CHAPTER 9

Rietveld Refinement

R. B. VON DREELE

IPNS/APS Argonne National Laboratory, Argonne, IL, USA

9.1 INTRODUCTION

A polycrystalline powder can be represented in reciprocal space as a set of nested spherical shells positioned with their centers at the origin¹ (Figure 9.1). These shells arise from the reciprocal lattice points from the myriad (*e.g.* $\approx 10^9 \text{ mm}^{-3}$ for $1 \mu\text{m}$ crystallites) of small crystals, ideally with random orientation, in the sample (Chapter 1). Their magnitude is related to the crystalline structure factors as well as the symmetry driven overlaps (*i.e.* reflection multiplicities) and are affected by systematic effects (*e.g.* Lorentz and polarization, absorption, extinction and preferred orientation). The structure factors and their systematic effects are discussed elsewhere in this volume (Chapter 3). These shells have some thickness or broadening from instrumental effects and the characteristics of the crystalline grains themselves; details are given in Chapters 5, 6 and 13. An experimentally measured powder diffraction pattern is a scan through this suite of shells, which by its nature, is a smooth curve consisting of a sequence of peaks resting upon a slowly varying background.

Techniques for obtaining these data are discussed in Chapter 2.

Early data analysis attempted to extract values of the individual structure factors from peak envelopes and then apply standard single crystal methods to obtain structural information. This approach was severely limited because the relatively broad peaks in a powder pattern resulted in substantial reflection overlap and the number of usable structure factors that could be obtained in this way was very small. Consequently, only very simple crystal structures could be examined by this method. For example, the neutron diffraction study of defects in $\text{CaF}_2\text{-YF}_3$ fluorite solid solutions² used 20 reflection intensities to determine values for eight structural parameters. To overcome this limitation, H. M. Rietveld^{3,4} realized that a neutron powder diffraction pattern is a smooth curve that consists of Gaussian peaks on top of a smooth background

Figure 9.1 Reciprocal space construction for a powder diffraction experiment. The myriad reciprocal lattice points for the crystallites combine to form nested spherical shells centered at the reciprocal space origin.

Figure 9.2 Portion of a powder diffraction pattern showing the contributions to the calculated pattern from 15 reflections above a small flat background.

and that the best way of extracting the maximum information from it was to write a mathematical expression to represent the observed intensity at every step in this pattern:

$$Y_c = Y_b + \sum Y_h \quad (1)$$

This expression has both a contribution from the background (Y_b) and each of the Bragg reflections (Y_h ; $\mathbf{h} = hkl$) that are near the powder pattern step (Figure 9.2).

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
