

MOBILE COMPUTING PERSONAE

David L. Cohn
Distributed Computing Research Laboratory
University of Notre Dame

Just what will we do with highly mobile computers,
and what are the system software implications?

1

MOBILE WORKSTATIONS vs PDAs

Mobile workstations (also portable computers, notebooks, etc.)

Fully configured computers

Screen, keyboard, disk, etc.

Big enough to do it all

PDA (Personal Digital Assistant, such as Newton, Eo, etc.)

Minimal computer

Wireless communication

Small enough to carry all of the time

2

— Notre Dame - Distributed Computing Research Laboratory —

DO WE NEED PDAs?

Question: Is there a "killer application" that will make PDAs indispensable?

Hint: It is not really an application

Clue: (from an Apple TV commercial)
"What's on your Powerbook is you!"

Answer: *Perhaps* - it depends on the evolution of ubiquitous computing

Portable workstation - carry you where ever you go

Universal connectivity - leave you home and access remotely

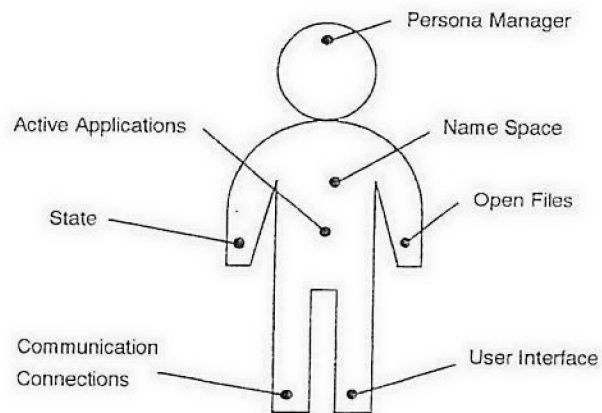

Mobile Personae - re-establish you at your location

By you, we mean your computing persona

3

— Notre Dame - Distributed Computing Research Laboratory —

WHAT IS A COMPUTING PERSONA?

4

— Notre Dame - Distributed Computing Research Laboratory —

IS PERSONA NEW?

Whenever a user logs in to a computer, a persona is established

Each user customizes his or her persona

Persona has a passive part and an active part

Passive part - files, devices, network connections

Active part - running applications, communication links

With multiple computers, a user has multiple personae

Must manually force consistency

Copy files, restart applications, rebuild communications

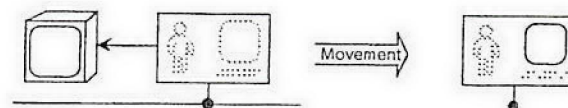

A major pain

5

MOBILE WORKSTATIONS AND IMPLICIT PERSONA

Be a turtle and carry your home with you - Mac Duo, for example

Problems:

Portable machines are never as powerful as fixed machines

Portable is a vulnerable single point-of-failure

Upgrades are traumatic

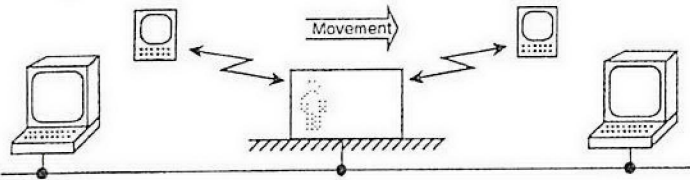

Does not solve the multiple machine problem

6

UBIQUITOUS COMPUTING AND PERSONA

Assume universal connectivity, say within a building
Use PDA as active badge and portable user interface
ParcTab, for example
Agent resides on a fixed computer

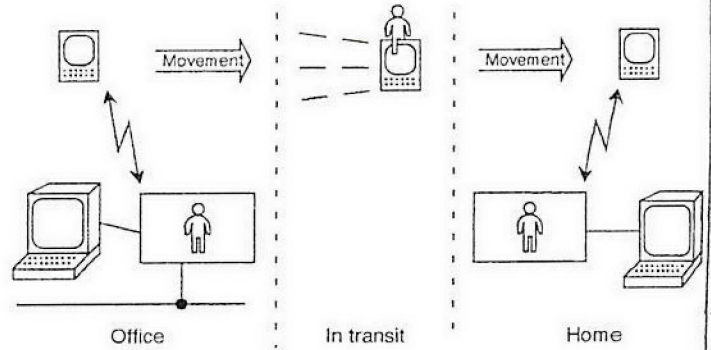

PDAs report user location, allow remote control of applications
Problems:
Need universal connectivity - will it ever happen?
Assumes significant computing structure in place

7

Notre Dame - Distributed Computing Research Laboratory

EXPLICIT MOBILE PERSONA

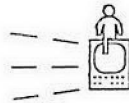

PDA as a persona carrier - could also use a network

8

Notre Dame - Distributed Computing Research Laboratory

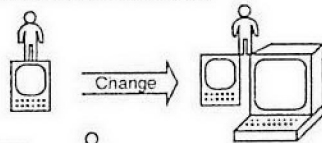

USER'S VIEW OF MOBILE PERSONA

Persona movement managed by PDA
Assumes PDA is with user at all times
PDA carries persona or network reference

Persona is imposed on computing resources
User initiates process, resources could be a collection of elements
Environment is recreated based on available resources

Can change dynamically

Must accommodate limited resources

9

Notre Dame - Distributed Computing Research Laboratory

OBJECTIONS TO PERSONA

"A persona is just a files system - like AFS"
AFS allows users to establish file access from most anywhere
Response - must evolve AFS and add active part

"I'm schizophrenic - I have multiple personae!"
Company-confidential files at work, games at home
Response - personae are location dependent

"It's not a 'persona', it's just the 'user environment!'"
It is actually what the user sees, not really the user
Response - perhaps it should look like:

10

Notre Dame - Distributed Computing Research Laboratory

PERSONA'S INTERNAL ORGANS

Note: organ transplants allowed and encouraged

File system - an evolution of disconnected file systems - like Coda
Persona is the client, not a specific machine
"Client-ness" moves through a sequence of machines

Information repository - a generalized file system
Related to Prospero and World Wide Web
Multiple storage sites, multiple access protocols
Flexible locking and caching

Mobile applications - including the persona manager
Eg: a "follow-me word processor"
Must be able to stop, move and restart - need "effective state"
Must preserve communication links - portable sockets, not mobile IP

11

FILE SYSTEMS AND MOBILE PERSONA

Files have a permanent home on a server
Persona caches files and makes updates
Files are "flushed" back to server

Similar to AFS and Coda
AFS allows client machines to cache files
Coda adds ability for clients to be disconnected

Persona may move to other machines
Files may return to server from another location
Persona leaves state behind
Useful if persona carrier dies
