#### Report from the FDA

### Approval Summary: Docetaxel in Combination with Prednisone for the Treatment of Androgen-Independent Hormone-Refractory Prostate Cancer

Ramzi Dagher, Ning Li, Sophia Abraham, Atiqur Rahman, Raji Sridhara, and Richard Pazdur

Division of Oncology Drug Products, Center for Drug Evaluation and Research, United States Food and Drug Administration, Rockville, Maryland

#### ABSTRACT

Purpose: Docetaxel, a taxane previously approved for the treatment of breast cancer and non-small cell lung cancer, was approved by the United States Food and Drug Administration on May 19, 2004 for use in combination with prednisone for the treatment of metastatic androgen-independent (hormone-refractory) prostate cancer. The purpose of this summary is to review the database supporting this approval.

Experimental Design: In a randomized, global study enrolling 1,006 patients, two schedules of docetaxel were compared with mitoxantrone + prednisone as follows: MTZ q 3w, mitoxantrone 12 mg/m2 every 21 days + prednisone 5 mg twice a day for a total of 10 cycles; TXT q 3w, docetaxel 75 mg/m² every 21 days + prednisone 5 mg twice a day for a total of 10 cycles; and TXT qw, docetaxel 30 mg/m² days 1, 8, 15, 22, and 29 every 6 weeks + prednisone 5 mg twice a day for a total of 5 cycles.

Results: There was a statistically significant overall survival advantage shown for the TXT q 3w arm over MTZ q 3w (median survival 18.9 months versus 16.5 months, P=0.0094). No overall survival advantage was shown for TXT qw compared with MTZ q 3w. The most commonly occurring adverse events included anemia, neutropenia, infection, nausea, sensory neuropathy, fluid retention, alopecia, nail changes, diarrhea, and fatigue.

Conclusions: This report describes the Food and Drug Administration review supporting this first approval of a combination therapy for hormone-refractory prostate cancer based on demonstration of a survival benefit.

Received 7/15/04; revised 7/30/04; accepted 8/5/04.

#### INTRODUCTION

Docetaxel (Taxotere, Aventis Pharmaceuticals, Bridgewater, NJ) is an antineoplastic agent that acts by disrupting the microtubular network in cells that is essential for mitotic and interphase cellular functions. Docetaxel binds to free tubulin and promotes the assembly of tubulin into stable microtubules. Microtubules bundles without normal function are produced, and mitosis is inhibited. Docetaxel has been previously approved by the United States Food and Drug Administration (FDA) for locally advanced or metastatic breast cancer after anthracycline therapy, locally advanced or metastatic non–small-cell lung cancer after prior platinum-based chemotherapy, and for use in combination with cisplatin for newly diagnosed locally advanced or metastatic non–small cell lung cancer.

After development of metastatic hormone-refractory disease, prostate cancer is incurable, with median survival of 9 to 12 months (1, 2). Historically, no single agent or combination regimen has shown a survival benefit in this setting. In 1996, mitoxantrone administered in combination with prednisone was approved by the FDA for the palliative treatment of metastatic or locally advanced disease that had progressed on standard hormonal therapy. This approval was based on results of a randomized trial comparing mitoxantrone plus prednisone to prednisone alone. A total of 161 patients were randomized in this trial, which used palliative response as a primary endpoint (3, 4). A second randomized trial of mitoxantrone plus hydrocortisone *versus* hydrocortisone alone conducted by the Cancer and Leukemia Group B provided supportive evidence of a palliative effect (4).

Docetaxel has been evaluated in single arm studies in hormone-refractory prostate cancer, either as a single dose every 3 weeks or a weekly regimen. Prostate-specific antigen (PSA) declines, and radiographic responses in those patients with bidimensionally measurable lesions were noted (5–9).

TAX327, a global multicenter trial, was designed to evaluate two docetaxel schedules with prednisone compared with a control arm of mitoxantrone plus prednisone. The design and findings of this study are outlined below.

#### TREATMENT PLAN

Patients were randomized to one of three treatments as follows:

The treatment plan is also outlined in Fig. 1.

MTZ q 3w. Mitoxantrone 12 mg/m² intravenously (day 1) as a 30-minute infusion every 21 days plus prednisone 5 mg orally twice daily for 10 cycles. Prednisone could be continued after completion of 10 cycles.

**TXT q 3w.** Docetaxel 75 mg/m<sup>2</sup> intravenously (day 1) as

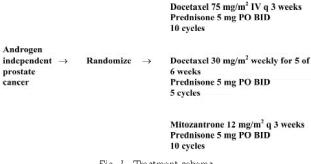

Fig. I Treatment schema.

twice daily for 10 cycles. Prednisone could be continued after completion of 10 cycles. Prophylactic dexamethasone 8 mg was to be administered orally at 12 hours, 3 hours and 1 hour before docetaxel.

TXT qw. Docetaxel 30 mg/m<sup>2</sup> intravenously as a 30-minute infusion on days 1, 8, 15, 22, and 29 every 6 weeks plus prednisone 5 mg orally twice daily for 5 cycles. Prednisone could be continued after completion of 5 cycles. Dexamethasone 8 mg was to be administered orally 1 hour before docetaxel infusion.

#### PATIENT POPULATION/DEMOGRAPHICS

The main protocol-specified inclusion criteria included histologically or cytologically proven adenocarcinoma of the prostate, metastatic disease unresponsive or refractory to hormone therapy (castration by orchiectomy and/or androgen blockade), and Karnofsky Performance Status  $\geq$ 60. Except for estramustine monotherapy, prior chemotherapy was not allowed. Treatment with bisphosphonates had to be discontinued before randomization. Patients with symptomatic peripheral neuropathy grade  $\geq$ 2 (National Cancer Institute Common Toxicity Criteria version 2.0), known brain or leptomeningeal involvement, or prior radiotherapy to  $\geq$ 25% of bone marrow were excluded.

Age, race, Karnofsky performance status at baseline, staging, baseline PSA, and Gleason score are listed by distribution across the three study arms in Table 1. These seem to be evenly distributed across treatment groups. Approximately 84 to 89% of patients enrolled to each treatment arm had a baseline PSA  $\geq$ 20. All of the patients had received prior hormonal therapy and/or surgery for hormonal control. Approximately half of all of the patients in each treatment had received prior radiation therapy, and -20% of the patients had received prior estramustine.

#### **EFFICACY**

The primary efficacy endpoint was survival, defined as time from randomization to the date of death from any cause. The primary analysis was done on the intent-to-treat population, consisting of all of the randomized patients. The study cutoff date for the primary analysis was March 24, 2003, the date on which the sponsor received notification of the 535th event. By that date, a total of 557 events had occurred. All of the subjects

date of last assessment or on the cutoff date if the last contact had taken place subsequently.

Three simultaneous comparisons of overall survival were done with a modified Bonferroni adjustment to control for multiplicity (10); TXT q 3w versus control MTZ q 3w, TXT q w versus control MTZ q 3w, or the two pooled docetaxel treatment groups versus the control. The proposed nominal significance level for each comparison to MTZ q3w is as follows: Combined TXT groups, 0.04; TXT q 3w, 0.0175; and TXT q w, 0.0175. The primary analysis was to be considered positive if at least one of the three adjusted log-rank test comparisons was less than the prespecified nominal significance level for that comparison.

The stratified log-rank test (stratified on baseline pain and Karnofsky performance status) was prospectively specified as the primary means of determining if TXT q 3w and/or TXT q w increased overall survival compared with MTZ q 3w.

Overall survival was significantly superior in the TXT q3w group compared with the MTZ q 3w group (median survival 18.9 months <code>versus</code> 16.50 months, P=0.0094). Overall survival was also significantly superior for the combined TXT groups compared with the MTZ q 3w group. Overall survival for the once weekly docetaxel arm was not statistically significantly different from that of the MTZ q 3w group. Results of the comparison of TXT q 3w to MTZ q 3w are summarized in Table 2, and the Kaplan-Meier survival curve for this comparison is depicted in Fig. 2.

Secondary endpoints included pain response rate and du-

<sup>\*</sup> Stratified  $\log$ -rank test. Threshold for statistical significance = 0.0175 because of 3 arms.

ration, PSA response rate and duration, tumor response, time-to-pain progression, time-to-PSA progression, and time-to-tumor progression. The FDA considered these secondary endpoints as exploratory and not supportive of a marketing claim for the following reasons: (a) there was no prespecified plan for adjustment for multiplicity or ordering of secondary endpoints; (b) only a portion of patients enrolled were evaluable for any one of these secondary endpoints; and (c) large proportions of patients were censored in the analyses for time-to-progression and response duration.

#### **SAFETY**

Docetaxel dose intensity was slightly lower in the weekly docetaxel regimen (96% of planned relative dose intensity, range 62 to 115%) versus the every 3 week regimen (98% of planned relative dose intensity, range 51 to 107%). These small differences are not likely to explain the difference found in efficacy outcome between the two docetaxel regimens.

Although >90% of patients enrolled on TAX327 had at least one reported treatment emergent adverse event, serious adverse events were less commonly reported in individual patients. Individual serious or life-threatening adverse events included infection, anemia, neutropenia, neuropathy, nausea, vomiting, diarrhea, and cardiac left ventricular dysfunction. Clinically relevant all grade and grade 3/4 treatment emergent adverse event observed in the TXTq3w and MTZ arms are

presented in Table 3. Although allergic reactions (all grade) did occur more commonly on the TXTq3w arm, grade 3 or 4 events were observed in <1% of patients.

Neutropenia was the most commonly observed grade 3/4 cytopenia, occurring in 32% of patients in the TXT q 3w arm and 22% in the MTZ arm. Peripheral edema and weight gain were the major signs of fluid retention; severe or life-threatening fluid retention events were uncommon, occurring in <1% of patients across the three treatment arms. All grade cardiac left ventricular dysfunction events occurred more frequently on the MTZ q 3w arm compared with TXT q 3w (22.1% versus 9.6%), consistent with known cardiotoxicity of mitoxantrone, and grade 3/4 events occurred in 1.2% of patients on MTZ q 3w and 0.3% on TXT q 3w.

The incidence of deaths within 30 days of last treatment infusion was equally distributed across treatments: 3.3% for TXT q w, and 2.7% for MTZ q 3w. Most were attributed to malignant disease or "other" causes. Of the deaths occurring within 30 days of last infusion, one on the TXT q 3w arm and two on MTZ q 3w were attributed to drug toxicity.

#### DRUG-DRUG INTERACTIONS

Because prednisone is a known inducer of CYP3A4 and 3A5 (11), the two enzymes involved in docetaxel metabolism, (12) the sponsor investigated any potential effect on docetaxel clearance by prednisone when both drugs were administered in combination. The pharmacokinetics of docetaxel were assessed in a subset of patients enrolled to TAX327. A total of 25 patients enrolled to TXT q 3w and 15 enrolled to TXT q w had blood samples collected for docetaxel pharmacokinetics with and without concomitant prednisone. Plasma docetaxel concentrations were measured with a validated liquid chromatography/ mass spectroscopy method (13). Plasma concentration/time data were analyzed with the previously developed population pharmacokinetics Nonlinear Mixed Effect Model (14, 15). No significant differences were observed between mean docetaxel clearance values when docetaxel was administered alone (day 1) or with prednisone (day 22) with either docetaxel dose/schedule.

Abbreviations: G, grade; N/A, not applicable.

Although peak docetaxel concentrations were higher in patients receiving TXT q 3w than those receiving TXT q w, the small sample size of patients with pharmacokinetics evaluation does not allow correlation of peak docetaxel concentrations with efficacy outcomes.

#### DISCUSSION

Although several single agent and combination regimens have previously indicated antitumor activity in metastatic hormone-refractory prostate cancer and mitoxantrone/prednisone had shown a palliative effect, none have shown a survival benefit in this setting. The results of TAX327 show a survival benefit of docetaxel given with an every 3 weeks schedule plus prednisone in this setting.

The shown survival advantage was noted for the q3 week schedule and was not observed with the weekly docetaxel schedule. As discussed above, the small difference in relative dose intensity between the two docetaxel arms is not likely to provide an adequate explanation for this outcome. One hypothesis is that peak levels (Cmax) achieved on a relatively more intermittent basis may be more relevant to biological activity than overall exposure (area under the curve) in this setting. However, the small sample size of the subset population of TAX327 for which pharmacokinetics data were collected and analyzed precludes our ability to reach any conclusions in this

Preliminary findings of a randomized study comparing docetaxel plus estramustine to mitoxantrone plus prednisone conducted by the Southwest Oncology Group (SWOG9916) also seem to show a survival benefit for a docetaxel-based combination regimen in the treatment of hormone-refractory prostate cancer. A median survival advantage of  $\sim\!2$  months was observed for docetaxel/estramustine compared with the standard arm in this trial, which enrolled 770 patients (16–18).

The findings reported herein provide a rationale for investigating the use of docetaxel in a less advanced and less heavily pretreated population of prostate cancer patients. These results also warrant additional investigation of novel agents in patients with hormone-refractory prostate cancer who have advanced disease and who progress after treatment with docetaxel-based therapy.

#### CONCLUSIONS

On May 19, 2004, the FDA approved docetaxel for use in combination with prednisone for the treatment of metastatic hormone-refractory prostate cancer based on a survival advantage shown over mitoxantrone plus prednisone in a global, multicenter clinical trial. The recommended dose of docetaxel is 75 mg/m<sup>2</sup> every 3 weeks as a 1-hour infusion. Prednisone 5 mg orally twice a day is administered continuously. This represents

<sup>\*</sup> Related to treatment.

## DOCKET

## Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## **Real-Time Litigation Alerts**

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

### **Advanced Docket Research**

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

### **Analytics At Your Fingertips**

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

#### API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

#### **LAW FIRMS**

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

#### **FINANCIAL INSTITUTIONS**

Litigation and bankruptcy checks for companies and debtors.

#### **E-DISCOVERY AND LEGAL VENDORS**

Sync your system to PACER to automate legal marketing.
