Rare-Earth-Doped Fiber Lasers and Amplifiers

Second Edition, Revised and Expanded

edited by

Michel J. F. Digonnet

*Stanford University
Stanford, California*

MARCEL

The first edition was published as *Rare Earth Doped Fiber Lasers and Amplifiers*, Michel J. F. Digonnet, ed. (Marcel Dekker, Inc., 1993).

ISBN: 0-8247-0458-4

This book is printed on acid-free paper.

Since this work, extremely efficient 1.48- μm -pumped Er-doped fiber laser in fact been reported by Wagener et al. at Stanford University [107]. This study established that a key factor that needs to be optimized to maximize the conversion efficiency is the erbium concentration. Measurements indicated that fibers with increasingly high erbium concentrations have increasingly high thresholds and low slope efficiencies. These effects were attributed to the presence of an increasing percentage of Er^{3+} clusters to the fact that clusters dramatically reduce the excited lifetime [133], and therefore the quantum efficiency of the transition. The most efficient fiber laser reported in this study used a low-concentration fiber (110 mol ppm Er_2O_3) and a correspondingly long fiber (42.6 m) [107]. The cleaved fiber ends ($\sim 3.5\%$ reflections) formed the laser Fabry-resonator. In spite of the high cavity loss (~ 29 dB), the threshold was low (~ 4.8 mW) and the laser was successfully pumped with a low-power laser diode. It emitted simultaneously in the forward and backward direction, with a forward slope efficiency of 31.8% [107]. This is the highest slope efficiency and the highest conversion efficiency reported in an Er-doped fiber laser (see Table 3). The backward slope efficiency was 31.8% . A dichroic high reflector was placed at the pump input end, a total slope efficiency of approximately the sum of these two figures, or $\sim 90.4\%$, would be expected, as well as a substantial reduction in threshold.

This study showed that Er-doped fiber lasers, when pumped near 1.48 μm , are at least as efficient as 980-nm pumped lasers. The reasons for this high performance are the low Er concentration and the similarity between the pump and laser photon energies [107]. The slope efficiency of 90.4% is, in fact, very close to the quantum limit of $\lambda_p/\lambda_s \approx 95\%$ predicted for the ratio of pump to signal photon energies. It confirms that the quantum efficiency of this transition can be within a few percent of unity. In this light, concentration quenching may well explain the suboptimal efficiencies and thresholds reported in Er-doped fiber lasers (see Table 3). It points to the importance of selecting a sufficiently low rare earth concentration to maximize the performance of fiber lasers or amplifiers. This requirement was confirmed in a more recent report of a ring fiber laser that used a very low-concentration fiber (see Table 3) [21]. After optimizing the fiber length and output coupler transmission, the laser had a low threshold (6.5 mW) and a fairly high slope efficiency of 38.8% . Tuning from 1525 to 1570 nm was achieved with an intracavity tunable filter.

3.6.8 Summary

In summary, Er-doped fiber lasers operating close to 1.55 μm are extremely efficient. When pumped at 1.48 μm , their slope efficiency can be within a few percent of the theoretical limit $\lambda_p/\lambda_s \approx 95\%$. Pumping at 980 nm produces a lower, although still substantial slope efficiency (theoretical limit of $\sim 63\%$). Pumping at about 800 nm is unfortunately less efficient ($\sim 15\%$) because of pump ESA, even with Yb co-doping. Er-doped fiber lasers are now almost exclusively pumped close to 980 or 1480 nm. They have also been operated at multiple wavelengths simultaneously. This feature, of great importance in dense WDM systems, is reviewed in Chapter 5.

3.7 YTTERBIUM

3.7.1 Basic Spectroscopy

Ytterbium is one of the most versatile laser ions in a silica-based host. It offers several very attractive features, in particular an unusually broad absorption band that str

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
