## 4.1 Introduction

This chapter deals with the basic concepts of positioning at sea; we start with an introduction to least squares, on which all modern positioning computations are based, and then develop the various formulae used in the computations.

We are going to put into a single chapter the information that is disseminated to undergraduate surveyors in about a year of study, so some of the detailed explanations and proofs will necessarily be shortened.

Before going straight into least squares, we will briefly revise the coordinate systems available to us in the context of computations.

## 4.2 Coordinate systems

### 4.2.1 The ellipsoid

The ellipsoid is the mathematical figure which approximates most closely the true shape of the earth. Unfortunately, many people have tried to establish the best-fit ellipsoid for the earth, and many of the ellipsoids they calculated are in use. Life would be very much easier if there were only one ellipsoid (or spheroid).

In Australia we generally use the Australian Geodetic Datum as a datum for our offshore surveys. Even this is somewhat complicated by the following facts:

- There are two Australian datums in use — AGD66 and AGD84.
- Neither of the two datums is geocentric.
- Australia intends to move to a geocentric datum in 2000.

The AGD66 datum has the following definition:

Semi-axis major: 6378 160.0m

Flattening: 1/298.25 exactly.

The minor axis of the spheroid was defined in 1966 to be parallel to the earth's mean axis of rotation in 1962 (this was later changed in 1970), and the meridian of zero longitude was defined as being parallel to the Bureau International de l'Heure (BIH) meridian plane near Greenwich. The centre of the spheroid was defined by the coordinates of Johnston Geodetic Station, a station in the centre of Australia. At that time it was assumed that the spheroid — geoid separation was zero at Johnston, and also zero at all the other geodetic stations listed in the 1966 adjustment.

Since 1966 a huge amount of information on the shape of the geoid has become available, particularly through satellite observations, and it was realized that the 1966 adjustment was no longer accurate. In 1982 all the information then available was put into a new least squares network

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

## API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

## LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

## FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

## E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
