

Need to make sure you understand my direction.

Precision is important by not my concern.

It is too easy for customer to sit chair on top of base without securing it.

For example, the chair can be placed on top of base even if it is backwards. Look at photo. Chair still looks OK to sit in, but it is not secure.

There needs to be a way for customer to sit chair on top of base and not worry if it is no correctly or not.

Current design makes customer line up front part of chair to front part of tray. This is too difficult.

Regards,

Scott

Scott

The current hand made sample with rough workmanship which is not perfect in term of construction and the latch system only for viewing. As per my understanding, the production mold will be more precise with smooth latch application.
