Overview

Crossroads Fibre Channel Storage Bridges and Routers provide seamless, reliable connectivity and protocol conversion from the Fibre Channel (FC) Storage Area Network (SAN) to tape and disk storage device interfaces. Our proven technology brings the best-of-class data accessibility, device management, system performance and security functionality required by today's enterprise SANs. Crossroads bridges and routers are an integral component of Crossroads Business Information Assurance (BIA) solutions that protect critical enterprise information by delivering accessible, resilient and secure business information – anytime, anywhere.

Key Features and Benefits

FC Storage Bridges – *Industry-Best Value*

Crossroads Storage Bridges set the industry standard for cost effective, reliable and easy-to-manage connectivity of SCSI storage resources to a FC SAN fabric or loop.

COST-EFFECTIVE – Useful life of SCSI storage resources can be extended by allowing them to be accessed in a FC SAN. Additionally, by aggregating device ports, Crossroads bridges save on switch port expenses.

RELIABLE – Path readiness and network event reporting detect and track errors affecting the backup and restore operations. Configuration issues and conflicts are identified and reported, resulting in a more reliable backup and recovery.

SIMPLE DEPLOYMENT – Simple configuration through multiple management interface options, coupled with field upgradeable firmware, combine to provide easy set up and maintenance.

FC Storage Routers – *Industry-Best Functionality*

Crossroads Storage Routers expand bridge functionality, offering complete "network-ready" services, enhancing security, manageability and system performance for storage devices.

SECURITY – Storage resources are securely allocated using Crossroads' patented Access Controls, a powerful resource sharing feature that controls access to storage targets from multiple hosts to the Logical Unit (LUN) level. Users can configure, secure and manage up to eight custom device maps. Additionally, dynamic mapping allows immediate changes to custom maps without router reboot.

ENHANCED MANAGEMENT – Crossroads Visual Manager (CVM) is a powerful Web-based management tool that configures, controls and manages all elements of the storage router. An intuitive graphical representation of the router allows "point and click" access to status information and management settings. CVM manages individual storage devices as an integrated system rather than as a collection of stand-alone devices and supports troubleshooting utilities, such as traces and event logging.

ENHANCED PERFORMANCE – Datapath write performance is enhanced using configurable buffered tape writes and immediate data response to remove the latency created by tape devices. The router also features inquiry caching which eliminates the potential for the application to respond unfavorably to slow responses from INQUIRY commands.
