new pages and sends messages to the other proxy servers to update their directories accordingly.

Each page may be tagged with an expiry date, so that updated information can be fetched automatically.

25

Updating and replacement of lesser-used pages can be implemented using a Least-Recently Used (LRU) algorithm. The LRU algorithm is a simple algorithm that gives good results under a wide range of conditions. It performs best when a few pages are very popular, but the timing of the page requests is otherwise random. Many data communication networks are found to exhibit this behaviour.

35 In theory a region may only require a single proxy server, since two or more proxy servers will duplicate work and hence raise the bandwidth on the relatively expensive link.

However a free market may demand that there be multiple proxy servers, and that the number and nature of the proxy servers be able to change over time.

5 Fig 2 illustrates in simplified form what will be termed a federated caching scheme. First and second vendors of information (information providers) 21,22 in region A have information stored in respective data banks 60,61. The information providers (IP's) are coupled to a first packet  
10 router 25 via relatively inexpensive links 23,24. The first packet router 25 is coupled via a relatively expensive link 26 to a second packet router 27 in region B. First and second proxy servers 28, 38 having respective cache stores 210,310 are coupled to the second packet router 27 via  
15 respective relatively inexpensive links 29,30 and to each other via link 31. First and second users 211, 212 are coupled to the first proxy server 28 via inexpensive links 213,214. Third and fourth users 311, 312 are coupled to the second proxy server 38 via inexpensive links 313,314.

20 Only two proxy servers have been shown for simplicity, but in practice as many as necessary may be provided, each being in communication with the others either directly or via other proxy servers or the packet router 27. The collection of  
25 proxy servers comprises a "federated cache".

In the present embodiment, each proxy server keeps a directory which contains a list of all the files which are stored by that proxy server, and a list of files held by  
30 other proxy servers of the federation. A request from a user is processed as follows.

A user 211 sends a request for information to the first proxy server 28. The proxy server consults its directory. If it  
35 holds the information requested, it sends the information to the user 211. It also generates data recording the

transaction as will be described later. The transaction then terminates.

5 If the first proxy server does not itself hold the information but can locate the information in the second proxy server 38, it forwards the request to the second proxy server 38. The second proxy server 38 sends the information to the first proxy server, which forwards it to the first user 211. However, the first proxy server 38 does not in  
10 general keep a copy of the information. Data recording the transaction details are generated. The transaction data may include details of the payment (if any) to be made by the first proxy server 28 to the second proxy server 38 for supplying the information, the charges being such as to  
15 promote equitable distribution of operating costs between the proxy servers. The transaction then terminates.

If the first proxy server is unable to locate a copy of the information in its directory, then it forwards the request to  
20 the source of information indicated by the first user 211 via the packet router and the expensive link 26. Say the information is held by the first IP 21. IP 21 then sends the information from its store 60 to the first proxy server 28. The proxy server forwards it to the first user 211.

25 In this instance the first proxy server does keep a copy of the information in its cache store 210. As well as generating data recording the transaction, it broadcasts a message to the other proxy servers in the federation that it  
30 now has a copy of that information. The transaction then terminates.

Thus the federation of caches can behave as a single proxy server for the purposes of reducing the bandwidth  
35 requirements of the expensive communications link 26, but can function as separate caches for the purposes of competing on

cost and quality.

5 It was mentioned above that the first proxy server does not  
in general keep a copy of data which is held by another proxy  
server. This would for example be the case where the cost to  
the first proxy server of obtaining the data from another  
proxy server was less than the cost of keeping that data. If  
10 the cost of obtaining the data from another proxy server was  
sufficiently high, or the data was subject to sufficient  
usage, it could well become more economical for the first  
proxy server to keep a copy of the data itself rather than  
obtaining it from another proxy server each time it was  
needed.

15 As was mentioned above, data recording the transaction is  
generated during operation.

20 A proxy server must ensure that payment reaches the original  
IP. Furthermore, the IP must be able to ensure that all the  
payment due is in fact reaching him. However, it is  
desirable for the IP not to be able to associate an arbitrary  
purchase with any particular person, lest this break  
anonymity.

25 For a non-federated cache of the type shown in Fig 1, the  
problem may be solved as follows.

30 The user sends an electronic payment to the proxy server with  
the request. Conveniently, payment consists of electronic  
funds transfer between bank accounts, or may consist of  
electronic messages exchanged between smartcards, for example  
the Mondex system. Mondex is a trademark of the National  
Westminster Bank PLC.

35 The proxy server generates a unique transaction number. If  
the proxy server does not hold the information, the payment

is forwarded to the IP with the request and the transaction number. The information is forwarded to the user, along with the transaction number.

5 If the proxy server does hold the information then the following parts of the transaction are sent to the IP:  
the amount paid;  
the transaction number; and  
the payment.

10

Thus the identity of the user is not conveyed to the IP and anonymity is preserved.

15 The payment operation may be delayed in order to batch up many payments, the relevant information being stored temporarily and processed en masse at a convenient time.

20 In a federated cache as shown in Fig 2 the payment accompanies the request until it reaches a site which actually holds the requested information. The transaction number is augmented with the name of the proxy server which fulfilled the request. Otherwise the system works as above.

25 For example, if user 211 requests information which is not held by proxy server 28, but which is held by proxy server 38, then proxy server 38 will be credited with the payment.

30 This allows the IPs to carry out spot checks by purchasing information through a proxy server (possibly via a third party to avoid detection) and then checking that the list of transactions sent by the proxy server do indeed include the test transactions.

35 In the present embodiment, when a first proxy server receives a request from a client, it assigns a unique code to that request, and transmits that request code to the client.

In the case that the first proxy server can fulfil the request, it transmits the request code to the appropriate IP, along with other accounting information such as the value of each request and an instruction to pay the IP for the information which has been provided to the client.

In the case that the first proxy server can locate the requested page on a second proxy server, then the first proxy server will forward the request code and payment instruction to the second proxy server along with the request. The second proxy server will then fulfil the request as described earlier, and forward the request code and other information as described in the first case to the IP.

In the case that the first proxy server cannot locate the requested page in any of the other proxy servers, it will forward the request, request code and payment to the appropriate IP.

In all cases the protocol for forwarding of payment instructions will include a non-repudiatable message acknowledging receipt to be sent from the payee to the payer. This message is known as a "digital receipt". The proxy servers will store these receipts for a predetermined time for inspection by the relevant IPs, and may then delete them.

The proxy servers may chose to batch up the data and payment which is to be sent to the IPs in order to reduce the cost of data transmission and money transfers.

The client transmits its copy of the request code to the IP. The IP can then check that the request code provided by the client is present in the list provided by the proxy servers. If the request code is absent, or the value given for the request is not the same as the value given for that request in the list, then the IP may reasonably conclude that one of

the proxy servers is behaving dishonestly. Inspection of the digital receipts stored by the various proxy servers will allow the IP to determine which proxy server this is.

5 In order to verify that Inter-Proxy payments are being made, a proxy server transmits to a client a "probe" request which names a non-existent page of information, and also transmits to a second proxy server an index update corresponding to this probe request. The client then transmits this probe  
10 request to the second proxy server, and the original proxy server monitors the request it receives in order to determine if the second proxy server correctly forwards the request to the original proxy server. If the original proxy server receives the probe request in a form which appears to have  
15 come from a client, then it may conclude that the second proxy server is behaving dishonestly.

In addition a proxy server can provide additional anonymity to users. In a commercial network in accordance with the  
20 invention there may be many small IPs, and some of them may attempt to gain information on their customers for illegal or unethical purposes such as blackmail or public disclosure. A crooked IP could record the network address of a client, and then find the user with that address. Since a network  
25 address identifies a particular machine, and a machine might be used by only one person, it would be possible to identify the person who had bought a particular piece of information. However if the client is purchasing information via a proxy server, the IP is denied the network address of the customer.  
30 The IP can only discover this information with the co-operation of the customer.

A crooked cache could behave in a similar way to a crooked IP, but there will be only a few proxy servers in a  
35 federation, so each will have a long-term interest in protecting the anonymity of their clients in order to avoid

bad publicity.

A number of modifications are possible within the scope of the invention.

5

In the embodiment of Figure 2, when any proxy server stores data in its cache memory, it broadcasts that fact to all the other proxy servers in the federation. However, it is not essential for the proxy servers to behave in this way under all circumstances, and the exchange of information need not be wholly reciprocal. In a modification of the network shown in Figure 2, the first proxy server 28 always informs the second proxy server 38 of the contents of its store 210, whereas the second proxy server 38 does not necessarily always inform the first proxy server 28 of the contents of its store 310. This arrangement allows the second proxy server 38 to store data of a sensitive or confidential nature, which data is only made available to authorised users associated with proxy server 38.

10  
15  
20

In a further modification all the proxy servers in a federated cache behave in this manner, each withholding the existence of at least some of the data which it is storing from at least some of the other proxy servers.

25

Further, certain data held by a proxy server may be selectively available to some proxy servers of the federation but not to others.

30

The embodiments have been described with reference to data for which a charge has been made. Networks in accordance with the invention may equally well be used to convey data for which no charge is made either in addition to or instead of chargeable data.

35

In addition to, or as an alternative to, tagging pages with

an expiry date, means may be provided to allow an IP to broadcast a message to the proxy servers indicating that a particular page is now out of date. The proxy server or servers holding that page may then update the expiry date associated with that page, or else delete the page concerned from their cache memory as appropriate, the page being re-  
5 stored when the next request for it is received from a user.

Alternatively, out-of-date records may simply be deleted in response to instructions broadcast from the IPs. This can avoid the need for proxy servers to store expiry dates as such.  
10

Further, at least some of the data held by a proxy server may be kept in permanently stored form. For example, data kept by a proxy server may include or consist entirely of reference works such as encyclopedias stored in read-only memory such as CD-ROM. To the user or another proxy server, the proxy server will behave just like any other proxy  
15 server.  
20

At least some of the proxy servers may hold information which does not appear in the directories of the other proxy servers, but which is nonetheless available if requested. The network is then provided with a request broadcast facility whereby, if a proxy server cannot find a page in its own directory or directories of which it has copies, then it broadcasts a request to the other members of the federation. Only if no positive response is received does it send the request to an IP.  
25  
30

In another modification, the LRU algorithm may be replaced by an algorithm which attempts to predict which pages will be popular in the near future. For instance, some pages may be very popular during weekends, but not during weekdays. Under these circumstances the LRU algorithm may cause these pages  
35

to be stored for most of the week, deleted on Friday and then refetched on Saturday. A more complex algorithm may take this into account when selecting pages for deletion.

- 5 In a further modification, a predictive algorithm fetches pages before they are requested. If the expensive link is much slower than the links from the proxy server to the customer then this will avoid delaying the first client while the page is transmitted from the IP.

10

Claims

1. A communications network for providing communication  
5 between at least one provider of data and a plurality of  
users, the network comprising a plurality of nodes, each node  
being arranged to receive a request for data from a user and  
to supply a copy of the data requested to that user, at least  
10 one first node comprising memory means arranged to store, in  
a semi-permanent manner, a copy of data requested by a user,  
at least one node comprising index means arranged to store  
information indicating the contents of its own memory means  
and at least part of the contents of the memory means of at  
15 least one other node, and means for providing communication  
between the nodes and the at least one provider of data.

2. A communications network as claimed in Claim 1 in which  
at least one node comprises data which is not included in the  
index means of at least one other node.

20 3. A communications network as claimed in Claim 1 or 2 in  
which the at least one first node comprises request  
processing means for processing a request for data from a  
user coupled thereto, the request processing means comprising  
25 means to consult the index of the node,

means to supply data from the memory means of the node  
if the data requested is present therein,

30 means to obtain the data from the memory means of  
another node if the data is held by that node,

means to obtain the data from a provider of data if the  
data is not held by any node, and

35 means to store in a semi-permanent manner, the data

requested by the user in the memory means of the node if that data was not previously stored therein and to update the index means of the node.

5 4. A communications network as claimed in Claim 3, further comprising means to update the index means of at least one further node to indicate the presence and location of the newly-stored data.

10 5. A communication network as claimed in Claim 3 or 4 in which the data requested by the user is stored in a semi-permanent manner only if that data is not already present in the memory means of another node.

15 6. A communications network as claimed in any one of Claims 3, 4 or 5, in which the request for data comprises authorisation to pay for the data requested, in which the request processing means comprises means to transfer the authorisation to the provider of the data.

20 7. A communications network as claimed in Claim 6, in which the request processing means comprises means to temporarily store the authorisation to pay.

25 8. A communications network as claimed in Claim 6 or 7 in which the request processing means comprises means to forward the authorisation to pay to the node providing the data when the data is provided from another node.

30 9. A communications network as claimed in any preceding claim, in which the at least one first node comprises means for determining the usage of each item of data stored in its own memory means, and means for selectively erasing lesser used data.

35 10. A communications network as claimed in any preceding

claim, comprising means to cause an item of semi-permanently stored data to be deleted when it is no longer valid.

5 11. A communications network for providing communication between at least one provider of data and a plurality of users, the network comprising a node arranged to receive requests for data from said users,

10 the node comprising memory means arranged to store, in a semi-permanent manner, a copy of data requested by a user, and index means arranged to store an indication of the contents of the memory means,

15 request processing means arranged to process a request for data from a user, the request being accompanied by an authorisation to pay for the data requested, the request processing means being arranged to;

20 supply the user with the requested data from the memory means and transfer the authorisation to pay to the provider of the data requested in the event of data requested being present in the memory means; and

25 in the event of the data requested not being present in the memory means, obtain the data requested from a provider of data, store that data in the memory means, update its index, supply the user with the data requested, and transfer the authorisation to pay to the provider of that data.

30 12. A data communication network substantially as described with reference to Figure 1 or Figure 2 of the drawings.

The "Highest Number Previously Paid For" (Total or Independent) is the highest number found in the appropriate box in column 1.

This collection of information is required by 37 CFR 1.16. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

<b>Interview Summary</b>	<b>Application No.</b> 11/980,687	<b>Applicant(s)</b> FARBER ET AL.	
	<b>Examiner</b> Samson B. Lemma	<b>Art Unit</b> 2432	

All participants (applicant, applicant's representative, PTO personnel):

(1) Samson Lemma. (3)\_\_\_\_\_.

(2) Brian Sirtzky Ph.D. Registration No. 37497. (4)\_\_\_\_\_.

Date of Interview: 17 March 2010.

Type: a)  Telephonic b)  Video Conference  
c)  Personal [copy given to: 1)  applicant 2)  applicant's representative]

Exhibit shown or demonstration conducted: d)  Yes e)  No.  
If Yes, brief description: \_\_\_\_\_.

Claim(s) discussed: 1,20,21 and 24.

Identification of prior art discussed: \_\_\_\_\_.

Agreement with respect to the claims f)  was reached. g)  was not reached. h)  N/A.

Substance of Interview including description of the general nature of what was agreed to if an agreement was reached, or any other comments: See Continuation Sheet.

(A fuller description, if necessary, and a copy of the amendments which the examiner agreed would render the claims allowable, if available, must be attached. Also, where no copy of the amendments that would render the claims allowable is available, a summary thereof must be attached.)

THE FORMAL WRITTEN REPLY TO THE LAST OFFICE ACTION MUST INCLUDE THE SUBSTANCE OF THE INTERVIEW. (See MPEP Section 713.04). If a reply to the last Office action has already been filed, APPLICANT IS GIVEN A NON-EXTENDABLE PERIOD OF THE LONGER OF ONE MONTH OR THIRTY DAYS FROM THIS INTERVIEW DATE, OR THE MAILING DATE OF THIS INTERVIEW SUMMARY FORM, WHICHEVER IS LATER, TO FILE A STATEMENT OF THE SUBSTANCE OF THE INTERVIEW. See Summary of Record of Interview requirements on reverse side or on attached sheet.

/Samson B Lemma/  
Examiner, Art Unit 2432

## Summary of Record of Interview Requirements

### Manual of Patent Examining Procedure (MPEP), Section 713.04, Substance of Interview Must be Made of Record

A complete written statement as to the substance of any face-to-face, video conference, or telephone interview with regard to an application must be made of record in the application whether or not an agreement with the examiner was reached at the interview.

### Title 37 Code of Federal Regulations (CFR) § 1.133 Interviews Paragraph (b)

In every instance where reconsideration is requested in view of an interview with an examiner, a complete written statement of the reasons presented at the interview as warranting favorable action must be filed by the applicant. An interview does not remove the necessity for reply to Office action as specified in §§ 1.111, 1.135. (35 U.S.C. 132)

#### 37 CFR §1.2 Business to be transacted in writing.

All business with the Patent or Trademark Office should be transacted in writing. The personal attendance of applicants or their attorneys or agents at the Patent and Trademark Office is unnecessary. The action of the Patent and Trademark Office will be based exclusively on the written record in the Office. No attention will be paid to any alleged oral promise, stipulation, or understanding in relation to which there is disagreement or doubt.

The action of the Patent and Trademark Office cannot be based exclusively on the written record in the Office if that record is itself incomplete through the failure to record the substance of interviews.

It is the responsibility of the applicant or the attorney or agent to make the substance of an interview of record in the application file, unless the examiner indicates he or she will do so. It is the examiner's responsibility to see that such a record is made and to correct material inaccuracies which bear directly on the question of patentability.

Examiners must complete an Interview Summary Form for each interview held where a matter of substance has been discussed during the interview by checking the appropriate boxes and filling in the blanks. Discussions regarding only procedural matters, directed solely to restriction requirements for which interview recordation is otherwise provided for in Section 812.01 of the Manual of Patent Examining Procedure, or pointing out typographical errors or unreadable script in Office actions or the like, are excluded from the interview recordation procedures below. Where the substance of an interview is completely recorded in an Examiners Amendment, no separate Interview Summary Record is required.

The Interview Summary Form shall be given an appropriate Paper No., placed in the right hand portion of the file, and listed on the "Contents" section of the file wrapper. In a personal interview, a duplicate of the Form is given to the applicant (or attorney or agent) at the conclusion of the interview. In the case of a telephone or video-conference interview, the copy is mailed to the applicant's correspondence address either with or prior to the next official communication. If additional correspondence from the examiner is not likely before an allowance or if other circumstances dictate, the Form should be mailed promptly after the interview rather than with the next official communication.

The Form provides for recordation of the following information:

- Application Number (Series Code and Serial Number)
- Name of applicant
- Name of examiner
- Date of interview
- Type of interview (telephonic, video-conference, or personal)
- Name of participant(s) (applicant, attorney or agent, examiner, other PTO personnel, etc.)
- An indication whether or not an exhibit was shown or a demonstration conducted
- An identification of the specific prior art discussed
- An indication whether an agreement was reached and if so, a description of the general nature of the agreement (may be by attachment of a copy of amendments or claims agreed as being allowable). Note: Agreement as to allowability is tentative and does not restrict further action by the examiner to the contrary.
- The signature of the examiner who conducted the interview (if Form is not an attachment to a signed Office action)

It is desirable that the examiner orally remind the applicant of his or her obligation to record the substance of the interview of each case. It should be noted, however, that the Interview Summary Form will not normally be considered a complete and proper recordation of the interview unless it includes, or is supplemented by the applicant or the examiner to include, all of the applicable items required below concerning the substance of the interview.

A complete and proper recordation of the substance of any interview should include at least the following applicable items:

- 1) A brief description of the nature of any exhibit shown or any demonstration conducted,
- 2) an identification of the claims discussed,
- 3) an identification of the specific prior art discussed,
- 4) an identification of the principal proposed amendments of a substantive nature discussed, unless these are already described on the Interview Summary Form completed by the Examiner,
- 5) a brief identification of the general thrust of the principal arguments presented to the examiner,  
(The identification of arguments need not be lengthy or elaborate. A verbatim or highly detailed description of the arguments is not required. The identification of the arguments is sufficient if the general nature or thrust of the principal arguments made to the examiner can be understood in the context of the application file. Of course, the applicant may desire to emphasize and fully describe those arguments which he or she feels were or might be persuasive to the examiner.)
- 6) a general indication of any other pertinent matters discussed, and
- 7) if appropriate, the general results or outcome of the interview unless already described in the Interview Summary Form completed by the examiner.

Examiners are expected to carefully review the applicant's record of the substance of an interview. If the record is not complete and accurate, the examiner will give the applicant an extendable one month time period to correct the record.

### Examiner to Check for Accuracy

If the claims are allowable for other reasons of record, the examiner should send a letter setting forth the examiner's version of the statement attributed to him or her. If the record is complete and accurate, the examiner should place the indication, "Interview Record OK" on the paper recording the substance of the interview along with the date and the examiner's initials.

Continuation of Substance of Interview including description of the general nature of what was agreed to if an agreement was reached, or any other comments: Applicant's representative Brain Sintzky registration No. 37,497 and examiner have discussed at least the independent claims 1, 20, 21 and 24. Applicant's rep. and examiner agreed to amend the independent claims in such a way that the limitation "Name" is specifically defined in the claim itself. Applicant's rep. Submitted a proposed amendment and the limitation "name" is defined in the claims. In view of the proposed amendment and the discussion made at the interview both parties have agreed the claim limitation that would overcome the ground of rejection and possibly make the application allowable. Furthermore a discussion and agreement was made to amend the claims to overcome the potential 101 rejection. Applicant's representative is going to file an RCE. Examiner has finally noted that further search and consideration would be conducted and approval from SPE is required before the application is finally allowed..

ART UNIT

PAPER NUMBER

2432

MAIL DATE

DELIVERY MODE

03/05/2010

PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Art Unit: 2432

### *DETAILED ACTION*

1. This office action is in reply to an amendment filed on 12/11/2009.  
Claims 1-25 are pending.
2. The amendment made to independent claim 20 overcomes the objection set forth in the previous office action. Thus the objection provided to independent claim 20 is withdrawn.
3. The information disclosure statements (IDS) submitted on have been considered.

### *Response to Arguments*

4. Applicant's argument filed on December 11, 2009 with respect to claims 1-25 have been fully considered but they are not persuasive.  
Referring to the independent claims 1, 20, 21 and 24, applicant's representative argued that, the combination of the references on the record namely Blickenstaff in view of Orita, does not disclose the following limitations.

**“the name being based at least in part on the data which comprise the contents of the data item; and (b) determining, based at least in part on said name, whether or not access to the data item is authorized”**

**Examiner disagrees with the above argument.**

Examiner counters that a careful reading of reference in particular the secondary reference on the record Orita reveals that the feature argued

Art Unit: 2432

by the applicant's representative is indeed still taught by the reference/s on the record.

Examiner would like to point out that, Orita discloses the following on the abstract.

**“When a specified file access is requested** after the execution of the user program, **whether execution of the file access is permitted or not is determined according to access protection information.** The access protection information is information having access types **and file contents defined by the environment profile information.”**

**From what is recited above it is clear that the permission is determined based on the access protection information.**

**Furthermore this access protection information have not only access types but also file contents. Thus the file content itself is one of the components in the access protection information that would be used for determining whether or not access is permitted.**

**In view of the above understanding such file content since it comprises of the content of the file it meets the limitation recited as " the name being based at least in part on the data which comprise the contents of the data item; and (b) determining, based at least in part on said name, whether or not access to the data item is authorized”**

Art Unit: 2432

In view of this understanding, unlike, applicant's argument, each and every limitation of the independent claim is disclosed by the reference on the record. Furthermore In response to applicant's arguments against the references individually, Examiner would like to point out that one cannot show nonobviousness by attacking references individually where the rejections are based on combinations of references namely Blickenstaff in view of Orita. See *In re Keller*, 642 F.2d 413, 208 USPQ 871 (CCPA 1981); *In re Merck & Co.*, 800 F.2d 1091, 231 USPQ 375 (Fed. Cir. 1986).

As indicated above, each and every limitation recited in independent claim is still disclosed by the reference on the record. Therefore the rejection is maintained.

Applicant's representative is encouraged to call the office and discuss how the broad limitation such as "name" recited in each independent claim be amended or elaborated to make the application distinct from the combination of the reference on the record.

### *Claim Rejections - 35 USC § 103*

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said

Art Unit: 2432

- subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.
6. **Claims 1-10 and 13-25** are rejected under 35 U.S.C. 103(a) as being unpatentable over Blickenstaff et al (hereinafter referred to as **Blickenstaff**), U.S. Patent No. 5,537,585 (filed on Feb 25, 1994) in view of Yukio Orita (hereinafter referred to as **Orita**) U.S. Patent No. 5,163,147 (Date of Patent: Nov 10,1992)
7. **As per independent claim 1, Blickenstaff discloses a method, in a system which includes a network of computers** [*See at least column 4, lines 23-28 and figure "1/local area network", ref. Num " 21, 22 and 42" and column 1, lines 6-8, "this invention relates to data communication networks, such as local area networks, that function to interconnect a plurality of data processors"*] (Note: as it is disclosed on column 4, lines 26-28, "*processors, shown on figure 1, are either personal computers, work stations or mini-computers*") **the method comprising:**
- **(a) obtaining a name for a data item, the name being included in a request for the data item** [*Figure 8, ref. Num "801-803" and column 13, lines 34-46,*] ( "*4. File management scheme, including access methods. For example, DOS data files are named with a 1-8 byte name and a 0-3 byte extent, which are delimited by a "." (nnnnnnnn.xxx). The directory architecture is illustrated in FIG. 13 and takes the form of a hierarchical tree of directory names. The root is typically a volume, from which a number of directories branch. Each directory includes other directories*

Art Unit: 2432

*and/or data files. A full data file name is represented by concatenating all the directory tree structure components from the root to the particular data file, with components being delimited by " ". An example of such a data file name using this convention is "vol\dir1\ dir3\filename.ext".) and*

**Blickenstaff further discloses,**

**based on said name, determine the location of the file and providing the requesting computer obtain the requested file from its own storage device or from the different server, distinct from the requesting computer. [See figure 8, and Column 5, lines 38-57]**

**Blickenstaff** does not explicitly disclose

- **the name being based at least in part on the data which comprise the contents of the data item; and (b) determining, based at least in part on said name, whether or not access to the data item is authorized.**

However, in the same field of endeavor **Orita at least on its abstract discloses the following which meets the above limitation.**

**“When a specified file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection information. The access protection information is information having access types and file contents defined by the environment profile information.”**

Art Unit: 2432

It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to combine the feature such as **the name being based at least in part on the data which comprise the contents of the data item; and determining, based at least in part on said name, whether or not access to the data item is authorized** as per teachings of **Orita** into the method of accessing of the file using the file name as taught by **Blickenstaff** in order provide a more secure access control and accurately/expeditiously retrieve requested file/s.

8. **As per independent claim 20, Blickenstaff discloses a method comprising: controlling distribution of licensed content** (*column 5, lines 28-35, see "migration of files"*) **from a first computer** [*Figure 1, ref. 41 and 43 or storage server processor 51*] **to a requesting computer** [*Figure 1, ref. Num "21" and "22"*] **in response to a request for the content from said requesting computer,** [*See figure 8, and Column 5, lines 38-57*]

**the request including at least a name of the data file,** [*Figure 8, ref. Num "801-803" and column 13, lines 34-46,*] ( "4. File management scheme, including access methods. For example, DOS data files are named with a 1-8 byte name and a 0-3 byte extent, which are delimited by a "." (nnnnnnnn.xxx). The directory architecture is illustrated in FIG. 13 and takes the form of a hierarchical tree of directory names. The root is typically a volume, from which a number of directories branch. Each directory includes other directories and/or data files. A full data file name

Art Unit: 2432

*is represented by concatenating all the directory tree structure components from the root to the particular data file, with components being delimited by " ". An example of such a data file name using this convention is "vol\dir1\ dir3\ filename.ext".)*

**Blickenstaff further discloses,**

**based on said name, determine the location of the file and providing the requesting computer obtain the requested file from its own storage device or from the different server, distinct from the requesting computer. [See figure 8, and Column 5, lines 38-57]**

**Blickenstaff** does not explicitly disclose the limitation recited as, the name having been determined using at least a function of the data comprising the data item, permitting the content to be provided to the requesting computer if the content is authorized or licensed.

However, in the same field of endeavor Orita at least on its abstract discloses the following which meets the above limitation.

**“When a specified file access is requested** after the execution of the user program, **whether execution of the file access is permitted or not is determined according to access protection information.** The access protection information is information having access types **and file contents defined by the environment profile information.”**

Art Unit: 2432

It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to combine the feature such as the name having been determined using at least a function of the data comprising the data item, permitting the content to be provided to the requesting computer if the content is authorized or licensed as per teachings of **Orita** into the method of accessing of the file using the file name as taught by **Blickenstaff** in order provide a more secure access control and accurately/expeditiously retrieve requested file/s.

9. **As per independent claim 21, Blickenstaff discloses a method comprising:**

**(a) obtaining a list of names, one for each of a plurality of data items, wherein, for each of the data items** *[Figure 8, ref. Num "801-803" and column 13, lines 34-46,], ("4. File management scheme, including access methods. For example, DOS data files are named with a 1-8 byte name and a 0-3 byte extent, which are delimited by a "." (nnnnnnnn.xxx). The directory architecture is illustrated in FIG. 13 and takes the form of a hierarchical tree of directory names. The root is typically a volume, from which a number of directories branch. Each directory includes other directories and/or data files. A full data file name is represented by concatenating all the directory tree structure components from the root to the particular data file, with components being delimited by " ". An example of such a data file name using this convention is "vol\dir1\dir3\filename.ext".),*

**(b) receiving, from a requestor, an identifier for a requested data item** [*Figure 8, ref. Num "801-803" and column 13, lines 34-46,*],

**Blickenstaff further discloses,**

**based on said name, determine the location of the file and providing the requesting computer obtain the requested file from its own storage device or from the different server, distinct from the requesting computer.** [*See figure 8, and Column 5, lines 38-57*]

**Blickenstaff** does not explicitly disclose the limitation recited as,

**the corresponding name for that data item was determined as a function of the contents of the data item; said identifier having been determined based at least in part on the contents of the requested data item; (c) determining, based at least in part on said identifier for said requested data item, and using said list of names, whether the requestor may access the requested data item; and (d) based on said determining, if it is determined that requestor may not access the requested data item, denying access to the requested data item.**

However, in the same field of endeavor **Orita** at least on its abstract discloses the following which meets the above limitation.

Art Unit: 2432

**“When a specified file access is requested** after the execution of the user program, **whether execution of the file access is permitted or not is determined according to access protection information.** The access protection information is information having access types **and file contents defined by the environment profile information.”**

It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to combine the feature such as the name having been determined using at least a function of the data comprising the data item, permitting or denying the content to be provided to the requesting computer as per teachings of **Orita** into the method of accessing of the file using the file name as taught by **Blickenstaff** in order provide a more secure access control and accurately/expeditiously retrieve requested file/s.

10. **As per independent claim 24,** limitations recited in independent claim 24 is similar/equivalent to that of the limitations recited in independent claim 21, thus the claim is rejected for the same reasons/rationale as that of independent claim 21.
  
11. **As per dependent claim 2, the combination of Blickenstaff and Orita** discloses **the method as applied to claims above. Furthermore Orita discloses the method further comprising: (c) based at least in part on said determining, denying access to the data item when it is determined that access to the data item is not authorized.** [See abstract] *(On abstract the following has been disclosed. “When a specified*

Art Unit: 2432

*file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection information. The access protection information is information having access types and file contents defined by the environment profile information.”*

12. **As per dependent claim 3, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method wherein the request is received from a particular requestor, and wherein said step (b) of determining comprises: determining whether or not the particular requestor is authorized.** [See abstract] *(On abstract the following has been disclosed. “When a specified file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection information. The access protection information is information having access types and file contents defined by the environment profile information.”*
13. **As per dependent claim 4, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method further comprising: if it is determined that the particular requestor is not authorized, denying the particular requestor's request for the data item.** [See abstract] *(On abstract the following has been disclosed. “When a specified file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection*

Art Unit: 2432

*information. The access protection information is information having access types and file contents defined by the environment profile information.”*

14. **As per dependent claim 5, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method wherein said step (b) of determining whether or not the data item is authorized comprises determining whether or not the name is contained in a database comprising a plurality of identifiers. [See figure 1 and abstract, See also Blickenstaff, figure 1]**
15. **As per dependent claim 6, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method wherein the name for the data item is based on a function of the data which comprise the contents of the data file, and wherein the plurality of identifiers in the database are identifiers of licensed content items, and wherein the identifier of each licensed content item is based at least in part on the function of the data comprising the licensed content item. [See figure 1 and abstract, See also Blickenstaff, figure 1]**
16. **As per dependent claim 7, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method further comprising: (d) collecting information regarding the data item. [See figure 1 and figure 8]**
17. **As per dependent claim 8, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore**

Art Unit: 2432

**Blickenstaff discloses the method, wherein the information collected includes at least one of: (a) information about which data items have been stored on a computer; (b) information about the content of the data item, (c) information about the owner of the data item, (d) information about the type of data item, (e) information about the contextual name of the data item, (f) information about whether the data item was copied; (g) the name of the data item; (h) information about an identity of the requestor; (i) a timestamp; (j) information about whether the data item was created; and (k) information about whether the data item was read.**

*[See figure 1 and figure 8]*

- 18. As per dependent claim 9, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method, wherein at least some of the information collected is maintained for accounting or billing purposes.** *(It is implicit that such secondary storage system provided, as shown on figure 1, ref. Num "51" and "52", which maintains/stores a collection of files to the users as shown on figure 1, ref. Num "21" and "22", could be used by the owner of the storage server/s shown on figure 1, in order to provide storage services for the users by charging them for the provided storage services)*
- 19. As per dependent claim 10, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method, further comprising: (d) tracking**

Art Unit: 2432

- identities of data items requested.** *[See at least figure 8, ref. Num “801-803”]*
- 20. As per dependent claims 13 and 22, the combination of Blickenstaff and Orita discloses the method as applied to claims above.**  
**Furthermore Blickenstaff discloses the method, wherein the name is a True Name.** *[Figure 8, ref. Num “801-803” and column 13, lines 34-46,]*
- 21. As per dependent claim 14, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method, wherein a data item may comprise a file, a portion of a file, a page in memory, a digital message, a digital image, a video signal or an audio signal.** *[Figure 1, ref. Num “801-803”]*
- 22. As per dependent claims 15 and 23, the combination of Blickenstaff and Orita discloses the method as applied to claims above.**  
**Furthermore Blickenstaff discloses the method, wherein at least some computers make up part of a peer-to-peer network of computers.** *(See at least column 4, lines 23-28 and figure “1/local area network”, ref. Num “ 21, 22 and 42” and column 1, lines 6-8, “this invention relates to data communication networks, such as local area networks, that function to interconnect a plurality of data processors”)*  
*(Note: as it is disclosed on column 4, lines 26-28, “processors, shown on figure 1, are either personal computers, work stations or mini-computers”)*

Art Unit: 2432

- 23. As per dependent claim 16, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method, further comprising: (c) authorizing access to the data item when it is determined that the data item is authorized.** [See abstract] *(On abstract the following has been disclosed. “When a specified file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection information. The access protection information is information having access types and file contents defined by the environment profile information.”*
- 24. As per dependent claim 17, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method, wherein the authorized access permits copying of the data item from at least one of the plurality of computers.** *[Figure 8, ref. Num “809” and Column 5, lines 38-57]*
- 25. As per dependent claim 18,** limitations recited in dependent claim 18 is similar/equivalent to that of the limitations recited in independent claim 20, thus the claim is rejected for the same reasons/rationale as that of independent claim 20.
- 26. As per dependent claim 19, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Orita discloses the method, if it is determined that said data item is authorized, access to the data item is authorized** *[See abstract]* **from**

Art Unit: 2432

**more than one of the plurality of computers** [See *Blickenstaff*, figure 1 and figure 8]

27. **As per dependent claim 25, the combination of Blickenstaff and Orita discloses the method as applied to claims above. Furthermore Blickenstaff discloses the method, further comprising: in response to said request: (iv) allowing the data file to be delivered to the requesting computer if the data file is authorized.** [See figure 8, and Column 5, lines 38-57, see also Orita's abstract how the authorization is determined, such as based on the content of the file]

28. **Dependent claims 11-12** are rejected under 35 U.S.C. 103(a) as being unpatentable over Blickenstaff et al (hereinafter referred to as **Blickenstaff**), U.S. Patent No. 5,537,585 (filed on Feb 25, 1994) in view of Yukio Orita (hereinafter referred to as **Orita**) U.S. Patent No. 5,163,147 (Date of Patent: Nov 10, 1992) further in view of Gramlich et al (hereinafter referred to as **Gramlich**), U.S. Patent No. 5,202,982 (date of Patent: 04/13/1993) (submitted/cited/listed with/in IDS)

29. **As per dependent claims 11 and 12, Blickenstaff discloses a method, in a system which includes a network of computers** [See at least column 4, lines 23-28 and figure "1/local area network", ref. Num " 21, 22 and 42" and column 1, lines 6-8, "this invention relates to data communication networks, such as local area networks, that function to interconnect a plurality of data processors"] (Note: as it is disclosed on

Art Unit: 2432

column 4, lines 26-28, "processors, shown on figure 1, are either personal computers, work stations or mini-computers") **the method comprising:**

- **(a) obtaining a name for a data item, the name being included in a request for the data item** [Figure 8, ref. Num "801-803" and column 13, lines 34-46,], ( "4. File management scheme, including access methods. For example, DOS data files are named with a 1-8 byte name and a 0-3 byte extent, which are delimited by a "." (nnnnnnnnn.xxx). The directory architecture is illustrated in FIG. 13 and takes the form of a hierarchical tree of directory names. The root is typically a volume, from which a number of directories branch. Each directory includes other directories and/or data files. A full data file name is represented by concatenating all the directory tree structure components from the root to the particular data file, with components being delimited by " ". An example of such a data file name using this convention is " vol\dir1\ dir3\ filename.ext".) **and**

**Blickenstaff further discloses,**

**based on said name, determine the location of the file and providing the requesting computer obtain the requested file from its own storage device or from the different server, distinct from the requesting computer.** [See figure 8, and Column 5, lines 38-57]

**Blickenstaff** does not explicitly disclose

- **the name being based at least in part on the data which comprise the contents of the data item; and (b) determining, based**

Art Unit: 2432

**at least in part on said name, whether or not access to the data item is authorized.**

However, in the same field of endeavor **Orita at least on its abstract discloses the following which meets the above limitation.**

**“When a specified file access is requested** after the execution of the user program, **whether execution of the file access is permitted or not is determined according to access protection information.** The access protection information is information having access types **and file contents defined by the environment profile information.”**

It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to combine the feature such as **the name being based at least in part on the data which comprise the contents of the data item; and determining, based at least in part on said name, whether or not access to the data item is authorized** as per teachings of **Orita** into the method of accessing of the file using the file name as taught by **Blickenstaff** in order provide a more secure access control and accurately/expeditiously retrieve requested file/s.

**The combination of Blickenstaff and Orita** does not explicitly discloses the limitation recited as, wherein the name is based, at least in part, on a function of the data which comprise the contents of the data item, and wherein the function is a message digest function or a hash function and wherein the function is selected from the functions: MD4, MD5, and SHA.

Art Unit: 2432

However, in the same field of endeavor **Gramlich at least on its abstract and column 2, lines 52-55, discloses the following which meets the above limitation.**

“In the method and apparatus of the present invention a file to be added to the database is given a unique name that is dependent upon the contents of the file such that, when the contents of the source file changes, the name of the database component file to be added to the database also changes. Conversely, if two files of the same name have the same information contained therein, the same file name will be generated and the duplication of information in the database is prevented by providing a simple test that checks for the existence of the name of the database file before the generation and addition of the new file to the database. If the file name exists in the database, information is already contained in the database and the file is not generated and added to the database information.

**Preferably the name of the file is generated by computing a hash value from the contents of the file concatenating the hash value to the name of the source file.”**

It would have been obvious to one having ordinary skill in the art, at the time the invention was made, to add the feature such as the name is based, at least in part, on a function of the data which comprise the contents of the data item, and wherein the function is a message digest function or a hash function as per teachings of **Gramlich** into the method as taught by **the combination of Blickenstaff and Orita, in order to provide efficient system that saves resources by avoiding**

Art Unit: 2432

**duplication of storage of files having the same content. [See Gramlich column 2, lines 36-51]**

### ***Conclusion***

30. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
  - a. US Publication No. 2005/0010792 A1, to Carpentier et al discloses Systems wherein representing a number of assets on an originating computer begins with selecting the assets to be represented. Cryptographic hash asset identifiers are generated; each of the asset identifiers is computed using the contents of a particular asset. The asset identifier is a content-based or content-addressable asset name for the asset and is location independent. An asset list is generated that includes the asset identifiers computed from the assets. A cryptographic hash asset list identifier is generated that is computed from the asset list. The asset list identifier is stored for later retrieval. The assets selected are also stored for safekeeping either locally or on a computer network. In the event of loss of the files from the originating computer, the asset list identifier is retrieved. Using the asset list identifier, the original asset list is found and retrieved from its safe location. The asset identifiers from the retrieved asset list are used to find and retrieve the individual assets from their backup locations. The assets are verified by recomputing the cryptographic hash asset identifier for each asset retrieved and comparing it to the asset identifier from the asset list. The MD5 algorithm is used for the cryptographic hash function. Assets are

Art Unit: 2432

retrieved using a multicast protocol. A series of importer programs searches for assets to retrieve in progressively more remote locations. Assets are retrieved whole or in segments. [See at least the abstract]

**THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a). A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Samson B Lemma whose telephone number is 571-272-3806. The examiner can normally be reached on Monday-Friday (8:00 am---4: 30 pm).

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, BARRON JR GILBERTO can be reached on 571-272-3799. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system.

In re PATENT APPLICATION OF:	Attorney Docket: 2618-0017
FARBER, David et al.	Group Art Unit: 2432
Application Serial No.: 11/980,687	Examiner: LEMMA, S. B.
Application Filing Date: October 31, 2007	Confirmation No.: 6761
Title: <b>CONTROLLING ACCESS TO DATA IN A DATA PROCESSING SYSTEM</b>	Date: December 11, 2009

**AMENDMENT / RESPONSE**

*via EFS-Web*

Hon. Commissioner of Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Sir:

This Amendment is being filed in response to the non-final Office Action mailed 06/15/2009. Please amend this application as follows:

**Amendments to the claims** begin on page 2 below.

**Remarks** begin on page 8 below.

An *Information Disclosure Statement* is being filed herewith, along with the required fee.

A *Petition for Extension of Time* is being filed herewith, along with the required fee.

**IN THE CLAIMS**

Please amend the claims as follows. This listing of claims will replace all prior versions and listings of claims in the application.

1. (Original) A method, in a system which includes a network of computers, the method comprising:

(a) obtaining a name for a data item, the name being included in a request for the data item, and the name being based at least in part on the data which comprise the contents of the data item; and

(b) determining, based at least in part on said name, whether or not access to the data item is authorized.

2. (Original) A method as recited in claim 1 further comprising:

(c) based at least in part on said determining, denying access to the data item when it is determined that access to the data item is not authorized.

3. (Original) A method as recited in claim 1 wherein the request is received from a particular requestor, and wherein said step (b) of determining comprises: determining whether or not the particular requestor is authorized.

4. (Original) A method as recited in claim 3 further comprising:

if it is determined that the particular requestor is not authorized, denying the particular requestor's request for the data item.

5. (Original) A method as recited in claim 1 wherein said step (b) of determining whether or not the data item is authorized comprises determining whether or not the name is contained in a database comprising a plurality of identifiers.

6. (Currently amended) A method as recited in claim 5 ~~[[19]]~~ wherein the name for the data item is based on a function of the data which comprise the contents of the data file, and wherein the plurality of identifiers in the database are identifiers of licensed content items, and wherein the identifier of each licensed content item is based at least in part on the function of the data comprising the licensed content item.

7. (Original) A method as recited in claim 1 further comprising:

(d) collecting information regarding the data item.

8. (Original) A method as recited in claim 7, wherein the information collected includes at least one of: (a) information about which data items have been stored on a computer; (b) information about the content of the data item, (c) information about the owner of the data item, (d) information about the type of data item, (e) information about the contextual name of the data item, (f) information about whether the data item was copied; (g) the name of the data item; (h) information about an identity of the requestor; (i) a timestamp; (j) information about whether the data item was created; and (k) information about whether the data item was read.

9. (Original) A method as recited in claim 8 wherein at least some of the information collected is maintained for accounting or billing purposes.

10. (Original) A method as recited in claim 1 further comprising:

(d) tracking identities of data items requested.

11. (Original) A method as recited in claim 1 wherein the name is based, at least in part, on a function of the data which comprise the contents of the data item, and wherein the function is a message digest function or a hash function.

12. (Original) A method as recited in claim 1 wherein the name is based, at least in part, on a function of the data which comprise the contents of the data item, and wherein the function is selected from the functions: MD4, MD5, and SHA.

13. (Original) A method as recited in claim 1 wherein the name is a True Name.

14. (Original) A method as recited in claim 1 wherein a data item may comprise a file, a portion of a file, a page in memory, a digital message, a digital image, a video signal or an audio signal.

15. (Original) A method as recited in claim 1 wherein at least some computers make up part of a peer-to-peer network of computers.

16. (Original) A method as recited in claim 1 further comprising:

(c) authorizing access to the data item when it is determined that the data item is authorized.

17. (Original) A method as recited in claim 16 wherein the authorized access permits copying of the data item from at least one of the plurality of computers.

18. (Original) A method as recited in claim 16 wherein the name is received at a first computer and wherein, if it is determined that said data item is authorized, access to the data item is authorized from at least one of said plurality of computers distinct from the first computer.

19. (Original) A method as recited in claim 16 wherein, if it is determined that said data item is authorized, access to the data item is authorized from more than one of the plurality of computers.

20. (Currently amended) A method comprising:

controlling distribution of licensed content from a first computer to a requesting computer, [[by]] in response to a request for the content from said requesting computer, the request including at least a name of the data file, the

name having been determined using at least a function of the data comprising the data item, ~~permitting~~ permitting the content to be provided to the requesting computer if the content is authorized or licensed.

21. (Original) A method comprising:
- (a) obtaining a list of names, one for each of a plurality of data items, wherein, for each of the data items, the corresponding name for that data item was determined as a function of the contents of the data item;
  - (b) receiving, from a requestor, an identifier for a requested data item, said identifier having been determined based at least in part on the contents of the requested data item;
  - (c) determining, based at least in part on said identifier for said requested data item, and using said list of names, whether the requestor may access the requested data item; and
  - (d) based on said determining, if it is determined that requestor may not access the requested data item, denying access to the requested data item.

22. (Original) A method as recited in claim 21 wherein the list of names comprises a list of True Names of authorized data items and wherein the identifier of the requested data item is a True Name of the requested data item.

23. (Original) A method as recited in claim 21 wherein at least some of said computers make up part of a peer-to-peer network of computers.

24. (Original) A method comprising:

(a) receiving at a first computer, from a requesting computer, a request for a data file, said request including a name for the data file, the name having been determined using at least a function of the data in the data file, wherein the data used by the function to determine the name comprises the contents of the data file; and

(b) in response to said request:

(i) causing the name of the data file to be compared to a plurality of values;

(ii) determining if access to the data file is authorized or unauthorized based on whether the name matches at least one of said plurality of values, and

(iii) based on said determining in step (i), not allowing the data file to be delivered to the requesting computer if it is determined that access to the data file is not authorized.

25. (Original) A method as recited in claim 24 further comprising:

in response to said request:

(iv) allowing the data file to be delivered to the requesting computer if the data file is authorized.

In re Application of: FARBER, David et al.  
Application S.N.: 11/980,687  
Response to Non-Final Office Action

### **REMARKS**

Reconsideration and allowance of this application are respectfully requested.

By this Amendment, claim 20 has been amended to correct an informality noted by the Examiner and claim 6 has been amended to correct its dependency. No new matter has been added by these amendments.

Claims 1-25 are pending in this application.

The Examiner objected to claim 20 for an informality. In view of the above amendment to claim 20, withdrawal of this objection is respectfully requested.

### **THE INFORMATION DISCLOSURE STATEMENT (IDS) OF 12/26/2007**

On 12/26/2007 Applicant submitted an IDS which included 17 sheets of listed references (form 1449). With the Office Action of June 15, 2009, the Examiner only returned 16 sheets (pgs. 2-17), without the first page of the Form 1449. A copy of page 1 of the Form 1449 is submitted herewith.

It is respectfully requested that the information / reference listed on the attached PTO-1449 be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

### **THE §103 REJECTIONS**

The Examiner rejected 1-10 and 13-25 under 35 U.S.C. §103(a) as being unpatentable over Blickenstaff et al, U.S. Patent No. 5,537,585 (hereinafter Blickenstaff) in view of Orita, U.S. Patent No. 5, 163,147 (hereinafter Orita). The grounds for this rejection are respectfully traversed.

As recited in independent **claim 1**, this invention is a method, operable in a system which includes a network of computers. The method includes the step of: “obtaining a **name** for a data item, **the name** being included in a request for the data item, and **the name** being based at least in part on the data which comprise the contents of the data item.” The method further includes the step of “determining, based at least in part on **said name**, whether or not access to the data item is authorized.”

The first (or “obtaining”) step has, *inter alia*, two requirements:

1. The “name” must be “included in a request for the data item,” and
2. Then same “name” must be “based at least in part on the data which comprise the contents of the data item.”

Blickenstaff uses an ordinary user-provided file name (*e.g.*, a DOS 1-8 byte name with a 0-3 byte extension. *Blickenstaff*, col. 13, lines 34 *et seq.*). To the extent that Blickenstaff provides any example of a name for a data item, he uses a name such as “vol\dir1\dir3\filename.ext” (as shown by the Examiner at pg. 4 of the Office Action). But Blickenstaff has no notion of using a name derived from or based in any way on the actual content of the data item, as required by claim 1 and its dependents.

And the Examiner acknowledges (at pgs. 4-5 of the Office Action) that Blickenstaff does not disclose “the name being based at least in part on the data

In re Application of: FARBER, David et al.  
Application S.N.: 11/980,687  
Response to Non-Final Office Action

which comprise the contents of the data item; and (b) determining, based at least in part on said name, whether or not access to the data item is authorized.”

However, the Examiner then asserts (*Id.* at 5) that: “Orita at least on its abstract discloses the following which meets the above limitation.”

Applicant respectfully submits, however, that Orita does not teach or in any way suggest using a name for a data item “based at least in part on the data which comprise the contents of the data item.” All that Orita states (and only in the Abstract), is:

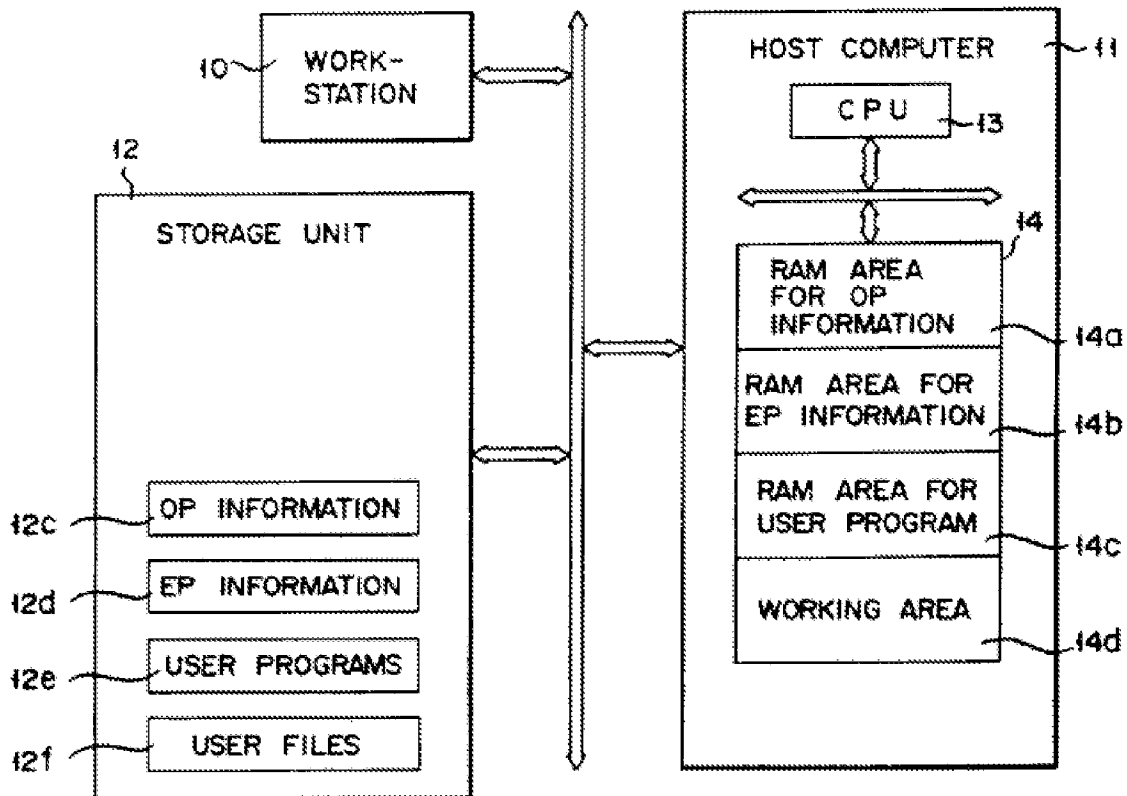

When a specified file access is requested after the execution of the user program, whether execution of the file access is permitted or not is determined according to access protection information. The access protection information is information having access types and file contents defined by the environment profile information.

To the extent that Orita uses the contents of any file to control access, it is the contents of the so-called “EP Information” file, but not the contents of the file that is to be accessed. Orita describes the so-called “EP Information” used to control access. See, *e.g.*, *Orita* Fig. 5 and col. 3, lines 56 *et seq.*:

As is shown in FIG. 5, the EP information 12d includes the following items: an EP information file name; an EP password; an EP authority level; an activable user program name; access file names; and a file password. The EP information file name is used as identification data when an EP information file stored in the operator profile is accessed or when an EP information file input by the operator is accessed. The EP password is entered by the operator along with the name of an EP information file, and is used for checking whether the access to the EP information file is allowed or prohibited. The EP authority level is a level determined for the EP information. The EP authority level is compared with the authority level of the operator profile, so as to determine whether the access to the EP information file is allowed or prohibited. Even if an EP information file name having a high authority level is mistakenly recorded in the operator profile with respect to a low-authority-level user, the EP authority level prevents access to the EP information file of the high authority level. The activable user file name indicates a user program which can be activated. One user program is stored in one EP information

file, and a user which is entitled to access the EP information file can open the user program stored in the EP information file. The access file names indicate user programs which can be accessed from the activable user program. The maximal number of access file names which can be designated by a user is 600. The file password is required for accessing a file since the file contains a password, along with the data indicating the access type. Since, in the present invention, the file password is recorded in the EP information file beforehand, a user need not be informed of the file password, so that the security of the file is ensured.

Thus, as shown in Orita's Figure 1 (reproduced below), the file "EP Information" 12d is used to control access by the user programs 12e to the user files 12f. But there is nothing in Orita to suggest that the name of any of the files is based in any way on the contents of any of the files.

Orita states that the file contents of the *access protection information* is defined by the *environment profile information*. But Orita does not state, as the

In re Application of: FARBER, David et al.  
Application S.N.: 11/980,687  
Response to Non-Final Office Action

Examiner would have it, that the a name of a data item is based in any way on the contents of that data item, and that **the name** is used to determine, whether or not access to the data item is authorized.

Accordingly, no proposed combination of Blickenstaff with Orita would produce the invention, as claimed, in which a name for a data item, the name being “based at least in part on the data which comprise the contents of the data item,” is used to “determine[] ...whether or not access to the data item is authorized.”

For at least these reasons, claim 1 and its dependents are patentable over Blickenstaff in view of Orita.

Similar arguments apply to claims **20, 21, and 24** and their dependents.

Claims 2-19 depend from claim 1 and are therefore patentable over Blickenstaff in view of Orita for the reasons given above.

Further as to **claim 5**, the Examiner’s entire basis for rejection of this claim consists of the statement “See figure 1 and abstract, See also Blickenstaff, figure 1”.

**Claim 5** recites a method as recited in claim 1 “wherein said step (b) of determining whether or not the data item is authorized comprises determining whether or not the name is contained in a database comprising a plurality of identifiers.” As noted above, neither Blickenstaff nor Orita has any disclosure of a “name” as claimed, “the name being based at least in part on the data which comprise the contents of the data item.” Furthermore, neither Blickenstaff nor Orita teaches or in any way suggests a “database comprising a plurality of identifiers”, or using such a database to determine whether or not the data item is authorized.

For at least these additional reasons, claim 5 is further patentable over Blickenstaff in view of Orita.

**Claim 6** depends from claim 5 and recites a method “wherein the name for the data item is based on a function of the data which comprise the contents of the data file, and wherein the plurality of identifiers in the database are identifiers of licensed content items, and wherein the identifier of each licensed content item is based at least in part on the function of the data comprising the licensed content item.” The Examiner’s entire basis for rejection of claim 6 consists of the statement “See figure 1 and abstract, See also Blickenstaff, figure 1”.

Since neither Blickenstaff nor Orita has any database of identifiers, they do not and cannot teach or in any way suggest a method, as claimed, “wherein the plurality of identifiers in the database are identifiers of licensed content items, and wherein the identifier of each licensed content item is based at least in part on the function of the data comprising the licensed content item.”

For at least these additional reasons, claim 6 is further patentable over Blickenstaff in view of Orita.

**Claim 7** recites a method as in claim 1 further comprising: collecting information regarding the data item. And **claim 8** recites a method as in claim 7 “wherein the information collected includes at least one of: (a) information about which data items have been stored on a computer; (b) information about the content of the data item, (c) information about the owner of the data item, (d) information about the type of data item, (e) information about the contextual name of the data item, (f) information about whether the data item was copied; (g) the name of the data item; (h) information about an identity of the requestor; (i) a timestamp; (j) information about whether the data item was created; and (k) information about whether the data item was read.”

The Examiner’s entire basis for rejection of these claims consists of the statement “See figure 1 and figure 8”.

In re Application of: FARBER, David et al.  
Application S.N.: 11/980,687  
Response to Non-Final Office Action

Applicant respectfully submits that neither Blickenstaff nor Orita teaches or in any way suggests the claimed collection of information.

For at least these additional reasons, **claims 7 and 8** are further patentable over Blickenstaff in view of Orita.

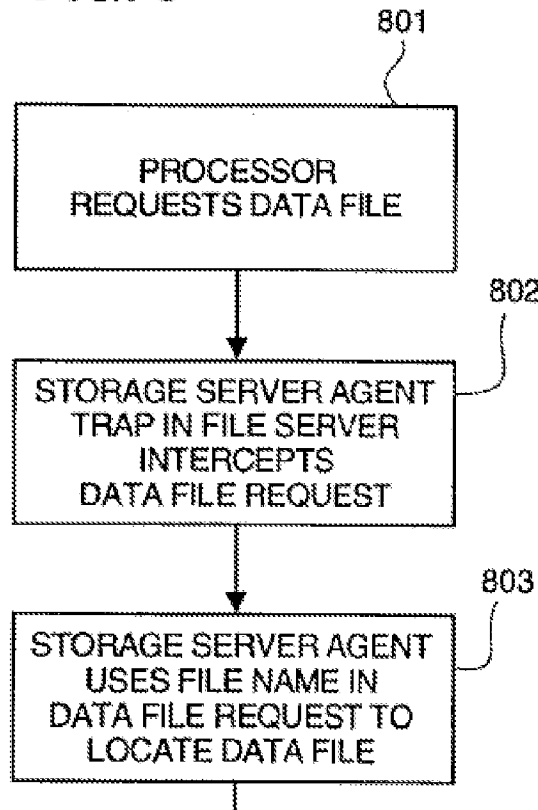

**Claim 9** recites a method as in claim 8 “ wherein at least some of the information collected is maintained for accounting or billing purposes.” No such feature is taught or suggested by Blickenstaff or Orita. The Examiner points to a secondary storage system in Blickenstaff’s figure 1 and states that such storage “could be used by the owner of the storage server/ s shown on figure 1, in order to provide storage services for the users by charging them for the provided storage services.” *Office Action*, pg. 13. The Examiner has not, however, shown any teaching or even suggestion that the structure could or would be so used. It is not sufficient for the Examiner to simply point to a memory or storage device and state that it could be used to perform the invention.

For at least these additional reasons, **claim 9** is further patentable over Blickenstaff in view of Orita.

**Claim 10** recites a method as in claim 1 further comprising: “tracking identities of data items requested.” No such feature is taught or suggested by Blickenstaff or Orita. The Examiner’s sole basis for rejecting this claim is the statement “See at least figure 8, ref Num "801 - 803"” (Applicant assumes that this citation is to Blickenstaff.)

The cited portions of Blickenstaff’s Figure 8 (reproduced in part below) neither teach nor in any way suggest “tracking identities of data items requested,” as claimed.

**FIG. 8**

For at least these additional reasons, **claim 10** is further patentable over Blickenstaff in view of Orita.

**Claims 13 and 22** use the inventors' defined term "True Name". E.g., claim 13 recites that "the name is a True Name," and claim 22 recites that "the list of names comprises a list of True Names of authorized data items."

The inventors' term "True Name" is defined in the application as filed, *e.g.*, at ¶0053 ("the terms "True Name", "data identity" and "data identifier" refer to the substantially unique data identifier for a particular data item."; See also ¶¶0085 *et seq.* describing the calculation of a True Name in a preferred embodiment).

Blickenstaff does not describe a True Name, as that term is defined by the inventors. The naming scheme described by Blickenstaff is nothing more than the

In re Application of: FARBER, David et al.  
Application S.N.: 11/980,687  
Response to Non-Final Office Action

DOS naming scheme, and names in that scheme are not substantially unique identifiers.

In view of the above, withdrawal of this rejection under §103 is respectfully requested.

In his concluding remarks, the Examiner commented on US Patent No. 5,742,807 (hereinafter “the ‘807 patent”). Applicant notes that the ‘807 patent is not prior art to the present application. The ‘807 patent was filed after the April 11, 1995 priority date of this application.

#### **RELATED APPLICATIONS**

The Examiner’s attention has previously been directed to co-pending U.S. Patent Applications which are directed to related technical subject matter. The attached Form PTO-1449 (modified) lists, *inter alia*, office actions issued in applications 11/017,650 and 11/724,232. As these patent applications are stored electronically at the PTO, no copies are being provided herewith. If the Examiner requires copies of any of these applications or any additional information regarding any of the documents cited herein, the Examiner is respectfully requested to contact the undersigned at the number provided.

### CONCLUSION

Applicant respectfully submits that this application is in condition for allowance, and an early action allowing the claims is earnestly solicited.

Should the Examiner believe that a telephone call will resolve any outstanding issues in this case, he is invited to telephone the undersigned at the number provided.

<b>CHARGE STATEMENT:</b> Deposit Account No. 501860, order no. 2618-0017.
The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 ( <u>missing or insufficiencies only</u> ) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a <u>duplicate</u> copy of this sheet is attached
<b>This CHARGE STATEMENT <u>does not authorize</u> charge of the <u>issue fee</u> until/unless an issue fee transmittal sheet is filed.</b>

**INFORMATION DISCLOSURE STATEMENT**

Hon. Commissioner of Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 C.F.R. § 1.56, the attention of the Patent and Trademark Office is hereby directed to the reference(s) listed on the attached PTO-1449. One copy of each non-U.S. Patent reference is attached. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

This Information Disclosure Statement is being filed within three (3) months of the U.S. filing date OR before the mailing date of a first Office Action on the merits. No certification or fee is required.

The Examiner's attention is again directed to the following co-pending U.S. Patent Applications which are directed to related technical subject matter. The

Examiner is respectfully requested to consider the cited application and the art cited therein during examination.

This IDS cites office actions from related applications. As these patent applications are stored electronically at the PTO, no copies are being provided herewith. If the Examiner requires copies of any of these applications or any additional information regarding any of the documents cited herein, the Examiner is respectfully requested to contact the undersigned at the number provided.

This IDS is intended to be in full compliance with the rules, but should the Examiner find any part of its requirement content to have been omitted, prompt notice to that effect is earnestly solicited, along with additional time under Rule 97(f), to enable Applicant to comply fully.

**CHARGE STATEMENT:** Deposit Account No. 501860, order no. **2618-0017**.

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached

**This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.**

POWER OF ATTORNEY,  
CORRESPONDENCE ADDRESS  
AND REVOCATION OF PRIOR POWERS

Hon. Commissioner of Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Sir:

**Revocation:** I hereby revoke all previous powers of attorney given in the application identified in the attached statement under 37 CFR 3.73(b).

**Power of Attorney:** I hereby appoint the practitioners associated with customer number **75948**, individually and collectively, as attorney(s) or agent(s) to represent the undersigned before the United States Patent and Trademark Office (USPTO) in connection with any and all patent applications assigned only to the undersigned according to the USPTO assignment records or assignment documents attached to this form in accordance with 37 CFR 3.73(b).

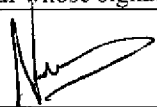

I authorize Davidson Berquist Jackson & Gowdey, LLP to delete names/numbers of persons no longer with the Firm and to act and rely on instructions from and communicate directly with the entity who first sent this case to them and by whom I hereby declare that I have consented after full disclosure to be represented unless/until I instruct Davidson Berquist Jackson & Gowdey, LLP in writing to the contrary.

**Correspondence Address:** Please recognize or change the correspondence address for the application identified in the attached statement under 37 CFR 3.73(b) to the address associated with Customer Number **75948**.

*Assignee Name and Address:*

**Kinetech, Inc.**  
14011 Ventura Boulevard, Suite 501  
Sherman Oaks, California 91423

A copy of this form, together with a statement under 37 CFR 3.73(b) (Form PTO/SB/96 or equivalent) is required to be filed in each application in which this form is used. The statement under 37 CFR 3.73(b) may be completed by one of the practitioners appointed in this form if the appointed practitioner is authorized to act on behalf of the assignee, and must identify the application in which this Power of Attorney is to be filed.

<b>SIGNATURE of Assignee of Record</b>			
The individual whose signature and title is supplied below is authorized to act on behalf of the assignee			
Signature		Date	3/13/08

Title	VP, Business Development		

## STATEMENT UNDER 37 CFR 3.73(B)

Applicant / Patent Owner: Kinetech, Inc.

Docket No. 2618-0017

Application No. / Patent No. 11/980,687

Filed / Issued Date: October 31, 2007

Entitled: **CONTROLLING ACCESS TO DATA IN A DATA PROCESSING SYSTEM**

Assignee: Kinetech, Inc.

A corporation

(Name of assignee)

(Type of Assignee: corporation, partnership, university, government agency, etc.)

States that it is:

1.  the assignee of the entire right, title, and interest; or
2.  an assignee of less than the entire right, title and interest.  
(The extent (by percentage) of its ownership interest is 50%)

in the patent application / patent identified above by virtue of either:

- A.  An assignment from the inventor(s) of the patent application / patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel , Frame , or for which a copy thereof is attached.

**OR**

- B.  A chain of title from the inventor(s), of the patent application / patent identified above, to the current assignee shown below:

1.	From: <u>INVENTORS</u> To: <u>Kinetech, Inc.</u> The document was recorded in the United States Patent and Trademark Office at Reel <u>009873</u> Frame <u>0463</u> .
2.	From: <u>Kinetech, Inc.</u> To: <u>Digital Island, Inc. (Assignment of 50% ownership interest)</u> The document was recorded in the United States Patent and Trademark Office at Reel <u>011217</u> Frame <u>0958</u> .
3.	From: <u>Kinetech, Inc.</u> To: <u>Digital Island, Inc.</u> The document was recorded in the United States Patent and Trademark Office at Reel <u>013295</u> Frame <u>0327</u> .

- Additional documents in the chain of title are listed on a supplemental sheet.
- Copies of assignments or other documents in the chain of title are attached.

**As required by 37 CFR 3.73(b)(1)(i), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.**

[Note: A separate copy (*i.e.*, a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, if the assignment is to be recorded in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.

**This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.**

**New Applications Under 35 U.S.C. 111**

**If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.**

**National Stage of an International Application under 35 U.S.C. 371**

**If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.**

**New International Application Filed with the USPTO as a Receiving Office**

**If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.**
