A SOLUTION FOR ORAL ADMINISTRATION CONTAINING ICI 182,780

The invention relates to a novel pharmaceutical composition, particularly to a pharmaceutical composition adapted for oral administration containing the compound
5 7α -[9-(4,4,5,5,5-pentafluoropentylsulphonyl)nonyl]oestra-1,3,5(10)-triene-3,17 β -diol, and more particularly to a solution formulation containing the compound
 7α -[9-(4,4,5,5,5-pentafluoropentylsulphonyl)nonyl]oestra-1,3,5(10)-triene-3,17 β -diol. The invention also relates to the use of the pharmaceutical composition of the invention for oral
administration to a warm blooded animal to produce an antioestrogenic effect and to a
10 method of producing an antioestrogenic effect by the oral administration of an effective amount of the pharmaceutical composition of the invention.

It is disclosed in European Patent Application No. 0 138 504 that certain steroid derivatives are effective antioestrogenic agents. The disclosure includes information relating to the preparation of the steroid derivatives of that invention. In particular there is
15 the disclosure within Example 35 of the compound
 7α -[9-(4,4,5,5,5-pentafluoropentylsulphonyl)nonyl]oestra-1,3,5(10)-triene-3,17 β -diol, which compound is specifically named in Claim 4. It is also disclosed that the compounds of that invention may be provided for use in the form of a pharmaceutical composition comprising a steroid derivative of the invention together with a pharmaceutically-
20 acceptable diluent or carrier. It is stated therein that the composition can be in a form suitable for oral or parenteral administration. For oral administration it is stated that a tablet or capsule containing the steroid derivative of the invention is particularly convenient. It is further stated therein that the tablet formulation can contain diluents, for example mannitol or maize starch, disintegrating agents, for example alginic acid, binding
25 agents, for example methyl-cellulose, and lubricating agents, for example magnesium stearate. No pharmaceutically-acceptable diluent or carrier for a capsule formulation is specifically disclosed therein.

Subsequently the compound
 7α -[9-(4,4,5,5,5-pentafluoropentylsulphonyl)nonyl]oestra-1,3,5(10)-triene-3,17 β -diol has
30 been identified by the code number ICI 182,780 and that number shall be utilised for the compound hereinafter.

It is further disclosed in Cancer Research, 1991, 51, 3867-3873 and
J. Endocrinology, 1992, 135, 239-247 that the antioestrogenic effect of ICI 182,780 in
immature rats, mature rats or monkeys can be assessed by the administration of a
suspension of the compound in arachis oil. This formulation was dosed either orally or by
5 subcutaneous injection. The studies in rats demonstrated that the potency of the compound
when dosed in arachis oil suspension was at least ten fold poorer when administration was
by the oral route than when administration was by the subcutaneous route suggesting that
the oral bioavailability of the compound from that formulation was low. A prolonged
antioestrogenic effect was demonstrated when a dispersion of the compound in arachis oil
10 was administered subcutaneously.

It is further disclosed in, for example, Laboratory Animal Science, 1993, 43,
247-251 that ICI 182,780 may be formulated for administration by intramuscular injection
in a castor oil-based depot formulation. That formulation when given to laboratory animals
at a dose of 4 milligrams per kilogram was found to inhibit the effects of endogenous
15 oestrogen for three to four weeks.

Furthermore it is disclosed in J. Endocrinology, 1992, 135, 239-247,
J. Endocrinology, 1993, 138, 203-209 and Cancer Research, 1994, 54, 408 that
ICI 182,780 may be provided for administration by daily intramuscular injection in a
'short-acting' liquid formulation comprising ICI 182,780 in a propylene glycol-based
20 solution.

It is an object of the present invention to provide a solution formulation
containing the hydrophobic drug ICI 182,780 which does not exhibit, or which exhibits to
a lesser degree, the problem of low oral bioavailability.

Many pharmaceutical compositions have been disclosed which are stated to be
25 'suitable for the dosing of hydrophobic drugs. Many of these formulations contain an oil
such as arachis oil in which the hydrophobic drug is dissolved or dispersed. However the
lack of miscibility of the oil with the aqueous environment of the gastrointestinal tract can
lead to variable rates of absorption of the drug. To try to overcome the problem, it is
common practice for a surfactant to be added to the pharmaceutical composition.
30 particularly a hydrophilic surfactant such as a surfactant with a hydrophilic-lipophilic
balance (HLB) of greater than about 8 and less than about 30. Such a surfactant may

produce an emulsion which, if the particle size is small, may lead to more complete absorption of the hydrophobic drug. However the use of hydrophilic surfactants may give a formulation of poor homogeneity as the surfactant may not be sufficiently miscible with the oil in which the hydrophobic drug is dissolved or dispersed. In a further refinement of such hydrophilic surfactant formulations, it is known that a lipophilic surfactant may be added to try to obtain the desired balance of hydrophilic and hydrophobic components to provide a stable emulsion when the formulation is added to an aqueous environment. The problem with this approach is that for each hydrophobic drug more than routine skill and knowledge is required to identify the exquisite balance of lipophilic and hydrophobic components which will provide a pharmaceutical composition of that hydrophobic drug which can be dosed orally to provide a reasonable oral bioavailability.

The many and various pharmaceutical compositions of the hydrophobic drug cyclosporin illustrate the complexities in this field of pharmaceutical research.

Thus, for example, it is disclosed in UK Patent Application No. 2 222 770 that cyclosporin may be formulated in a mixture of an oil such as a medium chain fatty acid triglyceride, a hydrophilic phase such as a mono- or di-alkyl ether of a polyoxyalkanediol, and a surfactant such as a hydrophilic or lipophilic surfactant or mixtures thereof.

Further it is disclosed in UK Patent Application No. 2 257 359 that cyclosporin may be formulated in a mixture of an oil such as a mixture of mono-, di- and tri-glycerides, a hydrophilic surfactant such as a surfactant having a HLB of at least 10, and the hydrophilic solvent 1,2-propylene glycol.

In addition it is disclosed in UK Patent Application No. 2 228 198 that cyclosporin may be formulated in a mixture of an oil such as a fatty acid triglyceride, a lipophilic surfactant such as a glycerol fatty acid partial ester, and a hydrophilic surfactant having a HLB of at least 10.

It has also been disclosed in PCT Patent Application WO 95/24893 that a hydrophobic drug may, for example, be formulated in a mixture of an oil such as a complete or partial ester of a medium chain or long chain fatty acid with a low molecular weight mono-, di- or polyhydric alcohol (for example a vegetable oil), a lipophilic surfactant such as a fatty acid or a mono- or di-glyceride of a fatty acid, and a hydrophilic surfactant having a HLB of greater than 10.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
