MICROMIRROR WAVELENGTH EQUALIZER

FIELD OF THE INVENTION

This invention relates to the field of optical systems, particularly to fiber optic communication systems.

5

P.

13

- 2

BACKGROUND OF THE INVENTION

Modulated light beams carry information in fiber optic communication systems. A single fiber carries several light beams, and therefore several separate information streams. Each light beam in the fiber has a unique wavelength. When necessary, the light beams are separated by wavelength and routed to their particular destination. Through the course of the network, various wavelengths come from different sources and along different paths. This typically results in the different wavelengths having different amplitudes.

When the various amplitudes have different wavelengths, optical amplification is difficult. An unequalized signal passing through an optical amplifier remains unequalized. The disparity between the various signals can become even worse upon amplification. EFDA are the amplifier of choice because they have gain across the entire spectrum of interest. When amplified by an EFDA, the stronger signals in the unequalized source are spontaneously matched/amplified, robbing from the weaker signals.

When unequalized signals pass through cascaded amplifiers, the equalization problem cascades as well. The worst case result is that the weaker signals become weaker and weaker

20 until the information in the weak signals is not recoverable. What is needed it a method of equalizing the signal strength between the various wavelengths in an optical fiber.

SUMMARY OF THE INVENTION

Objects and advantages will be obvious, and will in part appear hereinafter and will be accomplished by the present invention which provides a method and system for wavelength equalization. One embodiment of the claimed invention provides a wavelength equalizer. The wavelength equalizer comprises an input waveguide, an output waveguide, a wavelength separation device, and a micromirror array. The wavelength separation device divides the input beam of light into sub-beams. A first sub-array of the micromirrors in the micromirror array are operable between a first and second position. The first position directing light in the sub-beam to the output waveguide, and the second position excluding the light in the sub-beam from the output waveguide.

According to another embodiment of the wavelength equalizer, a method of equalizing a plurality of components of an optical input signal is provided. The method comprises: separating the components, directing each component to a sub-array of a micromirror array, positioning micromirrors in each sub-array such that micromirrors in a first position direct incident light to an output waveguide and micromirrors in a second position do not, and combining the sub-beams into an output beam of light.

BRIEF DESCRIPTION OF THE DRAWINGS

For a more complete understanding of the present invention reference is now made to the following descriptions taken in conjunction with the accompanying drawings, in which:

FIGURE 1 is a perspective view of a small portion of a micromirror array of the prior art.

FIGURE 2 is an exploded perspective view of a single micromirror element from the micromirror array of Figure 1.

FIGURE 3 is a schematic view of one embodiment of a wavelength equalizer according to the present invention.

FIGURE 4 is a schematic view of one embodiment of a wavelength equalizer according to the present invention using a detector to sense the strength of the input signals.

FIGURE 5 is a schematic view of another embodiment of a wavelength equalizer according to the present invention that operates without the use of a fixed mirror.

FIGURE 6 is a schematic view of another embodiment of a wavelength equalizer according to the present invention similar to the embodiment of Figure 5, using both a detector and a light trap.

FIGURE 7 is a schematic view of another embodiment of a wavelength equalizer according to the present invention that does not require a circulator or other light separation device.

FIGURE 8 is a schematic view of another embodiment of a wavelength equalizer
20 according to the present invention using a retro-reflector and two groups of mirror elements and having an output power monitor.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
