THE ASSISTANT COMMISSIONER FOR PATENTS Washington, D.C. 20231

Re: Inventor(s): Raul Z. Diaz and Jefferson E. Owen

For: Video and/or Audio Decompression and/or Compression Device that Shares a Memory Interface

Our File No: 96-S-11

Sir:

Enclosed with this transmittal letter are:

- (1) Subject patent application with Declaration and Power of Attorney;
- (2) Five (5) sheets of informal drawings;
- (3) Certificate of Express Mail;
- (4) Assignment and Recordation Cover Sheet;
- (5) Check in the amount of \$1,396.00;
- (6) Return postcard which we would appreciate your date stamping and returning to us upon receipt;

The total filing fee has been calculated as follows:

Basic fee	=		\$ 750.00
Recordation of Assignment		=	40.00
29 claims in excess of 20		=	638.00
2 independent claim in excess of 3		=	156.00
Total filing fee		=	\$1.584.00
29 claims in excess of 20 2 independent claim in excess of 3 Total filing fee		= = =	638.00

I authorize the Commissioner to charge any additional fees which may be required, or credit any overpayment to Account No. 19-1353. A duplicate copy of this sheet is enclosed.

15 <u>Background</u>

5

D

10

20

25

The present invention relates to the field of electronic systems having a video and/or audio decompression and/or compression device, and is more specifically directed to sharing a memory interface between a video and/or audio decompression and/or compression device and another device contained in the electronic system.

The size of a digital representation of uncompressed video images is dependent on the resolution, and color depth of the image. A movie composed of a sequence of such images, and the audio signals that go along with them, quickly becomes large enough so that uncompressed such a movie typically cannot fit entirely onto conventional recording medium, such as a CD. It is also typically

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 1

Page 9 of 280

now prohibitively expensive to transmit such a movie uncompressed.

It is therefore advantageous to compress video and audio sequences before they are transmitted or stored. A great deal of effort is being expanded to develop systems to compress these sequences. There are several coding standards currently used that are based on the discrete cosine transfer algorithm including MPEG-1, MPEG-2, H.261, and H.263. (MPEG stands for "Motion Picture Expert Group", a committee of the International Organization for Standardization, ISO.) The MPEG-1, MPEG-2, H.261, and H.263 standards are decompression protocols that describe how an encoded bitstream is to be decoded. The encoding can be done in any manner, as long as the resulting bitstream complies with the standard.

Video and/or audio compression devices (hereinafter encoders) are used to encode the video and/or audio sequence before it is transmitted or stored. The
resulting bitstream is decoded by a video and/or audio decompression device (hereinafter decoder) before the video and/or audio sequence is displayed. However, a bitstream can only be decoded by a decoder if it complies to the standard used by the decoder. To be able to decode the bitstream on a large number of systems it is advantageous to encode the video and/or audio sequences
to comply to a well accepted decompression standard. The MPEG standards are currently well accepted standards for one way communication. H.261, and H.263 are currently well accepted standards for video telephony.

Once decoded the images can be displayed on an electronic system dedicated to displaying video and audio, such as television or digital video disk (DVD) player, or on electronic systems where image display is just one feature of the system, such as a computer. A decoder needs to be added to these systems to

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 2

Page 10 of 280

5

10

25

allow them to display compressed sequences, such as received images and associated audio, or ones taken from a storage device. An encoder needs to be added to allow the system to compress video and/or audio sequences, to be transmitted or stored. Both need to be added for two way communication such as video telephony.

A typical decoder, such as an MPEG decoder 10 shown in Figure 1a, contains video decoding circuitry 12, audio decoding circuitry 14, a microcontroller 16, and a memory interface 18. The decoder can also contain other circuitry depending on the electronic system the decoder is designed to operate in. For example, when the decoder is designed to operate in a typical television the decoder will also contain an on screen display (OSD) circuit.

Figure 1b shows a better decoder architecture, used in the STi3520 and
STi3520A MPEG Audio/MPEG-2 Video Integrated Decoder manufactured by SGS-THOMSON Microelectronics. The decoder has a register interface 20 instead of a microcontroller. The register interface 20 is coupled to an external microcontroller 24. The use of a register interface 20 makes it possible to tailor the decoder 10 to the specific hardware the decoder 10 interfaces with or change its operation without having to replace the decoder by just reprogramming the register interface. It also allows the user to replace the microcontroller 24, to upgrade or tailor the microcontroller 24 to a specific use, by just replacing the microcontroller and reprogramming the register interface 20, without having to replace the decoder 10.

25

5

10

The memory interface 18 is coupled to a memory 22. A typical MPEG decoder 10 requires 16 Mbits of memory to operate in the main profile at main

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 3

Page 11 of 280

level mode (MP at ML). This typically means that the decoder requires a 2Mbyte memory. Memory 22 is dedicated to the MPEG decoder 10 and increases the price of adding a decoder 10 to the electronic system. In current technology the cost of this additional dedicated memory 22 can be a significant percentage of the cost of the decoder.

An encoder also requires a memory interface 18 and dedicated memory. Adding the encoder to an electronic system again increases the price of the system by both the price of the encoder and its dedicated memory.

10

15

5

A goal in the semiconductor industry is to reduce the die area of an integrated circuit device for a given functionality. Some advantages of reducing the die area is the increase in the number of the die that can be manufactured on same size silicon wafer, and the reduction in price per die resulting therefrom. This results in both an increase in volume and reduction in price of the device.

Many of the functional circuits described above for Figure 1a and Figure 1b take up a lot of die space. However, each of them is needed to make the respective decoder operate.

20

25

Figure 1c shows a computer 25 containing a decoder 10, a main memory 168 and other typical components such as a modem 199, and graphics accelerator 188. The decoder 10 and the rest of the components are coupled to the core logic chipset 190 through a bus 170. The bus is typically a PCI (peripheral component interface) or ISA (industry standard architecture) bus, and each component contains an appropriate interface for interfacing with the bus.

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 4

Page 12 of 280

When any component needs access to the memory 168 either to read from or write to the main memory 168, it generates a request which is placed on the bus 26. When the request is a write the data to be written is also placed on the bus 26. The request is processed in the core logic chipset 190 and the data is then either written to or read from the main memory 168. When data is read from the main memory 168 the data is now placed on the bus and goes to the component that requested the read.

There are typically many components in the computer systems that may 10 require access to the main memory 168, and they are typically all coupled to the same bus 174, or possibly several buses 170, 188 connected together by a PCI bridge 192, if there are not enough connectors on one bus to accommodate all of the peripherals. However, the addition of each bus is very expensive. Each request is typically processed according to a priority scheme. The priority scheme is 15 typically based on the priority given to the device and the order in which the requests are received. Typically, the priority scheme is set up so no device monopolizes the bus, starving all of the other devices. Good practice suggests that no device on the bus require more than approximately 50% of the bus's bandwidth.

The minimum bandwidth required for the decoder 10 can be calculated based on the characteristics and desired operation of the decoder. These characteristics include the standard to which the bitstream is encoded to comply with, whether the decoder is to operate in real time, to what extent frames are dropped, and how the images are stored. Additionally, the latency of the bus that couples the decoder to the memory should be considered.

If the decoder does not operate in real time the decoded movie would stop

Page 13 of 280

5

20

25

periodically between images until the decoder can get access to the memory to process the next image. The movie may stop quite often between images and wait.

To reduce the minimum required bandwidth and still operate in real time, the decoder 10 may need to drop frame. If the decoder 10 regularly does not decode every frame then it may not need to stop between images. However, this produces very poor continuity in the images. This is problematic with an image encoded to the MPEG-1 or MPEG-2 standards, or any standards that uses temporal compression. In temporal (interpicture) compression some of the images are decoded based on previous images and some based on previous and future images. Dropping an image on which the decoding of other images is based is unacceptable, and will result in many poor or even completely unrecognizable images.

The computer can also contain both a decoder and encoder to allow for video 15 telephony, as described above. In this case not operating in real time would mean that the length of time between the occurrence of an event, such as speaking, at one end of the conversation until the event is displayed at the other end of the conversation is increased by the time both the encoder and then the decoder must wait to get access to the bus and the main memory. Not being able to operate in 20 real time means that there would be gaps in the conversation until the equipment can catch up. This increases the time needed to have a video conference, and makes the conference uncomfortable for the participants.

One widely used solution to allow a component in a computer system to operate in real time is to give the component its own dedicated memory. Thus, as shown in Figure 1c, the decoder 10 can be given its own dedicated memory 22, with a dedicated bus 26 to connect the decoder 10 to its memory 22. The

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 6

Page 14 of 280

a

10

25

à

dedicated memory 22, its controller and the pins to control this memory significantly increase the cost of adding a decoder 10 to the computer.

 \mathcal{A}

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 7

Page 15 of 280

Summary of the Invention

The present application discloses an electronic system that contains a first device and video and/or audio decompression and/or compression device capable of operating in real time. Both the first device and the video and/or audio decompression and/or compression device require a memory interface. The video and/or audio decompression and/or compression device shares a memory interface and the memory with the first device. In the preferred embodiment of the invention the shared memory interface contains an arbiter. The arbiter and DMA engines of the video and/or audio decompression and/or compression device and of the first device are configured to arbitrate between the two devices when one of them is requesting access to the memory. This allows the use of one memory interface to control the access of both the video and/or audio decompression and/or compression device and the first device to the memory.

15

20

25

When the video and/or audio decompression and/or compression device used in an electronic system, such as a computer, already containing a device that has a memory interface the video and/or audio decompression and/or compression device can share that memory interface and the memory of the device and the memory interface and memory of the video and/or audio decompression and/or compression device can be eliminated. Eliminating this memory interface reduces the die area without changing the critical dimensions of the device. Therefore increasing the volume and reducing the cost of the decoder or encoder. Eliminating the memory greatly reduces the cost of adding the video and/or audio decompression and/or compression device to the electronic system while not requiring the video and/or audio decompression and/or compression and/or

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 8

Page 16 of 280

compression device to operate in real time.

An advantage of the present invention is significant cost reduction due to the fact that the video and/or audio decompression and/or compression device does not need its own dedicated memory but can share a memory with another device and still operate in real time.

Another significant advantage of the present invention is that the die space needed for the video and/or audio decompression and/or compression device is smaller because the memory interface on the video and/or audio decompression and/or compression device is eliminated.

A further advantage of the present invention is that the video and/or audio decompression and/or compression device can share the memory of the device with which it is sharing the memory interface more efficiently.

Another advantage of the present invention is that the cost of producing a video and/or audio decompression and/or compression device is reduced because the memory interface on the video and/or audio decompression and/or compression device is eliminated.

Another advantage of the present invention is that the video and/or audio decompression and/or compression device can be monolithically integrated into the first device and no extra packaging or pins are needed for the video and/or audio decompression and/or compression device, and no pins are needed for the first device to connect to the video and/or audio decompression and/or compression device, saving pins on both devices and producing a better connection between the

20

two devices.

5

Other advantages and objects of the invention will be apparent to those of ordinary skill in the art having reference to the following specification together with the drawings.

Detailed Description of the Preferred Embodiment

Figure 2 shows an electronic system 40 containing a first device 42 having access to a memory 50 through a memory interface 48, and a decoder 44 and 5 encoder 46, having access to the same memory 50 through the same memory interface 48. First device 42 can be a processor, a core logic chipset, a graphics accelerator, or any other device that requires access to the memory 50, and either contains or is coupled to a memory interface. Any parts common to Figures 1 through 4 are indicated using the same numbering system. In the preferred 10 embodiment of the invention, electronic system 40 contains a first device 42, a decoder 44, an encoder 46, a memory interface 48, and a memory 50. Although, either the decoder 44 or encoder 46 can be used in the decoder/encoder 45 without the other. For ease of reference, a video and/or audio decompression and/or compression device 45 will hereinafter be referred to as decoder/encoder 45. The 15 decoder/encoder 45 may be a single device, or cell on an integrated circuit, or may be two separate devices, or cells in an integrated circuit. In the preferred embodiment of the invention, the first device 42, decoder/encoder 45, and memory interface 48 are on one integrated circuit, however, they can be on separate integrated circuits in any combination.

20

25

a

circuit 12

The decoder 44 includes a video decoding 12 circuit and an audio decoding circuit 14, both coupled to a register interface 20. The decoder 44 can be either a video and audio decoder, just a video, or just an audio decoder. If the decoder 44 is just a video decoder it does not contain the audio decoding circuitry 14. The audio decoding can be performed by a separate audio codec coupled to the first device 42, or through software. In the preferred embodiment of the invention, when the decoder/encoder 45 is in a system containing a processor and is coupled

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 12

Page 20 of 280

to the processor, the audio decoding is performed in software. This frees up space on the die without causing significant delay in the decoding. If the audio decoding is performed in software, the processor should preferably operate at a speed to allow the audio decoding to be performed in real time without starving other components of the system that may need to utilize the processor. For example, currently software to perform AC-3 audio decoding takes up approximately 40% of the bandwidth of a 133 MHz Pentium. The encoder 46 includes a video encoding circuit 62 and an audio encoding circuit 64, both coupled to a register interface 20. The encoder 46 can be either a video and audio encoder, just a video, or just an audio encoder. If the encoder 46 is just a video encoder, it does not contain the audio encoding circuitry 64. The audio encoding can be performed by a separate audio codec coupled to the first device 42, or through software. In the preferred embodiment of the invention, when the decoder/encoder 45 is in a system containing a processor and is coupled to the processor, the audio encoding is software. Presenting performed in software. Presenting the same advantages of freeing up space on the die without causing significant delay in the encoding. The register interfaces 20 of the decoder 44 and encoder 46 are coupled to a processor.

20

25

5

10

a 15

The decoder 44 and encoder 46 are coupled to the direct memory access (DMA) engine 52. The decoder and encoder can be coupled to the same DMA engine as shown in Figure 2, or each can have its own DMA engine, or share a DMA engine with another device. When the decoder/encoder 45 are two separate devices or cells, decoder 44 and encoder 46 can still be coupled to one DMA engine 52. When the decoder/encoder is one device or is one cell on an integrated circuit, the DMA engine 52 can be part of the decoder/encoder 45, as shown in Figure 2. The DMA engine 52 is coupled to the arbiter 54 of the memory interface 48.

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 13

Page 21 of 280

The first device 42 also contains a DMA engine 60. The DMA engine 60 of the first device 42 is coupled to the arbiter 54 of the memory interface 48. The arbiter is also coupled to the refresh logic 58 and the memory controller 56. The memory interface 48 is coupled to a memory 50. The memory controller 56 is the control logic that generates the address the memory interface 48 access in the memory 50 and the timing of the burst cycles.

In current technology, memory 50 is typically a DRAM. However, other types of memory can be used. The refresh logic 58 is needed to refresh the DRAM. However, as is known in the art, if a different memory is used, the refresh logic 58 may not be needed and can be eliminated.

The decoder/encoder 45 is coupled to the memory 50 through devices, typically a bus 70, that have a bandwidth greater than the bandwidth required for the decoder/encoder 45 to operate in real time. The minimum bandwidth required for the decoder/encoder 45 can be calculated based on the characteristics and desired operation of the decoder, including the standard to which the bitstream is encoded to comply with, whether the decoder/encoder 45 is to operate in real time, to what extent frames are dropped, and which images are stored. Additionally, the latency of the bus 70 that couples the decoder/encoder 45 to the memory 50 should be considered.

A goal is to have the decoder/encoder 45 operate in real time without dropping so many frames that it becomes noticeable to the human viewer of the movie. To operate in real time the decoder/encoder 45 should decoder and/or encode images fast enough so that any delay in decoding and/or encoding cannot be detected by a human viewer. This means that the decoder/encoder 45 has a

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 14

Page 22 of 280

a 5

10

25

required bandwidth that allows the decoder/encoder 45 to operate fast enough to decode the entire image in the time between screen refreshes, which is typically 1/30 of a second, with the human viewer not being able to detect any delay in the decoding and/ or encoding. To operate in real time the required bandwidth should be lower than the bandwidth of the bus. In order not to starve the other components on the bus, i.e. deny these components access to the memory for an amount of time that would interfere with their operation, this required bandwidth should be less the entire bandwidth of the bus. Therefore a fast bus 70 should be used. A fast bus 70 is any bus whose bandwidth is equal to or greater that the required bandwidth. There are busses, in current technology, including the ISA bus, whose bandwidth is significantly below the bandwidth required for this.

In the preferred embodiment of the invention the decoder/encoder 45 is coupled to the memory 50 through a fast bus 70 that has a bandwidth of at least the bandwidth required for the decoder/encoder 45 to operate in real time, a threshold bandwidth. Preferably the fast bus 70 has a bandwidth of at least approximately twice the bandwidth required for the decoder/encoder 45 to operate in real time. In the preferred embodiment the fast bus 70 is a memory bus, however any bus having the required bandwidth can be used.

20

a

25

15

5

 a^{10}

The decoder/encoder 45 only requires access to the memory during operation. Therefore, when there is no need to decode or encode, the first device 42, and any other devices sharing the memory 50 have exclusive access to the memory₁ and can use the entire bandwidth of the fast bus 70.

In the preferred embodiment, even during decoding and encoding the decoder/encoder 45 does not always use the entire required bandwidth. Since the

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 15

Page 23 of 280

fast bus 70 has a bandwidth a little less than twice the required bandwidth the decoder/encoder 45 uses at most 60% of the bandwidth of the fast bus 70.

The required bandwidth is determined based on the size and resolution of the image, and the type of frame (I, P, or B). In the preferred embodiment the decoder/encoder typically will be using less than 40% of the bandwidth of the fast bus 70. This frees up the remaining bandwidth to be used by the other devices the decoder/encoder 45 is sharing the memory 50 with.

10 The decoder/encoder 45 can decode a bitstream formatted according to any . one or a combination of standards. In the preferred embodiment of the invention the decoder/encoder 45 is a multi-standard decoder/encoder capable of decoding and encoding sequences formatted to comply to several well accepted standards. This allows the decoder/encoder 45 to be able to decode a large number of video and/or audio sequences. The choice of which standards the decoder/encoder 45 is capable of decoding bitstreams formatted to and of encoding sequences to comply to is based on the desired cost, efficiency, and application of the decoder/encoder 45.

In the preferred embodiment, these standards are capable of both intrapicture compression and interpicture compression. In intrapicture compression the redundancy within the image is eliminated. In interpicture compression the redundancy between two images are eliminated and only the difference information is transferred. This requires the decoder/encoder 45 to have access to the previous or future image that contains information needed to decode or encode the current image. These precious and/or future images need to be stored then used to decode the current image. This is one of the reasons the decoder/encoder 45 requires access to the memory, and requires a large bandwidth. The MPEG-1 and MPEG-2

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 16

Page 24 of 280

5

standards allow for decoding based on both previous images and/or future images. Therefore for a decoder/encoder 45 capable of operating in real time to be able to comply with the MPEG-1 and MPEG-2 standards it should be able to access two images, a previous and a future image, fast enough to decode the current image in the 1/30 of a second between screen refreshes.

An MPEG environment is asymmetrical; there are much fewer encoders than decoders. The encoders are very difficult and expensive to manufacture and the decoders are comparatively easy and cheap. This encourages many more decoders than encoders, with the encoders in centralized locations, and decoders available such that every end user can have a decoder. Therefore, there are many receivers but few transmitters.

For video telephony and teleconferencing each end user has to be able to 15 both receive and transmit. H.261, and H.263 are currently well accepted standards for video telephony. An encoder that can encode sequences to comply to the H.261 and H.263 standards is less complicated, having a lower resolution and lower frame rate than an encoder that complies to the MPEG-1 or MPEG-2 standards. a Possibly making the quality of the decoded images somewhat lower than those 20 from an encoder that complies with the MPEG-1 or MPEG-2 standards. Such an encoder, since it should be inexpensive and operate in real time, is also less efficient than an encoder to encode sequences to comply to the MPEG-1 or MPEG-This means that the compression 2 standards. Meaning that compression factor, which is the ratio between the source data rate and the encoded bitstream data rate, of such an encoder is lower 25 for a given image quality than the compression factor of an MPEG encoder. However, because such an encoder is less complicated is it much cheaper and faster ~ than an encoder capable of complying with the MPEG-1 and/or MPEG-2 standards.

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 17

Page 25 of 280

5

10

æ

a

This makes video telephony possible, since both a long delay in encoding the signal and a cost that is prohibitively expensive for many users is unacceptable in video telephony.

In the preferred embodiment, the decoder/encoder 45 is capable of decoding a bitstream formatted to comply to the MPEG-1, MPEG-2, H.261, and H.263 standards, and encoding a sequence to produce a bitstream to comply to the H.261, and H.263 standards. This allows the decoder/encoder 45 to be able to be used for Having the encoding comply to the H.261 and H.263 standards but rideo telephony. The encoding to comply to the H.261 and H.263 standards but standards the desire to reduce the cost of . transmission and storage by encoding to produce the highest compression factor and the desire to keep cost low enough to be able to mass market the device.

The decoder/encoder 45 is preferably monolithically integrated into the first device as shown in Figure 3 and Figure 4. In Figure 3 the decoder/encoder 45 is integrated into a core logic chipset 150. In Figure 4 the decoder/encoder 45 is integrated into a graphics accelerator 200. Although, the decoder/encoder 45 can be separate from the first device 42, as shown in Figure 2.

Figure 3 shows a computer where the decoder/encoder 45 and the memory interface 48 are integrated into a core logic chipset 150. The core logic chipset 150 can be any core logic chipset known in the art. In the embodiment shown in Figure 3 the core logic chipset 150 is a PCI core logic chipset 150, which contains a PCI core logic device 158, the processor interface 154, and bus interfaces 156 for any system busses 170 to which it is coupled. The core logic chipset 150 can also contain a accelerated graphics port (AGP) 160 if a graphics accelerator 200 is present in the computer, and an enhanced integrated device electronics (EIDE)

> SGS-THOMSON Microelectronics Inc. 96-S-11 Page 18

Page 26 of 280

Petitioners HTC & LG - Exhibit 1002, p. 26

5

 α

10

15

20

interface 186. The core logic chipset 150 is coupled to a processor 152, peripherals, such as a hard disk drive 164 and a DVD CD-ROM 166, a bus, such as a PCI bus 170, and a main memory 168.

5 In this embodiment, the main memory 168 is the memory 50 to which the memory interface 48 is coupled to. The main memory 168 is coupled to the memory interface 48 through a memory bus 167. In current technology the memory bus 167, which corresponds to the fast bus 70, for coupling a core logic chipset to a memory, is capable of having a bandwidth of approximately 400 Mbytes/s. This bandwidth is at least twice the bandwidth required for an optimized decoder/encoder 45, allowing the decoder/encoder 45 to operate in real time.

The core logic chipset 150 can also be coupled to cache memory 162 and a graphics accelerator 200 if one is present in the computer. The PCI bus 170 is also coupled to the graphics accelerator 200 and to other components, such as a local-area network (LAN) controller 172. The graphics accelerator 200 is coupled to a display 182, and a frame buffer 184. The graphics accelerator can also be coupled to an audio codec 180 for decoding and/or encoding audio signals.

Figure 4 shows a computer where the decoder/encoder 45 and the memory interface 48 are integrated into a graphics accelerator 200. The graphics accelerator 200 can be any graphics accelerator known in the art. In the embodiment shown in Figure 4, the graphics accelerator 200 contains a 2D accelerator 204, a 3D accelerator 206, a digital to analog converter 202, and bus interfaces 210 for any system busses 170 to which it is coupled. The graphics accelerator 200 can also contain an audio compressor/decompressor 208. The graphics accelerator 200 is coupled to a display 182, and a frame buffer 184.

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 19

Page 27 of 280

Petitioners HTC & LG - Exhibit 1002, p. 27

In this embodiment, the frame buffer 184 is the memory 50 to which the memory interface 48 is coupled. The frame buffer 184 is coupled to the memory interface 48 through a memory bus 185. In this embodiment, memory bus 185 corresponds to the fast bus 70. In current technology the memory bus 185, for coupling a graphics accelerator to a memory, is capable of having a bandwidth of up to 400 Mbytes/s. This bandwidth is more that twice the bandwidth required for an optimized decoder/encoder 45. This allows the decoder/encoder 45 to operate in real time.

10 The graphics accelerator 200 can also be coupled to an audio codec 180 for decoding and/or encoding audio signals. The PCI bus 170 is also coupled to a chipset 190, and to other components, such as a LAN controller 172. In the present embodiment the chipset is a PCI chipset, although it can be any conventional chipset. The chipset 190 is coupled to a processor 152, main memory 168, and a PCI bridge 192. The PCI bridge bridges between the PCI bus 170 and the ISA bus 198. The ISA bus 198 is coupled to peripherals, such as a modem 199 and to an EIDE interface 186, which is coupled to other peripherals, such as a hard disk drive 164 and a DVD CD-ROM 166. Although, if the peripherals are compatible to the PCI bus the EIDE interface 186 can be integrated in to the PCI chipset 190 and the 20 peripherals 164, 166 can be coupled directly to the PCI chipset, eliminating the PCI bridge 192 and the ISA bus 198.

Referring to Figure 2, the operation of the memory interface 48 during a memory request will now be described. During operation the decoder/encoder 45, the first device 42, and the refresh logic 58, if it is present, request access to the memory through the arbiter 54. There may also be other devices that request access to the memory 50 through this arbiter. The arbiter 54 determines which of

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 20

Page 28 of 280

Petitioners HTC & LG - Exhibit 1002, p. 28

5

the devices gets access to the memory 50. The decoder gets access to the memory in the first time interval and the first device gets access to the memory in the second time interval. The DMA engine 52 of the decoder/encoder 45 determines the priority of the decoder/encoder 45 for access to the memory 50 and of the burst length when the decoder/encoder 45 has access to the memory. The DMA engine 60 of the first device determines its priority for access to the memory 50 and the burst length when the first device 42 has access to the memory.

The decoder/encoder 45 or one of the other devices generates a request to access the memory 50. The request will be transferred to the arbiter 54. The state . of the arbiter 54 is determined. The arbiter typically has three states. The first state is idle, when there is no device accessing the memory and there are no requests to access the memory. The second state is busy when there is a device accessing the memory and the are no requests access the memory and there is a device access the memory. The third state is queue when there is a device accessing the memory and there is another request to access the memory.

It is also determined if two requests are issued simultaneously. This can be before or after performed either before of after determining the state of the arbiter. Access to the memory is determined according to the following chart.

5

a

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 21

Page 29 of 280

	Arbiter state	Simultaneous requests	Action
()	Idle	Yes	One of the requests gets access to the memory based on the priority scheme, and the other request is queued.
	Busy	Yes	Both requests are queued in an order based on the priority scheme.
	Queue	Yes	Both requests are queued in an order based on the priority scheme.
5	Idle	No	The device gets access to the memory.
	Busy	No	The request is queued.
	Queue	No	The requests are queued in an order based on the priority scheme.

The priority scheme can be any priority scheme that ensures that the 10 decoder/encoder 45 gets access to the memory 50 often enough and for enough of a burst length to operate properly, yet not starve the other devices sharing the memory. The priority of the first device, device priority, and the priority of the decoder/encoder 45, decoder priority, is determined by the priority scheme. This can be accomplished in several ways.

15

仍已

To operate in real time, the decoder/encoder 45 has to decode an entire image in time to be able to display it the next time the screen is refreshed, which is typically every 1/30 of a second. The decoder/encoder 45 should get access to the

Page 30 of 280

SGS-THOMSON Microelectronics Inc. 96-S-11

Page 22

memory to store and retrieve parts of this and/or of past and/or future images, depending on the decoding standard being used, often enough and for long enough burst lengths to be able to decode the entire image in the 1/30 of a second between screen refreshes.

There are many ways to this. One way to do this is to make the burst length of the first device, and any other device like the screen refresh that shares the memory and memory interface, [hereinafter sharing device] have short burst lengths, and to make sure that the same device is not the next device to get access 10 to the memory when other devices have been waiting for a long time. Another way is to preempt the sharing device if its burst length exceeds a burst length threshold and again to make sure that the same device is not the next device to get access to the memory when other devices have been waiting for a long time. Preferably, when the preemption is used the sharing device would be preempted when its burst 15 length exceeds 16 words. A third way is to limit the bandwidth available to the sharing devices, this way the decoder/encoder 45 always has enough bandwidth to operate in real time. Preferably the bandwidth of the sharing devices is limited only when the decoder/encoder 45 is operating. In the preferred embodiment a memory queue, such as a FIFO, in the decoder/encoder 45 generates an error signal 20 when it falls below a data threshold. The error is sent to the CPU 152 and the CPU 152 can either shut down the system, drop a image frame or resume the decoding/encoding process.

There are also many ways to make sure that the same device is not the next device to get access to the memory when other devices have been waiting for a long time. This both ensures decoder/encoder 45 gets access to the memory 50 often enough, yet not starve the other devices sharing the memory. One way to do

5

ネ

25

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 23

Page 31 of 280

this is to disallow back to back requests. Another is to have shifting priority, where a particular request starts with a lower priority when first made and the priority increases with the length of time the request is in the queue, eventually reaching a priority above all of the other requests. In the preferred embodiment, the decoder/encoder 45 has a one clock cycle delay between requests to allow a sharing device to generate a request between the decoder/encoder requests.

In the preferred embodiment the burst length of the decoder is relatively short, approximately four to seventeen words. This allows the graphics accelerator more frequent access to the memory to ensure that the display is not disturbed by the sharing of the memory interface 48 and memory 50 when the decoder/encoder is in the graphics accelerator 200.

An electronic system 40, shown in Figure 2, containing the first device 42, 15 the memory interface 48 coupled to a memory 50 and to the first device 42, a decoder/encoder 45 coupled to the memory interface 48, where the decoder/encoder 45 shares the memory interface 48 with the first device 42 provides several advantages. Referring to Figure 2 and Figure 1b simultaneously, the decoder 44, and encoder 46, according to the preferred embodiment of the invention do not 20 need their own memory interfaces 18, as was needed in the prior art. Eliminating the memory interface 18 results in reducing the die size. This allows both a reduction in the price per die of the decoder, or encoder, and an increase in the volume of the product that can be produced.

Additionally, because the decoder/encoder 45 shares the memory interface 48 of the first device it also shares its memory 50. This eliminates the dedicated memory 22 that was necessary in the prior art for the decoder/encoder to operate

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 24

Page 32 of 280

5

10

25

in real time, resulting in significant reduction in the cost of the device. Allowing the decoder/encoder 45 to share the memory 50 with a first device 42 and to allow the decoder/encoder 45 to access the memory 50 through a fast bus 70 having a bandwidth of a least the bandwidth threshold permits the decoder/encoder to operate in real time. This allows the decoder/encoder to operate in real time and reduces stops between images and dropping frames to a point where both are practically eliminated. This produces better images, and eliminates any discontinuities and delays present in the prior art.

Furthermore, as the geometry used for devices decreases and the functionality of device increases the number of pads required in them increases. This at times requires the die size to be dictated by the number of pads and their configuration, leaving empty space on the die. This is typically the situation for core logic chipsets. In current technology, the pad requirements of a core logic chipset require the chipset to be one-third larger than required for the functional components of the core logic chipset. That means that one-third of the die space is empty. Incorporating the decoder/encoder 45 into the core logic chipset 150, as shown in Figure 3 provides the added advantage of effectively utilizing that space, without adding any extra pins to the core logic chipset 150. It also provides better connections between the decoder/encoder 45 and the core logic chipset 150.

WE CLAIM:

1	1. An electronic system coupled to a memory and to a first device that
2	requires access to the memory, the electronic system comprising:
3	a decoder that requires access to the memory sufficient to maintain
4	real-time operation; and
5	a memory interface coupled to the decoder, for selectively providing
6	access for the first device and the decoder to the memory.
1	2. The electronic system of claim 1, wherein the memory interface is
2	coupled to the first device.
1	3. The electronic system of claim 1, wherein the memory interface is
2	coupled to the memory.
1	4 The electronic system of claim 1 wherein the decoder comprises a
2	video decoder
2	
1	5 The electronic system of claim 1, wherein the decoder is conclude of
1	decoding a hitstrage formatted to country with the MDEC 2 standard
2	decoding a busirearm formatied to comply with the MPEG-2 standard.
1	6. The electronic system of claim 1, wherein the memory interface further
2	comprises an arbiter for selectively providing access for the first device and the
3	decoder to the memory.
1	/ 7. The electronic system of claim 1, further comprising an encoder
2	coupled to the memory interface.

1 8. The electronic system of claim 7, wherein the decoder, the encoder and 2 the memory interface are monolithically integrated into the first device.

1 9. The electronic system of claim 7, wherein the encoder is capable of 2 producing a bitstream that complies with the H.263 standard.

1 10. The electronic system of claim 1, wherein the decoder and the memory 2 interface are monolithically integrated into the first device.

1 11. The electronic system of claim 1, further comprising a fast bus coupled .
 2 to the memory, to the decoder and to the first device.

1 12. The electronic system of claim 11, wherein the fast bus has a 2 bandwidth of greater than a threshold bandwidth.

1 13. The electronic system of claim 11, wherein the fast bus comprises a 2 memory bus.

An electronic system coupled to a memory, comprising:

a first device that requires access to the memory;

a decoder that requires access to the memory sufficient to maintain real time operation;

a fast bus coupled to the first device and the decoder; and

a memory interface for coupling to the memory, and coupled to the
first device, and to the decoder, the memory interface having an arbiter for
selectively providing access for the first device and the decoder to the memory.

 $\frac{1}{24}$. The electronic system of claim 14, wherein the first device is a graphics accelerator.

1 25. The electronic system of claim 14, wherein the decoder is capable of 2 decoding a bitstream formatted to comply with the MPEG-2 standard.

10-02/26. The electronic system of claim 14, wherein the fast bus has a bandwidth of greater than a threshold bandwidth.

1 $\frac{\sqrt{4}}{27}$. The electronic system of claim 14, wherein the fast bus comprises a memory bus.

A computer comprising:

an input device;

an output device;

a memory;

1 2

4

5

1 2

3

a first device that requires access to the memory;

a decoder that requires access to the memory sufficient to maintain real
time operation; and

8 a memory interface coupled to the memory, to the first device, and to 9 the decoder, the memory interface having a means for selectively providing access 10 for the first device and the decoder to the memory.

15
28. The computer of claim 28, wherein: the first device is capable of having a variable bandwidth; and the decoder is capable of having a variable bandwidth.

30

Page 38 of 280

P The computer of claim 28, wherein the decoder comprises a video 1 2 decoder.

18 31. The computer of claim 2^{8} , wherein the decoder is capable of decoding 1 2 a bitstream formatted to comply with the MPEG-2 standard.

The computer of claim 28, wherein the memory interface further 1 2 comprises an arbiter for selectively providing access for the first device and the 3 decoder to the memory.

D 15 The computer of claim 28, further comprising an encoder coupled to 33. 1 2 the memory interface.

 $\mathcal{F}^{\mathcal{V}}$ The computer of claim 33, wherein the decoder, the encoder and the 1 2 memory interface are monolithically integrated into the first device.

ЪD The computer of claim 23, wherein the encoder is capable of producing a bitstream that complies with the H.263 standard.

The computer of claim 28, wherein the decoder and the memory interface are monolithically integrated into the first device.

24 15 The computer of claim 28, wherein the first device is a processor chipset.

24

The computer of claim 37, wherein the processor chipset is coupled to

Page 39 of 280

1 39. The computer of claim 28, wherein the first device is a graphics 2 accelerator.

1 40. The computer of claim 28, wherein the decoder is capable of decoding 2 a bitstream formatted to comply with the MPEG-2 standard.

1 $10^{-0.47}$ 41. The computer of claim 28, further comprising a fast bus coupled to the 2 memory, to the decoder and to the first device.

42. The computer of claim 41, wherein the fast bus has a bandwidth of .
 greater than a threshold bandwidth.

1 43. The electronic system of claim 41, wherein the fast bus comprises a 2 memory bus.

1 2 44. In an electronic system having a first device coupled to a memory 2 3 4. In an electronic system having a first device coupled to a memory 3 4 a device priority and capable of generating a request to access the memory, a 4 method for selectively providing access to the memory comprising the steps of:

5 providing a decoder coupled to the memory interface, the decoder capable of 6 operating in real time, having a decoder priority and capable of generating a request

7 to access the memory;

8 providing an arbiter having an idle, a busy and a queue state;

9 generating a request by the decoder to access the memory;

10 determining the state of the arbiter;

11 providing the decoder access to the memory responsive to the arbiter being

12 in the idle state;

SGS-THOMSON Microelectronics Inc. 96-S-11 Page 32

Page 40 of 280

queuing the request responsive to the arbiter being in the busy state; and queuing the request responsive to the arbiter being in the queue state in an order responsive to the priority of the decoder request and the priority of any other queued requests.

> 29 The method of claim 44, further comprising the steps of: determining the number of requests issued simultaneously;

responsive to number of requests issued simultaneously being greater than one:

selectively providing access to the memory responsive to the arbiter being in the idle state, and the priority of the simultaneously issued requests;

7 queuing the simultaneously issued requests responsive to the arbiter 8 being in the busy state in an order responsive to the priority of the simultaneously 9 issued requests;

10 queuing the simultaneously issued requests responsive to the arbiter 11 being in the queue state in an order responsive to the priority of the simultaneously 12 issued requests and the priority of any other queued requests.

 \mathcal{D} The method of claim \mathcal{A} , wherein the step of determining the number 2 of requests issued simultaneously is performed prior to the step of determining the 3 state of the arbiter.

The method of claim 44, further comprising the step of preempting the first device access to the memory and providing the decoder access to the memory responsive to the first device having a burst length above a burst length threshold.

The method of claim 44, wherein the decoder priority increases

2 responsive to the length of time the request issued by the decoder is queued.

1 49. In an electronic system having a first device coupled to a memory 2 interface and a memory coupled to the memory interface, a method for selectively 3 providing access to the memory comprising the steps of: 4

providing a memory management system;

7 8

5 providing a decoder coupled to the memory interface, the decoder capable of operating in real time; 6

providing access to the memory at a first time interval to the decoder; and providing access to the memory at a second time interval to the first device.

ABSTRACT

An electronic system that contains a first device that requires a memory interface and video and/or audio decompression and/or compression device that shares a memory interface and memory with the first device while still permitting the video and/or audio decompression and/or compression device to operate in real time is disclosed.

Docket No. 96-S-11

DECLARATION FOR PATENT APPLICATION

As a below named inventor, I hereby declare that:

My residence, post office address, and citizenship are as stated below next to my name.

I believe I am the original, first, and sole inventor (if only one name is listed below) or an original, first, and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

Video and/or Audio Decompression and/or Compression Device that Shares a Memory Interface

the specification of which is attached hereto.

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claims, as amended by any amendment referred to above.

I acknowledge the duty to disclose information which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, Section 1.56(a).

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

I hereby appoint Lisa K. Jorgenson, Reg. No. <u>34,845</u> and Irena Lager, Reg. No. <u>39,260</u> to prosecute this application and to transact all business in the U.S. Patent and Trademark Office in connection therewith.

Please send all correspondence to:

Lisa K. Jorgenson Reg. No. 34,845 SGS-Thomson Microelectronics, Inc. 1310 Electronics Drive Carrollton, TX 75006 (214) 466-7414

INFORMATION DISCLOSURE STATEMENT UNDER C.F.R. 1.97

Honorable Assistant Commissioner for Patents Washington, D.C. 20231

C	;	-	
Э	1	I.	

Applicants request that the information listed on the attached Form PTO-1449 be considered by the Office during the pendency of the above entitled application, pursuant to 37 C.F.R. 1.97.

Please charge any fees necessary for prosecution of the present application to deposit account no. 19-1353. If any extension of time is required, such extension is hereby requested. Please charge any additional required fee for extension of time to Applicant's Deposit Account No. 19-1353.

CERTIFICATE OF MAILING (37 CFR 1.8a)

I hereby certify that this paper (along with any paper referred to as being attached or enclosed) is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to the: Assistant Commissioner for Patents, Washington, D.C. 20231, on $(\mathcal{OA}, \mathcal{J})$, 1996.

In accordance with 37 C.F.R. 1.97(h), the filing of this Information Disclosure Statement shall not constitute an admission that any information cited therein is, or is considered to be, material to patentability as defined in 37 C.F.R. 1.56(b). In the interest of full and complete disclosure to the Office, some or all of the art cited herein may not be considered by Applicant(s) or the Undersigned to be material under the new standards of materiality defined in 37 C.F.R 1.56(b), enacted March 16, 1992, but may be material under the old standard of materiality defined in 37 C.F.R. 1.56(a), last amended on November 28, 1988, or may merely be technical background which may be of interest to the Examiner. In accordance with 37 C.F.R. 1.97(g), the filing of this Information Disclosure Statement shall not be construed to mean that a search has been made.

This Information Disclosure Statement is being filed under 37 C.F.R. § 1.97(b) within three months of the filing date of the application, or before the mailing date of a first office action on the merits. No fee or certification is required.

Respectfully submitted,

Irena Lager Registry No. 39,260 SGS-THOMSON Microelectronics, Inc. 1310 Electronics Drive Carrollton, Texas 75006 (972) 466-7511

PETITION TO SECURE FILING DATE AS OF

MAILING DATE VIA EXPRESS MAIL

Applicant petitions that this application be accorded the filing date on which the papers

were sent "Express Mail Post Office to Addressee" mailing label no. EG947362259US on August

23, 1996.

CERTIFICATE OF MAILING (37 CFR 1.8a)

I hereby certify that this paper (along with any paper referred to as being attached or enclosed) is being deposited with the United States Postal Service on the date shown below with sufficient postage as first class mail in an envelope addressed to the: Assistant Commissioner for Patents, Washington, D.C. 20231, on \underline{GDD} , 1997.

SUBMISSIONS

Submitted herewith is:

- A copy of the executed Express Mail certificate with mailing label number EG947362259US.
- A copy of the Express Mail Receipt No. EG947362259US with a "date in" of August 24, 1996 as entered by the U.S. Postal Service.
- 3. Declaration of Kimberley K. Larson.
- A copy of Collection Management System, Collection Point Inventory by Address (CPIA) for the U.S. Post Office, Dallas District.

Applicant respectfully requests that the above-referenced application be accorded a filing date of August 23, 1996 as shown by the attached declaration of Kimberley K. Larson and the attached CPIA from the U.S. Post Office. Applicant had a reasonable basis to believe that the correspondence placed in the Express Mail envelope and deposited in a U.S. Postal Service Mail box on August 23, 1996 would be picked up that same day and, therefore, the Express Mail label would have a "date in" of August 23, 1996. Therefore, Applicants request that the application be accorded a filing date of August 23, 1996 as specified in 37 C.F.R. §1.10(c) in effect on August 23, 1996.

PETITION FEE

The petition fee (37 CFR 1.17(h)) is hereby authorized to be charged to Deposit Account No. 19-1353 of SGS-THOMSON Microelectronics, Inc.

Assistant Commissioner for Patents Washington, D.C. 20231

Sir:

DECLARATION OF KIMBERLEY K. LARSON

I, KIMBERLEY K. LARSON, do hereby take oath and swear as follows:

- I am employed as a patent secretary in the Patent Department of SGS-THOMSON Microelectronics, Inc.
- (2) As part of my duties, I am responsible for the preparation of certain documents for transmittal to the Patent and Trademark Office, including ensuring that proper documents are present to be transmitted, organizing the documents to be transmitted and placing these documents in envelopes for transmittal.
- (3) On August 23, 1996, I prepared an Express Mail mailing label bearing mailing label number EG947362259US addressed to the Assistant Commissioner for Patents, Washington, D.C. 20231. I also prepared and signed a Certificate of Mailing by Express Mail dated August 23, 1996 with express mail mailing label number EG947362259US, a copy of which is attached hereto.

96-S-011

-1-

- (4) Pursuant to the requirements of 37 CFR 1.10, I placed the correspondence in an Express Mail envelope and deposited the Express Mail envelope in a U.S. Express Mail mailbox on Friday, August 23, 1996 around 4:45 p.m. This was prior to the last designated pickup time of 5:00 p.m for this U.S. Express Mail mailbox. Therefore, the certificate of Express Mailing and the application was deposited with the U.S. Postal Service "Express Mail Post Office to Addressee" service under 37 CFR 1.10 on August 23, 1996 addressed to the Assistant Commissioner for Patents, Box Patent Applications, Washington, D.C. 20231. Attached is a copy of the collection times sent via facsimile from Vincent Lewis of the Consumer Affairs/Claims Division of the U.S. Postal Service. This facsimile shows the last collection time of 5:00 p.m. for the post office on 13904 Josey Lane where the Express Mail package was deposited.
- (5) I am unaware as to the circumstances that caused our express mail package not be picked up and processed by the U.S. Postal Service until the next day, August 24, 1996. The above-referenced application was accorded a filing date of August 26, 1996, instead of August 23, 1996. A copy of the return postcard bearing a cancelled date of August 24, 1996, and an actual receipt date of August 26, 1996 is enclosed, along with a copy of the Express Mail Receipt No. EG947362259US with a postmark date of August 24, 1996.

96-S-011

Page 72 of 280
I declare further that all statements made herein of my own knowledge are true; that all statements made herein on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such wilful false statements may jeopardize the validity of this application and any registration resulting therefrom.

In re Application of Raul Z. Diaz et al. Application No. 08/702,911 Filed: August 26, 1996 Attorney Docket No. 96-S11

DECISION DISMISSING PETITION

This is a decision on the petition filed February 26, 1997, requesting that the above-identified application be accorded a filing date of August 23, 1996, rather than the presently accorded filing date of August 26, 1996.

:

:

Petitioners request the earlier filing date on the basis that the application was purportedly deposited in Express Mail service on August 23, 1996, pursuant to the requirements of 37 CFR 1.10. Petitioners acknowledge that the date of deposit in Express Mail shown on petitioners' Express Mail receipt is August 24, 1996, a Saturday, but argue that the application was actually deposited in an Express Mail drop box on August 23, 1996, before the last scheduled pick up for the day.

Paragraph (c) of 37 CFR 1.10 stated on August 23, 1996, that:

"the...Office will accept the certificate of mailing by 'Express Mail' and accord the paper or fee the certificate date under 35 U.S.C. 21(a)... without further proof of the date on which the mailing by 'Express Mail' occurred unless a question is present regarding the date of mailing."

Page 88 of 280

Application No. 08/702,911

Page 2

However, on May 16, 1995, the Commissioner waived the requirement for a certificate of mailing under 37 CFR 1.10. See 1174 Off. Gaz. Pat. Office 92. The Commissioner noted that the certificate of mailing under 37 CFR 1.10 is redundant in view of the fact that the date of deposit in Express Mail is entered as the "Date-In" on the Express Mail label by the U.S. Postal Service (USPS). Thus, the PTO considers the date "the paper or fee is shown to have been deposited as Express Mail" to be the "Date-In" on the Express Mail label.

Placing the "Date-In" on the Express Mail label or receipt by the postal clerk establishes that the package was actually received by the USPS. That is the date that verifies that the package was actually mailed. Accordingly, the application was accorded a filing date of August 26, 1996, the next business following the date of deposit in Express Mail service.

Petitioners allege that the date of deposit in Express Mail shown by petitioners' Express Mail receipt is a USPS error. In support, the petition is accompanied by a declaration of Kimberley K. Larson stating her recollection that the Express Mail package she deposited six (6) months earlier was deposited in an Express Mail drop box at about 4:45 p.m. and that the last pickup for the day at that particular drop box was 5:00 p.m.

The arguments and evidence presented have been considered, but are not persuasive. Petitioners' Express Mail receipt is considered to be more probative of the correct date of deposit than the declaration presented with the petition, because the Express Mail receipt was completed by the USPS contemporaneously with the processing of the Express Mail package by the USPS while the Larson declaration was made six (6) months after the date of mailing. Postal employees are presumed to discharge their duties in a proper manner. Charlson Realty Co. v. United States, 690 F.2d 434, 442 (Ct. Cl. 1967). Therefore, in view of the August 24, 1996 "date-in" shown on the Express Mail receipt it is concluded that the Express Mail package in question must have been deposited either after the last scheduled pickup for the day on August 23, 1996, or on Saturday, August 24, 1996. It is petitioners' burden to establish to the satisfaction of the Commissioner that the August 24, 1996 "Date-In" on Express Mail label No. EG947362259US is the result of

Application No. 08/702,911

Page 3

an error on the part of an employee of the USPS. However, no statement from the USPS has been presented verifying that any error was made by the USPS in the processing of petitioners' Express Mail package. Petitioners were made aware of the date of deposit in Express Mail acknowledged by the USPS upon return of petitioners' Express Mail receipt to counsel's office. It is not understood why petitioners did not obtain a statement in writing from the USPS acknowledging an error in the processing of petitioners' Express Mail package immediately after receiving the Express Mail receipt. It is also unfortunate that petitioners chose to deposit a paper as important as a patent application in Express Mail without immediately obtaining an Express Mail receipt showing the desired date of deposit. Since the date of mailing is established by the rule as the date shown by the Express Mail receipt and petitioners' receipt shows a date of mailing of August 24, 1996, the application was correctly accorded a filing date of August 26, 1996.

The petition is dismissed.

Any request for reconsideration should be filed within TWO MONTHS of the date of this decision in order to be considered timely. See 37 CFR 1.181(f). This time period may <u>not</u> be extended pursuant to 37 CFR 1.136(a) or (b).

Further correspondence with respect to this matter should be addressed as follows:

By mail:	Assistant Commissioner for Patents Box DAC Washington, D.C. 20231
By FAX:	(703) 308-6916 Attn: Special Program Law Office
By hand:	One Crystal Park, Suite 520 2011 Crystal Drive Arlington, VA

The application is being returned to Examining Group 2400 for examination <u>in due course</u> with the presently accorded filing date of August 26, 1996.

Art Unit: 2414

1. This Application has been examined.

2. This application has been filed with informal drawings which are acceptable for examination purposes only. Formal drawings will be required when the application is allowed.

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claims 1-49 are rejected under 35 U.S.C. 102(B) as being clearly anticipated by Lin et al...

The publication of Lin discloses in Figure one a MPEG II decoder which employs memory interface which uses bus arbitration to allocate resources between the decoder and another device. The arbitration scheme, see figure 3, allocates access to the memory on a priority level. The basic requirement of having the interface and the decoder be monolithic is presumed from figures one since both component are found in the rectangle box, and the introduction which discloses uses in " TV set-top boxes, PC add-on and entertainment machines."

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Art Unit: 2414

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the examiner to consider the applicability of 35 U.S.C. 103© and potential 35 U.S.C. 102(f) or (g) prior art under 35 U.S.C. 103(a).

Claims 1-49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Retter et al. (
 US Patent 5,557,538) in view of Harney (US Patent 5,522,080).

Retter discloses the prior art devices employed in the compression and decompression of video and audio data. Retter diploses most of the requirements of the claimed invention with the exception of having a memory interface employing an arbitration routine. Though not expressly reciting an arbitration routine the patent does concern itself with managing " an internal bidirectional bus on which all data transfers between the external DRAM buffer and all the internal units." It would stand to reason that Retter must determine who has priority of the DRAM or must settle contentions if one arises when clients are accessing the same resource simultaneously. The Patent to Harney discloses a an arbitration scheme in the same environment as the patent to Retter:

Additionally, it is permitted to impose no relative local priority within Group III if all three types of request are equally likely and equally important. In this alternate embodiment of method x the transfers Page 3

Art Unit: 2414

of Group III are processed on a first come, first served basis. There is by definition arbitration between transfers involving the system bus because system 300 contains two hi-directional burst buffers which allow up to sixteen word transfers to be captured. It also contains a set of dual scaler buffers, which are used to capture scaler accesses. These buffers allow scaler and burst request to be performed even if the bus resource is unavailable.

With respect to Group III local arbitration, the band width requirements are highly dependent upon system configuration. The functions performed by block transfer controller 368 during block data transfers of data between global memory 366 and local memories 362a-n include arbitration of transfer requests of competing global memory 366 and execution units 360a-n, address generation and control for two-dimensional block transfers between global memory 366 and local memories 362a-n, control for scalar, first-in first-out, and statistical decoder transfers between local memories 362a-n and global memory 366 and address generation and control for block instruction load following cache miss.

A number of different types of transfers requiring input/output access arbitration by block transfer controller 368 may take place between global memory 366 and local memories 362a-n. These include fetching instructions from global memory 366. Image processor system 300 initializes the process by downloading instructions from system memory 364 to global memory 366. On power up of image processor 300 the instructions are loaded from system memory 364 or global memory 366 into the controller.

Different types of transfers may be prioritized by block transfer controller 368 as follows, proceeding from highest priority to lowest priority: (1) instruction, (2) scalar, first-in, first-out and statistical decoder, and (3) block transfer. Thus block transfer controller 368 not only prioritizes and arbitrates within image processor 300 based upon whether a request is an instruction type of request or a data type of request. Block transfer controller 368 also prioritizes and arbitrates based upon the subtypes of data. <u>Column 21</u>, lines 1-30.

Harney recognizes the problem associated with systems, like Retter, which have multiple

processors requiring access to the same resource. In column 3, lines 9-12, Harney discloses that

Page 4

Art Unit: 2414

to allow each datapath (i.e., process) to have a independent access to external memory is impractical for semiconductor implementation. A sharing of resources is proposed and elucidated upon by the patent.

Therefore, it would have been obvious to those of ordinary skill in the art, at the time of the invention, to combine the Retter patent with the patent of Harney because when the same resource is required by multiple users and since it would be impractical to have independent or exclusive access, an arbitration scheme would insures the most optimal means of assuring prompt resolution of contentions and a judicial process for allocating the memory pie.

7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to **Primary Examiner Ellis B. Ramirez, Esq.,** whose telephone number is (703) 305-9786. The examiner can normally be reached on Monday-Friday from 7:30 AM to 6:00 PM. If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, E. Voeltz, can be reached on (703) 305-9714. Any inquiry of a general nature or relating to the status of this application or proceeding should be directed to the Group receptionist whose telephone number is (703) 305-3800.

Any response to this action should be mailed to:

PETITION FOR AN EXTENSION OF TIME

UNDER 37 C.F.R. § 1.136(a)

Sir:

Applicants herewith petition the Assistant Commissioner of Patents under 37 C.F.R. § 1.136(a) for a three-month extension of time for filing the response to the Examiner's Action dated September 3, 1997, from December 3, 1997 to March 3, 1998. Submitted herewith is a check in the amount of \$950 to cover the cost of the extension.

Any deficiency or overpayment should be charged or credited to Deposit Account No. 19-1090. This petition is being submitted in triplicate.

Respectfully submitted, Raul Z. Diaz et al. SEED and BERRY LLP

GENERAL AUTHORIZATION UNDER 37 C.F.R. § 1.136(a)(3)

Sir:

With respect to the above-identified application, the Assistant Commissioner is authorized to treat any concurrent or future reply requiring a petition for an extension of time under 37 C.F.R. § 1.136(a)(3) for its timely submission as incorporating a petition therefor for the appropriate length of time. The Assistant Commissioner is also authorized to charge any fees which may be required, or credit any overpayment, to Deposit Account No. 19-1090.

AMENDMENT

In response to the Office Action dated September 3, 1997, please extend the period of time for response three months, to expire on March 3, 1998. Enclosed are a Petition for an Extension of Time and the requisite fee. Please amend the application as follows:

In the Specification:

On page 5, line 11, please replace "188" with -- 198 --. On page 5, line 17, please replace "suggest" with -- suggests --.

On page 6, line 5, please replace "frame" with -- frames --.

On page 6, line 8, please replace "standards" with -- standard --.

On page 6, line 11, please delete the "," after "acceptable".

On page 12, line 21, please replace "12 circuit" with -- circuit 12 --.

On page 13, line 15, please replace "software. Presenting" with - software,

presenting --.

On page 14, line 5, please replace "access" with -- accesses --.

Page 105 of 280

On page 15, please delete the "," after "busses".

On page 15, line 23, please delete the "," after "memory".

On page 17, lines 18 and 19, please replace "standards. Possibly" with -- standards, possibly --.

On page 17, line 23, please replace "Meaning that compression" with -- This means that the compression --.

On page 17, line 26, please replace "complicated is it" with -- complicated, it

is --.

On page 18, line 8, please delete "to be able".

On page 18, line 9, please replace "The encoding to comply" with -- Having the encoding comply --.

On page 18, line 10, please insert -- standards -- between "MPEG-2" and "balances".

On page 21, line 14, please replace "the are no a request" with -- there are no

On page 21, line 19, please replace "before of after" with -- before or after --. On page 23, line 21, please replace "a image" with -- an image --.

In the Claims:

Please cancel claims 1-13, 42-43, and 49, and amend claims 14, 26, 28, 41,

and 44 as follows:

requests ---.

14. (Amended) An electronic system coupled to a memory, comprising: a first device that requires access to the memory;

a decoder that requires access to the memory sufficient to maintain real time

operation;

[a fast bus coupled to the first device and the decoder;] and

a memory interface for coupling to the memory, and coupled to the first device[,] and to the decoder, the memory interface having an arbiter for selectively providing access for the first device and the decoder to the memory <u>and a shared bus coupled to the memory</u>, the first device, and the decoder, the bus having a sufficient bandwidth to enable the decoder to access the memory and operate in real time when the first device simultaneously accesses the bus.

Page 106 of 280

has a bandwidth of [greater than a threshold] <u>at least twice the</u> bandwidth <u>required for the</u> <u>decoder to operate in real time</u>.

528. (Amended) A computer comprising:

processing means;

an input device connected to the processing means;

an output device connected to the processing means;

a memory connected to the processing means;

a first device that requires access to the memory;

a decoder that requires access to the memory sufficient to maintain real time

operation; and

a memory interface coupled to the memory, to the first device, and to the decoder, the memory interface having a means for selectively providing access for the first device and the decoder to the memory and a shared bus coupled to the decoder, the first device, and the memory, the shared bus having a sufficient bandwidth to enable the decoder to operate in real time while sharing access to the bus.

 $\mathcal{F}_{\mathcal{M}}$ (Amended) The computer of claim $\mathcal{I}_{\mathcal{R}}$, [further comprising a fast] wherein the shared bus [coupled to the memory, to the decoder to the first device] has at least twice the required bandwidth for the decoder to operate in real time.

44. (Amended) In an electronic system having a first device coupled to a memory interface and a memory coupled to the memory interface, the first device having a device priority and capable of generating a request to access the memory, a method for selectively providing access to the memory comprising the steps of:

providing a decoder coupled to the memory interface[,] <u>through a bus having</u> <u>sufficient bandwidth to enable</u> the decoder [capable of operating] <u>to operate</u> in real time <u>while</u> <u>sharing access to the bus</u>, having a decoder priority and capable of generating a request to access the memory;

> providing an arbiter having an idle, a busy and a queue state; generating a request by the decoder to access the memory; determining the state of the arbiter;

Page 107 of 280

Petitioners HTC & LG - Exhibit 1002, p. 107

3

providing the decoder access to the memory responsive to the arbiter being in the idle state for the decoder to operate in real time;

queuing the request responsive to the arbiter being in the busy state; and queuing the request responsive to the arbiter being in the queue state in an order responsive to the priority of the decoder request and the priority of any other queued requests.

<u>REMARKS</u>

In the first Office Action, claims 1-49 were rejected under 35 U.S.C. § 102(b) in view of Lin et al., which is an article entitled "On the Bus Arbitration for MPEG II Video Decoder." Claims 1-49 were also rejected under 35 U.S.C. § 103(a) over Retter et al. (U.S. Patent No. 5,557,538) in view of Harney (U.S. Patent No. 5,522,080).

Applicants respectfully disagree with the bases for the rejections and request reconsideration and withdrawal of the rejections.

Some of the technical differences between the applied references and embodiments of the invention will now be discussed. Of course, these discussed differences regarding the embodiments, which are disclosed in detail in the patent specification, do not define the scope of interpretation of any of the claims; where presented below, such discussed differences merely help the Examiner appreciate important claim distinctions discussed thereafter. Embodiments of the present invention are directed to systems and method for coupling memory to a plurality of devices through a single shared bus that enables one of the devices, such as a decoder, to operate in real time. The shared bus has a bandwidth that is at least the required bandwidth for the decoder to operate in real time, and preferably at least twice the size of the required decoder bandwidth.

Lin et al. discusses a scheme for assigning duration rates to input/output tasks to ensure the decoding duration rate is greater than the display input requirements. Lin et al. does not suggest using a single shared bus having a bandwidth of sufficient size to permit real time decoding when sharing the bus with one or more other devices.

Retter et al., U.S. Patent No. 5,557,538, is directed to the management of internal bidirectional busses for data transfers with DRAM and other internal units. The arbitration scheme proposed by Retter et al. does not suggest or disclose a bus having a bandwidth sufficient to permit a decoder to operate in real time while sharing bus access with

Page 108 of 280

Petitioners HTC & LG - Exhibit 1002, p. 108

4
one or more other devices, and Retter et al. does not disclose the claimed arbitration method for accomplishing real time operation of the decoder.

Harney, U.S. Patent No. 5,522,080, is not concerned with real time operation and does not teach or suggest a bandwidth of at least the required bandwidth for the decoder to operate in real time while simultaneously sharing bus access with one or more other devices. Rather, each of the devices in Harney has a local memory and interface.

Turning to the claims, independent claim 14, as amended, is directed to an electronic system coupled to a memory that comprises a "first device requiring access to the memory", a "decoder that requires access to the memory sufficient to maintain real time operation", and a "memory" interface for coupling to the memory, the memory interface being coupled to the first device and the decoder. Claim 14 further recites the memory interface having an arbiter for selectively providing access for the first device and the decoder, to the memory through a shared bus, the "shared bus having a sufficient bandwidth to enable the decoder to access the memory and operate in real time when the first device simultaneously accesses the bus"

Lin et al. does not teach or suggest such a system. More particularly, Lin et al. does not disclose a bus having a sufficient bandwidth to enable the decoder to operate and maintain real time operation when simultaneously accessing the shared bus with the first device. Rather, Lin et al. proposes a scheme for assigning duration rates for input/output tasks that ensures the decoding duration rate is greater than the display input requirements.

Retter et al. and/or Harney fail to make up for Lin et al.'s deficiencies. Retter et al. in combination with Harney fails to teach, disclose, or suggest to one of ordinary skill a shared bus having sufficient bandwidth to enable the decoder to operate in real time and maintain real time operation when simultaneously accessing the bus with the first device. While Retter et al. and Harney propose various methods for accomplishing their particular purposes, they do not suggest maintaining real time operation of a device through shared use of a bus interface to memory. Consequently, applicants respectfully submit that claim 14 is allowable over the references cited and applied by the Examiner.

Claim 15, which depends from claim 14, recites the first device and the decoder as being capable of having a variable bandwidth. Nowhere does Lin et al. or the combination of Retter et al. or Harney disclose or suggest to one of ordinary skill a decoder and first device having variable bandwidths in combination with a shared bus having sufficient bandwidth to enable the decoder to operate in real time when simultaneously

Page 109 of 280

Petitioners HTC & LG - Exhibit 1002, p. 109

5

accessing the bus with the first device. Claim 26, which depends from claim 14, recites the bus as having a bandwidth at least twice the bandwidth required for the decoder to operate in real time. Lin et al., Harney, and Retter et al. are all silent with respect to providing a bus having at least twice the bandwidth required for a decoder to operate in real time. Applicants respectfully submit that claims 15-26 are allowable for these reasons as well as for the reasons why claim 14 is allowable.

The remaining claims recite limitations similar to those explained above. Claim 28 is directed to a computer comprising a processing means, an input and output device coupled to the processing means along with a memory, and a first device and decoder coupled to a memory interface through a shared bus that has a sufficient bandwidth to enable the decoder to operate in real time. Claim 29, which depends from claim 28, recites the first device and decoder as having a variable bandwidth. Claim 41, which depends from claim 28, recites the bus as having at least twice the required bandwidth for the decoder to operate in real time. Applicants respectfully submit that claims 28-41 are allowable for the reasons why claims 14-26 are allowable.

Claim 44 recites a method for selectively providing access to the memory of an electronic system having a first device coupled thereto, the method comprising the steps of providing a decoder coupled to the memory interface for operating in real time and having a decoder priority and request generation capability, providing an arbiter having an ideal, busy, and queue state, generating a request by the decoder to access memory, determining the state of the arbiter, and providing the decoder access to the memory for the decoder to operate in real time. As discussed above, neither Lin et al. nor the combination of Harney with Retter et al. teach or suggest to one of ordinary skill a method for providing decoder access to a memory through a shared bus that utilizes a bus of "sufficient bandwidth to enable the decoder to operate in real time while sharing access to the bus". In the prior devices described in Lin et al., Retter et al., and Harney, bandwidth is not discussed in the context of providing real time operation for a decoder and maintaining real time operation while sharing access to the bus. None of the applied references taken individually or in any motivated combination thereof teaches the combination of claimed steps in the recited method. Consequently, applicants respectfully submit that claim 44 and dependent claims 45-48 are allowable over the references cited and applied by the Examiner.

Overall, none of the applied references, taken alone or in any combination thereof apparently teach or suggest the claimed features recited in independent claims 14, 28,

6

and 44, and thus such claims are allowable. Since these independent claims are allowable based on the above reasons, the claims which depend from them are likewise allowable. If the undersigned attorney has overlooked a relevant teaching in any of the references, the Examiner is requested to point out specifically where such teaching may be found.

In light of the foregoing remarks, the Applicant respectfully submits that all pending claims are allowable. The Applicant, therefore, respectfully requests the Examiner to reconsider this application and timely allows all pending claims. Examiner Ramirez is encouraged to contact Mr. Tarleton by telephone to discuss the above and other distinctions between the claims and the applied reference, if desired. If the Examiner notes any informalities in the claims, the Examiner is encouraged to contact Mr. Tarleton to expediently correct any such informalities by telephone.

In view of the forgoing, applicants respectfully submit that all of the claims remaining in this application are now clearly in condition for allowance. Consequently, early and favorable action allowing these claims and passing this case to issuance is respectfully solicited.

Respectfully submitted, Raul Z. Diaz et al. SEED and BERRY LLP

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED.

THE ISSUE FEE MUST BE PAID WITHIN <u>THREE MONTHS</u> FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. <u>THIS STATUTORY PERIOD CANNOT BE EXTENDED</u>.

HOW TO RESPOND TO THIS NOTICE:

IMPORTANT REMINDER: Utility patents issuing on app maintenance fees. It is pater	plications filed on or after Dec. 12, 1980 may require payment of tee's responsibility to ensure timely payment of maintenance
III. All communications regarding this application must give Please direct all communications prior to issuance to Bo	application number and batch number. ISSUE FEE unless advised to the contrary.
II. Part B-Issue Fee Transmittal should be completed and a ISSUE FEE. Even if the ISSUE FEE has already been should be completed and returned. If you are charging B-Issue Fee Transmittal should be completed and an ex-	returned to the Patent and Trademark Office (PTO) with your paid by charge to deposit account, Part B Issue Fee Transmittal the ISSUE FEE to your deposit account, section "4b" of Part ttra copy of the form should be submitted.
 A. If the status is changed, pay twice the amount of the FEE DUE shown above and notify the Patent and Trademark Office of the change in status, or B. If the status is the same, pay the FEE DUE shown above. 	 A. Pay FEE DUE shown above, or B. File verified statement of Small Entity Status before, or with, payment of 1/2 the FEE DUE shown above.
I. Review the SMALL ENTITY status shown above. If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:	If the SMALL ENTITY is shown as NO:

TRANSMITTAL OF FORMAL DRAWINGS

OFFICIAL DRAFTSMAN Hon. Assistant Commissioner for Patents Washington, D.C. 20231

Sir:

In response to the "Notice of Allowability" (POL 37) mailed March 30, 1998, in the above-referenced patent application, please find enclosed for filing five (5) sheet(s) of formal drawings.

I hereby authorize the Commissioner to charge any fees which may be required to Deposit Account No. 19-1353. A duplicate copy of this sheet is enclosed.

Respectfully submitted,

Lisa K. Jorgenson

SUPPLEMENTAL DECLARATION

Full March 1990 JUN 29 1998

Hon. Assistant Commissioner for Patents Washington, D.C.

Dear Sir:

I, Raul Z. Diaz, and Jefferson E. Owen, as below-named inventors in the application for letters patent for an improvement in Video and/or Audio Decompression and/or Compression Device That Shares a Memory Interface, Serial No. 08/702,911, filed in the United States Patent and Trademark Office on or about the 26th day of August, 1996, declare that my residence, post office address and citizenship are as stated below next to my name;

I believe I am the original, first and joint inventor of the subject matter which is claimed and for which a patent is sought;

I hereby state that I have reviewed and understand the contents of the aboveidentified patent application, including the claims;

that said subject matter, including the claims as amended, was part of my invention before the filing of the original application, above identified, for such invention; and that I acknowledge my duty to disclose information of which I am aware which is material to the patentability of this application in accordance with Title 37, Code of Federal Regulations, §1.56(a).

PAT No: 5812789 ISSUE: 9/22/98

ABSTRACT

We present a high performance implementation of a MPEG decoder, written entirely in a high level language. The decoder implementation fully complies with the MPEG-I standard and decodes all (I, P, B) frame types in MPEG video bitsteams and is portable.

Versions of this decoder are implemented on Windows 3.1, and on Windows NT (X86, MIPS, ALPHA). A comparison of the performance of the decoder between the various platforms is made. We also present a high quality, fast dithering and interpolation algorithm used to convert YCbCr directly into 8 bit palletized images.

We propose a new method called Collaborative Compression, of dealing with compression and decompression tasks at a very low cost to achieve 30 fps SIF performance for desktop applications. Collaborative Compression is a systems approach to partitioning the functionality between CPU-centric (i.e. software) and hardware-assist (VLSI) in order to achieve the optimal cost solution. The CPU provides glue programmability to tie the accelerated and non-accelerated parts of the algorithm together. The advent of high bandwidth, low latency busses (VL Bus and PCI) enable a high speed data pathway between the distributed computational elements.

1. INTRODUCTION

The Motion Picture Experts Group (MPEG) video coding algorithm is a standard for the storage of video and audio data in a compressed digital form. It was defined by the CCITT MPEG group formed with a goal of defining a standard that could compress video and audio to a bandwidth of 1.5Mbit/sec or less. The committee draft dated December 1991³ has formed the basis for the implementation described in this paper.

The MPEG Decoder we have implemented decodes only the video bitstream. Its primary goal was to explore the possibility of decoding MPEG bitstreams on Personal Computer class platforms. Patel et. al¹ have already presented a software decoder designed primarily for portability across Unix platforms with X Windows. Our software player was designed for portability across PC platforms, with RISC or CISC CPUs and running 16bit or 32bit operating systems, while delivering the highest performance and be fully compliant with the ISO standard. The GUI for the decoder uses the Windows 3.1 API, which makes it work with OS2, Windows NT and Windows 3.1. We have documented the performance of this decoder on Windows 3.1, Windows NT running on X86, MIPS and ALPHA platforms.

Even though the MPEG standard defines one resolution - SIF at 320x240, for the PC environment a defacto standard commonly called QSIF has emerge - at 160x120. Typical PCs do not have enough CPU power to do 30 (or even 15) Frames Per Second (Fps) SIF resolution. So a common practice is to encode a 160x120 (QSIF) resolution image, and then after decoding, to interpolate the output image by a factor of 2 to obtain a 320x240 SIF resolution image. We have also developed a non-real-time MPEG encoder, which is capable of producing bitstreams containing I. P and B frames, with arbitrary M and N parameters. This encoder can also produce video bitstreams with any resolution. Our decoder can also decode any resolution image, and has a user selectable output interpolation factor (1x or 2x).

We have developed a novel method of doing the Color Space Conversion that is especially suited to PC systems using the Windows OS. We present the computational loads presented by the different phases of the MPEG decoding algorithm. Section 3.1 deals with the architecture of the software decoder that allows the core decoder to be ported to any platform that has a 32 bit ANSI-C compiler, and the GUI to be ported to any platform supporting the Windows 3.X API.

SPIE Vol. 2187 / 241

Page 134 of 280

Section 3.1 presents the dithering and Color Space Conversion algorithms used in this decoder. Section 4.0 presents the performance results obtained on the various platforms.

2. THE MPEG-1 VIDEO CODING STANDARD

In this paper we refer only to the video bitstream when referring to MPEG-I. The MPEG video coding standard specifies the format of the video bitstream. The standard also specifies the decoding process to be used and the errors tolerable in the process. The process of encoding the bitstream is not specified and is left as an area of differentiation for implementers. We shall attempt to present the MPEG-I standard more from a decoding computational load point of view. Details of the actual standard can be found in the standards document³.

MPEG uses transform coding in conjunction with motion compensation to achieve its compression goals. It performs spatial compression using transforms (specifically the Discrete Cosine Transform, DCT) and temporal compression using motion compensation. MPEG encoded video frames are basically of three types: (i) Intra Frames (I), (ii) Predictive Frames (P) and (iii) Bi-Directional Frames (B). Each frame type is encoded in a different manner. Each frame is first subdivided in square blocks of 16x16 pixels called macroblocks. Each macroblock of RGB pixels is converted to a 16x16 Y block and a 8x8 Cb block and an 8x8 Cr block representing the Luminance (Y) and Chrominance (Cb, Cr) information respectively.

Intra Frames are also called key Frames. They are coded only spatially and decoding them does not require data from any other frame, past or present. P Frames are coded temporally and spatially. Thus they depend on data from the previous I|P frame in the past. B Frames are dependent on the nearest I|P Frames in the past and the future. Each frame type represents a different type of computational load to a typical PC class machine.

The input video data can be assumed as being represented as a two dimensional array of triplets (each triplet is one pixel with the Red, Green and Blue values). It is also possible to have input data in the form of Luminance and Chrominance arrays. Figure 1. shows the different stages of the video encoding process for Intra Frames. Each macroblock is transform coded using DCT. The coefficient terms are then quantized and run-length coded. The resulting bitstream is then entropy coded using Huffman codes. This is repeated for every block in the image.

Figure 1.0 Encoding process for Intra Frames

For P and B frames, any macroblock that can be represented from its reference key frame is represented as a motion vector - a tuple representing the relative displacement from its position in the reference frame. In the case of P frames, there is only one reference frame - the nearest IIP frame in the past. For B frames there are two reference frames - the nearest past and future IIP frames. For B frames the current macroblock can be a simple linear function of macroblock from both reference frames. Any block that cannot be so represented is called an Error term, and is coded like a macroblock from an I frame.

2.1 Computational Loads in MPEG

From a computational point of view, each type of frame differs in it computational load. We shall differentiate computational loads as:

(i) arithmetic operations: Those that are predominantly comprised of arithmetic operations (+, -, *) and whose memory access pattern fits in a relatively small cache.

(ii) memory operations: Those whose memory bandwidth utilization is heavy in relation to their arithmetic operation count.

242 / SPIE Vol. 2187

Page 135 of 280

(iii) Bit manipulations: Comprised of manipulating bit fields, extracting, rotating, shifting and masking variable length bit fields. Some processors have special instructions for dealing with bit field operations. Others perform bit field operations by decomposing them into standard arithmetic and logical operations.

The major operations performed in Decoding are:

- Martin La sub Da
- Variable Length Decoding
 Inverse quantization and Zig-Zag scanning
- (3) IDCT
- (4) Motion Compensation (for P and B frames)
- (5) Color Space Conversion (from YCbCr to RGB color space) OPTIONAL
- (6) Dithering (reducing from 24 bit RGB color space to 8 bit color space). OPTIONAL

The kind of load presented by each major phase is dependent on the implementation. This in turn allows tradeoffs to be made in order to tune the decoder for different processor architectures.

2.2 Architectural features and their impact on MPEG decoding

As will be seen in the following sections, different architectural features impact the performance of a decoding algorithm implementation. We will attempt to catalog some of the performance axes that influence decoder performance. They are:

- 1) CPU performance
- 2) Cache and Memory subsystem performance
- Bus performance
- 4) Display subsystem performance

CPU performance affects all compute bound operations such as IDCT, or bit field operations. However if the data required cannot be contained in registers - as is always the case, whether doing IDCT or any other operation, the cache subsystem performance becomes crucial. Operations such as VL decoding, Inverse quantization and IDCT may not fit in the first level cache of the CPU. Second level cache size and performance then become crucial. The motion compensation (frame reconstruction) part is extremely memory dependent. The CPU just constructs the output frame from two input frames, using mostly copying. Given the size of the frames, and the random nature in which the blocks can move, large second level caches are necessary to contain the input and output frames. Once the output frames is ready, it has to be transferred to the display frame buffer. This operation is dependent on the available bandwidth on the bus connecting the display adapter itself may not allow efficient access to the display memory from the host bus (e.g. the display memory may be organized to provide higher priority to the graphics accelerator rather than the host CPU bus). We will discuss in Section 3.0, how these architectural features affect our decoder, and what features are best suited to software MPEG decoders.

2.3 Other Software MPEG Decoders

There are a few other software only MPEG compliant video decoders, both commercial and shareware/freeware. Ketan Patel et. al at UC Berkeley have released an excellent portable implementation for Unix platforms into the public domain. There is also a shareware Windows NT based MPEG decoder, which can decode video bitstreams. This is slower than our implementation and also has poor video quality.

Our implementation can decode bitstreams containing any frame type and has been tested with several bitstreams, both from the Internet and from those provided by other collaborators. We also produced bitstreams using our own non-real-time software encoder. This encoder allowed us to play with performance sensitivity to quantization levels, frame type sequencing and so forth.

SPIE Vol. 2187 / 243

Page 136 of 280

3. THE SOFTWARE MPEG-I VIDEO DECODER

The primary goal of the decoder was to determine if a full implementation of the decoder would achieve reasonable performance (as measured by frame rate) on a PC class machine. We define this to be a 486Dx2-66 PC, with a 256Kbyte second level cache, 8 or 16 Mbytes of main memory - 70 nS. We also wanted a decoder written in a high level language for case of maintenance and portability.

The decoder is partitioned into 2 distinct parts. A GUI based front end, that provides a user friendly player, allowing play, stop, rewind and variable speed fast play functionality in both forward and reverse directions and handles all the display rendering. This GUI front end uses the Windows 3.X API and is portable across all operating systems that provide Windows API servers (such as WABI, OS2, Windows NT). The second part (backend) of the decoder is implemented as a Dynamic Linked Library (DLL).

Windows provides a format called the Device Independent Bitmap (DIB) for representing color bitmaps. It also provides API calls for drawing such DIBs. These routines first convert the DIB from the color system provided to the native color format (eg. 16 bit or 8 bit) and then renders the bitmap.

The percentage of total time spent in the major operations when decoding to a 1x interpolated 8 bit Device Dependent Bitmap (DDB) output format is given. The data was collected on a DEC Alpha system, DECpc AXP 150 running WinNT 3.1 - release build. The compiler used was the release SDK 3.1 compiler for the Alpha architecture.

Major Operation Type	8 bit dithered		
VL Decoding	10.5 %		
DCT	16.5%		
CSC + Dithering	26.5%		
Frame Reconstruction	26.0%		
Frame Display	13.5%		
Misc.	7%		

Table 1. Breakup of time spent in Decoding a video bitstream

The kinds of loads presented by our decoder implementation are as follows:

1) VL Decoding - bit manipulation:

Converted to logical operations, shifting, masking and rotating. This is CPU intensive and register intensive (given the 8 registers on the x86).

2) Inverse quantization and unzigzag:

This stage is performed using table lookups - and is there cache performance sensitive in our implementation.

3) IDCT:

We believe this is sensitive to register pressure in machines with few registers. On machines with hardware single cycle multipliers, this is CPU bound.

4) Color Space Conversion:

We implement this using table lookup - both in the true color (16 bit or 24 bit case) and in the 8 bit dithered output case. This phase is cache and memory latency sensitive. Even though the lookup tables may fit in the primary cache, the reading and writing of the image frame pollutes the cache. Primary write through caches without write buffers suffer in this regard when compared to write through with write buffers. Large primary caches such as those on the MIPS Magnum systems definitely help the performance.

244 / SPIE Vol. 2187

Page 137 of 280

On the whole, our implementation showed a large sensitivity to memory/cache subsystem performance, and to display subsystem speed. For our player the memory to screen bitblt speed is the primary governing factor in display subsystem performance. For this reason - a fast frame buffer access path is better than a very powerful graphics accelerator, coupled with slow host access speeds. This is demonstrated in Section 4.1.

3.1 Dithering

Dithering was a major area where there were large swings in performance depending on the dithering algorithm used. Typical algorithms used for dithering are error diffusion algorithms (Floyd-Steinberg) and ordered dither². We have developed our own dithering algorithm that is similar to the one used by Patel et. al. Windows 3.X and WinNT workstations used for multimedia typically have a 256 color display accelerator card. Out of the 256 colors available, Windows 3.X⁴ uses 20 color which occur at pre-defined indices in the color LUT. The first 10 and last 10 indices are used by Windows, i.e. colors 0-9 and 246-255. In order to achieve the greatest performance under Windows, the displayed bitmap should used what is called an "Identity Palette". This palette has the 20 fixed Windows colors in their nominal positions i.e. 0-9 and 246-255. Only 236 colors at indices 10-245 are available for an application to use.

Typically dithering converts 24 bit RGB images to 8 bit palletized images. In MPEG, the output of the decompression process typically results in a YCbCr image, which is then color converted into an RGB image. This RGB image is then displayed. If the display system cannot accept full color RGB images, the image is then dithered (color sub sampled) to allow for display at lower color resolutions.

Given the additional constraints imposed by Windows 3.X, we finally developed an algorithm that converts directly from YCbCr to a fixed palette with 228 entries in it. This has the advantage of avoiding the intermediate conversion from YCbCr to RGB. This is similar to the algorithm given by Patel, except that we use 228 colors instead of 128. We have also folded the 2X output interpolation into this stage, when we do the look up.

4. PERFORMANCE RESULTS

We present the performance of our decoder as measured in Frames Per second on the different platforms in Table 2. We did not have access to a Pentium based NT platform at the time this was written. The bitstream used had I, P and B frames and a resolution of 320x240 and an average bitrate of 1.0 MBits/sec at 30 frames per second. The output format was 1X interpolated 8 bit dithered output. We also give the performance on QSIF sequence - encoded at 160x120 resolution and displayed with 1X and 2X output interpolation,

CPU-Mhz,Primary Cache, Secondary	OS	320x240	160x120 / 2X	160x120 / 1X
486DX2-66, 8Kb, 256Kb	Win 3.1	5.0	14	26
486DX2-66, 8Kb, 256Kb	Win NT	4.8	13	24
Mips R4400-100, 32Kb, 512Kb	Win NT	10.3	26	42
Alpha AXP-150, 16Kb, 512Kb	Win NT	12.5	29	49

Table 2. Performance in Frames Per Second.

Note: The Mips machine had a direct linear frame buffer, providing the highest display subsystem performance of all the machines. The Intel machines had VESA local bus display adapters. The Alpha machine had an EISA bus based graphics adapter. The source code is the same for all the systems.

We find that none of the machines can do real-time decoding of a SIF frame. However by using bitstreams encoded at QSIF resolution and then by performing a 2X interpolation of the output image, we can perform 30 fps on the RISC platforms. We have not exhausted all the performance gains to be made by playing with aggressive compiler optimization switches. The code is written in 32 bit C and does not utilize the 64 bit data paths available on the MIPS and ALPHA platforms.

SPIE Vol. 2187 / 245

4.1 Performance Sensitivity to Memory and Display subsystems

We conducted a side by side performance test of two MIPS based NT machines with identical MIPS R4400 100 Mhz (50 Mhz bus) processors. Both machines had similar Primary caches (on board the R4400). Machine A had a slow 512kb secondary cache and a slow memory controller - identical to those used on 486 Dx2-66 based machines. Machine B had a fast secondary cache of 512kb and a very fast memory controller. Machine A had an ISA bus based 8 bit graphics card and Machine B had a direct linear frame buffer which the host CPU could access at high speeds. For the same sequence. Machine A had a performance of 6.1 Fps and Machine B had a performance of 10.1 Fps. This was a combination of both the memory subsystem and the display subsystem effects. The gain (Machine A) was 1.65 for this case. We disabled the display of frames to find the effect of memory subsystem effects alone. The speed up dropped to 1.36, still a substantial difference considering the processors are identical and running identical code.

5.0 COLLABORATIVE COMPRESSION

We define collaborative compression to be the optimal balance of software decoding with hardware assist to enable real-time decompression at minimal cost. There are a number of hardware devices on the market that are designed to perform 30 frames per second SIF decoding, such as those from SGS Thompson, C-Cube, IIT etc.

Some of these devices are programmable (IIT) while others are hardwired. Even though these devices themselves are low cost (~ \$30), the end cost of a system solution is much higher (~\$150). This is due to the extra glue logic required to interface to a PC bus (VL, PCI or ISA), the external memory, DACs etc. On the other hand, we have presented a software only decoder whose performance clearly does not meet real-time requirements. However, it is possible to add a minimum amount of hardware, which when properly designed will together with the existing CPU and display subsystem, will enable real-time full SIF decoding.

5.1 Color Space Conversion and Stretching

The plethora of compression standards in the Windows arena (such as MS Video 1, Cinepak, Motion JPEG) has already led to the emergence of rudimentary forms of hardware assist such as Color Space Converters (CSC) and stretchers. Examples of such devices are made by Weitek (VideoPower) and Videologic, Tseng Labs. All these devices accelerate YCbCr -> RGB conversion, dithering and also stretching bitmaps from QSIF or SIF to full screen proportions. This is a logical first step, because most of the compression algorithms in vogue today can use these functionality.

5.2 IDCT and Huffman Decoding

The next step would be to accelerated compute intensive portions of the algorithm. The next largest gain will be made by performing the IDCT using hardware assist.

It is best to leave random control operations and other logic to the hands of software running on the host CPU. This enables rapid development of the decompressor, reduces time to market. Also, generic blocks such as IDCT. Huffman. can be re-used by other compression algorithms, by merely changing the glue software which ties the various hardware modules together. The requirement of any hardware module designed for collaborative compression are as follows:

(1) They support concurrency. The CPU must be free to perform other tasks after priming the hardware module. This allows us to pipeline the operations (in software).

(2) Data flow must be one-way. If there is too much data movement required of the CPU, for example to move from one module to the other - e.g. from IDCT to CSC, the speedup gained from the hardware module will be lost in the extra work done in shifting data around. The best model to view this is as several functional units - all sharing the same memory as shown in Figure 2.0 below.

246 / SPIE Vol. 2187

Page 139 of 280

Fig. 2.0 Conceptual view of Collaborative Compression

The CPU performs the task of managing the different units, decoding headers, parsing the bitstream etc. In the initial stages, the data volume is low, and the data resides in CPU main memory anyway (deposited there by a peripheral). In the later stages, as data volume grows, the CPU acts as a re configurable pipeline manager and chains the other functional units using shared memory as the buffer between the units. This shared memory can be on a peripheral card connected to the CPU by a low latency, high bandwidth bus such as PCI.

6.0 CONCLUSION

We have presented the performance of a portable software MPEG player designed for PC platforms. The performance of the player is sensitive to memory/cache system performance and to display subsystem bandwidth. The performance of the software decoder approaches real-time for pseudo-SIF sequences (QSIF interpolated by 2X). IDCT occupies only a sixth of the time, much less than is conventionally expected. The highest performance workstations such as those base on the 300Mhz DEC Alpha should be able to perform real-time decoding of SIF streams. However for volume PC environments, collaborative compression offers the best means of achieving cost effect real-time MPEG video decoding.

7.0 APPENDIX

A. The Decoder Specification

The backend DLL contains all the functionality of the MPEG decoder. It is written entirely in 32bit ANSI-C. The output formats supported are (1) Windows 3.X Device Independent Bitmaps (DIB) which consists of a header and has the first pixel in the lower left corner of the image and (2) a simple array with pixel arranged in row major form, top left corner pixel leading (which we shall call DDB). For both these formats the following bit depths are supported:

- (1) 8 bit dithered (DIB and DDB)
- (2) 16 bit DIB (5,5,5) and DDB (5,5,5; 5,6,5; etc)
- (3) 24 bit DIB and DDB
- (4) 32 bit DIB and DDB

The following operations are also supported:

Play (I and P only, I, P and B)
