This book is in the Addison-Wesley UNIX and Open Systems Series

Series Editors: Marshall Kirk McKusick and John S. Quarterman

Publishing Partner: Peter S. Gordon Associate Editor: Deborah R. Lafferty

Associate Production Supervisor: Patricia A. Oduor

Marketing Manager: Bob Donegan

Senior Manufacturing Manager: Roy E. Logan

Cover Designer: Barbara Atkinson Troff Macro Designer: Jaap Akkerhuis

Copy Editor: Lyn Dupré Cover Art: John Lasseter

UNIX is a registered trademark of X/Open in the United States and other countries. Many of the designations used by manufacturers and sellers to distinguish their products are claimed as trademarks. Where those designations appear in this book, and Addison-Wesley was aware of a trademark claim, the designations have been printed in initial caps or all caps.

The programs and applications presented in this book have been included for their instructional value. They have been tested with care, but are not guaranteed for any particular purpose. The publisher offers no warranties or representations, nor does it accept any liabilities with respect to the programs or applications.

This facility allows buffers in different parts of a process address space to be written atomically, without the need to copy them to a single contiguous buffer. Atomic writes are necessary in the case where the underlying abstraction is record based, such as tape drives that output a tape block on each write request. It is also convenient to be able to read a single request into several different buffers (such as a record header into one place and the data into another). Although an application can simulate the ability to scatter data by reading the data into a large buffer and then copying the pieces to their intended destinations, the cost of memory-tomemory copying in such cases often would more than double the running time of the affected application.

Just as *send* and *recv* could have been implemented as library interfaces to *sendto* and *recvfrom*, it also would have been possible to simulate *read* with *readv* and *write* with *writev*. However, *read* and *write* are used so much more frequently that the added cost of simulating them would not have been worthwhile.

Multiple Filesystem Support

With the expansion of network computing, it became desirable to support both local and remote filesystems. To simplify the support of multiple filesystems, the developers added a new virtual node or *vnode* interface to the kernel. The set of operations exported from the vnode interface appear much like the filesystem operations previously supported by the local filesystem. However, they may be supported by a wide range of filesystem types:

- · Local disk-based filesystems
- Files imported using a variety of remote filesystem protocols
- Read-only CD-ROM filesystems
- Filesystems providing special-purpose interfaces—for example, the /proc filesystem

A few variants of 4.4BSD, such as FreeBSD, allow filesystems to be loaded dynamically when the filesystems are first referenced by the *mount* system call. The vnode interface is described in Section 6.5; its ancillary support routines are described in Section 6.6; several of the special-purpose filesystems are described in Section 6.7.

2.7 Filesystems

A regular file is a linear array of bytes, and can be read and written starting at any byte in the file. The kernel distinguishes no record boundaries in regular files, although many programs recognize line-feed characters as distinguishing the ends of lines, and other programs may impose other structure. No system-related information about a file is kept in the file itself, but the filesystem stores a small amount of ownership, protection, and usage information with each file.

DOCKET

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
