QUINOLINE TYPE MEVALONOLACTONES

The present invention relates to novel mevalonolactones having a quinoline ring, processes for their production, pharmaceutical compositions containing them and their pharmaceutical uses particularly as anti-hyperlipidemic, hypolipoproteinemic and anti-atherosclerotic agents, and intermediates useful for their production and processes for the production of such intermediates.

Some fermentation metabolic products such as compactine, CS-514, Mevinolin or semi-synthetic derivatives or fully synthetic derivatives thereof are known to be inhibitors against HMG-CoA reductase which is a rate limiting enzyme for cholesterol biosynthesis. (A. Endo J. Med Chem., 28(4) 401 (1985))

CS-514 and Mevinolin have been clinically proved to be potentially useful anti-hyperlipoproteinemic agents, and they are considered to be effective for curing or preventing diseases of coronary artery sclerosis or atherosclerosis. (IXth Int. Symp. Drugs Affect. Lipid

Metab., 1986, p30, p31, p66)

However, with respect to fully synthetic derivatives, particularly hetero aromatic derivatives of inhibitors against HMG-CoA reductase, limited information is disclosed in the following literatures:

All checked

WPI ACC NO. 84-158675, 86-028274, 86-098816, 86-332070, 87-124519, 87-220987, 88-07781, 88-008460, 88-091798 and 88-112505.

The present inventors have found that mevalonolactone derivatives having a quinoline ring, the corresponding dihydroxy carboxylic acids and salts and esters thereof have high inhibitory activities against cholesterol biosynthesis wherein HMG-CoA reductase acts as a rate limiting enzyme. The present invention has been accomplished on the basis of this discovery.

The novel mevalonolactone derivatives of the present invention are represented by the following formula I:

The mevalonolactones of the formula I can be prepared by the following reaction scheme. The enal III can also be prepared by processes K, L and M.

114

In the above reaction scheme, R^1 , R^2 , R^3 , R^4 , R^5 , R^6 and R^{12} are as defined above with respect to the formula I, and R^{21} and R^{22} independently represent C_{1-4} lower alkyl such as methyl, ethyl, n-propyl, i-propyl or
5 n-butyl.

Step A represents a reduction reaction of the ester to a primary alcohol. Such reduction reaction can be conducted by using various metal hydrides, preferably diisobutylaluminium hydride, in a solvent such as
10 tetrahydrofuran or toluene at a temperature of from -20 to 20°C , preferably from -10 to 10°C .

Step B represents an oxidation reaction of the primary alcohol to an aldehyde, which can be conducted by using various oxidizing agents. Preferably, the reaction can be
15 conducted by using pyridinium chlorochromate in methylene chloride at a temperature of from 0 to 25°C , or by using oxalyl chloride, dimethyl sulfoxide and a tertiary amine such as triethylamine (Swern oxidation), or by using a sulfur trioxide pyridine complex.

20 Step C represents a synthesis of a 3-ethoxy-1-hydroxy-2-propene derivative, which can be prepared by reacting a compound V to lithium compound which has been preliminarily formed by treating cis-1-ethoxy-2-(tri-n-butylstannyl)ethylene with butyl
25 lithium in tetrahydrofuran.

As the reaction temperature, it is preferred to employ a low temperature at a level of from -60 to -78°C .

Step D represents a synthesis of an enal by acidic hydrolysis. As the acid catalyst, it is preferred to employ p-toluene sulfonic acid, hydrochloric acid or sulfuric acid, and the reaction may be conducted in a solvent mixture of water and tetrahydrofuran or ethanol at a temperature of from 10 to 25°C. The 3-ethoxy-1-hydroxy-2-propene derivative obtained in Step C can be used in Step D without purification i.e. by simply removing tetra-n-butyl tin formed simultaneously.

Step E represents a double anion condensation reaction between the enal III and an acetoacetate. Such condensation reaction is preferably conducted by using sodium hydride and n-butyl lithium as the base in tetrahydrofuran at a temperature of from -80 to 0°C, preferably from -30 to -10°C.

Step F represents a reduction reaction of the carbonyl group, which can be conducted by using a metal hydride, preferably sodium borohydride in ethanol at a temperature of from -10 to 25°C, preferably from -10 to 5°C.

Further, the reduction reaction may be conducted by using zinc borohydride in dry ethyl ether or dry tetrahydrofuran at a temperature of -100 to 25°C, preferably from -80 to -50°C.

Step G is a step for hydrolyzing the ester. The hydrolysis can be conducted by using an equimolar amount of a base, preferably potassium hydroxide or sodium hydroxide, in a solvent mixture of water and methanol or

ethanol at a temperature of from 10 to 25°C. The free acid hereby obtained may be converted to a salt with a suitable base.

Step H is a step for forming a mevalonolactone by the
5 dehydration reaction of the free hydroxy acid I-2. The dehydration reaction can be conducted in benzene or toluene under reflux while removing the resulting water or by adding a suitable dehydrating agent such as molecular sieve.

10 Further, the dehydration reaction may be conducted in dry methylene chloride by using a lactone-forming agent such as carbodiimide, preferably a water soluble carbodiimide such as
N-cyclohexyl-N'-[2'-(methyilmorpholinium)ethyl]carbodiimide
15 p-toluene sulfonate at a temperature of from 10 to 35°C, preferably from 20 to 25°C.

Step J represents a reaction for hydrogenating the double bond connecting the mevalonolactone moiety and the quinoline ring. This hydrogenation reaction can be
20 conducted by using a catalytic amount of palladium-carbon or rhodium-carbon in a solvent such as methanol, ethanol, tetrahydrofuran or acetonitrile at a temperature of from 0 to 50°C, preferably from 10 to 25°C.

Step K represents a reaction for the synthesis of an
25 α,β -unsaturated carboxylic acid ester, whereby a trans-form α,β -unsaturated carboxylic acid ester can be obtained by a so-called Horner-Wittig reaction by using an

alkoxycarbonylmethyl phosphonate. The reaction is conducted by using sodium hydride or potassium t-butoxide as the base in dry tetrahydrofuran at a temperature of from -30 to 0°C, preferably from -20 to -15°C.

5 Step L represents a reduction reaction of the α,β -unsaturated carboxylic acid ester to an allyl alcohol. This reduction reaction can be conducted by using various metal hydrides, preferably diisobutylaluminumhydride, in a solvent such as dry tetrahydrofuran or toluene at a
10 temperature of from -10 to 10°C, preferably from -10 to 0°C.

Step M represents an oxidation reaction of the allyl alcohol to an enal. This oxidation reaction can be conducted by using various oxidizing agents, particularly
15 active manganese dioxide, in a solvent such as tetrahydrofuran, acetone, ethyl ether or ethyl acetate at a temperature of from 0 to 100°C, preferably from 15 to 50°C.

Step N represents a reaction for the synthesis of an
20 α,β -unsaturated ketone by the selective oxidation of the dihydroxy carboxylic acid ester. This reaction can be conducted by using activated manganese dioxide in a solvent such as ethyl ether, tetrahydrofuran, benzene or toluene at a temperature of from 20 to 80°C, preferably
25 from 40 to 80°C.

PHARMACOLOGICAL TEST EXAMPLES

Test A: Inhibition of cholesterol biosynthesis from
20 acetate in vitro

Enzyme solution was prepared from liver of male Wistar rat bilially cannulated and discharged bile for over 24 hours. Liver was cut out at mid-dark and microsome and supernatant fraction which was precipitable with 40-80% of
25 saturation of ammonium sulfate (sup fraction) were prepared from liver homogenate according to the modified method of Knauss et. al.; Kuroda, M., et. al., Biochim.

Biophys. Acta, 489, 119 (1977). For assay of cholesterol biosynthesis, microsome (0.1 mg protein) and sup fraction (1.0 mg protein) were incubated for 2 hours at 37°C in 200 µl of the reaction mixture containing ATP; 1 mM,

5 Glutathione; 6 mM, Glucose-1-phosphate; 10 mM, NAD; 0.25 mM, NADP; 0.25 mM, CoA; 0.04 mM and 0.2 mM [2-¹⁴C]sodium acetate (0.2 µCi) with 4 µl of test compound solution dissolved in water or dimethyl sulfoxide. To stop reaction and saponify, 1 ml of 15% EtOH-KOH was added to
10 the reactions and heated at 75°C for 1 hour.

Nonsaponifiable lipids were extracted with petroleum ether and incorporated ¹⁴C radioactivity was counted.

Inhibitory activity of compounds was indicated with IC50.

15 Test B: Inhibition of cholesterol biosynthesis in culture cells

Hep G2 cells at over 5th passage were seeded to 12 well plates and incubated with Dulbecco's modified-Eagle (DME) medium containing 10% of fetal bovine serum (FBS) at 37°C, 5% CO₂ until cells were confluent for about 7 days.
20 Cells were exposed to the DME medium containing 5% of lipoprotein deficient serum (LpDS) prepared by ultracentrifugation method for over 24 hours: Medium was changed to 0.5 ml of fresh 5% LpDS containing DME before assay and 10 µl of test compound solution dissolved in
25 water or DMSO were added. 0.2 µCi of [2-¹⁴C]sodium acetate (20 µl) was added at 0 hr(B-1) or 4 hrs(B-2) after addition of compounds. After 4 hrs further incubation with [2-¹⁴C]sodium acetate, medium was removed and cells

were washed with phosphate buffered saline (PBS) chilled at 4°C. Cells were scraped with rubber policeman and collected to tubes with PBS and digested with 0.2 ml of 0.5 N KOH at 37°C. Aliquot of digestion was used for
5 protein analysis and remaining was saponified with 1 ml of 15% EtOH-KOH at 75°C for 1 hour. Nonsaponifiable lipids were extracted with petroleum ether and ¹⁴C radioactivity was counted. Counts were revised by cell protein and indicated with DPM/mg protein. Inhibitory activity of
10 compounds was indicated with IC50.

Test C: Inhibition of cholesterol biosynthesis in vivo

Male Sprague-Dawley rats weighing about 150 g were fed normal Purina chow diet and water ad libitum, and exposed to 12 hours light/12 hours dark lighting pattern (2:00 PM
15 - 2:00 AM dark) prior to use for in vivo inhibition test of cholesterol biosynthesis. Animals were separated into groups consisting of five rats as to be average mean body weight in each group. Test compounds at dosage of 0.02-0.2 mg/kg body weight (0.4 ml/100 g body weight),
20 were dissolved in water or suspended or in 0.5% methyl cellulose and orally administered at 2-3 hours before mid-dark (8:00 PM), while cholesterol biosynthesis reaches to maximum in rats. As control, rats were orally administered only water or vehicle. At 90 minutes after
25 sample administration, rats were injected intraperitoneally with 10 µCi of [2-¹⁴C]sodium acetate at volume of 0.2 ml per one. 2 Hours later, blood samples

were obtained and serum were separated immediately. Total lipids were extracted according to the method of Folch et al. and saponified with EtOH-KOH. Nonsaponifiable lipids were extracted with petroleum ether and radio activity incorporated into nonsaponifiable lipids was counted.

Inhibitory activity was indicated as percent decrease of counts in testing groups (DPM/2 ml serum/2 hours) from that in control group.

10 was cooled 0°C. Then, 10 mg (0.263 mmol) of sodium borohydride was added, and the mixture was stirred for one hour. Then, 1 ml of a 10% hydrochloric acid aqueous solution was added thereto, and the mixture was extracted three times with ethyl ether. The ethyl ether solution
15 was washed with a saturated sodium chloride aqueous solution and dried over anhydrous magnesium sulfate. Then, the solution was evaporated to dryness under reduced pressure. The residual oil was purified by silica gel column chromatography (eluent: 5% methanol-chloroform) to
20 obtain the desired product as a pure colorless oily substance. 70 mg (Yield: 64%)

EXAMPLE 2

Sodium salt of (E)-3,5-dihydroxy-7-[4'-(4''-fluorophenyl)-2'-(1''-methylethyl)-quinolin-3'-yl]-hept-6-enoic acid (compound I-51)

5 60 mg (0.133 mmol) of compound I-11 was dissolved in 3 ml of ethanol. Then, 0.26 ml of a 0.5 N sodium hydroxide aqueous solution was dropwise added thereto. The mixture was stirred at room temperature for further one hour, and ethanol was distilled off under reduced pressure. Then, 5
10 ml of water was added thereto, and the mixture was extracted with ethyl ether. The aqueous layer was freeze-dried to obtain 40 mg (67%) of hygroscopic white powder. Melting point: 207-209°C (decomposed).

EXAMPLE 3

15 (E)-3,5-dihydroxy-7-[4'-(4''-fluorophenyl)-2'-(1''-methylethyl)-quinolin-3'-yl]-hept-6-enoic acid (compound I-21)

110 mg (0.244 mmol) of compound I-11 was dissolved in 10 ml of ethanol. Then, 0.79 ml of a 0.5 N sodium
20 hydroxide aqueous solution was dropwise added thereto. The mixture was stirred at room temperature for further one hour, and ethanol was distilled off under reduced pressure. Then, 10 ml of water was added thereto, and the mixture was extracted with ethyl ether. The aqueous layer
25 was weakly acidified (pH 4) with a dilute hydrochloric aqueous solution and extracted three times with ethyl ether. The ethyl ether layers were put together and dried

over anhydrous magnesium sulfate. Then, the solvent was distilled off under reduced pressure to obtain 90 mg of slightly yellow oily substance.

quinolin-3'-ylethenyl]-4-hydroxy-3,4,5,6-tetrahydro-
2H-pyran-2-one (compound I-31)

90 mg of compound I-21 was dissolved in 10 ml of dry toluene, and the solution was refluxed under heating for 3 hours by means of a Dean Stark apparatus.

15 Toluene was distilled off under reduced pressure, and the residual solid was recrystallized from diisopropyl ether to obtain 40 mg of colorless prism crystals.

Melting point: 182-184°C.

20 By silica gel thin chromatography, the product gave two absorption spots close to each other attributable to the diastereomers. (Developping solvent: 3% methanol-chloroform)

25 These diastereomers were separated and isolated by silica gel thin layer chromatography. [Developping solvent: t-BuOMe/hexane/acetone=7/2/1 (v/v), R_f=0.6 and 0.7 (obtained weight ratio: 1/2)]

quinolin-3'-ylethynyl]-4-hydroxy-3,4,5,6-tetrahydro-2H-
pyran-2-one (compound I-41)

15 20 mg of a mixture of diastereomers of compound I-31
was dissolved in 5 ml of ethanol, and 10 mg of 5%
palladium-carbon was added thereto. The mixture was
stirred under a hydrogen atmosphere. After confirming the
disappearance of the starting substance and the appearance
20 of a new spot by thin layer chromatography, the
palladium-carbon was filtered off, and ethanol was
distilled off to obtain colorless oil.

This oil was purified by preparative thin layer
chromatography to obtain 16 mg of the desired product as
25 pure colorless oil.

This test was carried out as described on pages 29 to 30 of the specification. The above numerical values indicate IC_{50} (molar concentration).

4. Based on the data reported above, it can be determined that the compound of this invention exhibits unobvious superiority, and in particular, sharply enhanced inhibition of cholesterol biosynthesis, in vitro, and culture cell, when compared with the referenced compound of the prior art, and compounds having an identical structure save for the selection of cyclopropyl, as opposed to isopropyl substituent, for R^5 . This enhanced activity could not be predicted on the basis of structure, or information available to those of ordinary skill in the art as of the effective filing date of this application.

All statements made herein of my own knowledge are true, and all statements made on information and belief are believed true. I am aware that willful false statements and the like are punishable by fine, imprisonment or both, 18 U.S.C. §1001, and that such willful false statements may jeopardize the validity of the above-captioned patent application and any patent issuing thereon.

FURTHER, I SAYETH NOT.

PRELIMINARY AMENDMENT

HONORABLE COMMISSIONER OF PATENTS AND TRADEMARKS
WASHINGTON, DC 20231

SIR:

Prior to examination on the merits in the above-captioned patent application, entry of the following amendments is respectfully requested.

IN THE CLAIMS:

Please cancel Claims ~~1-35~~.

Please renumber Claims 46-50 submitted in the Preliminary Amendment of May 15, 1992 as Claims 36-40.

REMARKS:

Entry and consideration of the above amendments, together with the executed Declaration of Kitahara, submitted herewith, is respectfully requested prior to the examination on the merits.

This application is a divisional application, the immediate parent application being U.S. Application Serial No. 631,092, a continuation of U.S. Application Serial No. 233,752. In filing the application, a Preliminary Amendment was filed which inadvertently sought to cancel Claims 41-45 (never presented in this application) and insert new Claims 46-50. In fact, of course, applicants intended, and undersigned Counsel respectfully requests, that Claims 1-35 be cancelled. Further, the claims identified as 46-50 in the Preliminary Amendment of May 15, 1992 should be correctly renumbered as Claims 36-40. The claims cancelled and added by the May 15, 1992 Preliminary Amendment were inadvertently misnumbered, based on the status of claims in the parent application. Any inconvenience is regretted.

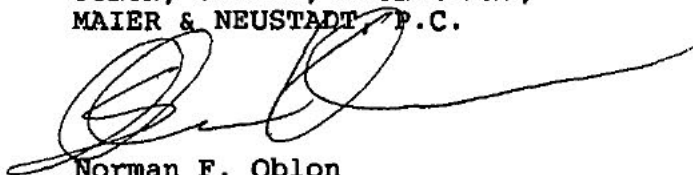

Submitted herewith is the executed Declaration of Kitahara,

identical to the unexecuted Declaration submitted with the divisional application filing on May 15, 1992. The Declaration clearly demonstrates that the subject matter of the Count of Interference exhibits unobviously superior bioactivity, when compared with the closest isomeric form. Indeed, the IC_{50} values obtained for both evaluation methods reported in the Declaration are 4-5 fold superior to the isomeric form, something that could not have been predicted on the basis of the structure alone, given the information available to those of ordinary skill in the art as of the effective filing date of the application. See the Declaration, paragraph 4.

Accordingly, examination and allowance of the claims originally presented in the Preliminary Amendment and numbered 46-50, properly numbered 36-40, is respectfully requested.

Respectfully submitted,

DECLARATION UNDER 37 CFR 1.132

HONORABLE COMMISSIONER OF PATENTS & TRADEMARKS
WASHINGTON, D.C. 20231

SIR:

I, Masaki Kitahara, do hereby declare and state
that:

1. I am a named co-inventor in the above-captioned
patent application, an employee of Nissan Chemical
Industries, Limited, and a citizen and resident of Japan.

2. I am familiar with the above-captioned patent
application, and Claims presented by Divisional
Application.

3. To demonstrate the unobvious superiority of the
subject matter claimed therein, comparative tests were
conducted, demonstrating the importance and unobvious
superiority conferred on these compounds by the selection

of the cyclopropyl (c-Pr) substituent. These are described as follows:

Data was obtained with regard to the following compound having the formula:

TEST METHOD

<u>Compound</u>	<u>R⁵</u>	<u>Test A Evaluation</u>	<u>Test B Evaluation</u>
Compound of this Invention	cyclopropyl (c-Pr)	4.4 × 10 ⁻⁹	35.0 × 10 ⁻⁹
Reference Compound	isopropyl (i-Pr)	23.0 × 10 ⁻⁹	105 × 10 ⁻⁹

Test A: Inhibition of cholesterol biosynthesis from acetate in vitro

This test was carried out as described on pages 28-29 of the specification. The above numerical values indicate IC₅₀ (molar concentration).

Test B: Inhibition of cholesterol
 biosynthesis in culture cells

This test was carried out as described on pages 29 to 30 of the specification. The above numerical values indicate IC₅₀ (molar concentration).

4. Based on the data reported above, it can be determined that the compound of this invention exhibits unobvious superiority, and in particular, sharply enhanced inhibition of cholesterol biosynthesis, in vitro, and culture cell, when compared with the referenced compound of the prior art, and compounds having an identical structure save for the selection of cyclopropyl, as opposed to isopropyl substituent, for R⁵. This enhanced activity could not be predicted on the basis of structure, or information available to those of ordinary skill in the art as of the effective filing date of this application.

All statements made herein of my own knowledge are true, and all statements made on information and belief are believed true. I am aware that willful false statements and the like are punishable by fine, imprisonment or both, 18 U.S.C. §1001, and that such willful false statements may jeopardize the validity of the above-captioned patent application and any patent issuing thereon.

EXAMINER'S ACTION

PTOL-326 (Rev. 9-89)

Serial No. 07/883,398

-2-

Art Unit 1201

The Abstract of the Disclosure is objected to because of undue length. Correction is required. See M.P.E.P. § 608.01(b).

Applicant is reminded of the proper language and format of an Abstract of the Disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 250 words. It is important that the abstract not exceed 250 words in length since the space provided for the abstract on the computer tape used by the printer is limited. The form and legal phraseology often used in patent claims, such as "means" and "said", should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Pages 27, 32 and 41 of the specification are missing. Replacement copies are required. They must be accompanied by a statement that they contain no new matter.

Claims 37-39 are rejected under 35 U.S.C. § 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. The term, "agent", renders the claims indefinite. Likewise, the term "containing" is open ended, leaving the claim open to the inclusion of unrecited ingredients, even in major amounts.
