CYCLOPROPYL-FUSED PYRROLIDINE-BASED INHIBITORS OF
DIPEPTIDYL PEPTIDASE IV AND METHOD

Field of the Invention

5 The present invention relates to cyclopropyl-fused
pyrrolidine-based inhibitors of dipeptidyl peptidase IV
(DP-4), and to a method for treating diabetes, especially
Type II diabetes, as well as hyperglycemia, Syndrome X,
diabetic complications, hyperinsulinemia, obesity,
10 atherosclerosis and related diseases, as well as various
immunomodulatory diseases and chronic inflammatory bowel
disease, employing such cyclopropyl-fused pyrrolidines
alone or in combination with another type antidiabetic
agent.

Background of the Invention

15 Dipeptidyl peptidase IV (DP-4) is a membrane bound
non-clasical serine aminodipeptidase which is located in
a variety of tissues (intestine, liver, lung, kidney) as
20 well as on circulating T-lymphocytes (where the enzyme is
known as CD-26). It is responsible for the metabolic
cleavage of certain endogenous peptides (GLP-1(7-36),
glucagon) in vivo and has demonstrated proteolytic
activity against a variety of other peptides (GHRH, NPY,
25 GLP-2, VIP) in vitro.

 GLP-1(7-36) is a 29 amino-acid peptide derived by
post-translational processing of proglucagon in the small
intestine. GLP-1(7-36) has multiple actions in vivo
including the stimulation of insulin secretion,
30 inhibition of glucagon secretion, the promotion of
satiety, and the slowing of gastric emptying. Based on
its physiological profile, the actions of GLP-1(7-36) are
expected to be beneficial in the prevention and treatment
of type II diabetes and potentially obesity. To support
35 this claim, exogenous administration of GLP-1(7-36)
(continous infusion) in diabetic patients has
demonstrated efficacy in this patient population.

Unfortunately GLP-1(7-36) is degraded rapidly in vivo and has been shown to have a short half-life in vivo ($t_{1/2} \approx 1.5$ min). Based on a study of genetically bred DP-4 KO mice and on in vivo/in vitro studies with selective DP-4 inhibitors, DP-4 has been shown to be the primary degrading enzyme of GLP-1(7-36) in vivo. GLP-1(7-36) is degraded by DP-4 efficiently to GLP-1(9-36), which has been speculated to act as a physiological antagonist to GLP-1(7-36). Thus, inhibition of DP-4 in vivo should potentiate endogenous levels of GLP-1(7-36) and attenuate formation of its antagonist GLP-1(9-36) and thus serve to ameliorate the diabetic condition.
