SIP Extensions for Instant Messaging
draft-ietf-simple-im-01

Status of this Memo

This document is an Internet-Draft and is in full conformance with all provisions of Section 10 of RFC2026.

Internet-Drafts are working documents of the Internet Engineering Task Force (IETF), its areas, and its working groups. Note that other groups may also distribute working documents as Internet-Drafts.

Internet-Drafts are draft documents valid for a maximum of six months and may be updated, replaced, or obsoleted by other documents at any time. It is inappropriate to use Internet-Drafts as reference material or to cite them other than as "work in progress."

The list of current Internet-Drafts can be accessed at <http://www.ietf.org/ietf/lid-abstracts.txt>.

The list of Internet-Draft Shadow Directories can be accessed at <http://www.ietf.org/shadow.html>.

This Internet-Draft will expire on January 16, 2002.

Internet-Draft SIP Extensions for Instant Messaging July 2001

1. Introduction

This document defines an extension to SIP (RFC2543 [2]) to support Instant Messaging.

Instant messaging is defined as the exchange of content between a

set of participants in real time. Generally, the content is short textual messages, although that need not be the case. Generally, the messages that are exchanged are not stored, but this also need not be the case. IM differs from email in common usage in that instant messages are usually grouped together into brief live conversations, consisting of numerous small messages sent back and forth.

Instant messaging as a service has been in existence within intranets and IP networks for quite some time. Early implementations include zephyr [1], the unix talk application, and IRC. More recently, IM has been used as a service coupled with presence and buddy lists; that is, when a friend comes online, a user can be made aware of this and have the option of sending the friend an instant message. The protocols for accomplishing this are all proprietary, which has seriously hampered interoperability. Furthermore, most of these protocols tightly couple presence and IM, due to the way in which the service is offered.

Despite the popularity of presence coupled IM services, IM is a separate application from presence. There are many ways to use IM outside of presence (for example, as part of a voice communications session). Another example are interactive games (possibly established with SIP - SIP can establish any type of session, not just voice or video); IM is already a common component of multiplayer online games. Keeping it apart from presence means it can be used in such ways. Furthermore, keeping them separate allows separate providers for IM and for presence service. Of course, it can always be offered by the same provider, with both protocols implemented into a single client application.

Along a similar vein, the mechanisms needed in an IM protocol are very similar to those needed to establish an interactive session - rapid delivery of small content to a user at their current location, which may, in general, be dynamically changing as the user moves. The similarity of needed function implies that existing solutions for initiation of sessions (namely, the Session Initiation Protocol (SIP) [2]) is an ideal base on which to build an IM protocol.

2. Changes Introduced in draft-ietf-simple-im-01

This version removes the idea of implicit sessions created by MESSAGE requests. MESSAGE requests are now completely stateless in themselves.

Rosenberg, et. al. Expires January 16, 2002 [Page 3]

Internet-Draft SIP Extensions for Instant Messaging July 2001

The version also some open issues: Bodies are not allowed in responses; an Accept header on a 415 response includes body types nested inside message/cpim bodies, all IM UAs MUST be able to receive message/cpim.

This draft introduces a new section for CPIM mapping. The authors expect this section will need further work to complete.

3. Changes Introduced in draft-ietf-simple-im-00

The draft name changed to reflect its status as a SIMPLE working group item. This version introduces no other changes.

4. Changes Introduced in draft-rosenberg-imp-01

This submission serves to track transition of the work on a SIP implementation of IM to the newly formed SIMPLE working group. It endeavors to capture the progress made in IMPP since the original submission (in particular, including the im: URL and the message/cpim body) and detail a set of open issues for the SIMPLE working group to address.

To support those goals, a great deal of the background and motivation material in the original text has been shortened or removed.

5. Terminology

Most of the terminology used here is defined in RFC2778 [4]. However, we duplicate some of the terminology from SIP in order to clarify this document:

User Agent (UA): A UA is a piece of software which is capable of initiating requests, and of responding to requests.

User Agent Server (UAS): A UAS is the component of a UA which receives requests, and responds to them.

User Agent Client (UAC): A UAC is the component of a UA which sends requests, and receives responses.

Registrar: A registrar is a SIP server which can receive and process REGISTER requests. These requests are used to construct address bindings.

6. Overview of Operation

When one user wishes to send an instant message to another, the sender formulates and issues a SIP request using the new MESSAGE

Rosenberg, et. al. Expires January 16, 2002 [Page 4]

Internet-Draft SIP Extensions for Instant Messaging July 2001

method defined by this document. The request URI of this request will normally be the im: URL of the party to whom the message is directed (see CPIM [15]), but can also be a normal SIP URL. The body of the request will contain the message to be delivered. This body can be of any MIME type, including "message/cpim" [16].

The request may traverse a set of SIP proxies using a variety of transport mechanism (UDP, TCP, even SCTP [5]) before reaching its destination. The destination for each hop is located using the address resolution rules detailed in the CPIM and SIP specifications (see Section 7 for more detail). During traversal, each proxy may rewrite the request URI based on available routing information.

Provisional and final responses to the request will be returned to

the sender as with any other SIP request. Normally, a 200 OK response will be generated by the user agent of the request's final recipient. Note that this indicates that the user agent accepted the message, not that the user has seen it.

MESSAGE requests do not create any implied session. They do not in themselves establish a call leg, or any concept of call state. SIP proxies may not record-route MESSAGE requests.

7. The MESSAGE request

This section defines the syntax and semantics of this extension.

7.1 Method Definition

This specification defines a new SIP method, MESSAGE. The BNF for this method is:

```
Message = "MESSAGE"
```

As with all other methods, the MESSAGE method name is case sensitive.

Tables 1 and 2 extend Tables 4 and 5 of SIP by adding an additional column, defining the headers that can be used in MESSAGE requests and responses.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
