        Please tell me what is "PEP" in the Telebit modem

```

"PEP" is short for Telebit's "Packetized Ensemble Protocol". It is the
method by which they divide the telephone bandwidth into 512 discreet
slow carriers on which they transmit the data, and the key to their
being able to get high throughput.

    "PEP" stands for "Packetized Ensemble Protocol", the transport protocol
used with Telebit's proprietary multicarrier modulation technique ("DAMQAM":
Dynamically Adaptive Multicarrier Quadrature Amplitude Modulation). Quite
often "PEP" is used where "DAMQAM" would be technically correct but, in the
case of Telebit modems, the two work hand in hand.

        I've gotten mine up to about 1600cps (avg) with the Worldblazer
TurboPEP and UUCP spoofing

I'm getting 2150cps (avg) with the Worldblazer TurboPEP and UUCP spoofing.
