IBUTTON PRODUCTS: 1-WIRE ADAPTERS

https://www.maximintegrated.com/en/products/ibutton/products/1wire_adapters.cfm

12/8/2015

Because <u>i</u>Buttons use the 1-Wire protocol, the hardware needed for communicating with an <u>i</u>Button is inexpensive. Any PC, PDA or other computing device with the necessary ports and software can easily communicate to any <u>i</u>Button through our 1-Wire port adapters.

PC 1-Wire Connectivity

The DS1402D Blue Dot Receptors are iButton reader/probes that provide a convenient pipeline into the PC for iButton-to-PC communication. The receptor's cable connects to a USB, serial, or parallel-port 1-Wire adapter, whichever type of port you wish to use. The receptor itself easily affixes to any accessible spot on the front of the PC. The user can elect a quick information transfer with a momentary touch of the iButton to the Blue Dot. For hands-free operation the iButton can be snapped into the Blue Dot and remain there.

Each receptor contains two Blue Dots to accommodate instances where multiple <u>i</u>Buttons are required for a transaction. A company's policy may, for example, require both an employee and a supervisor to authenticate access to sensitive data stored on a network server.

Several adapters are available that actually hold <u>i</u>Buttons. Each adapter/<u>i</u>Button combination becomes a self-contained security device perfect for software authorization solutions.

USB Port Adapters

We offer two 1-Wire USB Port Adapters, the DS9490R and the DS9490B, both of which connect to any standard universal serial bus (USB) port. The DS9490R is designed to connect multiple 1-Wire/iButton devices to a PC or handheld through its RJ-11 connector. Attaching the DS1402D-DR8 Blue Dot Receptor to the RJ-11 connector is a popular way to interface a PC to a 1-Wire network comprised of multiple iButtons.

The DS9490B, in contrast, is designed to hold a single <u>i</u>Button, perfect for software authorization solutions. The DS9490 family of 1-Wire USB port adapters comes with the following features:

- DS9490R
 - USB port
 - Internal 64-bit address
 - Communicates to all <u>i</u>Buttons; can read but not write to DS198x EPROM iButtons

- RJ-11 out; compatible with DS1402D-DR8 Blue Dot Receptor
- DS9490B
 - USB port
 - Internal 64-bit address
 - Single iButton holder
 - Can be used as a key-chain fob
 - Ideal choice for software authorization solutions

Serial Port Adapter

The DS9097U RS-232 Serial Port Adapters and the DS1402D-DR8 Blue Dot Receptor connect to any standard RS-232-C serial port. The DS9097U connects to the serial port and then the DS1402D-DR8 connects to the DS9097U through a RJ-11 connection. The DS9097U is not a pass-through device. A serial port must therefore be dedicated to perform iButton communication.

The DS9097U RS-232-C COM Port Adapter comes in three versions:

- DS9097U-S09
 - 9-Pin RS-232-C port
 - Communicates with all iButton devices, can read but not write to DS198x EPROM iButton devices
- DS9097U-009
 - 9-Pin RS-232-C port
 - Has internal 64-bit address
 - Communicates with all iButton devices, can read but not write to DS198x EPROM iButton devices

Please note that other serial-port adapters are available, including some that can physically hold an <u>iButton</u>. These adapters are perfect for software authorization solutions. We also offer passive serial-port adapters for legacy systems. To examine our complete line of serial-port adapters, please visit the associated parametric tables.
