This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

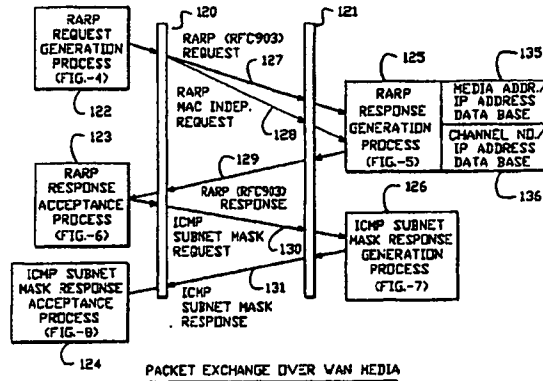

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

(54) Title: SYSTEM FOR REVERSE ADDRESS RESOLUTION FOR REMOTE NETWORK DEVICE

(57) Abstract

A reverse address resolution protocol for use in a communication network which allows resolution logic to provide a higher level protocol information (such as an IP address) to a source of a request (127) for such information (122), independent of the physical network address of such source. The protocol is used in a processor having a plurality of ports, at least one of such ports connected by a point-to-point channel to a remote network device. Reverse address resolution protocol is responsive (129) to a resolution request from the remote network device across the point-to-point channel to supply the higher level protocol information based upon the port through which the resolution request is received (125), rather than the physical network address of the requesting device. Thus, a remote device may be coupled to a network, and connected to a central management site across a point-to-point communication link, in a "plug and play" mode. The person connecting the device to the remote network does not need to determine the physical network address of the device or configure the device with a higher level address protocol.

**SYSTEM FOR REVERSE ADDRESS RESOLUTION
FOR REMOTE NETWORK DEVICE**

FIELD OF THE INVENTION

The present invention relates to start up protocols for devices in communication networks; and more particularly to systems which allow a machine without a configured higher level protocol address to obtain such
5 address without a unique machine identifier.

DESCRIPTION OF RELATED ART

A widely accepted series of international standards describing network architectures is known as the OSI reference model. See, generally,
10 Tannenbaum, Computer Networks, 2nd Ed., 1988, Prentice-Hall. According to this model, network communications are divided into a plurality of protocols within layers of the model. Local Area Networks (LANs) operate using medium access protocols within the lower layers, layers 1 and 2, of the OSI model, such as the carrier sense multiple access with collision detection
15 CSMA/CD, IEEE Standard 802.3, also known as ETHERNET, and the token ring access ring method of IEEE Standard 802.5. These two lower layers are typically broken down into the physical layer and the data link layer, with the data link layer being further broken down into a media access control (MAC) layer, and a logical link layer.

20 Systems, such as personal computers, workstations, and mainframe computers, attached to the LANs each have a distinct lower level protocol identifier known as the physical network address or MAC address. LAN frames forwarded to a destination system on the network under these lower level protocols contain the destination system MAC address, or other
25 physical network address, as a destination. LAN frames forwarded from a source system on the network contain the source system MAC address, or other physical network address, as a source address. Systems

communicate by encapsulating additional protocols (OSI layers 3-7) within the lower layer LAN frames. These higher level protocols are grouped into suites such as the TCP/IP protocol suite and the XNS protocol suite. Many LANs contain groups of end systems that use different higher level protocol
5 suites. These higher level protocol suites also assign unique higher level protocol identifiers to systems which transmit or receive frames in the network.

For instance, an internet protocol IP address is assigned to each system operating within an internet protocol network. The internet protocol
10 address includes a network address portion and a host address portion. The network address portion identifies a network within which the system resides, and the host address portion uniquely identifies the system in that network. Processors routing packets in an internet protocol network rely on the network address portion of the IP address in a frame to find the local area
15 network of the destination machine. Once the local area network of the destination is located, the frame is forwarded to that network where the host address portion is relied upon to assign a MAC address for the destination machine to the packet. Thus, higher level protocol address places the device in a particular network or subnetwork, so that the higher level protocol
20 can effectively manage the routing of packets among the networks, without maintaining a table of the unique physical access layer identifiers for all of the terminals in the network.

In order to communicate in such a network, the machine must first obtain its higher level protocol address. This address is typically assigned
25 by a central authority, such as the Internet Activities Board, or by a network manager. Normally, a particular machine learns its IP address by a configure operation, in which a technician uses a local terminal to configure the machine. In a centrally managed network, this could be a cumbersome task, involving travel of skilled personnel away from the central management
30 location. However, a reverse address resolution protocol RARP has been

developed for networks such as TCP/IP or SNMP protocols. The RARP allows a machine without a configured IP address to obtain an IP address from a remote server. The machine broadcasts a request and waits until an RARP server responds. In the request, the requesting machine must provide
5 its physical network address (MAC address) to uniquely identify itself, allowing the server to map it into an IP address.

This RARP protocol works fine, so long as the central management site is aware of the physical network address of the devices being added to the network. In order to find out the physical network address, all of the
10 system being added to the network must be passed through the central management site so that the address can be read from these machines, or a local technician must read the physical network address from the machine and telephone the central site. This process makes connecting a new device to a network difficult. Further, this process of physically reading the physical
15 network address from the box is prone to human errors. Such addresses are typically very long (MAC addresses are 48 bits long), and can be misread or typed in erroneously.

It is desirable to have so-called "plug and play" network devices. Such devices can be plugged in and turned on by unskilled personnel.
20 However, the need to find out the physical network address of the box detracts from this ability.

Accordingly, it is desirable to provide a technique for resolving higher level protocol addresses, without reliance on the lower level protocol addresses.
25

SUMMARY OF THE INVENTION

The present invention provides a reverse address resolution protocol for use in a communication network which allows resolution logic to provide a higher level protocol address, or other information, to a source of a request
30 for such address, independent of the physical network address of such

source. The protocol according to the present invention is used in a processor having a plurality of ports, at least one of such ports connected by a point-to-point channel to a remote network device. The reverse address resolution protocol is responsive to a resolution request from the remote network device across the point-to-point channel to supply the higher level protocol address based upon the port through which the resolution request is received, rather than the physical network address of the requesting device. Thus, a remote device may be coupled to a network, and connected to a central management site across a point-to-point communication link in a "plug and play" mode. The person connecting the device to the remote network does not need to determine the physical network address of the device or configure the device with a higher level address protocol. All this can be handled automatically.

Thus, the present invention can be characterized as an apparatus for resolving higher level protocol addresses in response to resolution requests from a source of resolution requests in a communication network. The apparatus comprises a central processor having a plurality of ports for connection to the communication network, and resolution logic which is coupled to the communication network and in communication with the central processor. The resolution logic provides a higher level protocol identifier in response to a particular port in the plurality of ports through which the resolution request is received by the central processor, independent of the lower level protocol identifier of the source of the resolution request. The resolution logic may be a routine executed by the central processor, or a routine executed by a network management processor coupled to the communication network, and in communication with the central processor.

The resolution logic, according to one aspect, includes a resolution table that is configurable independent of the lower level protocol identifiers, which assigns higher level protocol identifiers to particular ports of the central processor through which the resolution requests may be received.

The higher level protocol identifier may comprise an internet protocol IP address, which includes a network address for the source of the resolution request, and a host address for the source of the resolution request. Further, the higher level protocol may be utilized by a network management system, which communicates network-wide, while the lower level protocol comprises a medium access protocol.

The resolution logic, according to the present invention, relies on the source of the resolution request being coupled across a point-to-point communication channel to the particular port of the processor receiving the request. In this way, the port serves as a virtual identifier for the source of the request.

Thus, the present invention can also be characterized as an apparatus for connecting a first network and a second network. This apparatus includes a communication link, a first processor, and a second processor. The first processor has a first interface coupled to the first network and a second interface coupled to the communication link. The second processor has a lower level protocol identifier and is coupled to the second network and to the communication link. Resolution logic is coupled to the first network to provide a higher level protocol identifier to the second processor in response to a resolution request through the second interface of the first processor, independent of the lower level protocol identifier of the second processor. In this manner, the first processor can configure the higher level protocol addresses for devices in the system, independent of the lower level protocol addresses.

According to another aspect of the invention, the first processor includes resources to provide network services to frames of data in the first and second networks through the first and second interfaces, and the second processor includes resources to extend the second interface of the first processor transparently to the second network.

The resolution logic may comprise a routine executed by the first processor, or a routine executed by a network management processor located in the first network.

5 Accordingly, a technique which greatly improves the "plug and play" capability of a network device has been provided. Remote networks may be set up using this system, without requiring error prone and cumbersome techniques to acquire the physical network address of each device being added to the network.

10 Other aspects and advantages of the present invention can be seen upon review of the figures, the detailed description, and the claims which follow.

BRIEF DESCRIPTION OF THE FIGURES

15 Fig. 1 is a schematic diagram of a system including the reverse address resolution logic according to the present invention.

Fig. 2 illustrates a prior art packet exchange sequence for reverse address resolution over LAN media.

Fig. 3 illustrates a packet exchange sequence over a WAN medium as extended according to the present invention.

20 Fig. 4 illustrates the resolution request generation process used in the sequence of Fig. 3.

Fig. 5 illustrates the resolution request response generation process used in the sequence of Fig. 3.

25 Fig. 6 illustrates the resolution request response acceptance process used in the sequence of Fig. 3, which results in a request for a subnet mask in IP networks.

Fig. 7 is a diagram of the subnet mask response generation process used in the sequence of Fig. 3.

30 Fig. 8 is a diagram of the subnet mask response acceptance process used in the sequence of Fig. 3.

Fig. 9 is a schematic diagram illustrating one network environment in which the present invention may be used.

DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

5 A detailed description of preferred embodiments of the present invention is provided with respect to Figs. 1-9. Fig. 1 illustrates application of the present invention in a preferred embodiment. Figs. 2-8 illustrate the extended protocol for reverse address resolution used in a preferred embodiment of the present invention. Fig. 9 provides an overview of a
10 network in which the present invention may be applied.

Fig. 1 provides a schematic diagram of an apparatus for connecting a first network 10 to a second network 11 using address resolution logic 25 according to the present invention. The first network 10 includes a first LAN 9 which includes a plurality of end systems and a server, and may be
15 interconnected to other LANs using intermediate systems (not shown) known in the art. Coupled to the LAN 9 is a boundary router 12. The boundary router 12 is an intermediate system in the network which provides network resources serving higher level protocol suites which, in one unique embodiment, constitute routing resources. As such, the boundary router 12
20 maintains end system directories 13 for the local LAN 9 and global routing information 14 to serve the routing functions according to the higher level protocol suites. Thus, the end system directories will include DEC end system tables, IPX end system tables, IP end system tables, and others to serve other protocol suites that are operating in the network 10. The
25 boundary router 12 may also be coupled to other portions of the corporate data network as schematically illustrated at arrow 15.

The boundary router 12 includes a local interface 16 which serves the local LAN 9 providing access to the network resources within the boundary router to end systems on LAN 9. The boundary router could also have
30 interfaces to other local LANs as well. In addition, the boundary router 12

includes a remote routing interface 17, which provides an interface to the network resources for end systems in the remote network 11. In support of the remote interface 17, the boundary router maintains end system directories 18 serving the higher level protocol suites in the remote network

5 11.

As illustrated schematically by the hatched symbol 19, the remote network 11 appears to the end systems in the local LAN 9 as if it were a LAN connected locally to the boundary router 12. This appearance is maintained across a communication link 20, which may use telephone or

10 other dial up lines, leased lines, satellites, wireless systems, or other communication media configured as a point-to-point channel, to a routing adapter 21, which is coupled to the remote network 11. The remote network 11 includes a remote LAN 22 to which a plurality of end systems and servers may be connected as known in the art. In addition, the LAN 22 may be

15 coupled to other LANs in the remote network 11 through intermediate systems (not shown) as known in the art. The routing adapter 21 provides resources for extending the remote routing interface 17 transparently to the remote network 11 across the communication link 20. From the perspective of the remote network 11, the routing adapter 21 provides the same

20 functionality as a router, while the routing adapter itself operates independent of the higher level protocol suites.

The system thus provides efficient communication between remote networks, and a corporate network, through a boundary router (e.g., net 11, routing adaptor 21, link 20, boundary router 12, net 9).

25 The routing adapter 21 includes hardware performing physical network access protocols for connection to the network 22. Also, such hardware is assigned a physical network address, or MAC address, to uniquely identify the system for the lower level protocol suites. However, in order to participate in the higher level protocol suites managed by the boundary

30 router 12 or elsewhere in the central network 10, an Identifier which serves

such higher level protocols is needed for the routing adapter 21. Thus, the boundary router 12 includes resolution logic 25 to provide such identifier in response to the interface 17 across which a request for such identifier is received.

5 Figs. 2-8 illustrate the reverse address resolution protocol executed by the resolution logic 25 in the boundary router of Fig. 1 according to a preferred embodiment, in which the higher level protocol address comprises an internet protocol IP address, such as used by SNMP (Simple Network Management Protocol) standard network management servers.

10 Fig. 2 illustrates the prior art mechanism which is utilized in the preferred system on ports of the routing adaptor coupled to LAN media. The structure of Fig. 2 includes a first interface 100 corresponding to the RARP client port of the routing adapter 21, and a second interface 101 corresponding to an RARP server in the local network 11. The routing
15 adaptor includes RARP request generation process 102, an RARP response acceptance process 103, and an ICMP subnet mask response acceptance process 104. The resolution logic 25 in the RARP server includes an RARP response generation process 105, and an ICMP subnet mask response generation process 106.

20 Using the industry standard RARP request generation process, as specified in RFC 903 dated June, 1984, the RARP request generation process 102 in the client generates an RARP RFC 903 request 107, which includes the client's MAC address. This request 107 is received at the server interface 101 and the RARP response generation process 105
25 generates a response 108 by accessing a database or other logic which assigns an IP address based upon the MAC address in the request 107. The RARP response acceptance process 103 in the client receives the IP address from the response 108, stores it as appropriate in the client, and generates an ICMP subnet mask request 109. The server 101 receives the
30 request 109 and the ICMP subnet mask response generation process 106

supplies a subnet mask response 110 to the client 100. The ICMP subnet mask response acceptance process 104 then configures the client with the IP address and the subnet mask, and assigns the address of the server 101 as the default gateway address.

5 Fig. 3 illustrates this process as extended according to the present invention for reverse address resolution independent of the physical network address of the client. In this aspect, the interface 120 corresponds to the routing adapter 21 operating as an RARP client. The interface 121 corresponds to the interface 17 of the boundary router 12 operating as an RARP server. The RARP server 121 need not be located in the boundary router 12. Rather, it can be located in any in system or intermediate system
10 coupled to the networks served by the boundary router 12.

 In the extended sequence, as illustrated in Fig. 3, the routing adapter also includes an RARP request generation process 122 (Fig. 4), an RARP response acceptance process 123 (Fig. 6), and an ICMP subnet mask response acceptance process 124 (Fig. 8). The RARP server in the boundary router includes an RARP response generation process 125 (Fig. 5) and an ICMP subnet mask response generation process 126 (Fig. 7).
15

 As in the prior art system, the RARP request generation process 122 in the client 120 generates an RARP RFC 903 request 127. Also, the process 122 generates an extended request 128, which indicates to the receiver that the address resolution must be conducted independent of the MAC address.
20

 The RARP response generation process 125 receives both the RFC 903 request 127 and the MAC independent request 128. If the response can be served with the RFC 903 request, then the response generation process 125 proceeds that way. However, if the MAC address of the client 120 has not been previously communicated to the response generation process 125, then the MAC independent request 128 must be utilized.
25

The RARP response generation process 125 is coupled to a media address/IP address database 135 and to a channel number/IP address database 136. These databases are configured by the network manager to assign IP addresses throughout the network. The channel number/IP address database is relied upon when the media address (MAC address) of the client 120 is not available at the time the IP address is configured.

In either event, the RARP response generation process 125 generates an RARP RFC 903 response 129 which includes an IP address. The RARP response acceptance process 123 in the client 120 accepts the IP address and generates an ICMP subnet mask request 130. In the server 121, the ICMP subnet mask response generation process 126 supplies an ICMP subnet mask response 131. The client 120 receives that response and executes the ICMP subnet mask acceptance process 124.

Fig. 4 shows the RARP request generation process corresponding to block 122 of Fig. 3. This routine loops through all of the interfaces or ports on the remote node, also called a leaf node, to determine its IP address. The algorithm starts with an interface up message 400. After an interface up message, the algorithm tests whether the IP address is available in local storage (step 401). If the address is available in local storage, then the routine is done, as indicated at step 402. If the IP address is not available, then an index for the interfaces is set to the first interface (step 403). Next, the algorithm tests whether the interface is up (step 404). If the interface is up, then the RFC 903 RARP request is sent through the interface (step 405). Next, the algorithm tests whether the interface is wide area network WAN interface (step 406). If it is a WAN interface, then the extended RARP request is sent which requires response independent of the MAC address (step 407).

If at step 404, the interface is not up, or if at step 406, the interface is not a WAN interface, or after the extended RARP request is sent in step 407, the algorithm loops to step 408. In step 408, the algorithm tests

whether the index indicates that the last interface has been tested. If not, the index is incremented in step 409 and the algorithm returns to step 404. If the last interface has been served, then the algorithm tests whether any requests have been successfully sent out and are still pending (step 410).
5 If there are no requests pending because no request was successfully sent, then a send request alarm is set (step 411) and the algorithm is done. If there are requests pending in step 410 because one or more requests were successfully sent, then a request retransmission alarm is set in step 412, and the algorithm is done.

10 The request retransmission alarm results in re-execution of the loop beginning at step 413 which proceeds directly to step 401. The send request alarm set by step 411 results in re-execution of the loop beginning with step 414. After step 414, the algorithm tests whether any requests are still pending in step 415. If there are pending requests, the algorithm is
15 done, if there are no pending requests, then the loop is entered by proceeding to step 401.

Thus, the RARP request generation process 122, as shown in Fig. 4, sends both the standard RFC 903 RARP request, which requires response based on the MAC address, and an extended RARP request, which requires
20 response independent of the MAC address, across WAN interfaces. The WAN interface in the preferred system is the point-to-point communication channel 120 between the boundary router and the routing adapter of Fig. 1.

Thus, the extended RARP interface composes a message using the standard message format according to RFC 903. The message is sent in
25 the data portion of an ethernet frame. An Ethernet frame carrying an RARP request has the usual preamble, ethernet source and destination addresses, and packet type fields in front of the frame. The frame type contains the value 0x8035 to identify the contents as an RARP message. The data portion of the frame contains the 28-octet RARP message.

The RARP client obtains the physical network address of the interface on which the RARP request will be sent out according to the standard techniques known in the art. The RARP request contains the RARP client's physical network address (MAC address) as the source hardware address field, and 0xFFFFFFFF as the destination hardware address. Both the source and destination higher level protocol addresses are undefined, thus, 0. The RARP request opcode is 3 for the standard RARP RFC 903. The protocol according to the present invention uses opcode 16 for the extended request requiring MAC address independent resolution. Of course, any other available opcode could be used.

When the RARP client sends out its first broadcast request for address resolution, it also sets a retransmission timer at 5 seconds according to one embodiment (step 412). This large delay ensures that the server has ample time to satisfy the request and return an answer. When the timer expires, if the client already has an IP address, it cancels the timer and the RARP client goes idle. Otherwise, for each interface which is up, it broadcasts another request and sets the timer again. It will retransmit indefinitely until it receives a response. At each retransmission, the timer will double until it reaches a maximum value 15 minutes. From then on, it will continue using this value.

The RARP client accepts only one response and discards any duplicate responses. Thus, before accepting any response, the client first ensures that no IP address has already been assigned to it.

Fig. 5 illustrates the RARP response generation process corresponding to block 125 of Fig. 3. This algorithm begins with receiving the RARP request 127 or 128 in step 500. After step 500, the algorithm tests whether it is a standard RFC 903 request (step 501).

If the request is the standard RFC 903 format request at step 501, then the algorithm searches the media address/IP address database 135 in step 502.

If the request was not in the standard RFC 903 format, then the algorithm tests whether it is in the extended format (e.g. opcode 16) in step 503. If it is in the extended format, then the channel number/IP address database is searched in step 504. If the request is not in either format, then
5 the algorithm is done as indicated at step 505.

After searching the database in step 502 or in step 505, the algorithm tests whether a matching entry was found in step 506. If no matching entry was found, then the algorithm is done in block 505. If a matching entry was found, then the algorithm formats and sends an RFC 903 RARP response
10 packet which provides an IP address to the client (step 507).

Fig. 6 illustrates the RARP response acceptance process 123 of Fig. 3. This algorithm begins with receiving the RARP response in step 600 which was generated in step 507 of Fig. 5. First, the algorithm determines whether the response is expected in step 601. If it is not expected, then the
15 RARP response is discarded in step 602, and the algorithm is done in step 603. If the response is expected, then the algorithm tests whether an IP address is already available in local storage (step 604). If the address is already available, then the process loops to step 602. If the IP address is not available in step 604, then the IP address from the RARP response is
20 saved in local storage (step 605). After step 605, all pending alarms in the client are cancelled (step 606), and an ICMP subnet mask request is sent across the interface (block 607). After sending the subnet mask request in step 607, an ICMP subnet mask request retransmission alarm is set in step 608, and the algorithm is done.

25 Thus, once the client or leaf node has obtained the IP address, it initiates an ICMP address mask request to the responder, and sets a retransmission timer of 5 seconds (step 608). The request specifies the RARP server which provided the IP address as the destination. If the leaf node does not obtain a successful response, and its retransmission timer
30 expires, it will broadcast another ICMP subnet mask request on all available

interfaces and reset the timer to 5 seconds. The maximum number of retransmissions is 10 in one embodiment. If the tenth retransmission fails, it assigns the natural subnet mask to the IP address class. This ensures that the software does not flood the network indefinitely with unnecessary traffic.

5
10
15
20
25
30

Fig. 7 illustrates the ICMP subnet mask response generation process corresponding to block 126 of Fig. 3. This process begins with receiving the ICMP subnet mask request in step 700. After receipt of the request, a response is generated and sent to the client in step 701. After sending the response, which includes a subnet mask for the previously sent IP address, the algorithm is done (step 702).

Fig. 8 illustrates the ICMP subnet mask response acceptance process corresponding to block 124 of Fig. 3. This algorithm is initiated upon receipt of the ICMP response in step 800. When the response is received, the subnet mask is saved in step 801. Next, any pending alarms are cancelled in step 802. After cancelling the alarms in step 802, the RARP server which supplied the responses to the earlier request is defined as the default gateway in step 803. After defining the default gateway, the algorithm is done as indicated at step 804.

20
25
30

If an ICMP retransmission alarm is asserted, this routine receives an indication in step 805. First, the algorithm determines in response to this alarm whether a maximum number of retries has been exceeded in step 806. If it has been exceeded, then the natural mask is utilized for the IP address as indicated at step 807, and the RARP server is set as the default gateway in step 803. If the maximum number of retries has not been exceeded, then an ICMP subnet mask request is generated in step 807, and the ICMP request retransmission alarm is reset in step 808. Finally, the algorithm is done as indicated at step 804.

Thus, a preferred embodiment of the present invention extends the RARP standard reverse address resolution protocol to provide for a special

request independent of the MAC address of the client. The RARP server uses the standard ARP table for mapping network physical addresses to IP addresses. It also includes a port-to-IP address table (channel number/IP address) which is used to respond to the extended RARP requests for MAC
5 independent resolution. This table maps a port number or channel number to an IP address. This method of assigning IP addresses avoids the hassle of having to know the MAC address of the RARP client in advance.

This technique may be extended to other types of protocols, such as the BootP protocol which provides for vendor extensions. In this aspect, the
10 vendor extensions may also be used for other functions that can be initialized based on the channel number or port upon which request is received by the server. Thus, the BootP request may request an IP address, a configuration manager ID, and configuration information independent of its MAC or physical network address.

15 Fig. 9 illustrates a network configuration in which the present invention may be utilized. According to the configuration of Fig. 9, a central node 900 includes a plurality of ports labelled 1, 2, 3, 4, 5, and 6. Ports 2, 4, and 5 are coupled to respective LANs 901, 902, and 903. LAN 903 includes a system operating as a network management processor 904, which may be
20 executing such protocols as the SNMP or a Telnet protocol relying on IP addresses to access end systems and intermediate systems in the network.

Port 1 is coupled across a point-to-point communication link 905 to a leaf node 906. Leaf node 906 is coupled to LAN 907.

25 Similarly, node 3 is coupled across point-to-point channel 908 to leaf node 909. Leaf node 909 is coupled to a LAN 910.

Port 6 is coupled across point-to-point channel 911 to leaf node 912. Leaf node 912 is coupled to LAN 913.

30 As illustrated in the figure, LAN 913, link 911, LAN 903, and LAN 902 are all managed as a single IPX network, IPX 1. LAN 907 and LAN 901 are managed as a single IPX network, IPX 2. LAN 910 is managed as an

AppleTalk network. The entire configuration is managed as a single IP network for the purposes of the network management processor 904. Thus, all of the leaf nodes 906, 909, 912 need an IP address for the purposes of the network management processor 904. These IP addresses may be
5 assigned according to the present invention independent of the physical network address of the leaf node using the MAC address independent IP address resolution logic 914 according to the present invention.

Also, the network management processor 904 may include a server to manage the IP address configuration according to the present invention.
10 For instance, a BootP protocol vendor extension could be used to tag a request packet requesting an IP address for a leaf node (e.g., node 906) with a channel number for link 905 and node number for central node 900. The central node 900 would then pass the tagged request packet to the remote network management processor 904. The network management processor
15 904 could then service the request packet with a database based upon the channel number and node number in the tagged request packet.

In the implementation described above based on the modified RARP protocol, the point-to-point channels were implemented using a PPP link, such that the physical port on the central node 900 could be used as a basis
20 for configuring IP addresses. This node number is passed along with the packet to the processor in the central node according to standard techniques.

Other systems may implement more than one channel on a given physical port on the central node. For instance, a frame relay system may
25 be used on a given link. In such a system, the DLCI (Data Link Communication Identifier) is carried with every packet on every logical connection between two points in the network. An X.25 type network which uses switched virtual circuits may also be coupled through a particular physical port on the central node 900. In such system, the X.25 address of
30 the calling device could be used as a basis for specifying the point-to-point

channel. Similarly, an ISDN port could use the unique identifier for the calling node (Q.931 address) which is used for call set up.

5 Accordingly, the present invention provides the ability to add new leaf nodes to a network, without requiring the network manager to know the physical network address of the leaf node before it is connected to the network. This greatly simplifies the process of adding new leaf nodes to the network, minimizes the chance of error in communicating the physical network addresses to the network manager, and otherwise contributes to the desired "plug and play" aspect of leaf node hardware.

10 The foregoing description of preferred embodiments of the present invention has been provided for the purposes of illustration and description. It is not intended to be exhaustive or to limit the invention to the precise forms disclosed. Obviously, many modifications and variations will be apparent to practitioners skilled in this art. The embodiments were chosen and described in order to best explain the principles of the invention and its
15 practical application, thereby enabling others skilled in the art to understand the invention for various embodiments and with various modifications as are suited to the particular use contemplated. It is intended that the scope of the invention be defined by the following claims and their equivalents.

CLAIMS

What is claimed is:

- 1 1. An apparatus for resolving higher level protocol identifiers in
2 response to resolution requests from a source of resolution requests in a
3 communication network, the source having a lower level protocol identifier,
4 comprising:
5 a processor having a plurality of channels for connection to the
6 communication network; and
7 resolution logic, coupled with the communication network and in
8 communication with the processor, to provide a higher level protocol
9 information in response to a particular channel in the plurality of channels
10 through which a resolution request is received by the processor independent
11 of the lower level protocol identifier of the source of the resolution request.
- 1 2. The apparatus of claim 1, wherein the resolution logic
2 comprises a routine executed by the processor.
- 1 3. The apparatus of claim 1, wherein the communication network
2 includes a network management processor in communication with the
3 processor, and the resolution logic comprises a routine executed by the
4 network management processor.
- 1 4. The apparatus of claim 1, wherein the resolution logic includes
2 a resolution table configurable independent of lower level protocol identifiers,
3 for assigning the higher level protocol information to particular channels of
4 the processor through which resolution requests may be received.

1 5. The apparatus of claim 1, wherein the higher level protocol
2 information comprises a network address for the source of the resolution
3 request.

1 6. The apparatus of claim 5, wherein the lower level protocol
2 information comprises a physical network address for the source of the
3 resolution request.

1 7. The apparatus of claim 6, wherein the higher level protocol
2 information comprises an internet protocol IP address.

1 8. The apparatus of claim 1, wherein the higher level protocol
2 information comprises a network address for the source of the resolution
3 request, and a host address for the source of the resolution request.

1 9. The apparatus of claim 1, wherein the higher level protocol
2 comprises a network management protocol, and the lower level protocol
3 comprises a medium access protocol.

1 10. The apparatus of claim 1, wherein the processor includes
2 resources to provide network services to frames of data in the
3 communication network through the plurality of channels.

1 11. An apparatus for connecting a first network and a second
2 network, comprising:
3 a communication link;
4 a first processor, having a first interface coupled to the first network
5 and a second interface coupled to the communication link;
6 a second processor having a lower level protocol identifier and
7 coupled to a second network and to the communication link; and
8 resolution logic, coupled with the first network, to provide a higher
9 level protocol information to the second processor in response to a resolution
10 request through the second interface of the first processor independent of the
11 lower level protocol identifier of the second processor.

1 12. The apparatus of claim 11, wherein the higher level protocol
2 information comprises a network address for the second network.

1 13. The apparatus of claim 12, wherein the lower level protocol
2 identifier comprises a physical network address for the second processor.

1 14. The apparatus of claim 13, wherein the higher level protocol
2 information comprises an internet protocol IP address.

1 15. The apparatus of claim 11, wherein the higher level protocol
2 information comprises a network address for the second network, and a host
3 address for the second processor.

1 16. The apparatus of claim 11, wherein the higher level protocol
2 comprises a network management protocol, and the lower level protocol
3 comprises a medium access protocol.

1 17. The apparatus of claim 11, wherein the first processor includes
2 resources to provide network services to frames of data in the first and
3 second networks through the first and second interfaces, and the second
4 processor includes resources to extend the second interface of the first
5 processor transparently to the second network.

1 18. The apparatus of claim 11, wherein the resolution logic
2 comprises a routine executed by the first processor.

1 19. The apparatus of claim 11, wherein the first network includes
2 a network management processor, and the resolution logic comprises a
3 routine executed by the network management processor.

1 20. The apparatus of claim 11, wherein the resolution logic includes
2 a resolution table configurable independent of the lower level protocol
3 identifier of the second processor, for assigning the higher level protocol
4 information to the second processor in response to the interface through
5 which the resolution request is received by the first processor.

1 21. The apparatus of claim 11, wherein the communication link
2 comprises a point-to-point channel, connecting the second interface of the
3 first processor and the second processor.

1 22. An apparatus for connecting a first local area network and a
2 second local area network, comprising:
3 a communication link including a point-to-point channel;
4 a first processor, having a first interface coupled to the first local area
5 network and a second interface coupled to the point-to-point channel of the
6 communication link;

7 a second processor having a physical network identifier and coupled
8 to the second local area network and to the point-to-point channel of the
9 communication link; and

10 network management resources, coupled with the first local area
11 network, operating according to a network management protocol, and
12 including resolution logic to provide a network management protocol
13 information to the second processor in response to a resolution request
14 through the second interface of the first processor, independent of the
15 physical network identifier of the second processor.

1 23. The apparatus of claim 22, wherein the resolution logic includes
2 a resolution table configurable independent of the physical network identifier
3 of the second processor, for assigning the network management protocol
4 information to the second processor in response to the interface through
5 which the resolution request is received by the first processor.

1 24. The apparatus of claim 22, wherein the network management
2 protocol information comprises an internet protocol IP address.

1 25. The apparatus of claim 22, wherein the resolution logic
2 comprises a routine executed by the first processor.

1 26. The apparatus of claim 22, wherein the first network includes
2 a network management processor controlling the network management
3 resources, and the resolution logic comprises a routine executed by the
4 network management processor.

(54) Title: POINT-TO-POINT INTERNET PROTOCOL

(57) Abstract

A point-to-point Internet protocol exchanges Internet Protocol (IP) addresses between units to establish a point-to-point communication link between the processing units through the Internet. In accordance with the disclosed protocol, a method of locating a user process over a computer network, the user process having a dynamically assigned network protocol address comprises the steps of (a) maintaining in a computer memory a compilation of entries, each entry comprising a network protocol address of a user process connected to the computer network; and (b) in response to identification of one of the entries by a requesting user processor, providing the network protocol address of the identified entry to the requesting user process. In accordance with another embodiment of the invention, a computer system having an audio transducer and a display device and being operatively coupled to other computers and a server over a computer network comprises (a) means for transmitting an E-mail signal containing a network protocol address of a first process to a second process over the computer network; (b) means for receiving a second network protocol address from the second process over the computer network; and (c) means, for responsive to the second network protocol address for establishing a communication link between the first process and the second process over the computer network.

POINT-TO-POINT INTERNET PROTOCOL

FIELD OF THE INVENTION

The present invention relates, in general, to data processing systems, and more specifically, to a method and apparatus for facilitating audio communications over computer networks.

5

BACKGROUND OF THE INVENTION

The increased popularity of on-line services such as AMERICA ONLINE™, COMPUSERVE®, and other services such as Internet gateways have spurred applications to provide multimedia, including video and voice clips, to online users. An example of an online voice clip application is VOICE E-MAIL FOR WINCIM and VOICE E-MAIL FOR AMERICA ONLINE™, available from Bonzi Software, as described in "Simple Utilities Send Voice E-Mail Online", MULTIMEDIA WORLD, VOL. 2, NO. 9, August 1995, p. 52. Using such Voice E-Mail software, a user may create an audio message to be sent to a predetermined E-mail address specified by the user.

Generally, devices interfacing to the Internet and other online services may communicate with each other upon establishing respective device addresses. One type of device address is the Internet Protocol (IP) address, which acts as a pointer to the device associated with the IP address. A typical device may have a Serial Line Internet Protocol or Point-to-Point Protocol (SLIP/PPP) account with a permanent IP address for receiving E-mail, voicemail, and the like over the Internet. E-mail and voicemail is generally intended to convey text, audio, etc., with any routing information such as an IP address and routing headers generally

25

being considered an artifact of the communication, or even gibberish to the recipient.

Devices such as a host computer or server of a company may include multiple modems for connection of users to the Internet, with a temporary IP address allocated to each user. For example, the host computer may have a general IP address "XXX.XXX.XXX," and each user may be allocated a successive IP address of XXX.XXX.XXX.10, XXX.XXX.XXX.11, XXX.XXX.XXX.12, etc. Such temporary IP addresses may be reassigned or recycled to the users, for example, as each user is successively connected to an outside party. For example, a host computer of a company may support a maximum of 254 IP addresses which are pooled and shared between devices connected to the host computer.

Permanent IP addresses of users and devices accessing the Internet readily support point-to-point communications of voice and video signals over the Internet. For example, realtime video teleconferencing has been implemented using dedicated IP addresses and mechanisms known as reflectors. Due to the dynamic nature of temporary IP addresses of some devices accessing the Internet, point-to-point communications in realtime of voice and video have been generally difficult to attain.

SUMMARY OF THE INVENTION

The above deficiencies in the prior art and the previously described needs are fulfilled by the present invention which provides, a directory server utility for providing the dynamically assigned network protocol addresses of client processes currently coupled to the computer network. Accordingly to one embodiment of the present invention, a method of locating users having dynamically assigned network protocol addresses comprises the steps of

maintaining a compilation of entries, each entry comprising a network protocol address of a client process connected to the computer network, and, in response to identification of one of the entries by a requesting client process, providing the network protocol address of the identified entry to the requesting client process.

In accordance with another embodiment of the invention, a computer system having an audio transducer and a display device and being operatively coupled to other computers and a server over a computer network comprises (a) means for transmitting an E-mail signal containing a network protocol address of a first process to a second process over the computer network; (b) means for receiving a second network protocol address from the second process over the computer network; and (c) means, for responsive to the second network protocol address for establishing a communication link between the first process and the second process over the computer network.

BRIEF DESCRIPTION OF THE DRAWINGS

The features of the invention will become more readily apparent and may be better understood by referring to the following detailed description of an illustrative embodiment of the present invention, taken in conjunction with the accompanying drawings, in which:

FIG. 1 illustrates, in block diagram format, a system for the disclosed point-to-point Internet protocol;

FIG. 2 illustrates, in block diagram format, the system using a secondary point-to-point Internet protocol;

FIG. 3 illustrates, in block diagram format, the system of FIGS. 1-2 with the point-to-point Internet protocol established;

FIG. 4 is another block diagram of the system of FIGS 1-2 with audio communications being conducted;

FIG. 5 illustrates a display screen for a processing unit;

FIG. 6 illustrates another display screen for a processing unit;

FIG. 7 illustrates a flowchart of the initiation of the point-to-point Internet protocols;

5 FIG. 8 illustrates a flowchart of the performance of the primary point-to-point Internet protocols; and

 FIG. 9 illustrates a flowchart of the performance of the secondary point-to-point Internet protocol.

DETAILED DESCRIPTION

Referring now in specific detail to the drawings, with like reference numerals identifying similar or identical elements, as shown in FIG. 1, the present disclosure describes a point-to-point network protocol and system
5 10 for using such a protocol.

In an exemplary embodiment, the system 10 includes a first processing unit 12 for sending at least a voice signal from a first user to a second user. The first processing unit 12 includes a processor 14, a memory 16, an input device 18, and an output device 20. The output
10 device 20 includes at least one modem capable of, for example, 14.4 kbaud communications and operatively connected via wired and/or wireless communication connections to the Internet or other computer networks such as an Intranet, i.e., a private computer network. One skilled in the art would understand that the input device 18 may be
15 implemented at least in part by the modem of the output device 20 to allow input signals from the communication connections to be received. The second processing unit 22 may have a processor, memory, and input and output devices, including at least one modem and associated communication connections, as described above for the first processing
20 unit 12. In an exemplary embodiment, each of the processing units 12, 22 may execute the WEBPHONE™ Internet telephony application available from NetSpeak Corporation, Boca Raton, FL, which is capable of performing the disclosed point-to-point Internet protocol and system 10, as described herein.

25 The first processing unit 12 and the second processing unit 22 are operatively connected to the Internet 24 by communication devices and software known in the art, such as an Internet Service Provider (ISP) or an Internet gateway. The processing units 12, 22 may be operatively interconnected through the Internet 24 to a connection server 26, and

may also be operatively connected to a mail server 28 associated with the Internet 24.

The connection server 26 includes a processor 30, a timer 32 for generating time stamps, and a memory such as a database 34 for storing, for example, E-mail and Internet Protocol (IP) addresses of logged-in units. In an exemplary embodiment, the connection server 26 may be a SPARC 5 server or a SPARC 20 server, available from SUN MICROSYSTEMS, INC., Mountain View, CA, having a central processing unit (CPU) as processor 30, an operating system (OS) such as UNIX, for providing timing operations such as maintaining the timer 32, a hard drive or fixed drive, as well as dynamic random access memory (DRAM) for storing the database 34, and a keyboard and display and/or other input and output devices (not shown in FIG. 1). The database 34 may be an SQL database available from ORACLE or INFORMIX.

In an exemplary embodiment, the mail server 28 may be a Post Office Protocol (POP) Version 3 mail server including a processor, memory, and stored programs operating in a UNIX environment, or, alternatively, another OS, to process E-mail capabilities between processing units and devices over the Internet 24.

The first processing unit 12 may operate the disclosed point-to-point Internet protocol by a computer program described hereinbelow in conjunction with FIG. 6, which may be implemented from compiled and /or interpreted source code in the C++ programming language and which may be downloaded to the first processing unit 12 from an external computer. The operating computer program may be stored in the memory 16, which may include about 8 MB RAM and/or a hard or fixed drive having about 8 MB. Alternatively, the source code may be implemented in the first processing unit 12 as firmware, as an erasable read only memory (EPROM), etc. It is understood that one skilled in the

art would be able to use programming languages other than C++ to implement the disclosed point-to-point network protocol and system 10.

The processor 14 receives input commands and data from a first user associated with the first processing unit 12 through the input device 18, which may be an input port connected by a wired, optical, or a wireless connection for electromagnetic transmissions, or alternatively may be transferable storage media, such as floppy disks, magnetic tapes, compact disks, or other storage media including the input data from the first user.

The input device 18 may include a user interface (not shown) having, for example, at least one button actuated by the user to input commands to select from a plurality of operating modes to operate the first processing unit 12. In alternative embodiments, the input device 18 may include a keyboard, a mouse, a touch screen, and/or a data reading device such as a disk drive for receiving the input data from input data files stored in storage media such as a floppy disk or, for example, an 8 mm storage tape. The input device 18 may alternatively include connections to other computer systems to receive the input commands and data therefrom.

The first processing unit 12 may include a visual interface for use in conjunction with the input device 18 and output device 20 similar to those screens illustrated in FIGS. 5-6, discussed below. It is also understood that alternative devices may be used to receive commands and data from the user, such as keyboards, mouse devices, and graphical user interfaces (GUI) such as WINDOWS™ 3.1 available from MICROSOFT Corporation, Redmond, WA., and other operating systems and GUIs, such as OS/2 and OS/2 WARP, available from IBM CORPORATION, Boca Raton, FL. Processing unit 12 may also include microphones and/or telephone handsets for receiving audio voice data

and commands, speech or voice recognition devices, dual tone multi-frequency (DTMF) based devices, and/or software known in the art to accept voice data and commands and to operate the first processing unit 12.

5 In addition, either of the first processing unit 12 and the second processing unit 22 may be implemented in a personal digital assistant (PDA) providing modem and E-mail capabilities and Internet access, with the PDA providing the input/output screens for mouse interactions or for touchscreen activation as shown, for example, in FIGS. 5-6, as a
10 combination of the input device 18 and output device 20.

 For clarity of explanation, the illustrative embodiment of the disclosed point-to-point Internet protocol and system 10 is presented as having individual functional blocks, which may include functional blocks labeled as "processor" and "processing unit". The functions represented
15 by these blocks may be provided through the use of either shared or dedicated hardware, including, but not limited to, hardware capable of executing software. For example, the functions of each of the processors and processing units presented herein may be provided by a shared processor or by a plurality of individual processors. Moreover, the use of
20 the functional blocks with accompanying labels herein is not to be construed to refer exclusively to hardware capable of executing software. Illustrative embodiments may include digital signal processor (DSP) hardware, such as the AT&T DSP16 or DSP32C, read-only memory (ROM) for storing software performing the operations discussed below, and random access memory (RAM) for storing DSP results. Very large
25 scale integration (VLSI) hardware embodiments, as well as custom VLSI circuitry in combination with a general purpose DSP circuit, may also be provided. Any and all of these embodiments may be deemed to fail within the meaning of the labels for the functional blocks as used herein.

The processing units 12, 22 are capable of placing calls and connecting to other processing units connected to the Internet 24, for example, via dialup SLIP/PPP lines. In an exemplary embodiment, each processing unit assigns an unsigned long session number, for example, a 32-bit long sequence in a *.ini file for each call. Each call may be assigned a successive session number in sequence, which may be used by the respective processing unit to associate the call with one of the SLIP/PPP lines, to associate a <ConnectOK> response signal with a <Connect Request> signal, and to allow for multiplexing and demultiplexing of inbound and outbound conversations on conference lines, as explained hereinafter.

For callee (or called) processing units with fixed IP addresses, the caller (or calling) processing unit may open a "socket", i.e. a file handle or address indicating where data is to be sent, and transmit a <Call> command to establish communication with the callee utilizing, for example, datagram services such as Internet Standard network layering as well as transport layering, which may include a Transport Control Protocol (TCP) or a User Datagram Protocol (UDP) on top of the IP. Typically, a processing unit having a fixed IP address may maintain at least one open socket and a called processing unit waits for a <Call> command to assign the open socket to the incoming signal. If all lines are in use, the callee processing unit sends a BUSY signal or message to the callee processing unit. As shown in FIG. 1, the disclosed point-to-point Internet protocol and system 10 operate when a callee processing unit does not have a fixed or predetermined IP address. In the exemplary embodiment and without loss of generality, the first processing unit 12 is the caller processing unit and the second processing unit 22 is the called processing unit. When either of processing units 12, 22 logs on to the Internet via a dial-up connection, the respective unit is provided a

dynamically allocated IP address by the a connection service provider.

Upon the first user initiating the point-to-point Internet protocol when the first user is logged on to the Internet 24, the first processing unit 12 automatically transmits its associated E-mail address and its
5 dynamically allocated IP address to the connection server 26. The connection server 26 then stores these addresses in the database 34 and time stamps the stored addresses using timer 32. The first user operating the first processing unit 12 is thus established in the database 34 as an active on-line party available for communication using the
10 disclosed point-to-point Internet protocol. Similarly, a second user operating the second processing unit 22, upon connection to the Internet 24 through the a connection service provider, is processed by the connection server 26 to be established in the database 34 as an active on-line party.

15 The connection server 26 may use the time stamps to update the status of each processing unit; for example, after 2 hours, so that the on-line status information stored in the database 34 is relatively current. Other predetermined time periods, such as a default value of 24 hours, may be configured by a systems operator.

20 The first user with the first processing unit 12 initiates a call using, for example, a Send command and/or a command to speeddial an NTH stored number, which may be labeled [SND] and [SPD] [N], respectively, by the input device 18 and/or the output device 20, such as shown in FIGS. 5-6. In response to either the Send or speeddial commands, the
25 first processing unit 12 retrieves from memory 16 a stored E-mail address of the callee corresponding to the NTH stored number. Alternatively, the first user may directly enter the E-mail address of the callee.

The first processing unit 12 then sends a query, including the E-mail address of the callee, to the connection server 26. The connection

server 26 then searches the database 34 to determine whether the callee is logged-in by finding any stored information corresponding to the callee's E-mail address indicating that the callee is active and on-line. If the callee is active and on-line, the connection server 26 then performs
5 the primary point-to-point Internet protocol; i.e. the IP address of the callee is retrieved from the database 34 and sent to the first processing unit 12. The first processing unit 12 may then directly establish the point-to-point Internet communications with the callee using the IP address of the callee.

10 If the callee is not on-line when the connection server 26 determines the callee's status, the connection server 26 sends an OFF-LINE signal or message to the first processing unit 12. The first processing unit 12 may also display a message such as "Called Party Off-Line" to the first user.

15 When a user logs off or goes off-line from the Internet 24, the connection server 26 updates the status of the user in the database 34; for example, by removing the user's information, or by flagging the user as being off-line. The connection server 26 may be instructed to update the user's information in the database 34 by an off-line message, such as
20 a data packet, sent automatically from the processing unit of the user prior to being disconnected from the connection server 26. Accordingly, an off-line user is effectively disabled from making and/or receiving point-to-point Internet communications.

25 As shown in FIGS. 2-4, the disclosed secondary point-to-point Internet protocol may be used as an alternative to the primary point-to-point Internet protocol described above, for example, if the connection server 26 is non-responsive, inoperative, and/or unable to perform the primary point-to-point Internet protocol, as a non-responsive condition. Alternatively, the disclosed secondary point-to-point Internet protocol may

be used independent of the primary point-to-point Internet protocol. In the disclosed secondary point-to-point Internet protocol, the first processing unit 12 sends a <ConnectRequest> message via E-mail over the Internet 24 to the mail server 28. The E-mail including the

5 <ConnectRequest> message may have, for example, the subject

[*wp#XXXXXXXXX#nnn.nnn.nnn.#emailAddr]

where nnn.nnn.nnn.nnn. is the current (i.e. temporary or permanent) IP address of the first user, and XXXXXXXX is a session number, which may be unique and associated with the request of the first user to initiate

10 point-to-point communication with the second user.

As described above, the first processing unit 12 may send the <ConnectRequest> message in response to an unsuccessful attempt to perform the primary point-to-point Internet protocol. Alternatively, the first processing unit 12 may send the <ConnectRequest> message in

15 response to the first user initiating a SEND command or the like.

After the <ConnectRequest> message via E-mail is sent, the first processing unit 12 opens a socket and waits to detect a response from the second processing unit 22. A timeout timer, such as timer 32, may be set by the first processing unit 12, in a manner known in the art, to wait

20 for a predetermined duration to receive a <ConnectOK> signal. The processor 14 of the first processing unit 12 may cause the output device 20 to output a Ring signal to the user, such as an audible ringing sound, about every 3 seconds. For example, the processor 14 may output a *.wav file, which may be labeled RING.WAV, which is processed by the

25 output device 20 to output an audible ringing sound.

The mail server 28 then polls the second processing unit 22, for example, every 3-5 seconds, to deliver the E-mail. Generally, the second processing unit 22 checks the incoming lines, for example, at regular intervals to wait for and to detect incoming E-mail from the mail server 28

through the Internet 24.

Typically, for sending E-mail to users having associated processing units operatively connected to a host computer or server operating an Internet gateway, E-mail for a specific user may be sent
5 over the Internet 24 and directed to the permanent IP address or the SLIP/PPP account designation of the host computer, which then assigns a temporary IP address to the processing unit of the specified user for properly routing the E-mail. The E-mail signal may include a name or other designation such as a user name which identifies the specific user
10 regardless of the processing unit assigned to the user; that is, the host computer may track and store the specific device where a specific user is assigned or logged on, independent of the IP address system, and so the host computer may switch the E-mail signal to the device of the specific user. At that time, a temporary IP address may be generated or assigned
15 to the specific user and device.

Upon detecting and/or receiving the incoming E-mail signal from the first processing unit 12, the second processing unit 22 may assign or may be assigned a temporary IP address. Therefore, the delivery of the E-mail through the Internet 24 provides the second processing unit 22
20 with a session number as well as IP addresses of both the first processing unit 12 and the second processing unit 22.

Point-to-point communication may then be established by the processing unit 22 processing the E-mail signal to extract the <ConnectRequest> message, including the IP address of the first
25 processing unit 12 and the session number. The second processing unit 22 may then open a socket and generate a <ConnectOK> response signal, which includes the temporary IP address of the second processing unit 22 as well as the session number of the first processing unit.

The second processing unit 22 sends the <ConnectOK> signal

directly over the Internet 24 to the IP address of the first processing unit 12 without processing by the mail server 28, and a timeout timer of the second processing unit 22 may be set to wait and detect a <Call> signal expected from the first processing unit 12.

5 Realtime point-to-point communication of audio signals over the Internet 24, as well as video and voicemail, may thus be established and supported without requiring permanent IP addresses to be assigned to either of the users or processing units 12, 22. For the duration of the realtime point-to-point link, the relative permanence of the current IP
10 addresses of the processing units 12, 22 is sufficient, whether the current IP addresses were permanent (i.e. predetermined or preassigned) or temporary (i.e. assigned upon initiation of the point-to-point communication).

 In the exemplary embodiment, a first user operating the first
15 processing unit 12 is not required to be notified by the first processing unit 12 that an E-mail is being generated and sent to establish the point-to-point link with the second user at the second processing unit 22. Similarly, the second user is not required to be notified by the second processing unit 22 that an E-mail has been received and/or a temporary
20 IP address is associated with the second processing unit 22. The processing units 12, 22 may perform the disclosed point-to-point Internet protocol automatically upon initiation of the point-to-point communication command by the first user without displaying the E-mail interactions to either user. Accordingly, the disclosed point-to-point Internet protocol
25 may be transparent to the users. Alternatively, either of the first and second users may receive, for example, a brief message of "CONNECTION IN PROGRESS" or the like on a display of the respective output device of the processing units 12, 22.

 After the initiation of either the primary or the secondary point-to-

point Internet protocols described above in conjunction with FIGS. 1-2, the point-to-point communication link over the Internet 24 may be established as shown in FIGS. 3-4 in a manner known in the art. For example, referring to FIG. 3, upon receiving the <ConnectorOK> signal from the second processing unit 22, the first processing unit 12 extracts the IP address of the second processing unit 22 and the session number, and the session number sent from the second processing unit 22 is then checked with the session number originally sent from the first processing unit 12 in the <ConnectRequest> message as E-mail. If the session numbers sent and received by the processing unit 12 match, then the first processing unit 12 sends a <Call> signal directly over the Internet 24 to the second processing unit 22; i.e. using the IP address of the second processing unit 22 provided to the first processing unit 12 in the <ConnectOK> signal.

Upon receiving the <Call> signal, the second processing unit 22 may then begin a ring sequence, for example, by indicating or annunciating to the second user that an incoming call is being received. For example, the word "CALL" may be displayed on the output device of the second processing unit 22. The second user may then activate the second processing unit 22 to receive the incoming call.

Referring to FIG. 4, after the second processing unit 22 receives the incoming call, realtime audio and/or video conversations may be conducted in a manner known in the art between the first and second users through the Internet 24, for example, by compressed digital audio signals. Each of the processing units 12, 22 also display to each respective user the words "IN USE" to indicate that the point-to-point communication link is established and audio or video signals are being transmitted.

In addition, either user may terminate the point-to-point

communication link by, for example, activating a termination command, such as by activating an [END] button or icon on a respective processing unit, causing the respective processing unit to send an <End> signal which causes both processing units to terminate the respective sockets, as well as to perform other cleanup commands and functions known in the art.

FIGS. 5-6 illustrate examples of display screens 36 which may be output by a respective output device of each processing unit 12, 22 of FIGS. 1-4 for providing the disclosed point-to-point Internet protocol and system 10. Such display screens may be displayed on a display of a personal computer (PC) or a PDA in a manner known in the art.

As shown in FIG. 5, a first display screen 36 includes a status area 38 for indicating, for example, a called user by name and/or by IP address or telephone number; a current function such as C2; a current time; a current operating status such as "IN USE", and other control icons such as a down arrow icon 40 for scrolling down a list of parties on a current conference line. The operating status may include such annunciators as "IN USE," "IDLE," "BUSY," "NO ANSWER," "OFFLINE," "CALL," "DIALING," "MESSAGES," and "SPEEDDIAL."

Other areas of the display screen 36 may include activation areas or icons for actuating commands or entering data. For example, the display screen 36 may include a set of icons 42 arranged in columns and rows including digits 0-9 and commands such as END, SND, HLD, etc. For example, the END and SND commands may be initiated as described above, and the HLD icon 44 may be actuated to place a current line on hold. Such icons may also be configured to substantially simulate a telephone handset or a cellular telephone interface to facilitate ease of use, as well as to simulate function keys of a keyboard. For example, icons labeled L1-L4 may be mapped to function keys F1-F4 on standard

PC keyboards, and icons C1-C3 may be mapped to perform as combinations of function keys, such as CTRL-F1, CTRL-F2, and CTRL-F3, respectively. In addition, the icons labeled L1-L4 and C1-C3 may include circular regions which may simulate light emitting diodes (LEDs) which indicate that the function or element represented by the respective icon is active or being performed.

Icons L1-L4 may represent each of 4 lines available to the caller, and icons C1-C3 may represent conference calls using at least one line to connect, for example, two or more parties in a conference call. The icons L1-L4 and C1-C3 may indicate the activity of each respective line or conference line. For example, as illustrated in FIG. 5, icons L1-L2 may have lightly shaded or colored circles, such as a green circle, indicating that each of lines 1 and 2 are in use, while icons L3-L4 may have darkly shaded or color circles, such as a red or black circle, indicating that each of lines 3 and 4 are not in use. Similarly, the lightly shaded circle of the icon labeled C2 indicates that the function corresponding to C2 is active, as additionally indicated in the status area 38, while darkly shaded circles of icons labeled C1 and C3 indicate that such corresponding functions are not active.

The icons 42 are used in conjunction with the status area 38. For example, using a mouse for input, a line that is in use, as indicated by the lightly colored circle of the icon, may be activated to indicate a party's name by clicking a right mouse button for 5 seconds until another mouse click is actuated or the [ESC] key or icon is actuated. Thus, the user may switch between multiple calls in progress on respective lines.

Using the icons as well as an input device such as a mouse, a user may enter the name or alias or IP address, if known, of a party to be called by either manually entering the name, by using the speedial feature, or by double clicking on an entry in a directory stored in the

memory, such as the memory 16 of the first processing unit 12, where the directory entries may be scrolled using the status area 38 and the down arrow icon 40.

Once a called party is listed in the status area 38 as being active
5 on a line, the user may transfer the called party to another line or a conference line by clicking and dragging the status area 38, which is represented by a reduced icon 46. Dragging the reduced icon 46 to any one of line icons L1-L4 transfers the called party in use to the selected line, and dragging the reduced icon 46 to any one of conference line
10 icons C1-C3 adds the called party to the selected conference call.

Other features may be supported, such as icons 48-52, where icon 48 corresponds to, for example, an ALT-X command to exit the communication facility of a processing unit, and icon 50 corresponds to, for example, an ALT-M command to minimize or maximize the display
15 screen 36 by the output device of the processing unit. Icon 52 corresponds to an OPEN command, which may, for example, correspond to pressing the O key on a keyboard, to expand or contract the display screen 36 to represent the opening and closing of a cellular telephone. An "opened" configuration is shown in FIG. 5. and a "closed"
20 configuration is shown in FIG. 6. In the "opened" configuration, additional features such as output volume (VOL) controls, input microphone (MIC) controls, waveform (WAV) sound controls, etc.

The use of display screens such as those shown in FIGS. 5-6 provided flexibility in implementing various features available to the user.
25 It is to be understood that additional features such as those known in the art may be supported by the processing units 12, 22.

Alternatively, it is to be understood that one skilled in the art may implement the processing units 12, 22 to have the features of the display screens in FIGS. 5-6 in hardware; i.e. a wired telephone or wireless

cellular telephone may include various keys, LEDs, liquid crystal displays (LCDs), and touchscreen actuators corresponding to the icons and features shown in FIGS. 5-6. In addition, a PC may have the keys of a keyboard and mouse mapped to the icons and features shown in FIGS. 5-6.

Referring to FIG. 7, the disclosed point-to-point Internet protocol and system 10 is illustrated. First processing unit 12 initiates the point-to-point Internet protocol in step 56 by sending a query from the first processing unit 12 to the connection server 26. If connection server 26 is operative to perform the point-to-point Internet protocol, in step 58, first processing unit 12 receives an on-line status signal from the connection server 26, such signal may include the IP address of the callee or a "Callee Off-Line" message. Next, first processing unit 12 performs the primary point-to-point Internet protocol in step 60, which may include receiving, at the first processing unit 12, the IP address of the callee if the callee is active and on-line. Alternatively, processing unit 60 may initiate and perform the secondary point-to-point Internet protocol in step 62, if the called party is not active and/or on-line.

Referring to FIG. 8, in conjunction with FIGS. 1 and 3-4, the disclosed point-to-point Internet protocol and system 10 is illustrated. Connection server 26 starts the point-to-point Internet protocol, in step 64, and timestamps and stores E-mail and IP addresses of logged-in users and processing units in the database 34 in step 66. Connection server 26 receives a query from a first processing unit 12 in step 68 to determine whether a second user or second processing unit 22 is logged-in to the Internet 24, with the second user being specified, for example, by an E-mail address. Connection server 26 retrieves the IP address of the specified user from the database 34 in step 70, if the specified user is logged-in to the Internet, and sends the retrieved IP address to the first

cellular telephone may include various keys, LEDs, liquid crystal displays (LCDs), and touchscreen actuators corresponding to the icons and features shown in FIGS. 5-6. In addition, a PC may have the keys of a keyboard and mouse mapped to the icons and features shown in FIGS. 5-6.

Referring to FIG. 7, the disclosed point-to-point Internet protocol and system 10 is illustrated. First processing unit 12 initiates the point-to-point Internet protocol in step 56 by sending a query from the first processing unit 12 to the connection server 26. If connection server 26 is operative to perform the point-to-point Internet protocol, in step 58, first processing unit 12 receives an on-line status signal from the connection server 26, such signal may include the IP address of the callee or a "Callee Off-Line" message. Next, first processing unit 12 performs the primary point-to-point Internet protocol in step 60, which may include receiving, at the first processing unit 12, the IP address of the callee if the callee is active and on-line. Alternatively, processing unit 60 may initiate and perform the secondary point-to-point Internet protocol in step 62, if the called party is not active and/or on-line.

Referring to FIG. 8, in conjunction with FIGS. 1 and 3-4, the disclosed point-to-point Internet protocol and system 10 is illustrated. Connection server 26 starts the point-to-point Internet protocol, in step 64, and timestamps and stores E-mail and IP addresses of logged-in users and processing units in the database 34 in step 66. Connection server 26 receives a query from a first processing unit 12 in step 68 to determine whether a second user or second processing unit 22 is logged-in to the Internet 24, with the second user being specified, for example, by an E-mail address. Connection server 26 retrieves the IP address of the specified user from the database 34 in step 70, if the specified user is logged-in to the Internet, and sends the retrieved IP address to the first

processing unit 12 in step 72 to enable first processing unit 12 to establish point-to-point communications with the specified second user.

The disclosed secondary point-to-point Internet protocol operates as shown in FIG. 9. First processing unit 12 generates an E-mail signal, including a session number and a first IP address corresponding to a first processing unit in step 76. First processing unit 12 transmits the E-mail signal as a <ConnectRequest> signal to the Internet 24 in step 78. The E-mail signal is delivered through the Internet 24 using a mail server 28 to the second processing unit 22 in step 80. Second processing unit 22 extracts the session number and the first IP address from the E-mail signal in step 82 and transmits or sends the session number and a second IP address corresponding to the second processing unit 22, back to the first processing unit 12 through the Internet 24, in step 84. First processing unit 12 verifies the session number received from the second processing unit 22 in step 86, and establishes a point-to-point Internet communication link between the first processing unit 12 and second processing unit 22 using the first and second IP addresses in step 88.

While the disclosed point-to-point Internet protocols and system have been particularly shown and described with reference to the preferred embodiments, it is understood by those skilled in the art that various modifications in form and detail may be made therein without departing from the scope and spirit of the invention. Accordingly, modifications such as those suggested above, but not limited thereto, are to be considered within the scope of the invention.

What is claimed is:

- 1 1. A method of locating a user over a computer network comprising
2 the steps of :
 - 3 A. maintaining a list having a plurality of entries, each entry
4 comprising the current Internet protocol address for a user
5 connected to the Internet; and
 - 6 B. in response to selection of one of the list entries by a
7 requesting user, providing the corresponding Internet
8 protocol address of the selected entry to the requesting user.

- 1 2. A method for locating users having dynamically assigned network
2 protocol addresses over a computer network, the method
3 comprising the steps of:
 - 4 A. maintaining in a computer memory, a compilation of entries,
5 each entry comprising a network protocol address of a user
6 process connected to the computer network;
 - 7 B. in response to identification of one of the entries by a
8 requesting user process, providing the network protocol
9 address of the identified entry to the requesting user
10 process.

- 1 3. The method of claim 2 wherein the network protocol address is an
2 Internet protocol address.

- 1 4. The method of claim 2 further comprising the step of:
2 C. modifying the compilation of entries.

- 1 5. The method of claim 4 wherein step C further comprises:

- 1 C.1 modifying an entry of the compilation upon the occurrence of
2 a predetermined event.
- 1 6. The method of claim 5 wherein the predetermined event
2 comprises notification from a user process that the user process is
3 coupled to the network.
- 1 7. The method of claim 5 wherein the predetermined event
2 comprises expiration of a predefined time interval since notification
3 from the user process.
- 1 8. In a computer system having a display and audio transducer, the
2 computer system coupled to other computers and a server over a
3 computer network, the apparatus for establishing a point-to-point
4 communication link comprising:
5 a. means for transmitting, from the first process to a server, a
6 query as to whether a second process is connected to the
7 computer network;
8 b. means for receiving a network protocol address of the
9 second process from the server when the second process is
10 connected to the computer network; and
11 c. means, responsive to the network protocol address of the
12 second process, for establishing a point-to-point
13 communication link between the first process and the second
14 process over the computer network.
- 1 9. The computer apparatus of claim 8 further comprising:
2 d. means for receiving audio data and transmitting the audio
3 data to the second processor over the established point-to-

1 point communication link.

- 1 10. In a computer system, the computer system having an audio
2 transducer and a display device and being operatively coupled to
3 other computer system and a server over a computer network,
4 apparatus for establishing a point-to-point communication link
5 comprising:
- 6 a. means for transmitting an E-mail signal containing a network
7 protocol address from the first process to a second client
8 process over the computer network;
 - 9 b. means for receiving a second network protocol address from
10 the second process over the computer network; and
 - 11 c. means, responsive to the second network protocol address,
12 for establishing a point-to-point communication link between
13 the first process and the second process over the computer
14 network.

(54) Title: DEDICATED SYSTEM AND PROCESS FOR DISTRIBUTED COMMUNICATION ON A PACKET-SWITCHED NETWORK

(57) Abstract

A dedicated appliance for packet-switched voice communication is provided with a mechanism to ensure that both the caller and a recipient of voice communication having a similar appliance have a connection to the packet-switched network. Such an appliance eliminates the need for complex and expensive multimedia computer systems and Internet telephony software which requires a pre-existing network connection for both parties prior to initiating communication. In one embodiment of the invention, a caller's appliance may cause a recipient's appliance to connect to the packet-switched network through the access medium of the recipient. Another mechanism which enables switching between circuit-switched and packet-switched voice communication allows for both kinds of communication to be used by the same appliance. Once connected to the network, the caller and recipient may establish a connection therebetween over the packet-switched network to permit communication. Network service providers (NSP) which provide access to the packet-switched networks for users do not need to dedicate connection ports to voice communication and therefore can allow use of any connection port for any purpose with the existing infrastructure.

**DEDICATED SYSTEM AND PROCESS FOR DISTRIBUTED
COMMUNICATION ON A PACKET-SWITCHED NETWORK**

Field of the Invention

5 The present invention is related to communication over packet-switched networks. The present invention is more particularly related to voice communication using such networks.

Background of the Invention

 Voice communication typically uses a circuit-switched network. Such a network is
10 maintained by regional and long distance telecommunication carriers, and typically provides a dedicated channel for each connection established between subscribers for voice communication. A circuit-switched network is expensive to operate, which in turn causes users to incur significant charges, particularly for long distance calls. Additionally, each connection requires a direct path between two locations, typically determined using a complex algorithm.
15 Additionally, each connection is recorded for billing purposes. The overhead incurred for billing is a substantial portion of the cost in maintaining the network.

 Recently there has been an increased interest in the use of packet-switched networks for voice communication. In particular, a global network of computers using a packet-switched network, commonly known as the Internet, has been the platform for some computer software
20 that allows for voice communication between two or more individuals connected to the Internet.

 Because packet-switched networks are less expensive to use and more versatile than circuit-switched networks, there is an increasing interest in developing their use for voice and video communication. However, there are some drawbacks to packet-switched networks. First, packet-switched networks are used primarily for general data communication. At present, it
25 generally does not guarantee reliable real-time performance, particularly for voice communication. The lack of reliable real-time communication results in degradation of the quality of voice data transmitted over the network. These problems will eventually be overcome as technology and communication standards develop. A second problem is that both users who wish to communicate by voice over a packet-switched network have to have operative
30 connections to the network. It is not possible at the present time to initiate voice communication over the packet-switched network without each party establishing their own connection to the network prior to communication being initiated by one of the parties. This requirement is in stark contrast to the circuit-switched networks where the recipient of a conventional telephone

call is notified, for example, by ringing of a telephone.

Some current proposals for using packet-switched networks for telephone communication either are computer software (e.g., the Internet Phone software from VocalTec of Northvale, New Jersey and the WebPhone software by Netspeak of Boca Raton, Florida) which are loaded onto a general purpose multimedia computer system with a modem or use centralized systems known as "hop-off" servers which translate between packet-switched data packets and electronic voice signals expected by a circuit-switched network and which generate outgoing phone calls through a regular telephone network (also called a plain old telephone system (POTS)). Some of the problems with the first kind of computer software are that the cost, complexity, and inconvenience of using the computer and the software is significant. To receive incoming calls, the computer system needs to be continuously, on wasting much electricity, and needs to have a continuous link to the Internet which can incur online charges from an access provider. Furthermore, the computer system uses much of the computer's central processor power that could otherwise be used for increasing performance on other software applications. The problem with the second kind of system is that it has operations costs similar to those associated with circuit-switched networks for general-purpose consumer and business use. In particular, current service providers to the Internet might have to dedicate bandwidth and connection ports for the sole purpose of providing voice communication and these dedicated servers are not useful for other kinds of data communication. Additionally, it is becoming increasingly likely that individual consumers may have one or more means to access the packet-switched network via various media such as cable television lines, optical fibers, wireless, digital subscriber lines, other than telephone lines. Having such versatility to easily switch among several options to conduct voice communication through any of these media would benefit consumers and businesses.

25

Summary of the Invention

A dedicated appliance for packet-switched voice communication is provided with a mechanism to ensure that both the caller and a recipient of voice communication having a similar appliance has a connection to the packet-switched network. Such an appliance eliminates the need for complex and expensive multimedia computer systems and Internet telephony software which requires a pre-existing network connection for both parties prior to initiating communication. In one embodiment of the invention, a caller's appliance may cause a

30

recipient's appliance to connect to the packet-switched network through the access medium of the recipient. Another mechanism which enables switching between circuit-switched and packet-switched voice communication allows for both kinds of communication to be used by the same appliance.

5 Once connected to the network, the caller and recipient may establish a connection therebetween over the packet-switched network to permit communication. Network service providers (NSP) which provides access to the packet-switched networks for users do not need to dedicate connection ports to voice communication and therefore can allow use of any connection port for any purpose with the existing infrastructure.

10 Accordingly, one aspect of the invention is a communication system using a packet-switched network. The communication system includes a first network access system for providing access to the packet-switched network. A second network access system also provides access to the packet-switched network. A first appliance has a mechanism for connecting to the first network access system through a first access medium, and sends and receives packets
15 through this connection to the packet-switched network. A second user appliance has similar capabilities. In addition, the second user appliance has mechanisms for causing the first appliance to connect to the packet-switched network through the first network access system. The first and second appliances then can send and receive packets to and from one another through the packet-switched network.

20 Another aspect of the invention is an appliance for communication using a packet-switched network. The appliance connects to a first access medium, and in turn connects to a first network access system connected to the packet-switched network using the access medium. The appliance includes a mechanism for causing another appliance to be connected, through a second access medium, to a second network access system connected to the packet-switched
25 network. After the connection of the other appliance is made, the two appliances may send and receive packets through the packet-switched network to each other.

 In one embodiment of the invention, the first appliance is caused to connect to the packet-switched network by first connecting with the first appliance using a public switched telephone network (PSTN) encompassing a local exchange carriers (LEC) and an inter-exchange carrier
30 (IXC) then instructing the first appliance to connect to the first network access system using its access medium. In another embodiment of the invention, the first appliance is caused to connect to the packet-switched network by the second appliance dialing the first appliance using PSTN

and then having the first appliance use the caller identification service of the LEC to connect to the first network access system using its access medium. In another embodiment of the invention, the first appliance is caused to connect to the packet-switched network by the second appliance identifying the first network access system and then by instructing the first network access system to connect with the first appliance through the access medium connected to the first appliance. In another embodiment of the invention, the first appliance is caused to connect to the packet-switched network by the second appliance identifying and instructing the first network dial-out service provider to inform the first appliance to connect through the access medium connected to the first appliance. In yet another embodiment, the first appliance is continuously connected to the first network access system and is caused to connect to the packet-switched network by the second appliance. In any embodiment of the invention, the appliance also way initiate any conventional calls using the PSTN.

Another aspect of the invention, which may be used in combination with other aspects of the invention, is a database system for storing information supporting a communication system using a packet-switched network, wherein first and second appliances are connected through first and second access media to first and second network access systems which are connected to the packet-switched network. The database stores user information for each of the first and second appliances, such as a first unique identifier indicating an address for the appliance accessible using the packet-switched network and a second unique identifier indicating an access mechanism for establishing a connection over an access medium between the first and second network access systems and the first and second appliances. The database responds to queries to return one of the first and second unique identifiers as well as any other pertinent user information.

In another aspect of the invention, an appliance selects whether a conventional telephone call is made or whether the call is made over the packet-switched network. In another aspect of the invention, the connection to the packet-switched networks made after the identifier of the recipient is input to the appliance by the caller.

Brief Description of the Drawings

In the drawings,

Fig. 1 is a block diagram of a voice communication system in accordance with the present invention:

Fig. 2a is a more detailed block diagram of one embodiment of the telephone appliance shown in Fig. 1;

Fig. 2b is a more detailed block diagram of another embodiment of the telephone appliance shown in Fig. 1;

5 Fig. 3 is a more detailed block diagram of the central database (CBD) shown in Fig. 1;

Fig. 4 is a more detailed diagram of the dedicated communication facility (DCF) as shown in Fig. 1;

Fig. 5a is a flow chart of one embodiment of a process for making an Internet telephone call using the voice communication system of the present invention;

10 Fig. 5b is a flow chart of another embodiment of a process for making an Internet telephone call using the LEC caller identification service with the voice communication system of the present invention;

Fig. 6a is a flow chart of an embodiment of a process for using the voice communication system of the present invention using dial-out possibilities with existing network service
15 providers;

Fig. 6b is a flow chart of another embodiment of a process for using the voice communication system of the with dedicated dial-out service providers;

Detailed Description

The present invention will be more completely understood through the following detailed description which should be read in conjunction with the attached drawing in which similar reference numbers indicate similar structures.

5 Referring now to Fig. 1, the voice communication system of the present invention is shown in comparison to a conventional voice communication system. A conventional system includes a conventional telephone 20 connected to a telephone network 22. The telephone network 22 includes a local exchange carrier (LEC) 24 connected to an inter-exchange carrier 26 (IXC) (i.e., long distance carrier) and a second LEC 28. The network 22 allows users of
10 conventional phone 20 to contact a recipient using conventional telephone 20' over long distances. In one embodiment of the present invention, an appliance 30, described in more detail below, is used to access a packet-switched network 32, such as the Internet, to contact a recipient having another similar appliance 34 or any compatible systems abiding to International
15 Telecommunications Union (ITU) multimedia communications standards for packet-switched communication, such as H.320, H.323 and H.324. While the invention is described herein with reference to the Internet, it should be understood that it is generally applicable to any packet-switched protocols and networks that allow for packet-switching capabilities, included but not limited to, TCP/IP, IPX, ATM, Ethernet, ISDN, and PSTN, using a variety of communications standards, including, but not limited to, ITU standards H.320, H.323 and H.324. The network
20 32 is accessed by appliances 30 and 34 via network access media 36 and 38. Such access may be provided over several possible access media. Such access media include, but are not limited to POTS, cable television cable lines, electric power lines, optical fibers, wireless, satellite, digital subscriber lines, etc. The term "access media" as used herein is intended to mean any mechanism for access to the network, whether analog, digital, optical or wireless. The access
25 media allow access to a public or private network service provider 40 or 42 such as an Internet service provider, which may be local to each user. The network service providers 40 and 42 access a packet-switched network 44, such as a large global network, commonly called the Internet, and have access to a central database 46, described in more detail below, of users of the appliances 30 and 34 or an otherwise compatible system which may utilize such a database.

30 Using the conventional communications network 22, the user 20 typically has access charges incurred for access to the local telephone company, and per call access charges due to a long distance carrier that supports the public switched telephone network. In the present

invention, the users of appliances 30 and 34 typically incur charges for obtaining access through a local network access medium 36 and 38 such as the local telephone company and/or a network service provider 40 and 42.

The appliance 30, 34 will now be described in connection with Figs. 2a and 2b. One form of packaging of the appliance may be a separate box that connects between a connector to the network access medium and a conventional telephone 76 for which the circuitry is shown in Fig 2a. This form of packaging may be integrated with other appliances such as cable television converter boxes and high-definition digital televisions to provide integrated telephony services using cable Internet access or video telephony using a small window image on a high-definition television (HDTV) set.

Another form of packaging of the appliance may be like a conventional telephone for which the circuitry shown in Fig. 2b is same as in Fig. 2a except for numeric keypad 66', handset with a transmitter 78 (e.g., microphone) and receiver 80 (e.g., speaker), and an integrated conventional telephone interface electronics 77. Yet another form of packaging could be a single household model for allowing all phones connected to the main household phone line to use Internet telephony.

The appliance has an Internet access jack 48 to permit connection to a network service provider. The Internet access jack can also accommodate other network connections depending on the network access medium such as coaxial cable connector for cable access or a conventional phone jack such as an RJ-11 connector if connecting to an LEC via a POTS modem. If the connection jack 48 is not a conventional phone jack, a conventional phone jack 50 such as an RJ11 jack can be made available for connection to the PSTN line for making conventional calls. Such means of network and phone connection allows the appliance to function just like a regular phone for local phone calls, but for long-distance phone calls, which may be detected by examining the telephone number of the appliance users from the central database 46, it may connect automatically into the network, if there is an appliance user corresponding to the telephone number, or into an IXC if there is no appliance user corresponding to the telephone number.

The appliance does not require both parties to be already linked to the network to initiate communication. At least five modes of operation may be provided for establishing a connection with the recipient. One mode uses a conventional long-distance telephone call to cause the recipient's appliance 34 to initiate a connection with its own network service provider, as

described in more detail below. A second mode causes the recipient's appliance to connect with its own network service provider by using caller identification of the caller as described in more detail below. A third mode causes the network service provider local to the recipient to initiate the connection with the recipient, as described in more detail below. A fourth mode causes a
5 network dial-out service provider local to the recipient to initiate the connection with the recipient as described in more detail below. A fifth mode causes the caller's appliance to directly connect to the recipient's appliance with a continuous connection to the network service provider as described in more detail below. These modes of operation may be compatible with each other depending on the available type of network access by each of the calling parties. The software
10 for causing these operation modes can also be adapted for running on conventional computer systems running on various operating systems for example Unix, Microsoft's Windows, IBM OS/2, and Apple operating system.

The appliance 30, 34 in Fig.2a and 2b shows two possible embodiments of the invention. The appliance 30, 34 includes a network interface module 50 and 50' such as a POTS modem for
15 establishing communication with the network access medium 36 through connection jack or port 48, a central processor, a random access memory 60 and 60', digital signal processor chip 56 and 56' to conduct dedicated audio and/or video compression and decompression, a manual input device 68 and 68' such as a keypad, and an information output unit 70 and 70' such as an LCD display and/or voice messaging software system directly to a receiver 80' or to the handset of a
20 conventional telephone 76 to inform the appliance user of any necessary status or decision requests.

A power supply 72 and 72' provides power to the appliance 30 and a back-up battery 74 and 74' maintains operation during a power outage. Other features 66 and 66' may also be
25 included such as those for data encryption and decryption, speaker phone, caller ID, call waiting, conferencing, and voice mail. A manual switch 64 and 64' or software setup change allows for switching between operation modes, of which three are described in more detail below. The appliance operates in full-duplex mode to allow both parties to talk at once.

The central processor unit 58 and 58' may be a microprocessor such as Motorola 68000 or Intel 486 chip. The central processor performs all high-level controls such as providing a
30 point-to-point protocol (PPP) or Serial Line Internet Protocol (SLIP) for TCP/IP (Transmission Control Protocol/Internet Protocol) communications, protocols of ITU standards such as H.323 for real-time multi-media communications, and may also conduct encryption/decryption

functions. The appliance uses the random access memory 60 and 60' to temporarily store operation code and data during operation. The network interface module 52 and 52' may be a stand-alone chip, chipsets, and/or other means that provide communication between the local communication medium 36 such as but not limited to POTS, ISDN, wireless such as satellite or cellular, or cable television networks. A POTS modem may be implemented using a commercially available modem chipset such as those produced by Rockwell which are prevalent in the market. For cable Internet access, a cable modem by Motorola and an Ethernet interface chipset can be used as the network interface module. These network interface modules may be designed to be modular such as using the PCMCIA standard so that the appliance can be easily modified for interfacing to the desired choice of network access.

A read only memory (ROM) chip 62 and 62', such as programmable erasable read only memory (EPROM) chip or Flash ROM chip, contains high-level control computer program code to manage all the other devices and deal with network protocols and standards. Flash ROMs provide the added benefit for automatic field upgradability for quick and easy software updates and patches which can be easily performed by the user. Such control code is described in more detail below by the flowcharts describing the appliance operation. The memory chip 62 and 62' may also be programmed to contain a unique network address, a phone number of a local network access provider, memory cache to store information such as recipients' network addresses and telephone numbers, long-distance calling codes that are currently serviced by network service providers for communication with such an appliance, and networking information such as gateway and authentication information. These user setups will be discussed in detail.

Audio compression and decompression may be provided by the central processor 58 and 58' or by dedicated audio/video compressors/decompressors 56 and 56' such as the TrueSpeech CT8020 Digital Signal Processor (DSP) chip available from DSP Group, Inc. of California or by general purpose DSP chips such as Analog Devices' AD21xx family of DSP chips or Texas Instruments' TMS320 family of DSP chips that can be programmed with audio or video compressors and decompressors (codecs) licensed or sold by numerous vendors, such as Lucent Technologies, Intel, and DSP Group. Audio codecs can comply to the following International Telecommunications Union (ITU) standard such as G.711, G.722, G.728, G.723, G.723.1, and G.729. G.723 and G.723.1 standards are preferred for low bit-rate voice communications on low bandwidth network access medium such as POTS. Video compression and decompression may

comply to the following ITU standard such as H.261 and H.263. H.263 is preferred for low bit-rate video communications on low bandwidth network access media.

Both the audio and video codec standards mentioned support ITU H.32x multimedia communication standards. The use of these ITU standards allow the appliance to be
5 interoperable with other computer systems or software that use the same standards.

The central processor in connection with the network interface module operate to establish a network connection such as TCP/IP through the network access medium. The multimedia communications standard used for network communications can include ITU standards such as H.320, H.323, and H.324.

10 When the connection is established, incoming packets are processed by the DSP chip as directed by the central processor to convert analog audio signals from the transmitter 78 usually a microphone for voice, a charge coupled display (CCD) camera, or the handset of a conventional phone 76 and output digital audio and/or video information to the network. The DSP chip also converts the digital audio information to an analog signal to be output to the receiver 70 such as a
15 speaker or an LCD or television video display or to the handset of a conventional phone 76. The central processor 58 and 58' and the DSP chip can produce packets abiding by a specific communication and network protocols to be transferred via the network interface module 52 and 52' and the local network access medium 36 to the other party. It is also possible to integrate the voice compression & decompression, the high-level central processing functions, and modem
20 functions controlled by a single DSP chip applications specific integrated circuit (ASIC) chip eliminating the need for dedicated chips.

The central database (CDB) 46 will now be described in more detail in connection with Fig. 3. This database is directly connected to a packet-switched network with a static network address as a place of information reference to allow lookup of appliance users or compatible
25 system users as part of the call connection process. A dedicated CDB comprises of a server 80, such as a Digital Alpha server and a fast database 82, such as those commercially-available from Oracle Corporation. The dedicated database also should include a router 84, such as those available from Cisco Systems or Bay Networks, which connects to the network using a high-speed access medium such as a T1 or T3 line connection to network backbones. Duplicates 80'
30 and 82' of the server and database located physically in a geographically different location provides for redundancy for fast access or in case one system becomes inoperative. Databases also may reside at any available network service provider.

The information stored in both the primary and redundant databases are synchronized at regular intervals using standard coherency techniques to maintain the same information. The user information stored in the database includes a unique identifier such as the user's telephone number. The slot for this value in the database is generally permanent for all users of appliances
5 or a compatible appliance or system that is allowed to use this communication system. The value may be modified for example, if a user changes location. The database also includes for each user an identifier which indicates an address for the user when the user's appliance is connected to the packet-switched network. This identifier may be dynamic or fixed, depending on how the addresses are assigned by the network. These network identifiers are used to establish call
10 connection between two or more users. The database may also include other useful or pertinent information for each user such as a subscriber's name, residential address, e-mail address, network service provider's IP address, and billing information.

As the user base increases, the CDBs may be distributed geographically to maximize the efficiency of CDB access and for redundancy. Multiple CDBs can be synchronized to make sure
15 that the databases contain the same information for redundancy. It is also possible to have distinct databases with respective redundant databases for separate groups of users in different locations especially as subscriptions increase. Queries can be processed, for example, by multicasting or broadcasting them to each database.

The following is a scenario of using distinct databases for specific regions. Each
20 database, wherever located world-wide, contains the network addresses of every CDB and the information of every appliance user in that local region. If a new CDB is installed, all existing CDBs are updated with the new CDB's IP address. If a caller in one location calls a recipient at a remote location and the recipient's information is unavailable when the caller's appliance contacts the local CDB, the CDB associates the long-distance dialing codes (e.g. country and
25 area code) with the remote CDB's network address to allow the caller's appliance to establish a link with the remote CDB at the recipient's location. The remote CDB may then take over to continue the process of linking the communication channel between the caller and recipient. In instances where some other recipient's information is used which does not provide sufficient locale information such as the recipient's Internet username or domain name, the CDB can
30 multicast or broadcast the recipient's information to all other CDBs in order to identify the locale of the recipient. Once the remote CDB has been identified, it can then take over to continue the process of establishing the communication channel between the caller and the recipient.

The central database responds to queries from dedicated communication facilities (described below), individual appliances, or any otherwise compatible system that complies to a database query protocol. The response includes packets of stored user data when a match is found. The database permits users with dynamically assigned network addresses to be located. Additionally, this database allows one person to request a connection with another person who is not presently connected to the network. The database also can identify a phone number that allows the network service provider of the individual to make an outgoing phone call from the network to the local individual.

Referring now to Fig. 4, each network service provider supporting this voice communication system also should include functions of a dedicated communication facility (DCF) in order to support a mode of operation where a connection to a recipient appliance is initiated by the service provider. Each DCF may be comprised of a router 90 which may be connected via a high speed access medium (e.g., T1 or T3) to the network, a server 92, remote and network access hardware 94, switch 96 to access the access medium used by the user of appliance, such as a telephone switch, and POTS modem pools 98.

The construction of the system shown in Fig. 4 is very similar to systems used by conventional network service providers. However, most of such network service providers are not programmed to allow outgoing dial-out to subscribers using a network access medium such as POTS, ISDN or Cable. Generally, they are programmed only to respond to incoming telephone calls. However, many systems may have the capability to make such outgoing phone calls. By providing additional functionality to identify an available access line, such capability may be used to initiate a telephone call with a recipient appliance 30. Such capability is useful in the second mode of operation to be described in more detail below.

A first mode of operation of this system uses a conventional long distance call via PSTN for initiating a connection between the recipient and its network service provider. The process of establishing a communication channel between two appliances using this mode of operation will now be described in connection with Fig. 5a using the Internet as an example. First, the caller dials the recipient's telephone number into the appliance using a conventional telephone connected to the appliance or directly into an appliance that is integrated with a conventional telephone in step 100. The appliance then determines, in step 101, whether the telephone call is long distance. If the telephone call is not a long distance call, the appliance allows for a conventional local telephone call over a plain old telephone system (POTS), in step 102. For

example, in the U.S., if the call is determined to be a long distance call from the standard telephone number prefix such as a "1" for inter-state or intra-state long-distance call or "011 + country code" for international long-distance call, the caller's appliance then checks its internal phonebook to see if the recipient's number is present (step 103) as described in detail with Fig. 8.

5 If the recipient's number is found in the phonebook, the calling process continues to step 104. The appliance establishes in step 104 a connection with the recipient's appliance by a conventional circuit-switched network call. If the call is not answered, as determined in step 105, and if no retry is to be performed (step 106), the user may hang up (step 108) by placing the phone handset on-hook. If the call is answered, the caller informs the recipient that a call with

10 this appliance is being made. For example, the caller may request that the recipient press a key on the telephone handset, such as the "*" key or pressing a button the appliance. If the recipient cannot be connected via the appliance for any reason (step 112), a conventional toll call may be continued (step 114) and eventually terminated (step 116); the phonebook check of step 103 helps to minimize this occurrence but it is conceivable that the recipient's appliance could be

15 malfunctioning or has been disconnected. If the recipient has a properly functioning appliance, both appliances hang up (in step 118) and both parties' appliances automatically connect with their network service providers, as described in more detail below in connection with Fig. 8. They may obtain an IP address (steps 120 and 122) dynamically or may already have a static IP address assigned by their network service provider.

20 With an IP address, each party's appliance then contacts a centralized database to exchange the network addresses to each party (steps 124 and 126) referencing each party's unique identifier such as their respective telephone numbers, as described in more detail below in connection with Fig. 10. In particular, the central database is updated with the recipient's IP address in step 124 and the central database is updated with the caller's IP address in step 126.

25 The caller then queries the central database to receive the recipient's IP address in step 128, as described in more detail below in connection with Fig. 12. If the address is not found, as determined in step 130, the caller's appliance continuously tries to identify the recipient's IP address as indicated by 130 in the loop back to step 128. If one minute or other time limit. has passed, the attempts to access an IP address are terminated and the caller is informed in step 134.

30 The telephone call then may be terminated. If the IP address is found, the caller may establish contact and make a TCP connection with the recipient as indicated at step 136. Also, if the recipient is using the telephone line for general Internet access and the recipient's computer

system has a software that is compatible with the appliance running, a connection also may be attempted. If the connection is not obtained as determined in step 138, and if a retry operation is not to be performed as determined in step 140, the caller may be informed of the lack of connection in step 142 and the phone hangs up in step 144. For example, if the recipient is using
5 a telephone line and receives a busy signal or is already on the phone with an Internet call in progress, the recipient's DCF will send a packet to the caller's appliance of the busy signal. However, upon establishing network access and a connection, the two parties may begin talking as indicated in step 146. When the call is terminated by either party by placing the handset on-hook, the TCP/IP connection is terminated in step 148 and the appliance hangs up in step 150.

10 One benefit to the first mode of operation is that it uses the existing services available from most POTS network service providers without modifying their software or hardware. Another benefit to this mode is that the caller may call from any compatible communication system rather than an appliance if the caller somehow knows that the recipient has this appliance or the caller's appliance is provided with the protocol to contact the central database and conduct
15 outgoing PSTN toll calls to the recipient.

There are a couple of minor drawbacks with this first mode of operation. First, there could be delays possibly from one-half to around five minutes depending on distance and network traffic conditions to establish a connection. Second, every time a long-distance call is initiated, the caller may incur charges for this initial connection making frequent calls somewhat
20 costly and reducing the freedom to call as frequently as desired. In order to minimize costs for these initial toll-calls, third-party conventional long-distance service providers may be used to allow the caller to be charged on a fraction of a second segments (e.g. one-sixth of a minute) rather than for a full minute.

A second mode of distributed operation is similar to the first mode which requires an
25 initiating conventional long-distance call, however, the toll charge can be eliminated using a local caller identification (Caller ID) service as shown in Fig. 5b. The caller dials the recipient's number using the telephone handset in step 430. The appliance will determine if the call is local or long-distance by counting the digits and checking the calling area code. If the call is long-distance, the caller's appliance automatically looks up the internal phonebook in step 432 to
30 check if the telephone number is associated with an appliance user. If the telephone number is determined to be associated with an appliance user, the caller's appliance will request if an Internet call is desired. The caller's appliance may be set-up to automatically select the Internet

call mode if the number dialed checks with the internal phonebook. If an Internet call is not desired, the appliance will just continue with PSTN toll call (step 436). If an Internet call is desired, the caller's appliance will dial the number and will make sure to allow for a maximum of only two or three rings (usually two) to let the recipient's appliance identify the caller's telephone number (step 440). If the recipient has not yet picked up the phone and the appliance detects that the caller is an appliance user by checking its internal phonebook in step 442, the recipient's appliance will wait until the ringing stops in step 446. If the recipient picks up the phone before the appliance has had a chance to identify the caller, the operation reverts back to the first mode. If the caller is identified not to be an appliance user as determined by the internal phone book, then the recipient's appliance will let the call process as a conventional one (step 444) and let the phone ring. After waiting for two or three rings, the caller's appliance will then automatically hang up in step 448 and continue with the rest of the first mode of operation beginning with step 122'. If the recipient has not yet picked up the phone and the caller has been identified as an appliance user by the recipient's appliance, the recipient's appliance will then continue to establish an Internet connection with steps 120' and 124'. While the appliance attempts to establish an Internet call connection and the recipient picks up the phone, the appliance will so inform the recipient that an Internet call is in progress with the caller identified on, for example, an LCD display. The recipient will have control to cancel an Internet call in progress if so desired by pressing a button on the appliance or a button on the handset such as the "*" or "#."

Benefits to the second mode of operation is that it uses the existing services available from most POTS network service providers without modifying their software or hardware just like the first mode of operation. Another same benefit to this mode is that the caller may call from any compatible communication system rather than an appliance if the caller somehow knows that the recipient has this appliance or the caller's appliance is provided with the protocol to contact the central database and conduct outgoing PSTN toll calls to the recipient. However, one major disadvantage of the caller being charged for the initial PSTN toll call associated with the first mode of operation is reduced or eliminated. The second mode of operation also eliminates the need for the recipient to intervene by picking up the handset and pressing a button to initiate an Internet call as in the first mode of operation. The second mode of operation increases the ease of establishing an Internet call and also helps to reduce PSTN long-distance charges even further.

A third mode of distributed operation is used when network service providers have the ability to call out to the recipient via its network access medium, with similar capabilities of a DCF, for example, as shown in Fig. 4. This mode of operation will now be described in connection with Fig. 6. With this embodiment, the appliance is configured with a local DCF
5 telephone number, however assigned, or other mechanism to access the network. The customer information including at least the subscriber's telephone number and DCF's network address may then be transferred to the central database (CDB) of subscribers and/or maintained on a DCF database.

The flow of information in the third mode of operation will first be described using the
10 Internet protocol as an example. When a caller attempts to make a long-distance call, the appliance automatically accesses a local DCF or an NSP (since an outgoing call to the caller is unnecessary) by means of the local network access medium to gain network access to the packet-switched network via for example a standard PPP/SLIP and authentication. When connection to the DCF/NSP is established, the caller's appliance sends a query packet (described below)
15 containing the recipient's telephone number or other distinct identification information such as a residential address, IP address, electronic mail address, to initiate a long-distance call.

Upon determining at least the recipient's DCF network address, the caller's appliance, caller's DCF/NSP, or the CDB contacts the recipient's DCF to transmit an information packet (described below) that contains the recipient's local telephone number or other information such
20 as the caller's network address. To minimize delays, one method is to have the CDB directly send the recipient's telephone number and caller's network address directly to the recipient's DCF. However, selected information, its point of origin and its transfer method may vary among different implementations.

With the recipient's local telephone number, the recipient's DCF then makes an outgoing
25 call to authenticate and to establish network access via PPP/SLIP if using POTS with the recipient's appliance. Authentication may be made by the DCF prior to making the outgoing call if the recipient's information received is sufficient for such pre-authentication in order to minimize delays.

The following will describe a few methods of initiating a communication channel through
30 a packet-switched network. In one method, if the recipient answers the call and the recipient's appliance is provided with the caller's network address by a CDB or its DCF, the recipient's appliance may directly contact the caller's appliance with the caller's network address to initiate

a communication channel. In another method, the recipient's appliance or DCF sends an information packet containing the recipient's network address to the caller's appliance upon which the caller's appliance initiates the communications channel using the recipient's network address. Whichever way, a communication link between the caller and the recipient may be
5 established to begin transmitting information packets over the network.

One embodiment of the data flow associated with the third mode of operation will now be described in more detail in connection with the flow chart of Fig. 6a. In particular, the caller dials the recipient's telephone number into the appliance using a conventional telephone connected to the appliance or directly into the appliance integrated with a conventional telephone
10 in step 200. The appliance then determines whether the telephone call is long distance, as determined in step 202. If the telephone call is not a long distance call, the appliance makes a local telephone call over a plain old telephone system (POTS), in step 204. If the call is determined to be a long distance call, the caller's appliance checks its internal phonebook to see if the recipient's number is present (step 205) as described in detail with Fig. 8. If the recipient's
15 number is found in the phonebook, the calling process continues to step 206. The caller's appliance automatically dials a local network service provider (NSP) or DCF to establish a PPP/SLIP link (step 206), as described in more detail below in connection with Fig. 9. If a PPP/SLIP link is not established as determined in step 208, a retry may be performed in steps 210 and 206 or the appliance or caller may hang up in step 212. If a PPP/SLIP link is
20 established, the caller's appliance sends a packet with the recipient's access information to the local central database (step 214) and queries the central database for the IP address of the recipient's dedicated communication facility step 216. This step is described in more detail below in connection with Fig. 12. If the IP address of the recipient's dedicated communication facility is not found, as determined in step 218, the caller may be given an option to make a
25 conventional toll call in step 220. If no toll call is to be made, the appliance or caller hangs up in step 222. Otherwise, a toll call may be made through a conventional public switched telephone network in step 224. When the call is completed, the caller hangs up in step 226.

If the caller connects to the network and identifies the IP address of the recipient's dedicated communication facility, the appliance then sends a packet with a caller's IP address and
30 the recipient's access information, e.g., its telephone number, to the recipient's dedicated communication facility in step 228. This information allows the recipient's DCF to connect with the recipient's appliance over the recipient's network access medium, for example, by making a

DOSP is not found, as determined in step 518, the caller may be given an option to make a conventional toll call in step 520. If no toll call is to be made, the appliance or caller hangs up in step 524. Otherwise, a toll call may be made through a conventional public switched telephone network in step 522. When the call is completed, the caller hangs up in step 514.

- 5 If the caller connects to the network and identifies the IP address of the recipient's DOSP, the caller's appliance then sends a packet with the recipient's access information, e.g., its telephone number, to the recipient's DOSP in step 526. This information allows the recipient's DOSP to connect with the recipient's appliance over the recipient's network access medium, for example, by making a telephone call, to establish a point-to-point protocol link in step 528.
- 10 During this process, the caller may be informed of the call status with phone ringing sounds on the recipient's telephone. This process is described in more detail below in connection with Fig. 11. If a link is established, the DOSP requests the recipient to indicate acceptance of the network phone call by, for example, pressing the "*" button on the handset in step 530. Steps 530 through 566 is essentially the same as that of the first and second modes of operation shown in
- 15 Fig. 5a from steps 110 through 144.

 A benefit of the fourth mode of operation is that initial long distance toll calls over the public switched telephone network for establishing an network connection between the caller and the recipient are completely eliminated. Another benefit of the fourth mode is that it does not involve modification to network service providers but rather uses less expensive (compared to

20 network service providers) dedicated dial-out service providers to allow the outgoing telephone calls to be made to the recipient. However, the delay in making a connection may be twice as long in comparison to the first mode.

 The fifth mode of operation will now be described with reference to Fig. 7. If continuous network access such as cable Internet access is used by the caller, a continuous

25 network link is provided so that there will not be a need to dial into the service provider nor conduct authentication. If the recipient has such continuous Internet access, the caller automatically dials the recipient via packet-switched means without the need for conducting a short long-distance call as associated with the first mode of operation; the caller could have accessed the Internet via any means. This is similar to the third mode of operation described

30 above using POTS Internet access however, using a continuous Internet access such as cable does not require any modifications to the cable service provider. This operation mode is also much faster for connection than the first, second, or third mode of operation.

telephone call, to establish a point-to-point protocol link in step 230. During this process, the caller may be informed of the call status with phone ringing sounds on the recipient's telephone. This process is described in more detail below in connection with Fig. 11. If a link is established, the recipient's DCF sends a packet with a recipient's appliance IP address to the caller's appliance in step 232. The caller's appliance then connects to the recipient's appliance via a TCP/IP connection in step 236. Also, if the recipient is using the telephone line for Internet access and the recipient's computer system has a software that is compatible with the appliance running, a connection also may be attempted. If a connection is not achieved as determine in step 238, a retry operation may be performed in steps 240 and 236. Otherwise, the caller may be informed that no connection is established in step 242 and the appliance hangs up in step 244. For example, if the recipient is using a telephone line and receives a busy signal or is already on the phone with an Internet call in progress, the recipient's DCF sends a packet to the caller's appliance of the busy signal. If a TCP/IP connection is made, the two parties may begin talking as indicated in step 246. When the call is terminated, the TCP/IP connection is terminated in step 248 and the parties may hang up as indicated at 244.

A benefit of the third mode of operation is that initial long distance toll calls over the public switched telephone network for establishing an network connection between the caller and the recipient are completely eliminated. The delay in making a connection may be reduced in comparison to the first mode as well. This third mode does involve modification to network service providers to allow the outgoing telephone calls to be made.

The fourth mode of operation is similar to the third mode by using dial-out service providers (DOSP) that could be located at many locations world-wide where there are large concentrations of appliance users rather than depending on network service providers to provide dial-out service. These dial-out service providers would be connected to the Internet and have dial-out capability using modem banks to inform the recipient's appliance of an incoming Internet call. This operation eliminates the need to modify existing network service providers for dial-out capability. Figure 6b shows the operation and will be described.

Steps 500 through 514 is the same as the third mode of operation described previously. If a PPP/SLIP link is established in step 510, the caller's appliance sends a packet with the recipient's access information to the local central database (step 516) and queries the central database for the IP address of the recipient's dial-out service provider in step 518. This step is described in more detail below in connection with Fig. 12. If the IP address of the recipient's

An example of using the appliance with a continuous cable television Internet access will be described. The appliance may be equipped with a network interface module comprising an Ethernet interface card connected to a cable modem such as those manufactured by Motorola. The appliance may be connected to both the cable Internet access line and the local exchange carrier. The unique MAC address that comes with each Ethernet interface card is registered with the cable Internet access provider for authentication. If static IP address is not assigned, the cable Internet access provider will automatically assign a dynamic IP address to the user whenever a connection is established using the Ethernet interface card's unique MAC address. If dynamic IP addressing is used, the appliance updates the central database upon obtaining a new IP address.

Fig. 7 shows an example of a task flow for establishing a connection using a continuous Internet link. Caller dials the recipient's number (step 450) and the appliance determines if the call is a long-distance call in step 452. If it is not a long-distance call, a local POTS call may be made. Otherwise, the caller's appliance may check the phonebook (step 455) as an option and if the recipient's telephone number is found, it sends a packet with the recipient's phone number to the central database (CDB) in step 456. Regardless of whether the phonebook function is used or not used, a CDB query is made (step 458) with the recipient's phone number and if the recipient's IP address is found (step 460) the caller's appliance attempts to establish a connection with the recipient's appliance in step 470. If the recipient's IP address is not found, then the caller is notified to decide on making a conventional toll call in step 462. After a conventional toll call is made in step 464, the caller then hangs up (step 466). If a conventional call is not made, the caller simply hangs up (step 468). If the recipient's IP address is found, the caller's appliance attempts to connect in step 472. If a connection is not made, the caller's appliance attempts to retry in step 474. If after several retries the connection could not be established, the caller is informed (step 480) and the caller hangs up in step 482. If a connection is made, the call is initiated in step 476 via TCP. Upon call completion, the TCP connection is closed with the recipient's appliance (step 478) and the call is terminated in step 482. The continuous connection to the network such as those with cable Internet access provider simplifies and speeds up the network call connection process.

Fig. 8 describes in more detail how a caller's appliance or compatible system checks and updates the phonebook of a recipient such as performed in step 101 of Fig. 5a and step 205 of Fig. 6a. The process of looking up a phone book eliminates the requirement of establishing a

long-distance call and incurring toll charges to determine if a recipient is capable of receiving a network call via the Internet and also provides the caller an option to cancel the call without establishing a toll connection with the recipient. If the recipient's phone number is found in its internal phonebook, the processes in Fig. 5 or Fig. 6 continue. However, if the recipient's phone number is not found, the caller is informed of this status (step 404) and requests the caller to decide if the appliance or compatible system should check if the recipient is a subscriber (step 406). If the caller decides not to conduct the check, the caller is given the option to continue with a PSTN toll call (step 408). If the caller decides not to continue with a toll call, the appliance hangs-up (step 414). Otherwise, a conventional long-distance call is made (step 410) and upon call completion, the appliance hangs-up. If the caller decides to check if a recipient is a subscriber, the caller's appliance dials into the local network service provider to establish a PPP/SLIP link (step 416). Upon establishing the PPP/SLIP link, the caller's appliance queries a central database server with the recipient's telephone number to check the status of the recipient's subscriber status (step 418). If the recipient is determined to be not a subscriber, i.e., not in the database at the decision step 420, then the procedure for a request to continue with a PSTN toll call (steps 408-414) is carried out. Otherwise, the central database sends a confirmation packet to the caller's appliance with the telephone number and any other pertinent information (step 422). The caller's appliance automatically updates the phonebook with the recipient's information (step 424) and the caller is informed of the update (step 426). Upon completion the subsequent steps are then continued. The appliance's user interface will allow any telephone number in the phonebook to be added, deleted, or edited.

How the appliance dials into a network service provider or dedicated communication facility to establish PPP/SLIP link will now be described in more detail in connection with Fig. 9. This example assumes that the network service providers are accessed using a regular telephone line (i.e. POTS). It is possible to make such a connection via a cable television modem or by connection through electrical power lines, among other mechanisms. In this embodiment, the appliance makes a regular telephone call to a network service provider to make a connection as indicated at step 250. If a connection is not made, as determined in step 252, the appliance may retry this operation as indicated at 254 and 250. Otherwise, the caller may be informed that connection was not made in step 256 and the appliance hangs up in step 258. If a connection to the network service provider is made, authentication information is sent to the provider in step 260. If authentication is not achieved, as determined in step 262, a retry of the

authentication operation may be performed as indicated at 264 and 260. Otherwise, the caller may be informed that authentication was not achieved in step 266 and the appliance hangs up in step 268. If authentication is achieved, a PPP/SLIP link may be established in step 270.

Successful establishment of this link, as determined in step 272 results in the appliance being
5 successfully connected to the network. Otherwise, a retry operation may need to be performed in step 274 and 250.

Referring now to Fig. 10, the process of updating the central database with a network address will now be described in more detail. Each appliance has a CDB network address already encoded. If the appliance happens to have a CDB network address not in its locale,
10 during initial setup when the user inputs the telephone number and other calling codes, the remote CDB automatically assigns an network address of a CDB in the appliance's locale and updates the appliance with the new CDB network address. Using a local CDB should help decrease connection time for calling. It also may help increase the connection speed for someone who wants to call the appliance because the recipient's local CDB may be directly contacted
15 rather than by multicasting or broadcasting.

The CDB updating process involves sending information which comprise of the current network address and any other correlating unique information such as a telephone number for updating to the central database server in step 280. This information is sent in a packet, of which example formats will be described in more detail below in connection with Figs. 13 and 14. The
20 appliance then awaits for a reply from the central database in step 282. If a reply does not indicate that data has been successfully updated, as determined in step 284, an attempt to update the information is retried in step 280. It may be desirable to put a time out operation in this loop, as indicated at 283. If a time out occurs, the caller is informed and may hang up as indicated at 285.

Referring now to Fig. 12, the logic flow of the central database will now be described in more detail. In particular, the central database server receives a request in step 290 that indicates the recipient's telephone number or other means for access that provides a unique identification of how the recipient connects to the network. This may be, for example, a telephone number. The database is then searched by the server for the recipient's unique identification information in
25 step 292. If it is not found, a "not found" packet is then sent in step 294. If the information is found, the recipient's data, such as the network address of the dedicated communication facility used by the recipient and its personal network address and any other pertinent information, are
30

packaged in a packet which is then sent to the caller's appliance in step 298.

The CDB request may be substituted by broadcasting and multicasting for any mode of operation. In such an embodiment, the caller's appliance processes the information packet and broadcast/multicast it to the world-wide Internet or other "white-page" services such as the "People Find" service from Lycos, or the "Big Yellow" Internet business yellow pages to obtain the recipient's individual information. The CDB or the recipient's DCF answers with at least the DCF network address when a matching recipient is found. After establishing contact with the CDB or recipient's DCF, the caller's appliance has the option to store and maintain the recipient's information in a local cache, i.e., phonebook for future use to minimize continual connections with CDB in an effort to reduce delays in establishing contact with the recipient for subsequent phone calls. If the recipient's or recipient's DCF network address is unavailable, the caller's appliance is informed and may be provided with an option to make a conventional long-distance phone call or automatically switch to the first mode of operation if the recipient was determined to be a subscriber as described above.

Example packet types which may be used by the system are shown in Figs. 13 and 14. These packets are transmission control protocol (TCP) packets that communicate over dedicated ports. The TCP packet shown in Fig. 13 includes a first byte of data indicating a type which may include a central database query, phone query, dedicated communication facility update, phone update, additions and deletions, or message indicating the party is ready to talk. The next four bytes of data indicate a length which represents the length of the data field 304 which follows. The data portion of the packet may contain one or more type, length and value entities, such as shown in Fig. 14. The type field 306 indicates a type such as whether the data includes a phone number. The length field 308 indicates the length of the value field 310. By using such packets, each of the central database, dedicated communication facility and the appliance readily may identify information which it needs to process, and how that information should be processed.

How a recipient's dedicated communication facility dials a recipient's appliance to establish a PPP/SLIP link, such as performed in step 230 of Fig. 6, will now be described in more detail in connection with Fig. 11. This operation is performed in manner similar to how a computer generally contacts a network server provider via a modem. In particular, the dedicated communication facility dials out to the recipient via the plain old telephone system (POTS) or other access media used by the appliance, in step 320. After step 320, if the caller hangs up

during the outgoing call step 328, the caller's appliance will inform the recipient's DCF to cancel the call before disconnecting from TCP/IP connection in step 330. In step 322, upon being informed of the caller appliance's on-hook status, the recipient's DCF cancels the outgoing call to the recipient. If the call is answered in step 322, authentication is performed in step 323. If authentication is not achieved, the appliance hangs up in step 328. If authentication is achieved, then an IP address is set in 324 and a PPP/SLIP link is established in 326. If the call is not answered, the dedicated communication facility hangs up in step 328 and informs the caller.

A user interface also may be provided for call status notification and setting up the appliance for initial and continual use. The user may be presented with menu items or call status such as by visual means with a liquid crystal display, audible means with voice messages to the speaker, or a combination thereof. The user may interact with the appliance via one or more means such as with a numeric keypad found on a conventional phone attached to the appliance, pushbuttons, dials, or by voice commands to the handset that may be recognized by the appliance.

A set of main menu items for the appliance may include (a) phonebook, (b) Internet access setup, (c) dialing setup, and (d) auto upgrade. When the phone book menu item is selected, phone numbers may be displayed and scrolled using an electro-mechanical thumb-dial interface attached to a potentiometer. Push buttons for deleting and editing a telephone number may be provided. New telephone numbers might be added, edited, or deleted manually using the numeric dialing keypad on the conventional telephone connected to the appliance. The Internet access setup if using POTS might include an Internet service provider's telephone number, username, and password. ASCII or foreign characters may be entered into the appliance by, for example, using the same thumb-nail dial described previously to select a character, the numeric dialing keypad on the conventional telephone attached to the appliance, or a dedicated keypad. The dialing setup might include the user's telephone number with area code and country code, call waiting cancel, and other dial-out prefixes. The auto upgrade menu item, which may be used with Flash ROM for field upgradability, may be executed with a single command from the user. Upon receiving the user command, the appliance automatically upgrades the appliance's software by auto-dialing into the network service provider, establishing a networking link such as PPP and TCP/IP, contacting a pre-programmed network address supporting a software download, uploading to the network address the model and version of the appliance, receiving the updated software or patches, hanging up, and executing the downloaded software in the

appliance.

By using the mechanisms described above, a caller's appliance ensures that a connection is made between the packet-switched network and the recipient of a telephone call. At least three modes of operation may be used in order to ensure that this connection is made. Additionally, with these appliances the network service providers of the caller and recipient do not require dedicated ports for voice communication. Accordingly, the cost of long distance calls may be reduced without substantially increasing the cost of maintenance of specialized voice communication hardware on the part of the network access providers. By providing a dedicated appliance such telephony is not limited to computer users and owners. With these features this telephony appliance may be used in the same manner as a conventional telephone.

Having now described a few embodiments of the invention, it should be apparent to those skilled in the art that the foregoing is merely illustrative and not limiting, having been presented by way of example and practice. Numerous modifications and other embodiments are within the scope of one of ordinary skill in the art.

For example, other communication protocols over a packet-switched network may be used such as TCP/IP, Frame Relay, ISDN, and IPX providing for reliable transmission or User Datagram Protocol (UDP) that uses Real-Time Protocol (RTP) to handle streaming audio and video and which is a part of the ITU H.323 standard for unreliable transmission. Wireless and asynchronous transfer mode (ATM) networks operating using packet or cell switching also may be used.

Additional functionality also may be provided, such as video and wireless capabilities. An example of video and wireless capability might include a mobile appliance that functions in a vehicle such as an automobile where the outgoing packet-switched communications signals such as video signals are sent by processing video images of the sender using a charge-coupled display (CCD) area sensors such as those sold by Sony Corporation and audio signals are sent by processing voice or audio from the sender using a microphone with active acoustical error cancellation circuitry for full-duplex hands-free speakerphone operation. The incoming packet-switched communication signals are also processed and delivered to the recipient via same wireless means. The incoming processed audio may be transmitted, for example, through the automobile's speakers via radio frequency (RF) signals sent directly to a radio's antenna inside the vehicle. The incoming processed video may be transmitted via a high-resolution liquid crystal display (LCD) such as those sold by Fujitsu or a miniature cathode ray tube (CRT) such

as those found on small television sets for which the image of the recipient can be seen directly from a visual display or viewed, for example, reflected off the front windshield of an automobile so that the driver quickly can focus in and out of the visual image while driving.

Flowing fax transmissions to conventional fax machines or storing fax transmissions also
5 may be added by using standard fax and reliable network transmission protocols. Capability commonly found in conventional telephones also may be added, such as number memory, a mute button, a redial button, speed dial, alphanumeric keypad, answering service, caller identification, call-waiting option, calling capability without using telephone number, caller identification
10 memory, teleconferencing, full duplex speaker phone, cordless handset, voice mail, etc. These functions may be integrated using telephony application programming interfaces (TAPI) developed by Microsoft and Intel for computer telephony application development such as those for PBX systems.

An appliance also may be constructed so as to accommodate different telephony standards such as telephone jacks and various POTS transmission laws such as A-law and Mu-
15 law.

These and other modifications are contemplated as falling within the scope of the invention as defined by the appended claims and equivalents thereto.

CLAIMS

1. A communication system for communication using a packet switched network, comprising:
a first network access system for providing access to the packet switched network;
a second network access system for providing access to the packet switched network;
5 a first appliance having means for connecting to the first network access system through a first access medium, and means for sending and receiving packets through the means for connecting to the packet switched network;
a second user appliance having means for connecting to the second network access system through a second access medium, wherein the second appliance includes means for causing the first
10 appliance to connect to the packet switched network through the first network access system using the means for connecting to the first network access system, and means for sending and receiving packets to and from the first appliance through the means for connecting and the packet switched network.
- 15 2. The communication system of claim 1, wherein the means for causing the first appliance to connect to the packet switched network in the second appliance comprises:
means for connecting with the first appliance using a public switched telephone network; and
means for instructing the first appliance to connect to the first network access system using the means for connecting of the first appliance.
- 20 3. The communication system of claim 1, wherein the means for causing the first appliance to connect to the packet switched network in the second appliance comprises:
means for identifying the first network access system; and
means for instructing the first network access system to connect with the first appliance
25 through the means for connecting in the first appliance.
4. The communication system of claim 1, further comprising:
a central database of user information including, for each of the first and second appliances,
a first unique identifier indicating an address for the appliance accessible using the packet switched
30 network and a second unique identifier indicating an access mechanism for establishing a connection over an access medium between the first and second network access systems and the first and second appliances, and comprising means, operative in response to a query, for returning one of the first and

second unique identifiers.

5. An appliance for communication using a packet switched network,
means for connecting the appliance to a first access medium;
5 means for connecting to a first network access system connected to the packet switched
network using the access medium;
means for causing another appliance to be connected through a second access medium to a
second network access system connected to the packet switched network; and
means for sending communication packets through the packet switched network to the other
10 appliance after connection of the other appliance to the packet switched network is established.
6. A database system for storing information supporting a communication system using a
packet switched network, wherein first and second appliances are connected through first and second
access media to first and second network access systems which are connected to the packet switched
15 network, comprising:
means for storing user information including, for each of the first and second appliances, a
first unique identifier indicating an address for the appliance accessible using the packet switched
network and a second unique identifier indicating an access mechanism for establishing a connection
over an access medium between the first and second network access systems and the first and second
20 appliances; and
means, operative in response to a query, for returning one of the first and second unique
identifiers.
7. The database system of claim 6, further comprising means for adding user information to the
25 database.
8. The database system of claim 6, further comprising means for deleting user information from
the database.
- 30 9. The database system of claim 6, further comprising means for updating user information in
the database.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**Système d'avertissement automatique de la réception
de messages dans un système de messagerie électronique**

DESCRIPTION

Description de l'art antérieur

Un système de messagerie électronique tel que le système DISOSS (Distributed Office Support System) de
5 marque IBM assure l'archivage et la distribution automatiques de messages et de documents au sein d'une
entreprise ou d'une organisation. Un tel système comprend un ordinateur central sur lequel tourne un
logiciel de messagerie électronique, un contrôleur
10 d'écran connecté à l'ordinateur et plusieurs terminaux connectés au contrôleur d'écran. L'arrivée de messages
ou documents dans l'ordinateur central est signalée par l'apparition d'une information dans une liste de
messages et documents reçus (file d'attente). La file
15 d'attente se trouve transmise en permanence vers les divers terminaux et sur l'écran de ceux-ci, les usagers
peuvent consulter la file d'attente et demander la réception d'un message ou consulter un document
identifié. Un système de messagerie électronique de ce
20 genre rend de grands services en ce sens qu'il permet notamment d'améliorer l'efficacité du travail administratif,
d'améliorer la communication entre décideurs et de réduire l'espace nécessaire pour les archives.
Cependant, un tel système ne permet pas d'avertir les

destinataires de messages ou de documents de l'arrivée de ces messages et de ces documents. Il s'agit là d'un désavantage universellement reconnu. La présentation d'un message ou d'un document, en effet, nécessite la
5 consultation régulière sinon permanente de la file d'attente des messages reçus, ce qui peut entraîner des délais dans la réception des messages ou la communication des documents et requiert une surveillance quasi-constante des utilisateurs.

10

Résumé de l'invention

L'invention a pour objet un système électronique automatique qui remédie au désavantage évoqué plus haut et assure que les destinataires de messages ou de documents soient avertis automatiquement de l'arrivée de ces messages ou documents. Les particularités caractéristiques du système selon l'invention sont définies
15 dans les revendications ci-annexées.

20

Un microprocesseur est relié au système de messagerie électronique pour recevoir les informations qui identifient les messages en attente et une mémoire vive est organisée pour constituer un fichier contenant des
25 codes qui identifient des destinataires de messages prédéterminés et des informations représentant les numéros de téléphone de ces destinataires. Un modem connecté à une ligne téléphonique est organisé pour extraire les informations de numéros de téléphone
30 dudit fichier et composer automatiquement les numéros de téléphone des destinataires afin de leur transmettre des signaux d'appel sur la ligne téléphonique. Le microprocesseur est organisé pour lire la file d'attente des messages reçus dans le système de messa-
35

gerie électronique, pour y détecter la présence des codes d'identification résidant dans le fichier, pour extraire du fichier l'information de numéro de téléphone correspondant à chaque code d'identification détecté, et pour donner ordre au modem de composer automatiquement les numéros d'appel correspondants afin de lancer un signal d'appel sur la ligne téléphonique pendant un intervalle de temps prédéterminé.

5

10 Le système selon l'invention a pour avantages que les destinataires de messages ou de documents reçus sont avertis immédiatement par téléphone de la réception d'un message ou document qui leur est destiné et que les messages et documents peuvent être réceptionnés plus rapidement par leurs destinataires et cela sans nécessiter de surveillance particulière. De plus, les destinataires peuvent être prévenus non seulement localement par l'intermédiaire d'un réseau téléphonique intérieur mais également à longue distance par l'intermédiaire d'un réseau téléphonique extérieur. Ce système selon l'invention peut également remplacer avec avantage l'utilisation telex en cas d'urgence au sein d'un groupe utilisant un système de messagerie électronique. Enfin, le système selon l'invention est d'un faible coût en matériel et en logiciel.

15

20

25

Description des dessins

30 La Fig. 1 représente schématiquement un système de messagerie électronique auquel est intégré un système d'avertissement automatique selon l'invention.

La Fig. 2 représente schématiquement l'architecture générale du système d'avertissement automatique selon l'invention.

35

La Fig. 3 est un organigramme du processus d'avertissement téléphonique mis en oeuvre dans le système selon l'invention.

5

Description d'un mode de réalisation exemplaire

Dans la figure 1 est représenté schématiquement un système de messagerie électronique tel que le système DISOSS. Un système de ce genre comprend un processeur central ou processeur-hôte 1, un contrôleur d'écran 2 et un ensemble de terminaux dont un terminal 4 est représenté. Le processeur-hôte gère la réception et la distribution des messages et documents. La réception d'un message ou document est signalée par l'insertion d'une information dans une liste ou file d'attente (QUEUE). Cette liste d'attente peut être transmise sur la ligne 3 et visualisée sur l'écran de chaque terminal 4 à la demande de l'utilisateur. Un exemple de liste d'attente est reproduit au tableau 1 ci-après.

Tableau 1

1	2	3	4	5	6	7	8	9

BXLDIS32	EPSPC1GS	RECP	1	0	08/16	24:46	08/16	24:46

25

30

Dans cet exemple, chaque rubrique de la liste d'attente contient la référence de la liste (colonne 1), le code d'identification d'un destinataire (colonne 2), le type de liste d'attente (colonne 3), le nombre de messages entrés pour le destinataire (colonne 4), le nombre de tentatives de réception des messages (colonne 5), la date et le temps d'attente du premier message entré (colonnes 6 et 7), la date et le temps d'attente du message le plus ancien (colonnes 8 et 9).
Lorsqu'un message ou document a été réceptionné par son destinataire, la rubrique correspondante se trouve mise à jour ou effacée selon qu'il reste encore un message à réceptionner par le destinataire en question ou que le dernier message ou document en attente a été réceptionné. Dans ce système connu, chaque usager doit consulter la file d'attente et pour cela manipuler le clavier de son terminal pour savoir si un message ou document lui est destiné.

Suivant l'invention, le système décrit ci-dessus est avantageusement complété par un système d'avertissement automatique 10 destiné à avertir automatiquement le destinataire d'un message ou d'un document par téléphone sitôt qu'un tel message ou document est reçu. Le système d'avertissement automatique selon l'invention est connecté d'une part au contrôleur d'écran 2 au moyen d'un câble coaxial 5 et il est connecté d'autre part à une ligne téléphonique 6 qui peut être reliée à un central téléphonique privé ou à un réseau téléphonique public représenté par le bloc 7.

L'architecture générale du système d'avertissement automatique 10 est représentée schématiquement par blocs à la figure 2. Le câble coaxial 5 est connecté à un circuit de connexion 11 qui sert d'interface avec

le bus 20 reliant entre elles les différentes unités organiques du système. Ces unités sont essentiellement un microprocesseur 12, un écran de contrôle 13 avec son interface 14, une mémoire ROM de grande capacité 5 15 pour stocker les programmes de commande, une mémoire vive 16 pour constituer un fichier comme on le verra plus loin, et un circuit modem 17 dont la fonction sera décrite ultérieurement.

10 Le microprocesseur 12 est un dispositif bien connu en soi, qui peut être réalisé dans divers modes d'exécution relevant de la compétence normale de l'homme de l'art pour exécuter différentes connexions et tâches fonctionnelles sous la direction de signaux de commande 15 prévus dans un programme d'opération enregistré dans la mémoire morte 15. Celle-ci a par exemple une capacité d'au moins 10 MB (mégabytes ou méga-octets).

Suivant l'invention, on attribue un code particulier à 20 chaque destinataire pour lequel un avertissement automatique est demandé et dans la mémoire vive 16 est constitué un fichier d'avertissement FIL. Les codes de destinataires sont appelés dans la suite codes $u_1, u_2 \dots u_n$. Dans le fichier FIL sont enregistrés les codes 25 $u_1, u_2 \dots u_n$ identifiant les destinataires et pour chaque code, des données numériques $n_1, n_2 \dots n_n$ représentant le numéro de téléphone du destinataire ainsi que des données $t_1, t_2 \dots t_n$ représentant des paramètres de transmission pour chaque appel téléphonique 30 ainsi qu'on le verra plus loin. Les numéros de téléphone peuvent être des numéros d'extension dans un réseau intérieur d'un groupe, des numéros d'appel d'une zone téléphonique locale ou des numéros d'appel interzonal ou à longue distance. Le modem 17 est un 35 dispositif connu en soi, organisé pour composer auto-

matiquement des numéros de téléphone à partir de données numériques et produire des signaux propres à la transmission sur la ligne téléphonique 6.

5 Le système d'avertissement automatique selon l'invention fonctionne sous la direction du microprocesseur 12 animé ou organisé par un système de commande rési-
dant dans la mémoire 15. Le fonctionnement du système selon l'invention est illustré par l'organigramme de
10 la figure 3.

Après démarrage du système (étape 100), la première étape du fonctionnement (étape 101) consiste à établir la liaison avec le processeur-hôte 1 du système de
15 messagerie électronique par l'intermédiaire du câble 3. Le microprocesseur 12 commande ensuite l'envoi au processeur-hôte 1 d'un signal de requête REQ demandant la présentation des codes d'identification des messages en attente (étape 102). En réponse au signal de
20 requête REQ, le processeur-hôte 1 envoie les codes d'identification de destinataires figurant dans la liste d'attente QUEUE et le microprocesseur 12 en commande l'affichage sur l'écran de contrôle 14.

25 Le microprocesseur 12 commande alors la lecture du contenu du fichier FIL résidant dans la mémoire 16 et la comparaison de chaque code d'identification $u_1, u_2 \dots u_n$ du fichier FIL avec les codes d'identification de la liste d'attente QUEUE (étape 103). Lorsque
30 celle-ci contient un code correspondant à un des codes $u_1, u_2 \dots u_n$ du fichier FIL, le microprocesseur 12 commande la production d'un signal d'adresse ADR pour adresser la mémoire 16 et extraire du fichier FIL les informations n_i représentant le numéro d'appel du
35 destinataire identifié et les données paramétriques t_i

précédemment mentionnées. Ces données servent à fixer les modalités ou conditions de transmission des signaux d'appel sur la ligne téléphonique 6. On peut par exemple fixer la durée de l'appel téléphonique, la tranche horaire durant laquelle l'appel doit être effectué, les jours pendant lesquels un appel peut être effectué, ou d'autres indications éventuelles. Le microprocesseur 12 commande l'affichage de ces informations sur l'écran de contrôle 14 en regard de chaque code d'identification. Sur l'écran de contrôle 14 apparaît par exemple une table du type montré au tableau 2 ci-après.

15

Tableau 2

u_i	N	DATE	t_i	n_i
BXLPC1DI	4	28/04	2:56	3280
BXLPC1RE	2	28/04	2:56	9145
EPSPC1OA	2	27/04	0:25	4302

20

Dans cette table exemplaire, chaque rubrique contient le code u_i d'un destinataire, le nombre N de messages ou documents reçus pour ce destinataire, la date de réception, la durée t_i (minutes et secondes) fixée pour chaque appel téléphonique, le numéro de téléphone n_i du destinataire. Les informations u_i , t_i et n_i , ainsi qu'il a été dit plus haut, sont extraites du fichier FIL selon l'invention.

25

30

Le microprocesseur 12 commande ensuite le transfert des informations numériques $n_1, n_2 \dots n_n$ au modem 17 (étape 104) et le modem répond en composant automatiquement le numéro de téléphone et produisant les im-

35

pulsions propres à la transmission sur la ligne téléphonique 6 (étape 105), suivant un processus bien connu dans le domaine de l'art.

5 Après un laps de temps correspondant aux informations paramétriques t_1 extraites du fichier FIL, le micro-
processeur 12 envoie au modem 17 un ordre d'interrup-
tion en réponse auquel le modem interrompt la trans-
mission des impulsions sur la ligne téléphonique 6. Le
10 même processus se déroule pour chacun des codes
d'identification $u_1, u_2 \dots u_n$ du fichier FIL. Lorsque
tous les codes ont été scrutés (étape 106), le proces-
sus de commande se poursuit (ligne 107) en répétant
les opérations à partir de l'étape 102 et ce, jusqu'à
15 ce qu'un ordre de fin soit reçu (étape 108). L'affi-
chage sur l'écran de contrôle 14 est mis à jour auto-
matiquement à intervalles réguliers ajustables.

20 Grâce au système selon l'invention, les destinataires
de messages ou documents reçus dans un système de mes-
sagerie électronique se trouvent avertis immédiatement
par téléphone de la réception des messages et docu-
ments qui leur sont destinés. Ces messages et docu-
ments peuvent ainsi être réceptionnés très rapidement
25 par leurs destinataires, ce qui accroît avec avantage
et optimise l'efficacité du système de messagerie
électronique. Il est à remarquer que les destinataires
de messages et documents peuvent être prévenus aussi
bien localement par l'intermédiaire d'un réseau télé-
30 phonique intérieur que par communication téléphonique
à longue distance.

35 Dans un mode de réalisation exemplaire, le système
d'avertissement électronique 10 est constitué à partir
d'un appareil disponible sur le marché sous l'appella-

tion d'ordinateur personnel, par exemple un appareil
PC 3270 de marque IBM. Pour pouvoir communiquer, selon
l'invention, avec le contrôleur d'écran 2 du système
de messagerie électronique, l'ordinateur personnel
5 doit être équipé d'une carte de connexion coaxiale,
par exemple la carte d'interface 3270 Adapter de mar-
que IBM. De plus, pour pouvoir convertir les données
numériques extraites de la mémoire 16 en signaux pro-
pres à être transmis sur la ligne téléphonique 6,
10 l'ordinateur personnel doit être équipé d'une carte
modem, par exemple une carte modem de la firme
Devlonics Terminals N.V. compatible avec les protoco-
les de transmission Hayes et CCITT V25bis bien connus
de l'homme de l'art.

15

La mémoire vive de l'ordinateur personnel est utilisée
pour contenir le fichier FIL précité et la mémoire
morte de l'appareil est utilisée pour mémoriser le
système de commande destiné à diriger le processus
20 d'avertissement téléphonique automatique décrit dans
ce qui précède. Il suffit de recopier sur disque dur,
par exemple, le système de commande d'application en-
registré préalablement sur une disquette.

25

Dans ce mode d'exécution exemplaire, dans lequel il
est fait usage d'un ordinateur personnel pour réaliser
le système selon l'invention, le système d'avertisse-
ment entre en liaison opérationnelle avec l'équipe-
ment de l'ordinateur personnel par l'intermédiaire de
30 logiciels d'interfaçage, par exemple : le logiciel
d'interfaçage DOS 3.30 pour la gestion d'un fichier et
le logiciel API pour l'interfaçage avec le logiciel
d'application (processus d'avertissement téléphonique)
dans le cas d'un ordinateur personnel PC 3270. La
35 liaison entre celui-ci et le système de messagerie

électronique peut s'effectuer au moyen d'un logiciel
d'opération Workstation Program 1.00. Tous ces logi-
ciels d'interfaçage, ainsi qu'il est clair pour l'hom-
me de l'art, sont démarrés avant le démarrage du
5 processus d'avertissement téléphonique selon l'inven-
tion.

L'homme de l'art reconnaîtra que l'invention n'est
nullement limitée au mode d'exécution exemplaire
10 décrit à titre illustratif. Toute variante, modifica-
tion ou tout agencement équivalent doit être consi-
déré comme compris dans le cadre de l'invention.

REVENDICATIONS

1. Système d'avertissement automatique de la réception d'un message dans un système de messagerie électronique, comprenant un microprocesseur (12) relié pour recevoir du système de messagerie électronique, les informations identifiant les messages en attente, une
5 mémoire vive (16) organisée pour constituer un fichier (FIL) contenant les codes d'identification ($u_1, u_2 \dots u_n$) de destinataires de messages prédéterminés et leurs numéros d'appel téléphonique ($n_1, n_2 \dots n_n$), et
10 un circuit modem (17) connecté à une ligne téléphonique (6), ce circuit modem étant agencé et organisé pour convertir les informations d'appel numériques ($n_1, n_2 \dots n_n$) résidant dans ledit fichier (FIL) en signaux analogiques propres à la transmission sur la
15 ligne téléphonique (6), le microprocesseur (12) étant organisé pour lire la file d'attente des messages (Queue) dans le système de messagerie électronique, pour y détecter la présence de codes d'identification ($u_1, u_2 \dots u_n$), pour extraire du fichier (FIL) l'in-
20 formation d'appel numérique correspondant à chaque code d'identification ($u_1, u_2 \dots u_n$) détecté, et pour donner ordre au circuit modem (17) de composer automatiquement les numéros d'appel correspondants pour leur transmission sur la ligne téléphonique (6).

25

2. Système selon la revendication 1, caractérisé en ce que le fichier (FIL) constitué dans la mémoire vive (16) contient en outre pour chaque numéro d'appel enregistré, des données fixant la durée de transmis-
30 sion de chaque appel téléphonique et/ou d'autres données de transmission.

3. Système selon la revendication 1 ou 2, caractérisé en ce qu'il est organisé pour afficher les données résidant dans le fichier (FIL) sur un écran de contrôle.
- 5 4. Système selon l'une quelconque des revendications précédentes, caractérisé en ce que la ligne téléphonique (6) est connectée à un central téléphonique privé.
- 10 5. Système selon l'une quelconque des revendications précédentes, caractérisé en ce que la ligne téléphonique (6) est connectée à un central téléphonique public.
- 15 6. Système selon l'une quelconque des revendications précédentes, caractérisé en ce qu'il est réalisé à partir d'un ordinateur personnel équipé d'une carte de connexion pour la connexion avec la ligne (5) allant vers le contrôleur d'écran (2), et d'une carte modem (17) pour la connexion avec la ligne téléphonique (6),
- 20 la mémoire vive de l'ordinateur personnel étant utilisée pour contenir le fichier (FIL) précité et la mémoire morte étant utilisée pour mémoriser le système de commande d'avertissement automatique.

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re PATENT APPLICATION OF:
Net2Phone, Inc. (Patent No. 6,108,704)
Control No.: 90/010,416
Issue Date: August 22, 2000
Title: **POINT-TO-POINT INTERNET
PROTOCOL**

Attorney Docket: 2655-0188
Group Art Unit: 3992
Examiner: KOSOWSKI, Alexander
Date: December 21, 2009
Confirmation No.: 1061

INFORMATION DISCLOSURE STATEMENT

Hon. Commissioner of Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 C.F.R. § 1.56, the attention of the Patent and Trademark Office is hereby directed to the reference(s) listed on the attached PTO-1449. One copy of each non-U.S. Patent reference is attached. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

In re Application of: Net2Phone, Inc.
Control No.: 90/010,416
Information Disclosure Statement dated December 21, 2009
Page 2 of 2

CHARGE STATEMENT: Deposit Account No. 501860, order no. **2655-0188.**

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached

This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.

Information:

Total Files Size (in bytes):	27171745
-------------------------------------	----------

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Total Files Size (in bytes):			27282915		

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

INFORMATION DISCLOSURE STATEMENT

Hon. Commissioner of Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 C.F.R. § 1.56, the attention of the Patent and Trademark Office is hereby directed to the reference(s) listed on the attached PTO-1449. One copy of each non-U.S. Patent reference is attached. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

In re Application of: Net2Phone, Inc.
Control No.: 90/010,416
Information Disclosure Statement dated January 26, 2010
Page 2 of 2

CHARGE STATEMENT: Deposit Account No. 501860, order no. 2655-0188.

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached

This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.

INFORMATION DISCLOSURE STATEMENT

Hon. Commissioner of Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 C.F.R. § 1.56, the attention of the Patent and Trademark Office is hereby directed to the reference(s) listed on the attached PTO-1449. One copy of each non-U.S. Patent reference is attached. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

The enclosed CD-ROM includes electronic copies of the help files (.hlp files) filed in the IDS submitted February 24, 2010 (as References 1-3 and 1-5) which were inadvertently referred to as ".inf" files in that IDS. The enclosed CD-ROM further includes a copy of the VocalChat GTI installation program (setup.exe) and its corresponding data file (vocchat.001). As described in the Redacted expert reports (References 1-1 and 1-2 of the IDS dated February 24, 2010), the VocalChat GTI software (including the .hlp files and the README.TXT file) is alleged to have been distributed more than one year prior to the effective filing date of this application.

CHARGE STATEMENT: Deposit Account No. 501860, order no. 2655-0188.

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached

This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.

Prior Art (Coverage Begins 1976)

- C** 11 ASYNCHRONOUS TRANSFER MODE COMMUNICATION SYSTEM, US PAT 5452296 Assignee: NEC Corporation, (U.S. PTO Utility 1995)
- C** 12 AUDIO COMMUNICATION SYSTEM FOR A COMPUTER NETWORK, US PAT 5434797 (U.S. PTO Utility 1995)
- C** 13 AUTOMATIC STATION IDENTIFICATION WHERE FUNCTION MODULES AUTOMATICALLY INITIALIZE, US PAT 5204669 Assignee: DataCard Corporation, (U.S. PTO Utility 1993)
- C** 14 BRIDGE-LIKE INTERNET PROTOCOL ROUTER, US PAT 5309437 Assignee: Digital Equipment Corporation, (U.S. PTO Utility 1994)
- C** 15 COMMUNICATIONS NETWORK DYNAMIC ADDRESSING ARRANGEMENT, US PAT 5166931 Assignee: AT&T Bell Laboratories, (U.S. PTO Utility 1992)
- C** 16 COMMUNICATIONS SYSTEM FOR AN ISDN AND A LAN, AND AN ISDN-LAN CONNECTION TERMINAL, US PAT 5400335 Assignee: Ricoh Company, Ltd., (U.S. PTO Utility 1995)
- C** 17 CONFERENCING OVER MULTIPLE TRANSPORTS, US PAT 5524110 Assignee: Intel Corporation, (U.S. PTO Utility 1996)
- C** 18 EXTENSION OF TWO PHASE COMMIT PROTOCOL TO DISTRIBUTED PARTICIPANTS, US PAT 5546582 Assignee: International Business Machines, (U.S. PTO Utility 1996)
- C** 19 HIGH PERFORMANCE MACHINE FOR SWITCHED COMMUNICATIONS IN A HETEROGENEOUS DATA PROCESSING NETWORK GATEWAY, US PAT 5463625 Assignee: International Business Machines, (U.S. PTO Utility 1995)
- C** 20 HUMAN MACHINE INTERFACE FOR TELEPHONE FEATURE INVOCATION, US PAT 5533110 Assignee: Mitel Corporation, (U.S. PTO Utility 1996)
- C** 21 LINK AND DISCOVERY PROTOCOLS FOR A RING INTERCONNECT ARCHITECTURE, US PAT 5457683 Assignee: Apple Computer, Inc., (U.S. PTO Utility 1995)
- C** 22 MESSAGE ROUTING SYSTEM FOR SHARED COMMUNICATION MEDIA NETWORKS, US PAT 5095480 (U.S. PTO Utility 1992)
- C** 23 METHOD AND APPARATUS FOR DELIVERING CALLING SERVICES, US PAT 5469500 Assignee: Voiceplex Corporation, (U.S. PTO Utility 1995)
- C** 24 METHOD AND SYSTEM OF MULTICAST ROUTING FOR GROUPS WITH A SINGLE TRANSMITTER, US PAT 5517494 Assignee: Apple Computer, Inc., (U.S. PTO Utility 1996)
- C** 25 METHOD FOR CONFIGURING AND OPERATING A TELECOMMUNICATION APPARATUS, US PAT 5544303 Assignee: International Business Machines, (U.S. PTO Utility 1996)
- C** 26 METHOD FOR POINT-TO-POINT COMMUNICATIONS WITHIN SECURE COMMUNICATION SYSTEMS, US PAT 5357571 Assignee: Motorola, Inc., (U.S. PTO Utility 1994)
- C** 27 METHODS AND APPARATUS FOR ROUTING PACKETS IN PACKET TRANSMISSION NETWORKS, US PAT 5309433 Assignee: International Business Machines Corp., (U.S. PTO Utility 1994)
- C** 28 MULTI-MEDIA INTEGRATED MESSAGE ARRANGEMENT, US PAT 5479411 Assignee: AT&T Corp., (U.S. PTO Utility 1995)

OPINION

SHWARTZ, Magistrate Judge

This matter having come before the Court as a result of objections to the Report of the Special Master dated April 21, 2008 and the motion to seal documents submitted in connection with the objections. For the reasons set forth **[*2]** herein, the objections are overruled, the Report is adopted, and the motion to seal is denied.

I. PROCEDURAL HISTORY

On June 1, 2006, plaintiff Net2Phone, Inc. ("Net2Phone" or "plaintiff") filed a Complaint against defendants eBay, Inc. ("eBay"), Skype, Inc., Skype Technologies SA ("Skype"), and John Does 1-10 (collectively "defendants") alleging patent infringement ¹ and violations of 35 U.S.C. § 271. See Compl. at P 1. Plaintiff filed its First Amended Complaint on June 7, 2006 ² and followed with its Second Amended Complaint on June 28, 2006 adding additional patents to the lawsuit ("patents-in-suit"). ³ Defendants filed an Answer and Counterclaim denying infringement, validity, and enforceability of the patents-in-suit on September 15, 2006, see Docket Entry No. 17, and plaintiff filed a Response to the Counterclaim on September 20, 2006. See Docket Entry No. 18. Discovery has proceeded in accordance with various scheduling orders.

FOOTNOTES

¹ The initial Complaint alleged violation of US. Patent No. 6,108,704. See Compl. at P 14-22.

² First Amended Complaint was re-filed on June 9, 2006. See Docket Entry No. 3.

³ In the Second Amended Complaint added alleged violations of U.S. Patent Nos. 6,701,365, [*3] 6,009,469, 6,131,121 and 6,226,678. See Second Am. Compl. at PP 23-62.

By way of letters dated November 14, 2007 and November 16, 2007, the parties advised the Court that plaintiff had designated over 1,000 documents as privileged or protected from disclosure under the work product rule and that defendant intended to challenge the majority of the plaintiff's designations. See Order Appointing Special Master at 1. After considering the parties submissions dated November 20, 2007, November 24, 2007, November 30, 2007, and December 3, 2007, the Court concluded that based on the volume of challenges and the likelihood that in camera inspection may be needed, the appointment of a Special Master under Fed. R. Civ. P. 53 to resolve the disputes was warranted. See *id.* at 1-2. The parties concurred in this assessment and, by way of Order dated December 7, 2007, the Court appointed Ronald J. Hedges as Special Master ("Special Master"), Docket Entry No. 146, and, by agreement of the parties, the parties agreed to limit any review of his findings to one level of appeal. Order Appointing Special Master at P 7.

The Special Master conducted five days of hearings, ⁴ reviewed documents in camera, and **[*4]** heard arguments concerning "hundreds of documents" as to which Net2Phone asserted privilege. Findings of Fact and Conclusions of Law of Special Master ("Report") dated April 21, 2008 at 3. In addition to these hearings, the Special Master considered the submissions made pursuant to the Order of September 27, 2007, including defendants' submission dated November 14, 2007 and plaintiff's submission dated November 16, 2007. See *id.* At the January 10, 2008 hearing, the Special Master also gave the plaintiff an opportunity to submit additional evidence to support its privilege claims even though the original submission deadline had passed. See Report at P 5. He advised that no further submissions would be allowed after January 15, 2008. See *id.* The plaintiff and defendants made additional submissions on April 8, 2008 and April 10, 2008 respectively, which the Special Master declined to consider because they were untimely. See *id.*

FOOTNOTES

4 These hearings took place on January 10, January 15, February 6, February 7, and March 24, 2008.

On April 21, 2008, the Special Master filed his report wherein he noted that plaintiff eventually produced 4,667 documents that it had previously withheld as privileged. [*5] Id. at 4. The Special Master also found other documents should be produced. Among other things, the Special Master concluded that, during an approximate one-year period, plaintiff and IDT "did not have any identity (or even similarity) of legal interests." Id. at 14. Accordingly, he found the "common interest" doctrine inapplicable to communications between the plaintiff and IDT and found that documents involving communications between plaintiff and IDT during the time period should be produced. Id. at 16.

The Special Master also concluded that the plaintiff and GE did not have the identical legal interest required for asserting the attorney-client privilege and their communications about a potential financing arrangement were not protected from disclosure. See id. at 22.

As to the valuation and infringement analyses, the plaintiff conceded that it voluntarily disclosed patent analyses and valuations of the patents-in-suit. Id. at 17. Accordingly, the Special Master concluded that the plaintiff waived the privilege over communications (other than those with trial counsel) concerning the following subjects: "(1) whether Skype infringes the NetSpeak patents; (2) whether the NetSpeak patents [*6] are easy to design around; (3) whether the NetSpeak patents are valid; (4) whether Vonage infringes the NetSpeak patents; (5) whether the PacketCable Specs require use of the NetSpeak patents; and (6) the value of the NetSpeak patents." Id. at 20. The Special Master observed that while the parties may disagree as to particular documents that fall within these subjects, such disagreement is "not yet ripe for judicial review." Id. at 21.

As to the disputes regarding privilege log entries 2623, 2629, 2632, 2633, 2634, 2645, 9062, 1861, 1864, 1870, 3814, 1870, 3814, 1142, 1332, 1333, 1337, 1840, 2783, 4562, 8832-33, 9061, 9073 and 4382, the Special Master concluded that the plaintiff failed to sustain its burden to show that the communications are entitled to protection under the attorney-client privilege or the work-product rule, or that any existing privilege has not been waived. 5 Id. at 5-12.

FOOTNOTES

5 The plaintiff did not appeal the Special Master's rulings regarding log entries 4638-39, 4675, 3893 and 1766.

On May 6, 2008, the plaintiff filed its Rule 53(f) Objections and Motion to Modify Findings of Fact and Conclusions of Law of the Special Master. See Docket Entry No. 224. Defendant filed [*7] a Response in Opposition to Net2Phone's Objections to the Report of the Special Master on May 21, 2008, see Docket Entry Nos. 232, 233, and plaintiff filed a reply on June 5, 2008. See Docket Entry Nos. 238, 239.

The plaintiff also filed a motion to seal certain documents submitted in connection with its objections. Plaintiff argues that good cause exists to seal the documents because they: (1) disclose a confidential arrangement between IDT and a third party to engage in joint patent enforcement, (2) disclose the name of a competitor against whom IDT was contemplating litigation, (3) contain confidential opinion of counsel on issues of patent infringement, (4) embody certain information that is designated for attorney's eyes only, and (5) contain the confidential agreement between Net2Phone and IDT. The plaintiff asserts that the fact that the Special Master's findings have been posted on the docket does not preclude the plaintiff from seeking to seal the information. In opposition, defendants argue that the plaintiff's motion to seal should be denied because: (1) the plaintiff's request is untimely, (2) none of the information it seeks to seal contains confidential information, and [*8] (3) the plaintiff has previously disclosed the information it now seeks to be sealed.

II. DISCUSSION

A. STANDARD OF REVIEW

The plaintiff argues that: (1) the Court must conduct a de novo review of the Special Master's findings of fact and conclusions of law, and (2) that the Court may review new evidence.

In response, the defendants argue that: (1) the Court should apply the "abuse of discretion" standard when reviewing the Special Master's procedural rulings regarding the discovery process, (2) the Court should show deference to the Special Master's findings on these matters, and (3) even if a de novo standard of review is appropriate, that standard does not permit plaintiff to present new arguments and evidence because allowing it to do so would undermine the purpose of the proceedings before the Special Master and would run counter to the interest of "fair and timely resolution of the issues."

In reply, plaintiff argues that Skype misstates the standard of review because: (1) Fed. R. Civ. P. 53 states that a Special Master's findings of fact and conclusions of law are to be reviewed de novo, and (2) pursuant to Rule 53, the Court may consider new arguments, documents, and evidence as **[*9]** part of its de novo review.⁶

FOOTNOTES

⁶ Plaintiff denies that they are attempting to raise new arguments, but points out that defendants are raising a whole new set of arguments related to preclusion.

Under Federal Rules of Civil Procedure 53(a)(1)(C), the Court may appoint a Special Master to "address pretrial and posttrial matters." Fed. R. Civ. P. 53(a)(1)(C). The Special Master must report his findings to the court that appointed him and serve a copy of his findings on each party. Fed. R. Civ. P. 53(e). The parties may appeal both the substantive and procedural findings of the Special Master. Fed. R. Civ. P. 53(f)(2); see, e.g., Commissariat A L'Energie Atomique v. Samsung Electronics Co., 245 F.R.D. 177, 179 (D.Del. 2007).

Here, the plaintiff appeals the Special Master's findings of fact, conclusions of law, and procedural decisions. The Special Master made rulings concerning the application of the attorney-client privilege. In this circuit, "the applicability of a privilege is a factual question" and "determining the scope of a privilege is a question of law." In re Bevill, Bresler, & Schulman Asset Management. Corp., 805 F.2d 120, 124 (3d Cir. 1986) (citing U.S. v. Liebman, 742 F.2d 807, 809 (3d Cir. 1984)). **[*10]** Objections to the Special Master's findings of fact and conclusions of law are reviewed de novo. Fed. R. Civ. P. 53(f)(3) and (4); see, e.g., Wachtel v. Guardian Life Ins. Co., Civ. Nos. 01-4183, 03.-1801, 2006 U.S. Dist. LEXIS 28879, 2006 WL 1320031, at *3 (D.N.J. May 11, 2006); accord In re Intel Corp. Microprocessor Antitrust Litigation, Civ. No. 05-485, 562 F. Supp. 2d 606, 2008 U.S. Dist. LEXIS 39642, 2008 WL 2156751, at *1 (D.Del May 14, 2008).

In conducting a de novo review of the Special Master's finding of facts and conclusions of law, the Court is mindful that a

[d]e novo review . . . does not necessarily mean a review that includes the submission of new evidence, particularly when evidentiary proceedings previously occurred before the Special Master. When a record on review "is sufficiently developed the district court may, *in its discretion*, merely conduct a de novo review" of the decision, making its own independent determination. Although de novo review refers to the review based on the record below plus any additional evidence received by the reviewing court, it also refers to review of the decision based only on the record below. The plain language of Rule 53 shows that the review of a Special Master's decision requires the court to make a de novo **[*11]** determination, not conduct a de novo hearing. Rule 53 is similar to 28 U.S.C. § 636(b)(1)(C), when a district court reviews the recommendations of a magistrate judge, the district judge "may accept, reject, or modify" the findings made by the magistrate and "may receive further evidence." Unlike a de novo hearing, "a de novo determination requires the district judge to 'consider the record which has been developed before the magistrate [judge] and make his own determination on the basis of that record, without being bound to adopt the findings and conclusions of the magistrate [judge].'"

Commissariat a l'Energie Atomique v. Samsung Electronics Co., 245 F.R.D. 177, 179 (D. Del. 2007). "The phrase 'de novo determination' . . . means an independent determination of a controversy that accords no deference to any prior resolution of the same controversy." United States v. Raddatz, 447 U.S. 667, 690, 100 S. Ct. 2406, 65 L. Ed. 2d 424 (1980) (Stewart, J., dissenting)(citing United States v. First City Nat'l Bank, 386 U.S. 361, 368, 87 S. Ct. 1088, 18 L. Ed. 2d 151 (1967)). This, however, does not require the reviewing court to hear new arguments. In fact, courts generally "exclud[e] evidence of new arguments on objections . . . [because] [s]ystematic efficiencies [*12] would be frustrated and the [Special Master's] role reduced to a mere dress rehearsal. . . . In addition, it would be fundamentally unfair to permit a litigant to set its case in motion before the [Special Master] . . . and -- having received an unfavorable recommendation -- shift gears before the [reviewing] judge." Dunkin' Donuts Franchised Restaurants LLC v. Mehta, Civ. No. 07-0423, 2007 U.S. Dist. LEXIS 67112, 2007 WL 2688710, at *1-2 (W.D.Pa. 2007) (citing Paterson-Leitch Co., Inc. v. Massachusetts Municipal Wholesale Electric Co., 840 F.2d 985, 991 (1st Cir. 1988)).⁷ For these reasons, in an appeal of a Special Master's decision, the parties "cannot raise entirely new arguments for the first time on an objection to a Special Master's Report." World Triathlon Corp. v. Dunbar, 539 F. Supp. 2d 1270, 1278 n. 13 (D.Hawaii 2008) (citing Convolve, Inc. v. Compaq Computer Corp., Civ. No. 00-5141, 2004 U.S. Dist. LEXIS 17502, 2004 WL 1944834, at *1 (S.D.N.Y. Sept. 1, 2004)).

FOOTNOTES

⁷ Generally, on appeal "[t]he matter of what questions may be taken up and resolved for the first time on appeal is one left primarily to the discretion of the [reviewing court], to be exercised on the facts of individual cases." Singleton v. Wulff, 428 U.S. 106, 121, 96 S. Ct. 2868, 49 L. Ed. 2d 826 (1976).

[*13] Appellate courts generally require exceptional circumstances in order to hear issues not presented in the court below. Harris Corp. v. Ericsson, Inc., 417 F.3d 1241, 1266 (Fed. Cir. 2005)

With respect to considering additional evidence, the reviewing Court has the discretion to consider additional facts or hear evidence itself if it is needed to make a de novo determination. See Raddatz, 447 U.S. at 692.

Challenges to the Special Master's rulings on procedural matters are only reviewed for an abuse of discretion. Fed. R. Civ. P. 53(f)(5); see, e.g., Wachtel, 2006 U.S. Dist. LEXIS 28879, 2006 WL 1320031, at *3; accord Gunter v. Ridgewood Energy Corp., 223 F.3d 190, 196-97 (3d Cir. 2000). Among other procedural rulings, the Special Master set deadlines for the presentation of submissions and evidence and precluded evidence not timely submitted.

i. Special Master's refusal to consider untimely submissions

The plaintiff asks the Court to consider evidence that it failed to present by the deadline that the Special Master had set for the presentation of new evidence. In effect, the plaintiff is asking the Court to overrule a procedural ruling of the Special Master. Here, the Special Master permitted the parties to submit [*14] certifications in support of their respective positions by January 10, 2008. The Special Master extended this deadline to January 15, 2008, Report at 5, and he notified the parties that he would not consider any submissions after this date. Hr'g Tr. 119:22-120:8, Jan. 10, 2008; Hr'g Tr. 52:16-18, 136:10-20, Jan. 15, 2008. Despite this warning, the plaintiff attempted to submit additional materials on April 8, 2008. The Special Master's decision not to consider plaintiff's untimely submissions was not an abuse of his discretion. First, the plaintiff has not provided the Court with any reason why its submissions were so untimely. Second, the plaintiff has not presented any evidence that it sought an extension of the deadline for submissions from the Special Master. Third, the additional materials contain information that was in plaintiff's control before the deadline passed, namely evidence known to its witnesses about documents in existence years before the January 15 deadline. Fourth, the record indicates that the plaintiff missed the Special Master's deadline to submit additional materials by approximately four months, not a few days. It would be nearly impossible for the Special [*15] Master to conduct the privilege review and meet the Court imposed deadline to file a report if the parties did not comport with the deadlines for submissions. As such, the Special Master's refusal to consider submissions that were presented more than four months past his deadline is not an abuse of discretion. Thus, the Court will not disturb any of his rulings based upon his decision not to consider the late filed materials.

Moreover, the Court declines to consider any factual materials not timely presented to the Special Master. To allow this without any explanation as to why these materials were not timely presented would render the proceedings before the Special Master nothing more than a moot court exercise. The appointment of a Special Master was made to expedite the resolution of privilege disputes. To this end, the Special Master set deadlines for submissions so he could have a complete record on which to render his rulings. Like all evidentiary proceedings, at some point, the record must be closed. Allowing unending augmentation would mean that the decision-maker would never have the complete record upon which to render a final decision and the adverse party would be deprived [*16] of an opportunity to confront the new evidence. Here, the parties had ample opportunity to present evidence. They were on notice of the deadline and the consequences of noncompliance. Hr'g Tr. 52:16-20, Jan. 15, 2008. There is no reason to allow further augmentation of the record with evidence clearly available to the plaintiff at the time the Special Master set the original January 15, 2008 deadline. "[T]o do so in this situation," where there has been no explanation provided for the failure to comply, "would emasculate the purpose of the Special Master and Rule 53." Commissariat, 245 F.R.D. at 180.

For these reasons, the Court declines to consider evidence not timely presented to the Special Master.

ii. Consideration of New Arguments

As to the assertion that the plaintiff has presented new arguments, the Court declines to parse the submissions that were presented to the Special Master and those that are presented to this Court to determine whether new cases are now being presented because all of the arguments raised to the Special Master and to this Court (with the exception of the need to find unfairness before requiring disclosure of documents embodying topics for which there has [*17] been a waiver) embrace the same legal theories concerning the applicability of the privilege, the common interest doctrine, and waiver. To the extent additional cases are presented, the Court finds that there is no prejudice to any party if the Court considers these cases because each side has had an opportunity to address them. To the extent that the "unfairness" component of the waiver analysis was not argued, consideration of this issue is required but it does not lead to conclusions different from those the Special Master reached. See Convolve, 2004 U.S. Dist. LEXIS 17502, 2004 WL 1944834, at * 1.

The Court turns to its de novo review of the Special Master's findings of fact and conclusions of law.

B. Attorney Client Privilege

As a preliminary matter, the Court notes that because jurisdiction is based upon the presence of a federal question, the federal common law of privilege governs this matter. See Fed. R. Evid. 501; Harding v. Dana Transport, Inc., 914 F. Supp 1084, 1090 (D.N.J. 1996)(citing Wm. T. Thompson Co. v. General Nutrition Corp., Inc., 671 F.2d 100, 103 (3d Cir. 1982)).

The purpose of the attorney-client privilege is to encourage "full and frank communication between attorney and their clients." Upjohn Co. v. United States, 449 U.S. 383, 389, 101 S. Ct. 677, 66 L. Ed. 2d 584 (1981); [*18] Westinghouse Electric Corp. v. Republic of the Philippines, 951 F.2d 1414, 1423 (3d Cir. 1991). Because the attorney-client privilege obstructs the truth-finding process, however, it is construed narrowly and "protects only those disclosures -- necessary to obtain informed legal advice -- which might not have been made absent the privilege." Westinghouse, 951 F.2d at 1423-24 (quoting Fisher v. United States, 425 U.S. 391, 403, 96 S. Ct. 1569, 48 L. Ed. 2d 39 (1976)(emphasis in original)); Harding, 914 F. Supp at 1091 (stating "because the privilege obstructs the search for the truth and because its benefits are, at best, indirect and speculative, it must be strictly confined within the narrowest possible limits consistent with logic of its principle")(citations and internal quotations omitted).

The Court of Appeals for the Third Circuit states the traditional elements of the attorney client privilege as follows:

- (1) the asserted holder of the privilege is or sought to become a client;
- (2) the person to whom the communication was made
 - (a) is a member of the bar of a court, or his or her subordinate, and

(b) in connection with this communication is acting as a lawyer;

(3) the communication relates to a fact of which the attorney **[*19]** was informed

(a) by his client

(b) without the presence of strangers

(c) for the purpose of securing primarily either

(i) an opinion of law or

(ii) legal services or

(iii) assistance in some legal proceeding, and

(d) not for the purpose of committing a crime or tort; and

(4) the privilege has been

(a) claimed and

(b) not waived by the client.

Montgomery County v. MicroVote Corp., 175 F.3d 296, 301 (3d Cir. 1999); Rhone-Poulenc Rorer Inc. v. Home Indem. Co., 32 F.3d 851, 862 (3d Cir. 1994). A party asserting the privilege must show "(1) that it submitted confidential information to a lawyer, . . . (2) that it did so with the reasonable belief that the lawyer was acting as the parties' attorney," Montgomery Acad. v. Kohn, 50 F. Supp. 2d 344, 350 (D.N.J. 1999), and (3) the purpose of the communications was to secure legal, as opposed to business, advice. In re Ford Motor Co., 110 F.3d 954, 965 (3d Cir. 1997). It is, therefore, "vital to a claim of privilege that the communications between client and attorney were made in confidence and have been maintained in confidence." In re Howard Indus., Inc., 67 B.R. 291, 293 (Bankr. D.N.J. 1986) (quoting In re Horowitz, 482 F.2d 72, 81-82 (2d Cir. 1973)); **[*20]** see Republic of Philippines v. Westinghouse Electric Corp., 132 F.R.D. 384, 388 (D.N.J. 1990) (stating "a litigant who wishes to assert confidentiality must maintain genuine confidentiality")(citations omitted and emphasis in original). A party may waive the attorney-client privilege through various actions including purposeful disclosure, partial disclosure, and careless disclosure. Edna Epstein, The Attorney-Client Privilege and the Work-Product Doctrine 292-309 (American Bar Association 2001). Under the doctrine of waiver, when "[c]onduct touches a certain point of disclosure, fairness requires that the privilege shall cease whether he intended that result or not." 8 Wigmore, Evidence § 2327 at 636 (1961). Accordingly, a client generally waives the privilege if he or she voluntarily discloses the privileged communication to a third party, Westinghouse, 951 F.2d at 1424; In re Diet Drugs Prods. Liab. Lit., MDL No. 1203, 2001 U.S. Dist. LEXIS 5494, at *13 (E.D. Pa. April 19, 2001), or fails to take reasonable measures to ensure the confidentiality of communications with counsel. See Kaufman v. SunGard Invest. Sys., Civ. No. 05-1236, 2006 U.S. Dist. LEXIS 28149, 2006 WL 1307882, at *3 (D.N.J. May 9, 2006); Smithkline Beecham Corp. v. Apotex Corp., 232 F.R.D. 467, 479 (E.D. Pa. 2005)(stating **[*21]** that mass dissemination of purportedly confidential communications can destroy an assertion of the privilege).⁸

FOOTNOTES

⁸ Similarly, the work-product privilege precludes disclosure of "materials prepared by an attorney, or an attorney's agent, in anticipation of or for litigation," as well as "[a]n attorney's mental impressions, conclusions, opinions or legal theories." In re Diet Drugs, 2001 U.S. Dist. LEXIS 5494, at *11 (citing In

re Ford Motor Co. v. Kelly, 110 F.3d 954, 967 (3d Cir. 1997); see also U.S. v. Ernstoff, 183 F.R.D. 148, 153 (D.N.J. 1998); Fed. R. Civ. P. 26(b)(3)). The work product privilege may be waived and "[t]he predicate of the waiver inquiry in the work-product context . . . [is] whether the material was disclosed to an adversary." Maldonado v. New Jersey ex rel. Administrative Office of Courts-Probation Division, 225 F.R.D. 120, 131-32 (D.N.J. 2004). "The essential question with respect to waiver of the work-product privilege by disclosure is whether the material has been kept away from adversaries." Id. (citing Nicholas v. Wyndham Int'l, Inc., Civ. No. 01-147, 2003 WL 23198845, at *3-4, 2003 U.S. Dist. LEXIS 24086, at *9 (D.V.I. May 19, 2003)). "The party seeking to [*22] obtain protected work product bears the burden of proving that the protection has been waived." Hatco Corp. v. W.R. Grace & Co.-Conn., Civ. No. 89-1031, 1991 U.S. Dist. LEXIS 6479, 1991 WL 83126, at *7 (D.N.J. May 10, 1991). A showing of disclosure to a third party does not result in a waiver of the work product protection if the parties have common interests. Id.

C. Common Interest Privilege

Here, defendants assert that plaintiff did not share the attorney-client privilege with either IDT or GE and therefore their communications with the plaintiff are not protected from disclosure. Plaintiff argues that, at the time of the communications, it had a common interest with these third parties and their communications are privileged. The "common interest privilege is an extension of the attorney-client privilege and work product doctrine," Block Drug Company, Inc. v. Sedona Laboratories, Inc., Civ. No. 06-350, 2007 U.S. Dist. LEXIS 29028, at *3 (D. Del. Apr. 19, 2007), and thus is "an exception to the general rule that the [] privilege is waived upon disclosure of privileged information to a third party." Katz v. AT&T Corp., 191 F.R.D. 433, 436 (E.D. Pa., 2000) (citing In re The Regents of the University of California, 101 F.3d 1386, 1390 (Fed. Cir. 1996)).

Under [*23] the common interest doctrine, "although an attorney actually represents only one party, there is no waiver of the attorney-client privilege by disclosure of privileged communications to third parties with a 'community of interest.'" ⁹ Pittston Co. v. Allianz Ins. Co., 143 F.R.D. 66, 69 (D.N.J. 1992). Parties have a "community of interest" where they "have an identical legal interest with respect to the subject matter of a communication between an attorney and client concerning legal advice. . . . The key consideration is that the nature of the interest be identical, not similar, and be legal, not solely commercial." Id. (citing Duplan Corp. v. Deering Milliken Inc., 397 F. Supp. 1146, 1172 (S.D.S.C. 1974); In re The Regents of Univ. of Cal., 101 F.3d at 1390; In re Diet Drugs, 2001 U.S. Dist. LEXIS 5494, at *14 (stating that the doctrine preserves a privilege where persons or companies "share a common legal interest in a legal issue or exchange privileged communications with one another"). For the doctrine to apply, the parties must have "an identical legal interest with respect to the subject matter of the communication" Id.; [*24] Grider v. Keystone Health Plan Central, Inc., Civ. No. 05-MC-40, 2005 U.S. Dist. LEXIS 44069, at *21 (M.D. Pa. July 28, 2005). Thus, under "the common interest doctrine . . . 'parties with shared interest in actual or potential litigation against a common adversary may share privileged information without waiving their right to assert the privilege.'" ¹⁰ Katz, 191 F.R.D. at 437 (quoting Thompson v. Glenmede Trust Co., Civ. No. 92-5233, 1995 U.S. Dist. LEXIS 18780, at *15 (E.D. Pa. Dec. 18, 1995)); see also Hewlett-Packard Co. v. Bausch & Lomb, Inc., 115 F.R.D. 308, 309-10 (N.D. Cal. 1987) (applying the doctrine where the communication is in anticipation of a joint litigation). The doctrine, however, does not apply where the third party's interest "'does not appear to be that of a potential co-defendant in a possible . . . action' . . . but rather [is] that of an 'adverse [party], negotiating at arm's length a business transaction between themselves.'" Nidec Corp. v. Victor Comp. Of Japan, Civ. No. 05-0686, 2007 U.S. Dist. LEXIS 48841, at *13-14 (N.D. Cal. July 3, 2007) (quoting SCM Corp. v. Xerox Corp., 70 F.R.D. 508, 512-13 (D. Conn. 1976)). In short, to assert the common interest doctrine, plaintiff must show: (1) the material is privileged, [*25] Grider, 2005 U.S. Dist. LEXIS 44069, at *20 (stating that "[t]he common interest privilege 'does not create an independent privilege, but depends upon a proper showing of the other elements of' . . . [a] recognized privilege before it will apply"), (2) "the parties had an identical legal and not solely commercial interest," In re The Regents of Univ. of Cal., 101 F.3d at 1390; Katz, 191 F.R.D. at 438, and (3) the communication was designed to further the shared legal interest. Nidec Corp., 2007 U.S. Dist. LEXIS 48841, at *10-11. Here, the Court will assume, without deciding, the first prong is met and the materials plaintiff seeks to withhold would be privileged if disclosed between an attorney and a client. As such, the Court turns to consider whether or not the remaining two prongs are met.

FOOTNOTES

⁹ Remington Arms Co. v. Liberty Mutual Insurance Co., 142 F.R.D. 408, 418 (D. Del. 1992) (declining to apply the common interest doctrine because "the rationale which supports the common interest exception to the attorney-client privilege simply doesn't apply if the attorney never represented the party seeking the allegedly privileged materials."); see also Pittston Co., 143 F.R.D. at 70.

¹⁰ Of course, [*26] "[e]ven if there were a common legal interest, the common interest exception requires that the communication at issue be 'designed to further that [legal] effort.'" Nidec Corp. v. Victor Comp. Of Japan, Civ. No. 05-0686, 2007 U.S. Dist. LEXIS 48841, at *15 (N.D. Cal. July 3, 2007) (quoting United States v. Bergonzi, 216 F.R.D. 487, 495 (N.D. Cal. 2003) (alteration and emphasis in original)).

I. Communications between Net2Phone and IDT

Plaintiff argues that the common interest privilege protects communications between plaintiff and IDT because: (1) plaintiff and IDT were closely affiliated companies with identical legal interests in preserving plaintiff's intellectual property, (2) the limited adversity between plaintiff and IDT as to a tender offer did not waive privilege on all issues, and (3) the common interest privilege between plaintiff and IDT arose separately from the IP Agreement.

The defendants argue that the common interest privilege does not apply to IDT and plaintiff between April 4, 2005 and March 13, 2006 because: (1) plaintiff and IDT were separate, publicly-traded corporations, (2) they did not share a common interest because their communications were not between a parent [*27] corporation and its wholly-owned subsidiary, (3) IDT did not then have any interest in the patents-in-suit, (4) the lack of adversity between the two corporations on certain topics does not necessarily imply they shared identical legal interests in those areas, (5) there is no evidence that either party to the communications considered the relationship between them to be that of attorney-client, (6) after the termination of the Intellectual Property Legal Services Agreement and before the acquisition, there was no existing legal relationship between the plaintiff and IDT that would permit application of the common interest privilege as reflected by plaintiff's use of its own counsel to enforce its patent portfolio, instead of IDT's attorneys, (7) IDT and plaintiff never entered into an agreement or placed any confidentiality restrictions on each other, (8) the information was disclosed for commercial purposes, and not to form a joint defense, and (9) the plaintiff has failed to show that joint legal activity between plaintiff and IDT was likely.

Here, a de novo review shows that the Special Master's conclusion that the communications between plaintiff and IDT between the dates April [*28] 4, 2005 and March 12, 2006 are not subject to the common interest privilege doctrine is correct. First, there was no common legal interest between plaintiff and IDT during the dates of April 4, 2005 and March 12, 2006. See Stott-Bumsted Dec. Ex. 5 ("S.E.C. Schedule 14D-9") at 28-35. ¹¹ April 4, 2005 is the date plaintiff's termination of its contractual relationship with IDT became effective. *Id.* at 28. March 13, 2006 is the date that IDT's acquisition of Net2Phone became effective. Thus, from April 4, 2005 to March 13, 2006, the parties were and functioned as separate, publically traded companies. See *id.* at 28-35. Indeed, after April 4, 2005, the independent committee of plaintiff affirmed that it was "not aware of any other arrangement that gave IDT any interest in the Netspeak patents, other than as an indirect interest as a shareholder of Net2Phone." Accordingly, we understand that no agreement exists between IDT and Net2Phone that gives IDT an interest in the Netspeak patents." *Id.* at 29. Second, from April 4, 2005 to March 13, 2006, IDT and Net2Phone had adverse interests because IDT and Net2Phone were negotiating the price IDT would pay for Net2Phone's shares. See *id.* Indeed, [*29] the plaintiff concedes that IDT was adverse to Net2Phone but argues that it was only on the issue of the price IDT would pay for Net2Phone shares. The fact that the parties were adverse in the price per share for Net2Phone illustrates that the parties were indeed separate entities negotiating at arms length in a commercial transaction. Corning, Inc. v. SRU Biosystems, LLC, 223 F.R.D. 189, 190 (D.Del. 2004); SCM Corp., 70 F.R.D. at 525, Nidec Corp., 2007 U.S. Dist. LEXIS 48841, at *13-14 (citing cases); see also Katz, 191 F.R.D. at 438 (no common interest between parties before reaching licensing agreement because such negotiations do show an identity of legal interests). Third, the relationship between plaintiff and IDT was that of a corporation and its controlling shareholder. Simply because in-house counsel enforced the corporation's patents, which would benefit its shareholders, does not mean that they shared a legal interest. Put differently, a legal interest cannot arise simply because a

company acts in a way that advances the economic interests of its majority shareholder. A logical extension of plaintiff's argument would expand the application of the common interest doctrine **[*30]** to cover all business transactions where a company acted in the interest of its majority shareholder. While shareholders and the corporation may share an interest in commercial success, this shared economic interest is not a legal interest. Moreover, IDT's direct contractual interest in the plaintiff's patents ended when the intellectual property agreement ended. In short, during this period, these legally separate entities had no mutual obligation and were engaging in negotiations to change their commercial relationship and they then shared no common legal interest. Their separate interests on legal issues is demonstrated by the representations to the SEC that plaintiff retained counsel for services that IDT had formerly provided. S.E.C. Schedule 14D at 13, 28-29. Finally, there is no indication that the communications associated with the tender offer were disclosed to further a common legal strategy or joint interest in pending or anticipated litigation. Rather, the information was shared to further a commercial transaction between legally separate entities. Nidec Corp., 2007 U.S. Dist. LEXIS 48841, at *15-16.

FOOTNOTES

11 Exhibit 5 is a Schedule 14D-9 Solicitation/Recommendation Statement filed **[*31]** by IDT with the Securities and Exchange Commission detailing to its shareholders the tender offer for the outstanding Net2Phone ↘ shares.

The cases plaintiff embraces do not change this result. Plaintiff's reliance on In re Teleglobe Communications Corp., 493 F.3d 345 (3d Cir. 2007), for the proposition that parent and subsidiary corporations are joint clients and thus afforded the common interest privilege is unpersuasive because: (1) the Teleglobe court applied Delaware state law, rather than Federal common law; and (2) the communications in Teleglobe were between parent-subsidiary and not between the corporation and its majority shareholder. For these reasons, Teleglobe does not change the analysis.

In addition, Hewlett-Packard Co., 115 F.R.D. at 310, does not advance the plaintiff's position as the facts in Hewlett-Packard Co. are distinguishable. In finding a common interest privilege between two parties, the court in Hewlett-Packard Co. observed that the defendant and its prospective business partner shared information pursuant to a confidentiality agreement. Moreover, the court observed that each faced litigation from the same plaintiff, and "[i]n such a lawsuit[,] defendant would **[*32]** be defending its marketing of the product in the years preceding the sale and GEC would be defending its marketing of exactly the same product in the years following the sale. Thus, at the time defendant and GEC were negotiating it seemed quite likely that defendant and GEC would be sued by plaintiff and that in that litigation defendant and GEC would be identically aligned, fighting to protect interests distinguished only by the time frame in which the marketing took place." *Id.* For these reasons, the court opined that the defendant and GEC would likely pursue a joint defense in defending the patent claims. *Id.* Here, there is nothing to show that plaintiff and IDT shared information under a confidentiality agreement nor is there evidence that at the time of the communication IDT and plaintiff faced the prospect of imminent litigation or a common adversary.

For these reasons, and on a de novo review, the Court finds that IDT and Net2Phone ↘ did not have a common legal interest during the period April 4, 2005 through March 13, 2006 and the Special Master's conclusions are adopted.

II. Communications between Net2Phone ↘ and GE

At some point during 2005, IDT and GE contemplated partnering to **[*33]** enforce IDT's patent portfolio through litigation or licensing. See Stott-Bumsted Dec. Ex. 17 (Email from James DiGiorgio, senior counsel to IDT, to David Greenblatt and "Ldiaz"). The transaction was to be structured as a loan from GE to IDT in the amount of a hundred million dollars. *Id.* The loan was to be repaid from the proceeds of the licencing/enforcement of the NetSpeak patent portfolio. *Id.* Any licencing/enforcement revenue above a hundred million dollars would be shared by GE and IDT on a pre-defined basis. *Id.*

The plaintiff argues that the communications between IDT and GE about joint enforcement of the NetSpeak patents are subject to the common interest privilege because the contemplated relationship between GE and IDT was not limited to a commercial transaction but rather involved both parties having an identical legal interest in the enforcement of the patents at issue. Finally, plaintiff argues that the fact that GE and

IDT did not consummate their negotiations is irrelevant because the appropriate standard is whether or not the parties contemplated joint legal action, which GE and IDT did. Plaintiff also points out that the parties intended to keep their communications **[*34]** confidential, which is a hallmark of the attorney-client privilege.

The defendant argues that the common interest privilege does not apply to the IDT-GE communications because: (1) the parties did not have a common legal interest, (2) the agreement contemplated between the parties did not move past the negotiation stage, (3) the parties did not execute a confidentiality agreement, and (4) the cases the plaintiff relies on are distinguishable.

Here, it is undisputed that IDT and GE had discussed an agreement where GE proposed to partner with IDT to enforce the patents through litigation or licensing. *Id.* This proposed business arrangement was to be configured as a loan, in which GE would lend IDT money which would be re-paid with the proceeds from any fruitful litigation or licensing agreements. *Id.* The interest here was commercial not legal. First, the arrangement between the parties was a proposed financing arrangement between independent entities. At the time of the negotiations, their interest was commercial and their communications during the negotiations were to further that interest and not a legal position. Second, at the time of the negotiations, GE was not a licensee, potential **[*35]** licensee, or owner of the patent. Third, although GE maintained the information received and shared with IDT in confidence, *Stott-Bumsted Dec. Ex. 18 at P 5*, the plaintiff has failed to show that there was a strict confidentiality agreement to do so or that their negotiations were conducted to advance a legal rather than a commercial interest.

Moreover, and as discussed above, *Hewlett-Packard Co.*, 115 F.R.D. at 310, does not advance the plaintiff's position. Here, plaintiff and GE did not face the prospect of imminent litigation. There was neither a threat of impending legal action against them nor was there a common adversary. Rather, GE and plaintiff were negotiating a business transaction whereby GE would loan plaintiff money that would be repaid through patent enforcement actions or licensing of patents. Had the agreement come to pass, then communications to further the enforcement activity may have been protectable but the purpose of the communications during the negotiations were to entice a third-party to loan plaintiff money and not to further a then-shared legal interest. For these reasons, the common interest doctrine does not cover the communications between plaintiff and **[*36]** GE and the conclusions of the Special Master are adopted.

Having determined that communications between IDT and plaintiff during the period April 4, 2006 and March 13, 2006 and the communications between plaintiff and GE are not privileged, the documents reflecting these communications must be disclosed.

III. Waiver

The Court next considers whether or not disclosure to these entities and disclosures to plaintiff's shareholders waives the privilege asserted over communications concerning the same topics. Generally, privileged material disclosed to a third party waives the privilege. *Westinghouse Electric Corp.*, 951 F.2d at 1425; *Bulow v. Bulow*, 828 F.2d 94, 103 (2d Cir. 1987). The Third Circuit has identified two distinct forms of "limited" waiver: selective waiver and partial waiver. *Westinghouse*, 951 F.2d at 1423 n.7. Selective waiver "permits the client who has disclosed privileged communications to one party to continue asserting the privilege against other parties" whereas partial waiver "permits a client who has disclosed a portion of privileged communications to continue asserting the privilege as to the remaining portions of the same communications." *Id.* (citations omitted). While **[*37]** fairness is not a consideration in selective waiver cases, it is a "central element" of a court's determination where partial waiver is invoked. *Harding*, 914 F.Supp at 1092; see also *Westinghouse*, 951 F.2d at 1426 (stating that "[g]enerally, the 'fairness doctrine' is invoked in partial (as opposed to selective) disclosure cases"). With a partial waiver, "the privilege is waived only as to the communication actually disclosed unless a partial waiver would be unfair to the party's adversary." *Westinghouse*, 951 F.2d at 1426 n.13; *Wachtel*, 2006 U.S. Dist. LEXIS 27591, 2006 WL 1286188, at *1 n. 2; *In re Intel Corp.*, 2008 WL 2310288, at *10; *In re Linerboard Antitrust Litigation*, 237 F.R.D. 373, 388 (D.Pa. 2006). The fairness component seeks to "prevent prejudice to a party and distortion of the judicial process that may be caused by the privilege holder's selective disclosures . . . of otherwise privileged information." *In re Intel Corp.*, 2008 WL 2310288, at *10 (citations omitted). A waiver can occur when a party attempts to use the communication in a litigation or where the party "makes factual assertions, the truth of which can only be assessed by examination of the privileged communications." *Id.* at 11. As the **[*38]** Intel court observed concerning disclosure of a report about document production, by

disclosing summaries of a report, it "placed the accuracy and validity of the information contained in these summaries at issue." Id. at 12. The Intel court reasoned that to conclude otherwise would enable Intel to assert facts as a sword and shield the adversary from challenging the accuracy of the assertions.

The plaintiff objects to the Special Master's conclusion that it waived privilege on the subjects of whether: (1) Skype infringes the NetSpeak patents, (2) NetSpeak patents are easy to design around, (3) NetSpeak patents are valid, (4) Vonage infringes the NetSpeak patents, (5) PacketCable Specs require the use of the NetSpeak patents, and (6) the value of the NetSpeak patents. The plaintiff argues that: (1) disclosure of a few communications between the parties should not result in subject matter waiver in the aforementioned topics; (2) according to the Court of Appeals for the Third Circuit, privilege is waived only as to those communications actually disclosed unless a partial waiver would be unfair to the party's adversary, and there has been no showing of unfairness nor prejudice here, (3), **[*39]** the plaintiff is willing to alleviate any fear of future prejudice to the defendants by agreeing not to "affirmatively rely on any of the partial disclosures at issue at any future stage in litigation," Pl. Reply Br. at 8, and (4) the subject matter waiver defendants demand would unfairly prejudice the plaintiff in other litigations because the scope of the Special Master's conclusions were not necessarily limited to the patents at issue in the present litigation.

The defendants argue that the Special Master correctly interpreted the scope of the subject matter waiver regarding the analyses and valuations of patents-in-suit. The defendants assert that: (1) they need not show prejudice under Third Circuit law and, in any event, defendants have been prejudiced by the plaintiff's withholding of documents because the plaintiff has selectively disclosed documents to support its argument while withholding others on the same subject that may contradict its position, (2) the Special Master correctly imposed the appropriate limitation on the subject matter waiver when he determined that the waiver covers all documents except communications with trial counsel, and (3) that the plaintiff's complaint **[*40]** regarding temporal limitations to the waiver should be rejected because it is untimely.

A de novo review of the scope of the waivers that resulted from disclosures of the Monetization Plan, summaries of the CRA Report, and opinions of Douglas Derwin demonstrates that the Special Master's conclusions are correct.

1. Monetization Plan and CRA Report ¹²

FOOTNOTES

¹² Attached as Exhibit A to the Declaration of Hannah Stott-Bumsted, dated May 5, 2008.

According to the plaintiff, IDT's and plaintiff's attorneys prepared and presented a Monetization Plan to shareholders, which discussed, among other things, the implementation of a licensing and patent sale strategy. The plan was also used during the tender offer negotiation to provide information about the value of the patents. During the tender offer negotiations, plaintiff's counsel also obtained a report from CRA International concerning the value of the patents. The report's conclusion was disclosed to the shareholders because the valuation was material to their decision about tendering their shares but the analysis was not disclosed.

A de novo review shows that the plaintiff waived its assertion of privilege concerning valuation. The plaintiff affirmatively **[*41]** disclosed valuation information when it advanced its interest. As to the Monetization Plan, it was publicly disclosed in IDT's 14-D9 Securities and Exchange filing in connection with its tender offer. S.E.C. Schedule 14D-9 at 28. Similarly, the conclusions in the CRA Report were disclosed to shareholders and referred to in IDT's 14-D9 Securities and Exchanged filing. Id. at 31, 44-45. There is no dispute that the topic of valuation was widely disseminated. Thus, at a minimum, the plaintiff engaged in a selective waiver when it disclosed the Monetization Report and the conclusions in the CRA report to its shareholders and others with an interest in the tender offer. Fairness is not a consideration in selective waiver cases, and thus the Special Master was correct in declining to undertake a fairness analysis.

Moreover, there is at least a partial waiver as it relates to the CRA report. Plaintiff disclosed the conclusions but not the analysis or reasoning for the conclusions. If viewed as a partial waiver, the Court must consider whether or not it would be unfair to the defendant to allow the plaintiff to withhold the remainder of the report. The Court finds that it would be unfair to **[*42]** allow the plaintiff to withhold the analysis portion

of the report.

First, the plaintiff seeks to rely on valuation to make arguments concerning damages. Even if the Monetization Plan or CRA Report are not offered affirmatively in evidence, plaintiff embraced them in the context of a commercial event and defendants should have an opportunity to investigate the bases for valuations contained in these documents and challenge the plaintiff's present valuation position with them. It would be unfair to allow plaintiff's to take one position in one context to advance its commercial purposes and preclude defendants from seeing if it took a different position in litigation. The defendants should be able to impeach plaintiff with its own statements or those it embraced on this topic. See V. Mane Fils S.A. v. Int'l Flavors and Fragrances, 249 F.R.D. 152, 2008 WL 619207, at *3 (D.N.J. 2008). Second, the plaintiff's representation that they do not intend to use these documents is insufficient. Plaintiff has not abandoned a desire to offer evidence about the value of its patents and thus the subject to which the documents relate is still present in this case and should be documents that [*43] defendants can examine. For all of these reasons, the Special Master's subject-matter waiver finding regarding valuation is correct.

2. Patent Opinions

IDT and plaintiff disclosed patent opinions outside the attorney-client relationship. According to the plaintiff, IDT retained Doug Derwin to evaluate a lawsuit against Vonage for infringement of the NetSpeak patents. In an October 2005 email, Doug Derwin disclosed his analysis to third parties about whether or not certain products infringe on plaintiff's patents, see Stott-Bumsted Dec. Ex. 4 at 1-2 (Email from Ely D. Tandler, Chief Legal Officer for IDT, to Doug Derwin and Abbe L. Dienstag) and provided an opinion that NetSpeak patents are easy to design around. Id. at 2. Derwin's views were then discussed by various third parties at a meeting in October 2005 consisting of legal counsel, consultants and technical personnel for both plaintiff and IDT at a time when plaintiff and IDT had no legal relationship beyond IDT's ownership of some of plaintiff's shares and at a time they had no shared legal interests. S.E.C. Schedule 14D at 31. Patent opinions were also embodied in the Monetization Plan. Specifically, the Monetization Plan included [*44] information pertaining to whether the NetSpeak patents are valid and whether the PacketCable Specs require use of the NetSpeak patents. S.E.C. Schedule 14D at 29. Plaintiff contends these disclosures were made to "an affiliate" in the context of a tender offer and the disclosure does not waive the privilege over other communications on the same subject and the Special Master's order directing disclosure was wrong because there was no finding of prejudice from nondisclosure of other communications on this subject.

When Mr. Derwin made his disclosures, the plaintiff and IDT did not share a common interest. Moreover, Mr. Derwin was acting only on behalf of IDT when he made his disclosures. Thus, by announcing his patent infringement opinions beyond IDT, the privilege has been waived on these subjects. Similarly, the Monetization Plan, which includes comments about the Net2Speak patents, was widely disseminated. Allowing plaintiff to withhold other communications on this subject would be unfair to the defendants. Defendants should be able to counter plaintiff's attempts to undermine Mr. Derwin's opinion and be confronted with their own views as announced in the Monetization Plan, particularly [*45] if the plaintiff attempts to distance itself from these opinions in this litigation about patents involving a similar technology.

Based upon these disclosures and the prejudice to the defendants by limiting the disclosure to the actual communication plaintiff conveyed to IDT and plaintiff's shareholders, and upon consideration of the subjects implicated by these disclosures, the Court finds that the Special Master correctly found that the plaintiff waived the privilege to the following topics: (1) whether Skype infringes the NetSpeak patents; (2) whether the NetSpeak patents are easy to design around; (3) whether the NetSpeak patents are valid; (4) whether Vonage infringes the NetSpeak patents; (5) whether the PacketCable Specs require use of the NetSpeak patents; and (6) the value of the NetSpeak patents. The absence of temporal limits to the scope of the waiver is consistent with the fact that certain of the disclosures do not have temporal limits. The Court notes that the Special Master imposed a temporal limitation on communication between IDT and the plaintiff and this reflects he was mindful of the applicability of such limits when appropriate.

For all of these reasons, the Court [*46] overrules that plaintiff's privilege assertion over responsive documents embodying: (1) communications between plaintiff and IDT during the period April 4, 2005 through March 16, 2006; (2) communications between plaintiff and GE; and (3) communications (except

those with trial counsel) falling within the following categories: (a) whether Skype infringes the NetSpeak patents; (b) whether the NetSpeak patents are easy to design around; (c) whether the NetSpeak patents are valid; (d) whether Vonage infringes the NetSpeak patents; (e) whether the PacketCable Specs require use of the NetSpeak patents; and (f) the value of the NetSpeak patents. The plaintiff shall produce the withheld documents no later than June 30, 2008.

D. Specific Documents

The plaintiff also objects to the Special Master's privilege rulings concerning specific documents. The plaintiff bears the burden to prove that any document that does not appear privileged on its face is in fact privileged material. To this end, it must present evidence about the identity of the author of the document and the reason for its creation. For the reasons set forth herein, plaintiff has not met its burden.

i. Entry 2623 (Exhibit D) ¹³

FOOTNOTES

¹³ The [*47] Exhibits are attached to the Declaration of Hannah Stott-Bumsted, dated May 5, 2008.

The Special Master concluded that the handwriting on log entry 2623 is not subject to privilege. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal impressions. The plaintiff asserts that the two sentences handwritten at the top of the first page reflects a legal comparison of the subject matter of the underlying document with another patent. The defendants argue that the Special Master reviewed the handwritten notes and did not err when he concluded that the privilege did not apply to the handwriting on entry 2623 because plaintiff failed to sustain its burden of proof and was correct in refusing to consider the Declaration of Joseph John, a senior technical director at during the relevant period, because it was submitted more than two months after the deadline.

The privilege log describes the document as embodying work product ¹⁴ and lists the author as Oblon Spivek. The plaintiff concedes, however, that it does not know the identity [*48] of the author of the handwriting. Pl. Br. at 24-25. Moreover, its effort to prove the identity circumstantially through the Declaration of Joseph John dated March 13, 2008 fails because it was submitted approximately two months after the Special Master's January 15, 2008 deadline. Stott-Bumsted Dec. Ex. 19 ("Joseph John's Dec."). Because it was not timely submitted, the Court will not consider it. Moreover, the record silent as to whether or not the document was prepared in anticipation of litigation and for no other purpose, which is critical to sustaining the assertion of work product. Without the identity of the author and the purpose for which the writings were made, the plaintiff cannot establish that the writings on these documents are privileged or protected by the work product rule.

FOOTNOTES

¹⁴ Rule 26 (b)(3) of the Federal Rules of Civil Procedure provides, in relevant part:

(A) Documents and Tangible Things. Ordinarily, a party may not discover documents and tangible things that are prepared in anticipation of litigation or for trial by or for another party or its representative (including the other party's attorney, consultant, surety, indemnitor, insurer, or agent). But, subject to [*49] Rule 26(b)(4), those materials may be discovered if:

(i) they are otherwise discoverable under Rule 26(b)(1); and

(ii) the party shows that it has substantial need for the materials to prepare its case and cannot, without undue hardship, obtain their substantial equivalent by other means.

(B) Protection Against Disclosure. If the court orders discovery of those materials, it must protect against disclosure of the mental impressions, conclusions, opinions, or legal theories

of a party's attorney or other representative concerning the litigation.

Fed. R. Civ. P. 26(b)(3). Rule 26(b)(3) essentially establishes "two tiers of protection: first, work prepared in anticipation of litigation by an attorney or his agent is discoverable only upon a showing of need and hardship; second, 'core' or 'opinion' work product that encompasses the 'mental impressions, conclusions, opinion, or legal theories of an attorney or other representative of a party concerning the litigation' is 'generally afforded near absolute protection from discovery.'" In re Cendant Corp. Sec. Litig., 343 F.3d 658, 663 (3d Cir. 2003) (quoting United States v. Nobles, 422 U.S. 225, 238-239, 95 S. Ct. 2160, 45 L. Ed. 2d 141 (1975)). As discussed by District Judge Stanley Chessler **[*50]** in In re Gabapentin Patent Litigation, 214 F.R.D. 178 (D.N.J. 2003),

Courts generally, and in this Circuit in particular, have applied what amounts to a two part test for ascertaining whether the documents (or things) at issue should be protected under the . . . work product privilege. The first prong of the inquiry is the "reasonable anticipation" test, which requires that the court determine at what point in time litigation could reasonably have been anticipated. Whether a particular document was prepared in "anticipation of litigation" is incapable of precise definition. In general, though, a party must show more than a remote prospect, an inchoate possibility, or a likely chance of litigation. Rather, a party must show that there existed an identifiable specific claim of impending litigation when the materials were prepared. The mere involvement of, . . . or investigation by an attorney does not, in itself, evidence the "anticipation of litigation." Neither will the mere fact that litigation actually occurred establish that the documents prepared before the litigation were created in anticipation thereof.

This Circuit has imposed an additional requirement beyond that embodied **[*51]** in the reasonable anticipation test. Thus, the second prong of the test is whether the material [was] produced because of the litigation and for no other purpose. In order to determine whether a document satisfies this standard, the proper inquiry is whether in light of the nature of the document and the factual situation in the particular case, the document can fairly be said to have been prepared or obtained because of the prospect of litigation. Documents created for other purposes that prove useful in subsequent litigation are not . . . work product; similarly, documents that are routinely prepared in the ordinary course of business are outside the scope of work product protection. Even where reasonable anticipation of litigation is established, whether the document comes within the purview of work product privilege still depends primarily on the reason or purpose for the document's production. Finally, the articulable claim likely to lead to litigation must pertain to this particular party, not the world in general.

In re Gabapentin Patent Litigation, 214 F.R.D. at 183-184 (citations and quotations omitted)(emphasis added).

ii. Entry 2629 (Exhibit E)

The Special Master concluded **[*52]** that the handwriting on log entry 2629 is not subject to privilege. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor the purpose of it, the substance of the writing indicates that it contains legal conclusions about priority date. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 2629 because plaintiff failed to sustain its burden of proof and Mr. John's Declaration is untimely and insufficient.

According to the log, plaintiff has asserted that the handwriting is protected by the attorney-client privilege. Although the log states the author is "Joe John," no timely submitted evidence establishes the identity of the author of the handwriting. Without proof of the identity of the author and the purpose for which the writings were made, the plaintiff cannot establish that the handwriting is privileged.

iii. Entry 2632 (Exhibit F)

The Special Master concluded that the handwriting on log entry 2632 is not subject to privilege. Plaintiff states that the Special Master erred in this [*53] ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal conclusions about prior art. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 2632 because plaintiff failed to sustain its burden of proof and Mr. John's Declaration is untimely and insufficient.

According to the log, plaintiff asserts that the handwriting on the document is privileged and protected work product. The timely presented record, however, does not reflect that the notes were made in anticipation of litigation nor does it establish the author of the handwriting. Moreover, although the log identifies Mr. Spivek as the author, the plaintiff concedes that it does not know the identity of the author for handwriting on entry 2632. See *id.* Without the identity of the author and the purpose for which the writings were made, the plaintiff cannot establish that the writing on the documents are privileged or protected work product.

iv. Entry 2633 (Exhibit G)

The Special Master concluded that the handwriting [*54] on log entry 2633 is not subject to privilege. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could not identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal conclusions about the patent's priority date. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 2633 because plaintiff failed to meet its burden of proof and Mr. John's Declaration is untimely and insufficient.

According to the log, plaintiff asserts that the document contains handwriting protected by the attorney-client privilege and work product rule. Although the log identifies Mr. Spivek as the author, plaintiff concedes that it does not know the identity of the author for writings on entry 2633. See *id.*

[*55] Moreover, the record is silent as to whether the notations were made in anticipation of litigation. Without the identity of the author and the purpose for which the writings were made, the plaintiff cannot establish that the writings on these documents are privileged or protected by the work product rule.

v. Entry 2634 (Exhibit H)

The Special Master concluded that the handwriting on log entry 2634 is not subject to privilege. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal conclusions about prior art. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 2634 because plaintiff failed to sustain its burden of proof and Mr. John's Declaration is untimely and insufficient.

According to the log, plaintiff asserts that the handwriting on the document is protected by the attorney-client privilege and work product rule. Although Mr. Spivek is listed on the log as the author, plaintiff concedes that it does not [*56] know the identity of the author for writings on entry 2634. See *id.* Moreover, the record is silent as to whether the notations were made in anticipation of litigation and for no other purpose. Without the identity of the author and the purpose for which the writings were created, the plaintiff cannot establish that the writings on these documents are privileged or protected by the work product rule.

vi. Entry 2645 (Exhibit 1)

The Special Master concluded that the handwriting on log entry 2645 is not privileged. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal conclusions that compare the patent's claim to certain technology. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 2645 because the plaintiff failed to carry its burden of proof and Mr. John's Declaration is untimely and insufficient.

According to the log, plaintiff asserts that the document is protected by the attorney-client privilege. The record, [*57] however, does not establish the identity of the author and the log merely asserts that the author is in-house counsel. Plaintiff concedes that it does not know the identity of the author, see id., and without the identity of the author and the purpose for which the writings were made, the plaintiff cannot establish that the writings on these documents are privileged. Moreover, the writing embodies a series of questions about a product and does not appear privileged on its face. Thus, the plaintiff has failed to meet its burden to sustain the privilege.

vii. Entry 9062 (Exhibit J)

The Special Master concluded that the writings on log entry 9062 are not privileged. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it contains legal conclusions. The defendants argue that the Special Master reviewed the handwriting and did not err when he concluded that the privilege did not apply to the handwritten entries on 9062 and properly declined to consider Mr. John's Declaration as it was untimely and insufficient.

According to the log, plaintiff [*58] asserts that the document constitutes work product prepared in anticipation of litigation. The record, however, does not show that it was created for this purpose nor does it establish the author of the handwritten notations. Although the log identifies Michael Casey as the author of the document, the plaintiff concedes that it does not know the identity of the author for handwriting on entry 9062. See Pl. Br. at 24-25. Moreover, entry 9062 does not include handwritten words but rather embodies underlines of words in the text of a published patent. Without the identity of the author and the purpose for which the lines were made, the plaintiff cannot establish that the writings on these documents are privileged.

viii. Entry 1861 (Exhibit K)

The Special Master concluded that log entry 1861 is an undated document without an identified author and nothing on its face shows that it is privileged. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, there is information within the document that suggests that it was drafted by one of IDT's in-house lawyers and the substance indicates that [*59] the document contains legal advice "on the most likely terms of a" sales transaction. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 1861 because plaintiff failed to produce evidence to support its claims that the document is privileged.

According to the log, entry 1861 is an undated outline that plaintiff asserts embodies work product and privileged communications with Jim DiGorgio about a VOIP patent. In 2005, Mr. DiGorgio was senior counsel for IDT. Nonetheless, there is no showing that the outline was prepared in anticipation of litigation, no showing that when it was shared with Net2Phone that the plaintiff and IDT had a shared legal interest, and no showing it was authored by an attorney. In fact, according to the log, the author is listed as "NetSpeak Corp." and the plaintiff has conceded that it does not know the identity of the author. See id. at 25. Moreover, the section titled "most likely" does not contain any legal analysis but rather it contains terms of a financial agreement that may be reached. Without the identity of the author and the purpose for which the document was created, the plaintiff cannot [*60] establish that the document is privileged.

ix. Entry 1864 (Exhibit L)

The Special Master concluded that log entry 1864 is an undated document without an identified author that does not embody privileged communications. Plaintiff states that the Special Master erred in this ruling because, although the plaintiff could neither identify the author of the writing nor its purpose, the substance of the writing indicates that it was prepared by a member of IDT's in-house legal team and contains legal advice "on the most likely terms of a" sales transaction. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 1864 because plaintiff failed to produce evidence to support its claim that the document is privileged.

According to the log, entry 1864 is identified as having been authored by "IDT" and received by David Greenblatt, an IDT employee, Declaration of Hannah Stotts-Bumstead, dated May 5, 2008, at Ex. 23, that

plaintiff asserts embodies work product and privileged communications with Jim DiGiorgio about the corporation's patent portfolio. Again, plaintiff conceded that it does not know the identity of the author of entry 1864. [*61] See id. Moreover, there is nothing in the record to show it was prepared in anticipation of litigation and for no other purpose. Lastly, the section titled "most likely" does not contain any privileged material on its face. Instead, it contains terms of a potential financial agreement, including time frame and payment method. Absent proof of the identity of the author and the purpose for which it was created, the plaintiff cannot establish that the document is privileged.

x. Entry 1870 (Exhibit M)

The Special Master concluded that the certification of IDT's in-house counsel attesting to the legal nature of log entry 1870 was insufficient to sustain the privilege assertion because in-house counsel could not identify who marked up the document, when, or why. Plaintiff argues that entry 1870 is a draft of IDT's tender offer that was drafted by IDT's inside and outside lawyers for filing with the Securities and Exchange Commission ["SEC"] and the Special Master erred in failing to credit the declaration of IDT's in-house counsel that asserts that the edits were those of lawyers. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to [*62] entry 1870 because the plaintiff provided no evidence as to who marked up the document, when or why.

According to the log, entry 1870 is a draft SEC filing allegedly reflecting communications with the law firm of Kramer Levin. The log describes the author as "Net2Phone, Inc. →NtoP acquisition IDT Corporation." The plaintiff, however, did not present evidence that establishes the author and conceded that it does not know the identity of the author. See id. at 25-26. The plaintiff submitted the Certification of Dov Schwell, Senior Vice President for IDT, dated March 18, 2008, to support its contention that these documents reflect confidential attorney-client communications, Stott-Bumsted Dec. Ex. 20, but it was untimely and will not be considered. Thus, the plaintiff failed to submit timely evidence that identifies the author of these edits. Without the identity of the author of the markings, the plaintiff cannot establish that they are privileged.

xi. Entry 3814 (Exhibit N)

The Special Master concluded that the certification of IDT's in-house counsel attesting to the legal nature of log entry 3814 was insufficient to sustain the privilege assertion because it embodies a communication among [*63] non-lawyers and the document is not clearly privileged on its face and the declaration submitted did not identify the author of the markings on the document. Plaintiff argues that entry 3814 is a draft of IDT's tender offer that was drafted by IDT's inside and outside lawyers for filing with the SEC and that the Special Master erred in failing to credit the certification of IDT's in-house counsel who attested to the legal nature of entry 3814 even though he could not identify its author. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 3814 because plaintiff's untimely declaration did not identify if counsel made any of the marks.

According to the log, the draft of the SEC filing is dated November 10, 2005 and the author is identified as a person at "semdd.com" and the recipient is a person at IDT. The plaintiff has conceded that it does not know the identity of the author of the markings on entry 3814. See Pl. Br. at 25-26. Moreover, at the time of these communications, IDT and plaintiff did not share a common legal interest and when the document was shared between them, it lost any privilege status. For these reasons, [*64] the privilege is not applicable.

xii. Entry 1142 (Exhibit O)

The Special Master concluded that plaintiff failed to present evidence to show that log entry 1142, an email from IDT's in house counsel Jim DiGiorgio to David Greenblatt about the VOIP patents, was privileged and there is no way to tell if it was a privileged communication on its face. Plaintiff argues that, because the email was written by its in house counsel, the only plausible interpretation is that in-house counsel is "proposing a meeting at which he will render legal advice concerning legal action," Pl. Br. at 26, and a corporation's declaration is not needed to establish the privilege. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 1142 and plaintiff presented no evidence to support its claim of privilege despite having had an opportunity to do so.

Although the log asserts that the email contains legal advice, the face of the document does not support

this description and plaintiff has presented no evidence to show that it was associated with an effort to secure legal advice. The mere fact it was from an attorney, without showing its purpose, is insufficient [*65] to sustain the privilege since the privilege applies only to communications engaged in for the purpose of securing or providing legal advice. As such, the Special Master's ruling will not be disturbed.

xiii. Entries 1332 & 1333 (Exhibit P)

The Special Master concluded that the plaintiff did not submit evidence that shows log entries 1332-33 are privileged and he could not determine from their face that they embody privileged communications. The plaintiff contends that the portion of the document summarizing a meeting between Binyamin Bauman, a nonlawyer, and the Chairman of IDT's Board of Directors concerning patent enforcement embodies a request for legal advice and is privileged. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entries 1332-33 because there is nothing to show that it involves a discussion between non-lawyers reflecting advice of counsel.

According to the log, entries 1332-33 are March 28, 2006 emails from Binyamin Bauman to David Lando, Net2Phone employees, Stott-Bumsted Dec. at Ex. 23, that contain communications with in-house counsel regarding the patent portfolio. The emails, however, were not exchanged [*66] between attorneys and their contents do not reflect legal advice. Moreover, the plaintiff has submitted no evidence to support its claim of privilege regarding these documents. Thus, the Special Master's conclusion that the documents are not privileged is correct.

xiv. Entry 1337 (Exhibit Q)

The Special Master concluded that entry 1337, a February 21, 2006 email from Philip Florenzo, an attorney in private practice, to David Lando, his client at Net2Phone, see id., forwarding slides prepared by Joseph John, a senior technical advisor in IDT's in-house Intellectual Property group, contains material that is purely factual and is thus not protected by privilege and plaintiff did not timely submit other evidence to establish its claim of privilege. In addition, the Special Master noted that the document was shared with IDT at a time that plaintiff and IDT did not share a common legal interest. The plaintiff asserts that the communication of these facts was for obtaining legal advice and is protected by the attorney-client privilege and that the Declaration of Joseph John explained this was the purpose. The defendants argue that the Special Master did not err when he concluded that the privilege [*67] did not apply to entry 1337 because he correctly disregarded Mr. John's Declaration and correctly acknowledged that, even if the document were privileged, that privilege had been waived.

According to the log, the plaintiff asserts that the email and attachment reflects legal advice from in-house patent counsel. Even if this were established, the contents actually emanated from an IDT employee during the period before the tender offer had occurred. As stated previously, the common interest doctrine does not protect communications with IDT during this period. Moreover, the only evidence to support the privileged assertion comes in from the untimely submission of the Declaration of Joseph John. See Stott-Bumsted Dec. at 20. Since that evidence is precluded, the plaintiff has failed to timely submit competent evidence to support its privilege claims. As such, the Special Master did not err in concluding that no privilege attached to these documents.

xv. Entries 1840 (Exhibit R)

The Special Master concluded that plaintiff produced no evidence that establishes log entry 1840, a draft of a 2005 operation plan with handwriting, is protected by privilege and nothing on the face of the document [*68] reveals that it is privileged. Entry 1845 (Exhibit S) is a similar document without handwriting. The plaintiff argues that entry 1840 is a draft presentation by IDT's in-house legal group and contains legal advice and legal services provided in 2005. Plaintiff asserts that the face of the document demonstrates its legal nature, and thus it was not required to provide a declaration to establish that it is privileged. Plaintiff also notes that the Special Master sustained the privilege concerning a similar document. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 1840 because plaintiff did not present an affidavit concerning the privilege and did not bring to the attention of the Special Master the similarity between 1840 and 1845, even though he allowed plaintiff to move for reconsideration.

According to the log, this document is described as a "presentation" that the IDT Phoenix Group authored. Plaintiff describes it as a privileged communication with Mr. DiGiorgio about patents. Despite this description, the plaintiff has failed to disclose the actual author of the document or handwriting on entry 1840, and indeed [*69] conceded that it does not know the identity of the author of the handwritings on entry 1840. See Pl. Br. at 27. Moreover, the document is titled "2005 Operating Plan" and does not contain any legal advice. Without the identity of the author or proof that it was created to obtain or convey legal advice, the plaintiff cannot establish that the document is privileged.

xvi. Entry 2783 (Exhibit T)

The Special Master concluded that log entry 2783, an April 2, 2003 email from Anthony Tobey, a member of IDT's information technology staff, to a person associated with IXtelecom, is not privileged because it is between non-lawyers, nothing on its face shows it is privileged, and plaintiff submitted no evidence to establish it is privileged. The plaintiff argues that the first sentence of the email is privileged on its face because it conveys legal advice received from IDT's legal department and thus there is no need for a certification to establish it as privilege. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 2783 because it involves a communication between non-lawyers and plaintiff failed to supply evidence to show that the [*70] entry was privileged.

According to the log, plaintiff describes the email as reflecting privileged communications between IDT's business and in-house counsel about the information-technology policy. Despite this entry, the plaintiff concedes that the communication is between non-lawyers. See id. at 28. The plaintiff did not submit any evidence that shows the information relayed between the non-attorneys is legal advice. Moreover, a review of this document shows that it is a group email about the employees' access to external file sharing networks and does not contain legal advice. Thus, the plaintiff has not established that the document is privileged.

xvii. Entry 4562 (Exhibit U)

According to the log, entry 4562 is an email and attachment from Jim DiGiorgio to Luis Diaz that relates to monetizing intellectual property. The Special Master concluded that the plaintiff has waived the privilege relating to the Monetization Plan by its disclosure of documents about the same subject. The plaintiff argues that entry 4562 is an email between two attorneys that contains both non-privileged and privileged information and that the privileged portion should be disclosed but the remainder should [*71] be shielded because it embodies legal advice to IDT about intellectual property and does not address the Monetization Plan. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 4562 because this document is within the scope of the waiver and plaintiff concedes the document should have been produced. Pl. Br. at 28.

A review of the document shows that the email merely forwards the attachment and the attachment is a document addressing monetization. For the reasons set forth herein, to the extent a privilege covered this subject, it has been waived. As such, the Special Master's conclusions will not be disturbed here.

xviii. Entries 8832 & 8833 (Exhibit C) (which are contained in entry 8034)

According to the log, entries 8832 and 8833 are January 24, 2005 emails among Jim DiGiorgio, Peter Emanuel, a GE lawyer, and Laurence Rosenberg, a member of GE's Technology Group, which were shared with seven GE staff members about a European patent. Although the Declaration of Kenneth Glick, an attorney for GE, reflects that GE maintained the confidentiality of its internal discussions with counsel and the information it received and shared [*72] with IDT, see Stott-Bumsted Dec. Ex.18 (attaching the Declaration of Kenneth Glick dated Jan. 14, 2008), the Special Master found that plaintiff failed to timely identify one of the recipients, Ed Howard. Thus, the Special Master concluded that the plaintiff failed to meet its burden of showing based on timely submitted evidence that this email was privileged. The plaintiff argues that the Special Master erred in his conclusion because, in light of Glick's Declaration, it was apparent that the email was confidential and it had timely produced evidence that shows Mr. Howard was a Net2Phone lawyer. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply because the plaintiff failed to meet its burden of proof and because the communications between IDT and GE are not privileged.

The Court concludes that even though the plaintiff timely identified Ed Howard, the contents were shared with GE personnel and, for the reasons already discussed, these communications are not privileged. Thus, the record before the Court shows that the plaintiff failed to meet its burden to withhold the document on privilege grounds.

xix. Entry 9061 (Exhibit C)

For [*73] the same reasons, the privilege assertion over entry 9061, which is represented to be duplicated in 8834 is overruled.

xx. Entry 9073 (Exhibit V) (redacted versions of already produced materials)

Document entry 9073 is an email dated January 20, 2005 from Arthur Dubroff at Net2Phone to Claude Pupkin and Glenn Williams and copies were provided to Lione Alroy, Michael Pastor, Mitch Silverman, Ken Kaplan and Nicholas Day. These individuals are associated with Net2Phone or IDT. The Special Master concluded that privilege did not apply to the redacted portions of entry 9073 because the plaintiff did not submit any proof the privilege applied and nothing from the face of the document indicated it was privileged. The plaintiff argues that the portions of one paragraph are privileged because it contains communications from Arthur Dubroff to Net2Phone attorneys about actions to be taken with respect to Net2Phone's intellectual property. The defendants argue that the Special Master did not err when he concluded that the privilege did not apply to entry 9073 because the plaintiff failed to meet its burden of proof.

As to entry 9073, this Court finds that the plaintiff fails to meet its burden of [*74] establishing that this document is privileged with timely produced evidence and therefore the privilege assertion is overruled. Moreover, a review of the document reveals that it does not contain or seek legal advice but rather pertains to valuation of assets. Furthermore, as stated previously, even if it were privileged, the privilege about valuation has been waived and because this document discusses valuation it must be disclosed.

xxi. Entry 4382 (Exhibit W)

The Special Master concluded that privilege did not apply to log entry 4382, a June 18, 2004 email and attachment from Pat Gartner to Luis Diaz, an IDT attorney, because it forwarded as an attachment drawings created by a non-lawyer that do not appear privileged on their face. Moreover, although the log states the email and attachment discuss obtaining legal advice about intellectual property, the Special Master concluded that the Declaration of Luis Diaz did not address this document, no timely evidence was adduced to support the privilege claim, and he refused to consider the untimely submissions purported to support plaintiff's assertion of privilege. The plaintiff argues that, because the document was sent to an attorney, [*75] it is only plausible to conclude that it was sent in connection with a request for legal advice about an intellectual property matter and the declaration of Mr. Gartner supports this conclusion. The defendants argue that the Special Master did not err when he declined to consider the untimely evidence and in any event, it did not address the document and the plaintiff did not prove that the privilege applies to entry 4382. The defendants also argue that any argument that is nonresponsive to any discovery demand cannot be a basis to object to the privilege ruling because this is not an issue ripe for resolution in this context.

This Court finds that the timely submission of Luis Diaz's Declaration does not satisfy its burden because Mr. Diaz's Declaration does not address this document. Moreover, the Court will not consider plaintiff's untimely submissions. Finally, a review of the document reflects it embodies factual information and does not on its face reflect legal advice. As such, the plaintiff has failed to meet its burden to show that the document is covered by the attorney-client privilege.

xxii. Additional Entries

Neither party's submission addresses the Special Master's decision [*76] regarding privilege to log entries 4638-39, 4675, 3893, and 1766. As such, the Court will deem any objections thereto waived and the Court will not address the Special Master's decision on these documents.

E. Motion to Seal

The plaintiff seeks to seal certain documents submitted in connection with its objections to the Special Master's Report. Plaintiff has not demonstrated that these documents warrant sealing. First, the Special Master's Report was publicly filed without opposition by the plaintiff and discloses information the plaintiff now seeks to seal. Second, the communications the plaintiff's seeks to seal relate to matters that occurred several years ago and thus the need to seal what may have been confidential information no longer exists as there is no showing that there would be present harm from disclosure. Lastly, to the extent the request to seal is made to preserve the confidential nature of alleged privileged documents, the assertion of privilege has been overruled and the need for confidentiality for this purpose is moot. Thus, plaintiff's motion to seal the documents in connection with the objection is denied.

III. Conclusion

For the foregoing reasons, the Special Master's [*77] findings of fact, conclusions of law, and procedural determinations are affirmed in their entirety and plaintiff's motion to seal is denied. The plaintiff shall produce the withheld documents no later than June 30, 2008.

/s/ Patty Shwartz

United States Magistrate Judge

Date: June 25, 2008

ORDER

This matter having come before the Court on the plaintiff's objections to the Special Master's Report issued on April 21, 2008 and plaintiff's motion to seal the documents submitted in connection with its objections;

and the Court having considered the parties submissions;

and the Court having decided this motion without oral argument pursuant to Fed. R. Civ. P. 78 and L. Civ. R. 78.1;

and for the reasons set forth in the Opinion dated June 25, 2008;

IT IS ON THIS 25th day of June, 2008,

ORDERED that the Special Master's Report is affirmed in its entirety and the objections [Docket No. 219] are overruled;

IT IS FURTHER ORDERED that the plaintiff shall produce the documents consistent with the Special Master's Report no later than **June 30, 2008**; and

IT IS FURTHER ORDERED that the plaintiff's motion to seal [Docket No. 222] is denied.

/s/ Patty Shwartz

INFORMATION DISCLOSURE STATEMENT

Hon. Commissioner of Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

Pursuant to 37 C.F.R. § 1.56, the attention of the Patent and Trademark Office is hereby directed to the reference(s) listed on the attached PTO-1449. One copy of each non-U.S. Patent reference is attached. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the reference(s) be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The submission of any document herewith, which is not a statutory bar, is not intended that any such document constitutes prior art against any of the claims of the present application or is considered to be material to patentability as defined in 37 C.F.R. § 1.56(b). Applicants do not waive any rights to take any action which would be appropriate to antedate or otherwise remove as a competent reference against the claims of the present application.

The Opposition to the enclosed Motion will be filed under separate cover.

CHARGE STATEMENT: Deposit Account No. 501860, order no. 2655-0188.

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached

This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.

9. Since the proceeding appears to be in condition for issuance of an *ex parte* reexamination certificate except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte* Quayle, 1935 C.D. 11, 453 O.G. 213.
10. Other: _____

cc: Requester (if third party requester)

Art Unit: 3992

DETAILED ACTION

1) This Office action addresses claims 1-7 and 10-44 of United States Patent Number 6,108,704 (Hutton et al), for which it has been determined in the Order Granting Ex Parte Reexamination (hereafter the "Order") mailed 3/11/09 that a substantial new question of patentability was raised in the Request for *Ex Parte* reexamination filed on 2/17/09 (hereafter the "Request"). Claims 8-9 are not subject to reexamination. This is a final office action in response to the amendment filed 11/27/09. The rejection of claims 44-45 is maintained below. All other previously rejected claims are confirmed below.

IDS

2) With regard to the IDS's filed 12/14/09, 12/21/09, 1/26/10, 2/24/10, 3/5/10, 5/6/10:

Where the IDS citations are submitted but not described, the examiner is only responsible for cursorily reviewing the references. The initials of the examiner on the PTO-1449 indicate only that degree of review unless the reference is either applied against the claims, or discussed by the examiner as pertinent art of interest, in a subsequent office action. See Guidelines for Reexamination of Cases in View of *In re Portola Packaging, Inc.*, 110 F.3d 786, 42 USPQ2d 1295 (Fed. Cir. 1997), 64 FR at 15347, 1223 Off. Gaz. Pat. Office at 125 (response to comment 6).

Consideration by the examiner of the information submitted in an IDS means that the examiner will consider the documents in the same manner as other documents in Office search files are considered by the examiner while conducting a search of the prior art in a proper field of search. The initials of the examiner placed adjacent to the citations on the PTO-1449 or PTO/SB/08A and 08B or its equivalent mean that the information has been considered by the examiner to the extent noted above.

Regarding IDS submissions MPEP 2256 recites the following: "Where patents, publications, and other such items of information are submitted by a party (patent owner or requester) in compliance with the requirements of the rules, the requisite degree of consideration to be given to such information will be normally limited by the degree to which the party filing the information citation has explained the content and relevance of the information."

Accordingly, the IDS submissions have been considered by the Examiner only with the scope required by MPEP 2256, unless otherwise noted.

In addition, that which are not either prior art patents or prior art printed publications have been crossed out so as not to appear reprinted on the front page of the patent.

Claim Rejection Paragraphs

3) ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Issue 1

4) Claims 43-44 are rejected under 35 U.S.C. 102(b) as being unpatentable by NetBIOS (See claim mapping chart in Exhibit M, pages 36-40, incorporated by reference).

Issue 2

5) Examiner notes the following will represent the Etherphone references utilized for the rejection below (All considered a single reference as published together):

"Zellweger": An Overview of the Etherphone System and its Applications

"Swinehart": Telephone Management in the Etherphone System

"Terry": Managing Stored Voice in the Etherphone System

"Swinehart 2": System Support Requirements for Multi-media Workstations

"Zellweger 2": Active Paths through Multimedia Documents

6) Claims 43-44 are rejected under 35 U.S.C. 102(b) as being unpatentable by Etherphone (See claim mapping chart in Exhibit N, pages 33-35, incorporated by reference).

Response to Arguments

7) In response to the amendment filed 11/27/09, some rejections are sustained as noted above, and others have been withdrawn. The following aspects of the current prosecution will be addressed as noted below:

- a) VocalChat are not printed publications.
- b) The 1.132 Declaration
- c) Objective evidence of non-obviousness
- d) Withdrawn rejections
- e) Maintained rejections

a) The amendment submitted 11/27/09 includes arguments that the VocalChat references are not printed publications. The Patent Owner (PO) cites exhibit L of the Request (the declaration of Alon Cohen) as the only evidence provided by PO that the VocalChat references are printed publications. Examiner notes that the Alon Cohen declaration fails to comply with 37 C.F.R. 1.68, including not setting forth in the body of the declaration that all statements made of the declarant's own knowledge are true and that all statements made on information and belief are believed to be true. Therefore, PO's arguments questioning the declaration as well as whether printed publication status has been established as set forth under statute are found persuasive. Examiner therefore withdraws all rejections utilizing the VocalChat references.

Art Unit: 3992

- b) Examiner notes that all evidence presented has been considered in its entirety, including both PO's arguments, including secondary considerations, as well as the 1.132 Declaration submitted by expert Ketan Mayer-Patel.
- c) Examiner notes that PO's arguments regarding objective evidence of non-obviousness, including commercial success and failure of others have been considered, however no nexus has been provided between the claimed invention and the submitted evidence as required by at least MPEP 716.03. Therefore, this evidence is not found persuasive.
- d) In light of PO's arguments and amendments filed 11/27/09, as well as the declaration of expert Mayer-Patel, examiner withdraws the rejections of claims 1-7 and 10-42. Examiner finds the presented arguments to be persuasive.

With regard to the NetBios rejection, examiner agrees with declarant Mayer-Patel that bringing dynamic addressing into a NetBIOS type system would create a new set of obstacles that would need to be solved that are not obvious in view of the combination of references. In addition, examiner notes with regard to the rejection of claims 10-31 that NetBIOS does not necessarily inherently include a "user interface", and support for such inherency is not currently of record. In addition, amended claims 11 and 22 (previously 10 and 21) now require the dynamic addressing aspects of the other claims 1-7 and 10-42.

With regard to the rejection under Etherphone, examiner agrees with declarant Mayer-Patel that the Etherphone system, which utilizes a datagram multicast, would not be obviously

Art Unit: 3992

combinable with DHCP due to expiration of address leases. In addition, amended claims 11 and 22 (previously 10 and 21) now require the dynamic aspects of the other claims 1-7 and 10-42.

A reasons for confirmation for the claims discussed above will follow in a subsequent office action.

e) The rejection of claims 43-44 are maintained in view of NetBIOS and Etherphone.

With regard to the rejection under NetBIOS, maintained above:

PO first argues with regard to claim 43 that NetBIOS does not teach that "the processes receive network protocol address 'following connection to the computer network'". However, examiner notes that this limitation is not required by the current claim language. Claim 43 recites "the network protocol address forwarded to the database following connection to the computer network". This claim language implies that the computer may already have an IP address before connecting to the server. Examiner notes, for example, that claim 1 requires *receiving* a network protocol address "following connection to the computer network". Claim 43 does not require this. Examiner notes that the original rejection was meant to be a rejection under 35 U.S.C. 102(b), despite PO attempting to argue a rejection under 35 U.S.C. 103(a) which was not made. As claim 43 does not require the same DHCP aspects as other independent claims, the arguments are therefore not found persuasive in view of declarant Mayer-Patel.

PO secondly argues with regard to claim 43 that NetBIOS does not teach a database "having a network protocol address for a selected plurality of processes having on-line status with respect to the computer network". PO argues that having an "active name" is not synonymous with an "on-line status", and that an "active name" simply refers to "a name that has

Art Unit: 3992

been registered and that has not yet been de-registered". However, examiner notes that PO's specification at col. 5 lines 39-44 teaches that the on-line status information may not always be current, and may be updated, for example, only every 24 hours based on operator configuration. Therefore, the database of NetBIOS which contains active name information reads on claim 43, whether or not the user data is current.

With regard to claim 44, PO argues similar to the dynamic addressing argument above with regard to claim 43. Claim 44 also recites "forwarding" rather than "receiving" an address. Therefore, referring to claim 44, see the response to arguments for claim 43 above.

PO also argues with regard to claim 44 that NetBIOS does not teach that an "active name" is synonymous with "whether the second process is connected to the computer network". As noted by examiner above with regard to claim 43, NetBIOS teaches that a process has connected and was active. There is no claim requirement that the database be current based on PO's specification.

With regard to the rejection under Etherphone, maintained above:

PO argues with regard to claim 43 that Figure 3 of Zelleweger1 "does not show that the cited database includes the claimed "network protocol address". In response, examiner notes that Figure 3 references a user interface aspect of Etherphone. This is separate from the hardware workings of the system. Swinehart1, page 4, clearly teaches that the "voice control server manages voice switching by sending to each Etherphone or service the network addresses of the other participants". Therefore, the database contains the required network protocol addresses.

Art Unit: 3992

Next, PO argues that Etherphone does not disclose the required dynamic addressing. In response, examiner notes the response to NetBIOS above. Dynamic addressing is not required in the claim language of claim 43.

With regard to claim 44, PO argues that no citation has been made regarding a query being sent to an address server. Examiner notes that given a broadest reasonable interpretation, an address server is merely a server that can hold a database of addresses. The term does not specifically require the server to perform DHCP functionality. Zelleweger1, page 3, clearly teaches the use of remote procedure calls to a server for establishing connections between two parties, which reads on the claimed limitation.

Therefore, the current arguments regarding claims 43-44 are not persuasive, and the rejections above are maintained.

Conclusion

THIS ACTION IS MADE FINAL.

Extensions of time under 37 CFR 1.136(a) do not apply in reexamination proceedings. The provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Further, in 35 U.S.C. 305 and in 37 CFR 1.550(a), it is required that reexamination proceedings "will be conducted with special dispatch within the Office."

Extensions of time in reexamination proceedings are provided for in 37 CFR 1.550(c). A request for extension of time must be filed on or before the day on which a response to this action is due, and it must be accompanied by the petition fee set forth in 37 CFR 1.17(g). The mere filing of a request will not effect any extension of time. An extension of time will be granted only for sufficient cause, and for a reasonable time specified.

The filing of a timely first response to this final rejection will be construed as including a request to extend the shortened statutory period for an additional month, which will be granted even if previous extensions have been granted. In no event however, will the statutory period for response expire later than SIX MONTHS from the mailing date of the final action. See MPEP § 2265.

All correspondence relating to this ex parte reexamination proceeding should be directed as follows:

By U.S. Postal Service Mail to:

Mail Stop Ex Parte Reexam

By EFS-Web:

Registered users of EFS-Web may alternatively submit such correspondence via the electronic filing system EFS-Web, at

<https://sportal.uspto.gov/authenticate/authenticateuserlocalepf.html>

EFS-Web offers the benefit of quick submission to the particular area of the Office that needs to act on the correspondence. Also, EFS-Web submissions are "soft scanned" (i.e., electronically uploaded) directly into the official file for the reexamination proceeding, which offers parties the opportunity to review the content of their submissions after the "soft scanning" process is complete.

Any inquiry concerning this communication or earlier communications from the Reexamination Legal Advisor or Examiner, or as to the status of this proceeding, should be directed to the Central Reexamination Unit at telephone number (571) 272-7705.

Issue Date: August 22, 2000
Title: **POINT-TO-POINT INTERNET
PROTOCOL**

Attorney Docket: 2655-0188
Group Art Unit: 3992
Examiner: KOSOWSKI, Alexander
Date: July 12, 2010
Confirmation No.: 1061

RESPONSE TO FINAL REJECTION IN A RE-EXAMINATION

Hon. Commissioner of Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

In response to the Office Action dated May 11, 2010, the Assignee hereby requests an automatic one-month extension of time so that the examiner may consider the filed response, and submits:

Claim Amendments starting on page 2; and
Remarks/Arguments beginning on page 3 of this paper.

Re-Examination of Patent No. 6,108,704
Control No.: 90/010,416
Filed: February 24, 2009
Reply to Office Action of May 11, 2010

AMENDMENTS TO THE CLAIMS

Please cancel the following claims in re-examination without prejudice as follows:

- 43. (Canceled)
- 44. (Canceled)

Re-Examination of Patent No. 6,108,704
Control No.: 90/010,416
Filed: February 24, 2009
Reply to Office Action of May 11, 2010

REMARKS/ARGUMENTS

Favorable reconsideration of the claims currently undergoing re-examination, in view of the present amendment and in light of the following discussion, is respectfully requested.

STATUS OF THE CLAIMS

Claims 1-7, 11-20 and 22-42 are pending and the subject of this re-examination. Claims 43 and 44 have been canceled herewith. No other claims have been added or amended. The cancellation of claims 43 and 44 is made without prejudice and in order to expedite prosecution as they are the only claims that remain rejected. However, the Assignee incorporates by reference the remarks from the previously filed rejection as to why the patentability of those claims should have been confirmed.

RESPONSE TO REJECTIONS

In the outstanding office action, claims 43 and 44 remained rejected, but the patentability of all remaining pending claims was confirmed. The cancellation of claims 43 and 44 renders moot all remaining rejections, and this re-examination proceeding should now terminate.

Re-Examination of Patent No. 6,108,704
Control No.: 90/010,416
Filed: February 24, 2009
Reply to Office Action of May 11, 2010

Consequently, in light of the above discussions and the cancellation of claims 43 and 44, the patentability of the claims subject to re-examination should be indicated as confirmed. An early and favorable action to that effect is respectfully requested.

CHARGE STATEMENT: Deposit Account No. 501860, order no. **2655-0188**.

The Commissioner is hereby authorized to charge any fee specifically authorized hereafter, or any missing or insufficient fee(s) filed, or asserted to be filed, or which should have been filed herewith or concerning any paper filed hereafter, and which may be required under Rules 16-18 (missing or insufficiencies only) now or hereafter relative to this application and the resulting Official Document under Rule 20, or credit any overpayment, to our Accounting/ Order Nos. shown above, for which purpose a duplicate copy of this sheet is attached.

This CHARGE STATEMENT does not authorize charge of the issue fee until/unless an issue fee transmittal sheet is filed.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Art Unit: 3992

DETAILED ACTION

1) This Office action addresses claims 1-7 and 10-44 of United States Patent Number 6,108,704 (Hutton et al), for which it has been determined in the Order Granting Ex Parte Reexamination (hereafter the "Order") mailed 3/11/09 that a substantial new question of patentability was raised in the Request for *Ex Parte* reexamination filed on 2/17/09 (hereafter the "Request"). This action is in response to the after final amendment filed 7/12/10. Claims 43-44 are currently canceled. Claims 10 and 21 are previously canceled. Claims 1-7, 11-20 and 22-42 are patentable and/or confirmed as noted in the final rejection mailed 5/11/10.

STATEMENT OF REASONS FOR PATENTABILITY AND/OR CONFIRMATION

2) Claims 1-7, 11-20 and 22-42 are patentable and/or confirmed.

The following is an examiner's statement of reasons for confirmation of the claims found patentable in this reexamination proceeding:

Referring to claims 1, 2, 4, 11, 22, 32, 33, 35, the claims are patentable and/or confirmed over the prior art that was explained in the request and determined to raise a substantial new question of patentability in the order granting reexamination and over the prior art that was applied and discussed by the examiner in the present reexamination proceeding because that prior art does not explicitly teach program code for transmitting to the server a network protocol address received by the first process following connection to the computer network (claim 1), each network protocol address stored in the memory following connection of a respective process to the computer network (claim 2), each of the network protocol addresses received following connection of the respective process to the computer network (claim 4), receiving a

Art Unit: 3992

network protocol address of the first callee process over the computer network from the server (claim 11), program code for receiving a network protocol address of the first callee process over the computer network from the server (claim 22), the Internet Protocol address added to the list following connection of the process to the computer network (claim 32), the network protocol address of the corresponding process assigned to the process upon connection to the computer network (claim 33), the network protocol address of the corresponding process assigned to the process upon connection to the computer network (claim 38), in combination with the remaining elements or features of the claimed invention.

Referring to all other claims, the claims are dependent on patentable and/or confirmed independent claims, and are therefore also patentable and/or confirmed.

Art Unit: 3992

Conclusion

All correspondence relating to this ex parte reexamination proceeding should be directed as follows:

By U.S. Postal Service Mail to:

Mail Stop Ex Parte Reexam
ATTN: Central Reexamination Unit
Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

By FAX to:

(571) 273-9900
Central Reexamination Unit

By hand to:

Customer Service Window
Randolph Building
401 Dulany St.
Alexandria, VA 22314

By EFS-Web:

Registered users of EFS-Web may alternatively submit such correspondence via the electronic filing system EFS-Web, at

<https://portal.uspto.gov/authenticate/authenticateuserlocalepf.html>

EFS-Web offers the benefit of quick submission to the particular area of the Office that needs to act on the correspondence. Also, EFS-Web submissions are "soft scanned" (i.e., electronically uploaded) directly into the official file for the reexamination proceeding, which offers parties the opportunity to review the content of their submissions after the "soft scanning" process is complete.

Art Unit: 3992

Any inquiry concerning this communication or earlier communications from the Reexamination Legal Advisor or Examiner, or as to the status of this proceeding, should be directed to the Central Reexamination Unit at telephone number (571) 272-7705.

/Alexander J Kosowski/

Primary Examiner, Art Unit 3992

(57) ABSTRACT

A point-to-point Internet protocol exchanges Internet Protocol (IP) addresses between processing units to establish a point-to-point communication link between the processing units through the Internet. A first point-to-point Internet protocol includes the steps of (a) storing in a database a respective IP address of a set of processing units that have an on-line status with respect to the Internet; (b) transmitting a query from a first processing unit to a connection server to determine the on-line status of a second processing unit; and (c) retrieving the IP address of the second unit from the database using the connection server, in response to the determination of a positive on-line status of the second processing unit, for establishing a point-to-point communication link between the first and second processing units through the Internet. A second point-to-point Internet protocol includes the steps of (a) transmitting an E-mail signal, including a first IP address, from a first processing unit; (b) processing the E-mail signal through the Internet to deliver the E-mail signal to a second processing unit; and (c) transmitting a second IP address to the first processing unit for establishing a point-to-point communication link between the first and second processing unit through the Internet.

1
EX PARTE

REEXAMINATION CERTIFICATE
ISSUED UNDER 35 U.S.C. 307

THE PATENT IS HEREBY AMENDED AS
INDICATED BELOW.

Matter enclosed in heavy brackets [] appeared in the patent, but has been deleted and is no longer a part of the patent; matter printed in italics indicates additions made to the patent.

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims 1-7 and 32-42 is confirmed.

Claims 10, 21, 43 and 44 are cancelled.

Claims 11, 12, 14, 15, 16, 19, 22, 23, 25, 27 and 30 are determined to be patentable as amended.

Claims 13, 17, 18, 20, 24, 26, 28, 29 and 31, dependent on an amended claim, are determined to be patentable.

Claims 8-9 were not reexamined.

11. [The method of claim 10] *In a computer system, a method for establishing a point-to-point communication link from a caller process to a callee process over a computer network, the caller process having a user interface and being operatively connectable to the callee process and a server over the computer network, the method comprising the steps of:*

- A. *providing a user interface element representing a first communication line;*
- B. *providing a user interface element representing a first callee process; and*
- C. *establishing a point-to-point communication link from the caller process to the first callee process, in response to a user associating the element representing the first callee process with the element representing the first communication line, wherein step C further comprises the steps of:*
 - c.1 *querying the server as to the on-line status of the first called [process] process; and*
 - c.2 *receiving a network protocol address of the first callee process over the computer network from the server.*

12. The method of claim [10] // further comprising the step of:

- D. *providing an element representing a second communication line.*

14. The method of claim [10] // further comprising the step of:

- D. *providing a user interface element representing a second callee process; and*
- E. *establishing a conference point-to-point communication link between the caller process and the first and second callee process, in response to the user associating the element representing the second callee process with the element representing the first communication line.*

15. The method of claim [10] // further comprising the step of:

- F. *removing the second callee process from the conference point-to-point communication link in response to the user disassociating the element representing the*

2

second callee process from the element representing the first communication line.

16. The method of claim [10] // further comprising the steps of:

- D. *providing a user interface element representing a communication line having a temporarily disabled status; and*
- E. *temporarily disabling a point-to-point communication link between the caller process and the first callee process, in response to the user associating the element representing the first callee process with the element representing the communication line having a temporarily disabled status.*

19. The method of claim [10] // wherein the caller process further comprises a visual display and the user interface comprises a graphic user interface.

22. [The computer program product of claim 21] *A computer program product for use with a computer system comprising:*

a computer usable medium having program code embodied in the medium for establishing a point-to-point communication link from a caller process to a callee process over a computer network, the caller process having a user interface and being operatively connectable to the callee process and a server over the computer network, the medium further comprising:

program code for generating an element representing a first communication line;

program code for generating an element representing a first callee process;

program code, responsive to a user associating the element representing the first callee process with the element representing the first communication line, for establishing a point-to-point communication link from the caller process to the first callee process,]wherein the program code for establishing a point-to-point communication link further comprises:

program code for querying the server as to the on-line status of the first callee process; and

program code for receiving a network protocol address of the first callee process over the computer network from the server.

23. A computer program product of claim [21] 22 further comprising: *program code for generating an element representing a second communication line.*

25. The computer program product of claim [21] 22 further comprising: *program code for generating an element representing a second callee process; and program code means, responsive to the user associating the element representing the second callee process with the element representing the first communication line, for establishing a conference communication link between the caller process and the first and second callee process.*

27. The computer program product of claim [21] 22 further comprising:

program code for generating an element representing a communication line having a temporarily disabled status; and

program code, responsive association of the element representing the first callee process with the element representing the communication line having a temporarily disabled status, for temporarily disabling the point-to-point communication link between the caller process and the first callee process.

30. A computer program product of claim [21] 22 wherein the computer system further comprises a visual display and the user interface comprises a graphic user interface.
