“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

Page 98 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**67.** The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.

Surine, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 31 above.*

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>81.</b> The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Surine, as evidenced by the example citations below, discloses “the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See</i> Claims 32, 33 and 49 above.</p> |                                                                                                                                                                                  |

Surine

“The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.”

**Claim 81**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Surine, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

Surine

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

Surine  
“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

Surine

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**89.** The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.

Surine, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claims 15, 17 and 24 above.*

Surine

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.”

**Claim 89**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**91.** The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.

Surine, as evidenced by the example citations below, discloses “the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 31 above.*

Surine

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Surine, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claim 32, 33 and 49 above.

Surine

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                             |

| 97.2 and wherein the updating comprises: associating the additional compressed boot data with the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Surine, as evidenced by the example citations below, discloses “and wherein the updating comprises: associating the additional compressed boot data with the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, and wherein the updating comprises: associating the additional compressed boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 2, 4, 5.6, and 8.6 above.</p> |                                                                                                                                                                              |

Surine

“and wherein the updating comprises: associating the additional compressed boot data with the boot data list.”

**Claim 97.2**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**98.** The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.

Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

See Claims 1.4.1, 5.6, and 8.6 above.

“Initially, the function pointers are initialized to addresses in ROM 310, but after copying to RAM 315, the high-use pointers are updated to addresses in RAM 315. Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for high-use functions 416.”

Surine, 6:29-35.

“Memory configuration manager then dynamically updates function pointer table 510 with entries reflecting review & play code 751.”

Surine, 8:23-25.

“If software for the new mode overwrites software for the previous mode, Memory configuration manager updates the function pointer table to de-link those functions which have been replaced (e.g., written over).”

Surine, 9: 59-63.

In step 1052, any processing for review & play mode is completed, and in step 1053, memory configuration manager 755 updates function pointer table 510 is updated to de-link the review & play code 751.”

Surine, 10:44-48.

Surine

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**107.** The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.

Surine, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

Surine

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                               |

| <p><b>108.</b> The method of claim 2, further comprising: compressing at least a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Surine, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See</i> Claims 1.1, 5, 9.1 and 8 above.</p> |                                                                                                                                                                               |

Surine

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**109.** The method of claim 108, further comprising: storing the compressed additional boot data.

Surine, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

Surine

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C22**

### **Invalidity of U.S. Patent 8,880,862 based on Teoman**

U.S. Patent No. 6,370,614 Teoman (“Teoman”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                          |

entire boot sequence.”

Teoman, 13:46-51.

“In yet another embodiment for using the user cache to support system startup, before the OS boot sequence is begun, boot program code in the user cache firmware is executed to notify the system BIOS that the user cache is a bootable mass storage device. Also, when executed, the boot program code loads software into system memory for operating the user cache as a bootable mass storage device. In this embodiment, the user selects the user cache as the boot device in the system BIOS settings. Then, during the boot sequence, the operating system accesses boot up files in the user cache.”

Teoman, 13:52-62.

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Teoman, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

“When an I/O request 40 to access the mass storage 46 is issued (e.g., a file read or write request issued in the course of executing an application program), the I/O request 40 is first applied to the OS cache maintained in system memory 16. If the I/O request 40 hits the OS cache (i.e., the data sought to be accessed is cached in the OS cache), the access is performed in the OS cache. If the I/O request 40 is a read request, the data is returned to the requestor. If the I/O request 40 does not hit the OS cache, the I/O request 40 is redirected from the mass storage 46 to the user cache 25 by software mechanisms described below. If the I/O request 40 hits the user cache 25, the access is performed in the user cache 25 without having to access the mass storage 46, thereby substantially reducing the overall access time. Also, because the user cache 25 is significantly larger than the OS cache and supports data preloading (discussed below), much higher hit rates can be achieved in the user cache than in the OS cache.”

Teoman, 4:57-5:7. *See also* Teoman, 5:16-20, 5:48-51.

“According to one embodiment, the user cache 25 includes boot firmware 66 for storing program code that is used to support operation of the user cache at system startup.”

Teoman, 7:50-52.

“In general, there are two types of storage operations that take place in the user cache: preloading and responsive caching. Responsive caching refers to the storage of data in the user cache in response to I/O requests from application processes. In a preload operation, by contrast, data is retrieved from mass storage and stored in the user cache before being

Teoman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

requested for use in an application process.”

Teoman, 9:24-31. *See also* Teoman, 9:31-44, 10:40-60.

“The user interface 123 also permits the user to configure the computer system to use the user cache as a boot device, meaning that the user cache will be treated as a source of boot software at system startup. In one embodiment, if the user enables the “Use as a boot device” option, the user cache manager process prompts the user to specify the logical drive that is ordinarily the source of boot software. The user cache manager software responds by interacting with the BIOS configuration to treat the user-cache as the user-specified logical drive and thereby to boot out of the user-cache at system startup.”

Teoman, 13:29-39.

“In another embodiment, the user cache driver is loaded very early in the OS boot sequence and is operable for most of the sequence. Most operating systems support loading device drivers early in the boot sequence so that, in most cases, this mode of operation requires no special hardware or software support.”

Teoman, 13:40-45.

“In yet another embodiment for using the user cache to support system startup, before the OS boot sequence is begun, boot program code in the user cache firmware is executed to notify the system BIOS that the user cache is a bootable mass storage device. Also, when executed, the boot program code loads software into system memory for operating the user cache as a bootable mass storage device. In this embodiment, the user selects the user cache as the boot device in the system BIOS settings. Then, during the boot sequence, the operating system accesses boot up files in the user cache.”

Teoman, 13:52-62.

| <p>4. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Teoman, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See Claims 1.4.1, and 2 above.</i></p> |                                                                                                                                                                                                                          |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                           |                                                                                                                                        |
|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p> | <p>Teoman, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 1-1.4.2 above.

*See also Add disclosure from ‘608 Patent Claims 1.1 and 1.2.*

“According to one embodiment, the user cache 25 includes boot firmware 66 for storing program code that is used to support operation of the user cache at system startup.”

Teoman, 7:50-52.

“In another embodiment, boot program code in the user cache firmware is executed to redirect boot time I/O requests before the operating system is loaded. In this way, boot time I/O requests are redirected to the user cache, making the user cache operable as a source of boot files during the entire boot sequence.”

Teoman, 13:46-51.

“In yet another embodiment for using the user cache to support system startup, before the OS boot sequence is begun, boot program code in the user cache firmware is executed to notify the system BIOS that the user cache is a bootable mass storage device. Also, when executed, the boot program code loads software into system memory for operating the user cache as a bootable mass storage device. In this embodiment, the user selects the user cache as the boot device in the system BIOS settings. Then, during the boot sequence, the operating system accesses boot up files in the user cache.”

Teoman, 13:52-62.

“The program code is returned to the bus interface circuitry 61 which outputs it to the expansion bus where it is routed to its ultimate destination

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

(e.g., the processor used to execute system boot code).”

Teoman, 7:61-64.

“Still referring to FIG. 1, the processing unit 12 includes one or more processors that fetch program code from system memory 16 and execute the code to operate on data and to read and Write data to the system memory 16 and to the I/O devices on the expansion bus 18.”

Teoman, 4:8-12.

“In another embodiment, boot program code in the user cache firmware is executed to redirect boot time I/O requests before the operating system is loaded. In this way, boot time I/O requests are redirected to the user cache, making the user cache operable as a source of boot files during the entire boot sequence.”

Teoman, 13:46-51.

| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Teoman, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See</i></p> <p style="padding-left: 40px;">“The program code is returned to the bus interface circuitry 61 which outputs it to the expansion bus where it is routed to its ultimate destination (e.g., the processor used to execute system boot code).”</p> <p>Teoman, 7:61-64.</p> <p style="padding-left: 40px;">“Still referring to FIG. 1, the processing unit 12 includes one or more processors that fetch program code from system memory 16 and execute the code to operate on data and to read and Write data to the system memory 16 and to the I/O devices on the expansion bus 18.”</p> <p>Teoman, 4:8-12.</p> <p style="padding-left: 40px;">“In another embodiment, boot program code in the user cache firmware is executed to redirect boot time I/O requests before the operating system is loaded. In this way, boot time I/O requests are redirected to the user cache, making the user cache operable as a source of boot files during the entire boot sequence.”</p> <p>Teoman, 13:46-51.</p> |                                                                                                                   |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                           |

Teoman  
“wherein the processor is configured”

Claim 6.3

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

6.4 to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory,

Teoman, as evidenced by the example citations below, discloses  
“to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See Claim 1.1 above.*

Teoman

Claim 6.4

“to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                          |

Teoman

Claim 11.3

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and                                                                                                                                                                                                                                                                                                                                                                                                                                                | Teoman, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
| To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions. |                                                                                                                                                                                  |

Teoman

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| 11.5 updating the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Teoman, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. **Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                          |                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising: | Teoman, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claim 1 (Preamble) above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**13.1** loading boot data in a compressed form that is associated with a boot data list from a boot device;

Teoman, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 1.1 above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Teoman, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                        |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>13.3</b> decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;</p> | <p>Teoman, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”</p> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 1.3 above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                          |                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>14 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising: | Teoman, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
|--------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 1 (Preamble) above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                             |                                                                                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Teoman, as evidenced by the example citations below, discloses<br/> “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 1.1 and 1.2 above.

*See also*

“According to one embodiment, the user cache 25 includes boot firmware 66 for storing program code that is used to support operation of the user cache at system startup.”

Teoman, 7:50-52.

“In another embodiment, boot program code in the user cache firmware is executed to redirect boot time I/O requests before the operating system is loaded. In this way, boot time I/O requests are redirected to the user cache, making the user cache operable as a source of boot files during the entire boot sequence.”

Teoman, 13:46-51.

“In yet another embodiment for using the user cache to support system startup, before the OS boot sequence is begun, boot program code in the user cache firmware is executed to notify the system BIOS that the user cache is a bootable mass storage device. Also, when executed, the boot program code loads software into system memory for operating the user cache as a bootable mass storage device. In this embodiment, the user selects the user cache as the boot device in the system BIOS settings. Then, during the boot sequence, the operating system accesses boot up files in the user cache.”

Teoman, 13:52-62.

Teoman

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                      |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Teoman, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 1.2 and 1.3 above.

*See also*

“When an I/O request 40 to access the mass storage 46 is issued (e.g., a file read or write request issued in the course of executing an application program), the I/O request 40 is first applied to the OS cache maintained in system memory 16. If the I/O request 40 hits the OS cache (i.e., the data sought to be accessed is cached in the OS cache), the access is performed in the OS cache. If the I/O request 40 is a read request, the data is returned to the requestor. If the I/O request 40 does not hit the OS cache, the I/O request 40 is redirected from the mass storage 46 to the user cache 25 by software mechanisms described below. If the I/O request 40 hits the user cache 25, the access is performed in the user cache 25 without having to access the mass storage 46, thereby substantially reducing the overall access time. Also, because the user cache 25 is significantly larger than the OS cache and supports data preloading (discussed below), much higher hit rates can be achieved in the user cache than in the OS cache.”

Teoman, 4:57-5:7. *See also* Teoman, 5:16-20, 5:48-51.

“After a user has specified a set of commanded preload parameters, the

Teoman

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

user cache manager 90 responds by generating I/O requests to retrieve the data identified by the preload parameters from mass storage 46”

Teoman, 9:56-59.

“In yet another embodiment for using the user cache to support system startup, before the OS boot sequence is begun, boot program code in the user cache firmware is executed to notify the system BIOS that the user cache is a bootable mass storage device. Also, when executed, the boot program code loads software into system memory for operating the user cache as a bootable mass storage device. In this embodiment, the user selects the user cache as the boot device in the system BIOS settings. Then, during the boot sequence, the operating system accesses boot up files in the user cache.”

Teoman, 13:52-62.

Teoman

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                 |                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p> | <p>Teoman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
|---------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

*See also*

“Consequently, by configuring the user-cache to store program code and configuration information used for computer system startup, the user-cache may be used as a boot source to provide much faster system boot up than can be achieved by booting out of mass storage media such as disk or tape.”

Teoman, 3:12-17.

Teoman

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

“For example, a user may specify to cache the contents of a folder or directory (e. g., the system directory that includes much of the operating system and system configuration files), files having a particular file type identifier (e.g., files with a given filename extension), files having particular file names, files accessed by a particular user and so forth.”

Teoman, 3:20-26.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**17.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.

Teoman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 15 above.*

Teoman

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

| <p><b>19.1</b> The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Teoman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> |                                                                                                                                                                                                                                                                    |

Teoman

**Claim 19**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                               |                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.2 associating the accessed boot data that is not associated with the boot data list to the boot data list. | Teoman, as evidenced by the example citations below, discloses “associating the accessed boot data that is not associated with the boot data list to the boot data list” |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, associating the accessed boot data that is not associated with the boot data list to the boot data list.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 2 above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                         |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>23.</b> The method of claim 1, wherein the portion of the boot data in the compressed form represents a plurality of files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Teoman, as evidenced by the example citations below, discloses<br>“the method of claim 1, wherein the portion of the boot data in the compressed form represents a plurality of files.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the portion of the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See Claim 16 above.</i></p> |                                                                                                                                                                                         |

Teoman

“The method of claim 1, wherein the portion of the boot data in the compressed form represents a plurality of files.”

| <b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Teoman, as evidenced by the example citations below, discloses<br>“the method of claim 1, wherein the memory comprises: a physical memory.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> |                                                                                                                                             |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See Claim 16 above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**29.** The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.

Teoman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claims 15 and 17 above.*

**Teoman**

“The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 29**

**Appendix C22**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                          |                                                                                                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>36.</b> The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system. | Teoman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system” |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claims 15 and 17 above.*

Teoman

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p> | <p>Teoman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 1.1 and 1.2 above.

Teoman

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**43.** The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.

Teoman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 31 above.*

Teoman

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

Page 77 of 114

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                          |                                                                                                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>44.</b> The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data. | Teoman, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data” |
|--------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 32 above.*

Teoman

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 44**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                |                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>45.</b> The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data. | Teoman, as evidenced by the example citations below, discloses “the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
|----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 32 and 33 above.

Teoman

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**47.** The system of claim 6, wherein the boot data in the compressed form represents a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                           |

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Teoman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 15, 17 and 24 above.

Teoman

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

| <p><b>60.</b> The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Teoman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                                 |

Teoman

**Claim 60**

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Teoman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See Claims 27 and 38 above.*

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                              |

| <p><b>67.</b> The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Teoman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Teoman discloses this limitation:</p> <p><i>See Claim 31 above.</i></p> |                                                                                                                                                                                                                    |

Teoman

“The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.”

**Claim 67**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>71.</b> The method of claim 11, wherein the boot data in the compressed form represents a plurality of files. | Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

Teoman

“The method of claim 11, wherein the memory comprises: a physical memory.”

**Claim 75**

Page 95 of 114

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**76.** The method of claim 11, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claims 15, 17 and 24 above.*

Teoman

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

Claim 77

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**79.** The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.

Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See Claim 31 above.*

Teoman

“The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.”

**Claim 79**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**80.** The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.

Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claims 32, 33 and 49 above.

Teoman

“The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.”

**Claim 80**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                             |                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>81.</b> The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form. | Teoman, as evidenced by the example citations below, discloses “the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form” |
|-----------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 32, 33 and 49 above.

Teoman

“The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.”

**Claim 81**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Teoman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

Teoman

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

Teoman  
 “The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Teoman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 16 and 23 above.

Teoman

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Teoman, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claim 32, 33 and 49 above.

Teoman

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

|                                                                                                                 |                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>93.</b> The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data. | Teoman, as evidenced by the example citations below, discloses “the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Teoman discloses this limitation:

*See* Claim 32, 33, and 49 above.

Teoman

“The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 93**

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

Teoman

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C22**  
**Invalidity of U.S. Patent 8,880,862 based on Teoman**

**109.** The method of claim 108, further comprising: storing the compressed additional boot data.

Teoman, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Teoman discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

Teoman

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C23**

### **Invalidity of U.S. Patent 8,880,862 based on Vers**

German Patent No. DE19721786 to Michael Vers (“Vers”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. |---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.

Vers, Abstract

The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.

Vers, 2

Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after

Vers

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the

Vers

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 5 of 139

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Vers, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the</p> |                                                                                                                                                         |

Vers  
“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a

checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Vers, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header</p> |                                                                                                                                                                                                                                                                                                         |

Vers

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element,

Vers

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

Vers, 3-4

Vers

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

| <p>1.4.1 updating the boot data list,</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Vers, as evidenced by the example citations below, discloses “updating the boot data list,”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable</p> |                                                                                                    |

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

If a user software from the volatile memory operates 18 may at any time provide the required memory locations for storing online modifications available memory management. For an online modified user program is again even with reclosing of the automation device in the previously amended version is available, it must be stored before switching off the automation device in the non-volatile memory, so that all previous changes and variable initialization are stored.

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Vers, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the</p> |                                                                                                                                                                  |

Vers  
“wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a

checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Vers, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See</i> Claims 1-1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can</p> |                                                                                                                                      |

| <p>5.5 utilizing the decompressed boot data to at least partially boot the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Vers, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”</p> |
| <p>To the extent that Realtme contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header</p> |                                                                                                                                                           |

Vers  
“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element,

decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.

Vers, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claims 1-1.3 above.

Vers

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                 |

| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Vers, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See</i></p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is</p> |                                                                                                                 |

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

| <p>8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Vers, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See</i></p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files</p> |                                                                                                                                                                                 |

Vers

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C23 Invalidity of U.S. Patent 8,880,862 based on Vers

in the volatile memories.

Vers, 2

Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

| <p><b>9.1</b> The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Vers, as evidenced by the example citations below, discloses “the method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files</p> |                                                                                                                                                                                                                           |

Vers

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

Claim 9.1

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

in the volatile memories.

Vers, 2

Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Vers, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.

Vers, Abstract

The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.

Vers, 2

Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC

Vers Claim 11.4  
“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C23

checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the

Vers

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

Vers

“a method for providing accelerated loading of an operating system in a computer system, comprising.”

**Claim 13 (Preamble)**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                 |                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13.1</b> loading boot data in a compressed form that is associated with a boot data list from a boot device; | Vers, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device” |
|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claim 1.1 above.

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Vers, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                      |

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

**13.3** decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Vers, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claim 1.3 above.

Vers

“decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Claim 13.3**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                            |

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claims 1.1 and 1.2 above.

*See also*

The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.

Vers, Abstract

Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used,

compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

Vers, 2

In FIG. 2, the memory map of the nonvolatile memory 16 is shown. Invention is provided in accordance with that system software, such as operating system is stored in a top portion 22. Following the operating system followed by a free space 24, the memory area 26 joins with a reset initialization and a decompression Algorithm mechanism as executable code.

Vers, 3

Fig. 3 shows the structure of a file system first header 28 in a region at the beginning of the establishment in which not the actual data but important structural information is saved to the file. So the CRC checksum (Cyclical Redundancy Check) is stored in a storage area 30 through the first four bytes of the first header 28. In a storage area 32 of the header, the length of the operating system is stored in non-volatile memory without the header itself. In a further memory area 34, the flag element is stored. It has the value "ONE" when the operating system is stored in compressed form and the value "zero" when the operating system in a transparent, i.e, unmodified form is saved. By a further storage area 36, the destination address is specified in the volatile memory to which copies the operating system is to be stored or

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See Claim 15 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">The invention relates to a method for operating a data processing device, in particular automation device, with volatile and non-volatile memories, said system and / or application software is copied from non-volatile to a volatile memory.</p> <p>Vers, 1</p> <p style="padding-left: 40px;">From the prior art it is known that in a data processing device, both the system and the application software is stored in a nonvolatile memory. The system software can run directly on the one hand from the non-volatile memory or on the other hand copies of the non-volatile memory to the volatile memory and run from this. The start of the system software from non-volatile memory has the disadvantage that either a quicker and thereby more expensive non-volatile memory must be used, or that the system power is discontinued by inserting wait states ago. At the start of the system software from the volatile memory non-volatile memory must be in full size of the system software, however, is no longer needed after copying the system software.</p> <p>Vers, 1</p> <p style="padding-left: 40px;">The problem is inventively achieved in that the system software stored compression form in the in the non-volatile memory after reset depending on a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and</p> |                                                                                                                                                                                                                |

Vers

**Claim 17**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

started there and / or that the application software associated, are compressed files containing changes the user software or by appointment by the programmer before power failure and stored in non-volatile memory and decompressed when power is restored to regenerate the files in the volatile memories.

Vers 2

In particular, programmable logic controllers or PLCs can be stored in non-volatile memory in compressed form and application software.

|-----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtme contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claims 1.1 and 1.2 above

*See also*

The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.

Vers, Abstract

From the prior art it is known that in a data processing device, both the system and the application software is stored in a nonvolatile memory. The system software can run directly on the one hand from the non-volatile memory or on the other hand copies of the non-volatile memory to the volatile memory and run from this. The start of the system software from non-volatile memory has the disadvantage that either a quicker and thereby more expensive non-volatile memory must be used, or that the system power is discontinued by inserting wait states ago. At the start of the system software from the volatile memory non-volatile memory must be in full size of the system software, however, is no longer needed after copying the system software.

It is also known that application software can run in non-volatile memory or can be loaded from a programming unit via a controlled by the system software programming in the volatile memory directly. While executing the application software from non-volatile memory often occurs a

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

problem that the application software on-line changes are difficult to achieve or only with a considerable increase in the cycle time. In a sequence of user software from the volatile memory is also known that a memory management can always provide the necessary resources for online changes available. If the modified data upon reconnection of the data processing apparatus provided in its amended form available to use must be assured that they were previously stored in non-volatile memory so that the previous online changes are saved. However, this would require an unnecessarily large non-volatile memory which would not be used during the lifetime of the data processing device.

Vers, 1-2

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

Vers, 3-4

Vers

“The method of claim 1, wherein the memory comprises: a physical memory”

**Claim 27**

Page 89 of 139

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Vers, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                          |                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>44.</b> The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data. | Vers, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data” |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See Claim 32 above.*

Vers

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Vers, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Vers discloses this limitation:</p> <p style="padding-left: 40px;">The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.</p> <p>Vers, Abstract</p> <p style="padding-left: 40px;">The invention is based on the problem to provide a method for operating a data processing device in such a way that non-volatile at least consistent performance storage elements with a minimum memory capacity can be used. the problem is inventively solved in that the system software stored in compressed form in the non-volatile memory and to reset in response to a flag element either is decompressed and stored in the volatile memory or copied without decompression in the volatile memory and started there and / or that the application software associated, are compressed changes of application software files containing or by instructing from the programming device before power failure and stored in the nonvolatile memory and decompressed when power is restored to regenerate the files in the volatile memories.</p> <p>Vers, 2</p> <p style="padding-left: 40px;">Preferably, a destination address in the volatile memory is in the header in the non-volatile memory, where the system software such as operating system copied or stored decompressed. It is also provided that after</p> |                                                                                                                                                                                          |

Vers

**Claim 50**

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

decompression or copying of the system software calculated CRC checksum compared with a in a second header in the region of the beginning of the file system software in the volatile memory, and if they match a start routine is started.

Vers, 2

A particularly preferred compressing algorithm is the LZW algorithm used.

Vers, 2

In Fig. 1 the basic construction of a programmable controller is shown with a bus 12 to which a microprocessor 14, non-volatile and volatile memories 16, 18 and one or more peripheral devices 20 are connected. as non-volatile memory 16 preferably flash memory modules are used, which can be written and read, and in contrast to the volatile memory 18 may be retained their content when they are not supplied with operating voltage. Other non-volatile memory such as EPROM and EEPROM can also be used. Preferably as a volatile memory SRAM and / or DRAM's are used. In Fig. 2, the memory map of the nonvolatile memory 16 is shown. According to the invention, that the system software as the operating system stored in an initial region 22nd Following the operating system is followed by a free space 24, which is a storage area 26 connects with a reset initialization and a decompression algorithm as executable code. Especially with programmable logic controllers or PLCs can also use the software in the nonvolatile memory is stored in compressed form be.

Vers, 3

By a further storage area 36, the destination address is specified in the volatile memory to which the operating system copies or store decompressed. Finally, the tray of the operating system begins in compressed or transparent form.

Vers, 3

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the

operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                              |                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Vers, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Vers, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See* Claims 15, 17 and 24 above.

Vers

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

| <p><b>67.</b> The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Vers, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Vers discloses this limitation:</p> <p><i>See Claim 31 above.</i></p> |                                                                                                                                                                                                                  |

Vers

“The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.”

**Claim 67**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                  |                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>71.</b> The method of claim 11, wherein the boot data in the compressed form represents a plurality of files. | Vers, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                           |

Vers

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 84**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                     |                                                                                                                                        |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <b>87.</b> The method of claim 13, wherein the memory comprises: a physical memory. | Vers, as evidenced by the example citations below, discloses “the method of claim 13, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Vers discloses this limitation:

*See Claim 27 above.*

Vers

“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                  |                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>88.</b> The method of claim 13, wherein the operating system comprises: a plurality of files. | Vers, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

*See* Claims 16 and 23 above.

Vers

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                   |

**Claim 98**

**Appendix C23**  
**Invalidity of U.S. Patent 8,880,862 based on Vers**

**107.** The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.

Vers, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Vers discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

*See also*

The method involves placing system software into a non-volatile memory (16) in compressed form. After a reset, the software is copied into the volatile memory (18) and is started there. This is done either after decompression or without decompression, depending on the characteristic element. Data corresponding to changes in the user software prior to voltage drop-out are compressed and stored in the non-volatile memory and after reset are decompressed for regeneration of the data in volatile memory.

Vers, Abstract

From the prior art it is known that in a data processing device, both the system and the application software is stored in a nonvolatile memory. The system software can run directly on the one hand from the non-volatile memory or on the other hand copies of the non-volatile memory to the volatile memory and run from this. The start of the system software from non-volatile memory has the disadvantage that either a quicker and thereby more expensive non-volatile memory must be used, or that the system power is discontinued by inserting wait states ago. At the start of the system software from the volatile memory non-volatile memory must be in full size of the system software, however, is no longer needed after copying the system software.

It is also known that application software can run in non-volatile memory or can be loaded from a programming unit via a controlled by the system software programming in the volatile memory directly. While executing

Vers

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

## Appendix C23

### Invalidity of U.S. Patent 8,880,862 based on Vers

the application software from non-volatile memory often occurs a problem that the application software on-line changes are difficult to achieve or only with a considerable increase in the cycle time. In a sequence of user software from the volatile memory is also known that a memory management can always provide the necessary resources for online changes available. If the modified data upon reconnection of the data processing apparatus provided in its amended form available to use must be assured that they were previously stored in non-volatile memory so that the previous online changes are saved. However, this would require an unnecessarily large non-volatile memory which would not be used during the lifetime of the data processing device.

Vers, 1-2

To inventively to guarantee the use of non-volatile memories of a minimum memory size is provided that the stored in compressed form in the non-volatile memory operating system during initialization in the volatile memory is loaded. For this purpose it is provided that the non-volatile memory compresses stored operating system, ie, when the flag element the value "ONE" has a function of the marker element, decompressed by a stored in nonvolatile memory uncompressed routine and is stored in the nonvolatile memory. Before the decompression of the operating system a CRC checksum is calculated and compared with the likewise in the header 28 stored in the storage area 30 by means of a checksum stored in the memory area 32 of the first header 28 length information. Is the calculated checksum matches the checksum stored, the process continues with the decompression. Here, the operating system is decompressed without the header 28 and stored decompressed to the stored in the memory area 36 of the header 28 destination address in the volatile memory. Does the marker element the value "zero" on, is the operating system directly, ie without decompression and without header in the volatile memory copied. After decompress or copying of the operating system as previously described a CRC checksum is determined and compared with a in a second header 40 in volatile memory which is present in decompressed form. If the two checksums match, a startup routine of the operating system is started, whose address is also stored in the header 40 in the storage area 46th

Vers, 3-4

### **Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

U.S. Patent No. 6,317,818 to Zwiegincew (“Zwiegincew”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

In addition, Apple incorporates by reference, as if set forth fully herein, all arguments related to Zwiegincew in pending inter partes review petitions IPR2016-01737, IPR2016-01738, and IPR2016-01739.

accomplished. However, other potential solutions involve the manipulation of memory storage through software program modules.

Zwiegincew, 1:45-51

In an exemplary embodiment, the present invention may comprise one or more memory management program modules 137 stored on the drives or RAM 125 of the computer 100. Specifically, program modules 137 of the present invention may comprise computer implemented instructions for determining which pages will have to be retrieved from disk during a potential hard page fault scenario and pre-fetching the determined pages into RAM prior to the occurrence of the potential hard page fault sequence.

Zwiegincew, 5:50-51.

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Zwiegincew, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

Hard page fault patterns of an application program module are analyzed in order to determine the pages that will be retrieved from disk storage during a common hard page fault scenario. Copies of, or references to, the determined pages are stored in a scenario file, along with an index referred to as a page sequence. The scenario file may also include a prologue indicating events that lead to a hard page fault scenario and an epilogue that may indicate subsequent hard page fault scenarios. Execution of the application program module is monitored to detect the occurrence of a hard page fault scenario. When a hard page fault scenario is detected, a corresponding scenario file is fetched from disk storage and the determined pages, or copies thereof, are transferred into RAM. The determined pages, or copies thereof, may be placed on a stand-by list in RAM and later soft-faulted into the working set of the application program upon request by the application program module, thereby avoiding a sequence of hard page faults.

Zwiegincew, Abstract

There are various potential solutions to the performance bottleneck caused by disk access time during hard page fault scenarios. An obvious potential solution is to reduce disk access time. The reduction of disk access time is primarily a hardware consideration and is not easily accomplished. However, other potential solutions involve the manipulation of memory storage through software program modules.

Zwiegincew, 1:45-51

In an exemplary embodiment, the present invention may comprise one or more memory management program modules 137 stored on the

Zwiegincew

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

drives or RAM 125 of the computer 100. Specifically, program modules 137 of the present invention may comprise computer implemented instructions for determining which pages will have to be retrieved from disk during a potential hard page fault scenario and pre-fetching the determined pages into RAM prior to the occurrence of the potential hard page fault sequence.

Zwiegincew, 5:50-51.

The present invention meets the needs described above by providing a system and method for improving the performance of an application program module by reducing the occurrence of hard page faults during the operation of an application program module. The present invention may be embodied in an add-on software program module that operates in conjunction with the application program module. In this manner, no effort is required on the part of the application programmer to manipulate or modify the application program module in order to improve performance. Furthermore, the add-on software program module does not detract from the intended operation of the application program module.

According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

determined pages into RAM. The copies of the determined pages are placed on a standby list in RAM. Accordingly, the determined pages will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed' ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

No compression:  $0.012 \text{ s (seek)} + 3 \text{ MB} / 8 \text{ MB/s (read)} = 0.3870 \text{ s}$ .

50% compression:  $0.012 \text{ s (seek)} + 1.5 \text{ MB} / 8 \text{ MB/s (read)} + 3 \text{ MB} / 25 \text{ MB/s (decompress)} = 0.3195 \text{ s}$ .

Thus, there is a 17.5% improvement in pre-fetch time using 50% compression.

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the determined pages into RAM. The copies of the determined pages are placed on a standby list in RAM. Accordingly, the determined pages will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed' ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

No compression:  $0.012 \text{ s (seek)} + 3 \text{ MB} / 8 \text{ MB/s (read)} = 0.3870 \text{ s}$ .

50% compression:  $0.012 \text{ s (seek)} + 1.5 \text{ MB} / 8 \text{ MB/s (read)} + 3 \text{ MB} / 25 \text{ MB/s (decompress)} = 0.3195 \text{ s}$ .

Thus, there is a 17.5% improvement in pre-fetch time using 50% compression.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

Hard page fault patterns of an application program module are analyzed in order to determine the pages that will be retrieved from disk storage during a common hard page fault scenario. Copies of, or references to, the determined pages are stored in a scenario file, along with an index referred to as a page sequence. The scenario file may also include a prologue indicating events that lead to a hard page fault scenario and an epilogue that may indicate subsequent hard page fault scenarios. Execution of the application program module is monitored to detect the occurrence of a hard page fault scenario. When a hard page fault scenario is detected, a corresponding scenario file is fetched from disk storage and the determined pages, or copies thereof, are transferred into RAM. The determined pages, or copies thereof, may be placed on a stand-by list in RAM and later soft-faulted into the working set of the application program upon request by the application program module, thereby avoiding a sequence of hard page faults.

Zwiegincew, Abstract

There are various potential solutions to the performance bottleneck caused by disk access time during hard page fault scenarios. An obvious potential solution is to reduce disk access time. The reduction of disk access time is primarily a hardware consideration and is not easily

Zwiegincew

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

accomplished. However, other potential solutions involve the manipulation of memory storage through software program modules.

Zwiegincew, 1:45-51

In an exemplary embodiment, the present invention may comprise one or more memory management program modules 137 stored on the drives or RAM 125 of the computer 100. Specifically, program modules 137 of the present invention may comprise computer implemented instructions for determining which pages will have to be retrieved from disk during a potential hard page fault scenario and pre-fetching the determined pages into RAM prior to the occurrence of the potential hard page fault sequence.

Zwiegincew, 5:50-51.

The present invention meets the needs described above by providing a system and method for improving the performance of an application program module by reducing the occurrence of hard page faults during the operation of an application program module. The present invention may be embodied in an add-on software program module that operates in conjunction with the application program module. In this manner, no effort is required on the part of the application programmer to manipulate or modify the application program module in order to improve performance. Furthermore, the add-on software program module does not detract from the intended operation of the application program module.

According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Page 13 of 128

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the determined pages into RAM. The copies of the determined pages are placed on a standby list in RAM. Accordingly, the determined pages will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed' ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

Zwiegincew

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Zwiegincew, as evidenced by the example citations below, discloses “updating the boot data list,” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p style="padding-left: 40px;">Hard page fault patterns of an application program module are analyzed in order to determine the pages that will be retrieved from disk storage during a common hard page fault scenario. Copies of, or references to, the determined pages are stored in a scenario file, along with an index referred to as a page sequence. The scenario file may also include a prologue indicating events that lead to a hard page fault scenario and an epilogue that may indicate subsequent hard page fault scenarios. Execution of the application program module is monitored to detect the occurrence of a hard page fault scenario. When a hard page fault scenario is detected, a corresponding scenario file is fetched from disk storage and the determined pages, or copies thereof, are transferred into RAM. The determined pages, or copies thereof, may be placed on a stand-by list in RAM and later soft-faulted into the working set of the application program upon request by the application program module, thereby avoiding a sequence of hard page faults.</p> <p>Zwiegincew, Abstract</p> <p style="padding-left: 40px;">The present invention meets the needs described above by providing a system and method for improving the performance of an application program module by reducing the occurrence of hard page faults during the operation of an application program module. The present invention may be embodied in an add-on software program module that operates in conjunction with the application program module. In this manner, no effort is required on the part of the application programmer to manipulate or modify the application program module in order to improve performance. Furthermore, the add-on software program module does not detract from the intended operation of the application program module.</p> <p style="padding-left: 40px;">According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the</p> |                                                                                                   |

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the determined pages into RAM. The copies of the determined pages are placed on a standby list in RAM. Accordingly, the determined pages will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed'

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

A hard page fault scenario analyzer 240 anticipates and analyzes hard page fault scenarios. As mentioned, a hard page fault scenario is a situation in which a hard page fault sequence is highly likely to occur. The hard page fault scenario analyzer logs various hard page fault scenarios that occur during operation of the application program module 205. The logged hard page fault scenarios are then analyzed to determine if they re-occur frequently, and if they do, they are put in a scenario file. This analysis can occur programmatically on the end-user's computer system, or in advance by the developer of a particular software product. As an example, suppose the application program module 205 is a word processor and that an anticipated hard page fault scenario is the situation in which the user selects a well known "file open" command. In response to the "file open" command, the application program will display a graphical representation of a file directory. However, in order to display the graphical representation of the file directory, a sequence of hard page faults will occur because the word processor must retrieve a particular set of pages from disk. In accordance with an exemplary embodiment of the present invention, the hard page fault scenario analyzer 240 anticipates the "open file" hard page fault scenario of the example and determines the set of pages that will need to be retrieved from disk upon the occurrence of the hard page fault. The determination of pages that will need to be retrieved from disk will be described in greater detail below. The detection of particular classes of hard page fault scenarios may be built into the system. For example, application launch is virtually always a hard page fault scenario, so an exemplary embodiment of the present invention may be configured such that any launch operation of an application program will be considered to be a hard page fault scenario.

Zwiegincew, 6:29-61.

The hard page fault scenario analyzer 240 may comprise functionality for automatically analyzing hard page fault scenarios and generating corresponding scenario files. By way of illustration, the hard page fault analyzer 240 may log hard page faults that occur upon execution of a process during operation of an application program module 205. During idle time of the application program module 205, the hard page fault scenario analyzer 240 may write the log of hard page faults to a log file. Then, a pattern matching algorithm may be used to find a pattern of hard page faults based on all log files generated for the process same. If

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

a pattern of hard page faults is found, a new scenario file may be generated based on the pages that are retrieved from disk during the pattern. Automatically generated scenario files may be subject to subsequent refinement, i.e., they may be input into the pattern-matching algorithm.

Zwiegincew, 7:24-40

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

No compression:  $0.012 \text{ s (seek)} + 3 \text{ MB} / 8 \text{ MB/s (read)} = 0.3870 \text{ s}$ .

50% compression:  $0.012 \text{ s (seek)} + 1.5 \text{ MB} / 8 \text{ MB/s (read)} + 3 \text{ MB} / 25 \text{ MB/s (decompress)} = 0.3195 \text{ s}$ .

Thus, there is a 17.5% improvement in pre-fetch time using 50% compression.

|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>3.</b> The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Zwiegincew, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                                                                                                                                                 |

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

4. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.

Zwiegincew, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 1.4.1, and 2 above.

| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Zwiegincew, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

Hard page fault patterns of an application program module are analyzed in order to determine the pages that will be retrieved from disk storage during a common hard page fault scenario. Copies of, or references to, the determined pages are stored in a scenario file, along with an index referred to as a page sequence. The scenario file may also include a prologue indicating events that lead to a hard page fault scenario and an epilogue that may indicate subsequent hard page fault scenarios. Execution of the application program module is monitored to detect the occurrence of a hard page fault scenario. When a hard page fault scenario is detected, a corresponding scenario file is fetched from disk storage and the determined pages, or copies thereof, are transferred into RAM. The determined pages, or copies thereof, may be placed on a stand-by list in RAM and later soft-faulted into the working set of the application program upon request by the application program module, thereby avoiding a sequence of hard page faults.

Zwiegincew, Abstract

There are various potential solutions to the performance bottleneck caused by disk access time during hard page fault scenarios. An obvious potential solution is to reduce disk access time. The reduction of disk access time is primarily a hardware consideration and is not easily accomplished. However, other potential solutions involve the manipulation of memory storage through software program modules.

Zwiegincew, 1:45-51

In an exemplary embodiment, the present invention may comprise one or more memory management program modules 137 stored on the drives or RAM 125 of the computer 100. Specifically, program modules 137 of the present invention may comprise computer implemented

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

instructions for determining which pages will have to be retrieved from disk during a potential hard page fault scenario and pre-fetching the determined pages into RAM prior to the occurrence of the potential hard page fault sequence.

Zwiegincew, 5:50-51.

The present invention meets the needs described above by providing a system and method for improving the performance of an application program module by reducing the occurrence of hard page faults during the operation of an application program module. The present invention may be embodied in an add-on software program module that operates in conjunction with the application program module. In this manner, no effort is required on the part of the application programmer to manipulate or modify the application program module in order to improve performance. Furthermore, the add-on software program module does not detract from the intended operation of the application program module.

According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the determined pages into RAM. The copies of the determined pages are placed on a standby list in RAM. Accordingly, the determined pages

Zwiegincew

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed' ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

No compression:  $0.012 \text{ s (seek)} + 3 \text{ MB} / 8 \text{ MB/s (read)} = 0.3870 \text{ s.}$

50% compression:  $0.012 \text{ s (seek)} + 1.5 \text{ MB} / 8 \text{ MB/s (read)} + 3 \text{ MB} / 25 \text{ MB/s (decompress)} = 0.3195 \text{ s.}$

Thus, there is a 17.5% improvement in pre-fetch time using 50% compression.

**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Zwiegincew, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See Claim 1 (Preamble) above.</i></p> |                                                                                                                                                                         |

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                 |                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13.1</b> loading boot data in a compressed form that is associated with a boot data list from a boot device; | Zwiegincew, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device” |
|-----------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claim 1.1 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Zwiegincew, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                            |

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**13.3** decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Zwiegincew, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See* Claim 1.3 above.

Zwiegincew

“decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Claim 13.3**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| <b>13.4</b> updating the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Zwiegincew, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. **Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                          |                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.” |
|--------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

Zwiegincew

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                      |

| <b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Zwiegincew, as evidenced by the example citations below, discloses<br>“the method of claim 1, wherein the memory comprises: a physical memory.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above</p> |                                                                                                                                                 |

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See* Claim 16 above.

| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See Claims 1.1 and 32 above.</i></p> |                                                                                                                                                                                                           |

Zwiegincew

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

Page 83 of 128

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                     |                                                                                                                                                              |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>35.</b> The method of claim 5, wherein the compressed boot data represents a plurality of files. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files” |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                          |                                                                                                                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>36.</b> The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system” |
|----------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See Claims 15 and 17 above.*

Zwiegincew

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                |

Zwiegincew

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Zwiegincew, as evidenced by the example citations below, discloses  
“the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                        |

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

Hard page fault patterns of an application program module are analyzed in order to determine the pages that will be retrieved from disk storage during a common hard page fault scenario. Copies of, or references to, the determined pages are stored in a scenario file, along with an index referred to as a page sequence. The scenario file may also include a prologue indicating events that lead to a hard page fault scenario and an epilogue that may indicate subsequent hard page fault scenarios. Execution of the application program module is monitored to detect the occurrence of a hard page fault scenario. When a hard page fault scenario is detected, a corresponding scenario file is fetched from disk storage and the determined pages, or copies thereof, are transferred into RAM. The determined pages, or copies thereof, may be placed on a stand-by list in RAM and later soft-faulted into the working set of the application program upon request by the application program module, thereby avoiding a sequence of hard page faults.

Zwiegincew, Abstract

There are various potential solutions to the performance bottleneck caused by disk access time during hard page fault scenarios. An obvious potential solution is to reduce disk access time. The reduction of disk access time is primarily a hardware consideration and is not easily accomplished. However, other potential solutions involve the manipulation of memory storage through software program modules.

Zwiegincew, 1:45-51

In an exemplary embodiment, the present invention may comprise one or more memory management program modules 137 stored on the drives or RAM 125 of the computer 100. Specifically, program modules

**Claim 50**

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

137 of the present invention may comprise computer implemented instructions for determining which pages will have to be retrieved from disk during a potential hard page fault scenario and pre-fetching the determined pages into RAM prior to the occurrence of the potential hard page fault sequence.

Zwiegincew, 5:50-51.

The present invention meets the needs described above by providing a system and method for improving the performance of an application program module by reducing the occurrence of hard page faults during the operation of an application program module. The present invention may be embodied in an add-on software program module that operates in conjunction with the application program module. In this manner, no effort is required on the part of the application programmer to manipulate or modify the application program module in order to improve performance. Furthermore, the add-on software program module does not detract from the intended operation of the application program module.

According to one aspect of the present invention, a scenario file is created which comprises ordered copies of pages that are likely to be retrieved from disk storage by an application program module during a hard page fault. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the scenario file is fetched from disk storage and the ordered copies of the pages are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. In another aspect of the invention, a hard page fault scenario analyzer is provided for analyzing a hard page fault scenario of an application program module in order to determine the pages that will be retrieved from disk storage upon the occurrence of a hard page fault scenario. The hard page fault scenario analyzer creates a scenario file comprising copies of the pages in the determined order. A hard page fault scenario detector is provided for monitoring the execution of the application module, detecting a hard page fault scenario and sending a message to a pre-fetcher. The hard page fault scenario detector may be manual or automatic. A pre-fetcher retrieves a scenario file from disk storage and transfers the copies of the determined pages into RAM. The copies of the determined pages are

Zwiegincew

**Claim 50**

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

## Appendix C24

### Invalidity of U.S. Patent 8,880,862 based on Zwiegincew

placed on a standby list in RAM. Accordingly, the determined pages will be available in RAM during a hard page fault scenario and will be soft-faulted into the working set of the application program module when they are requested by the application program module, thereby avoiding a hard page fault.

According to another aspect of the invention, a scenario file is created which comprises ordered references to pages that are likely to be retrieved from disk storage by an application program module during a hard page fault scenario, rather than the actual pages themselves. The scenario file is stored in the disk storage. Then, the execution of the application program module is monitored until either an explicit begin-of-scenario instruction is detected, or a hard page fault scenario is detected. A hard page fault scenario may comprise any situation or event that is likely to trigger a hard page fault, i.e., one or more requested pages will not be available in RAM and will be retrieved from disk storage. In response to the detection of a begin-of-scenario instruction or a hard page fault scenario, the pages referenced by the scenario file are fetched from disk storage in the optimal manner and are transferred into a standby list in RAM. In this manner, the requested pages will be soft faulted into a working set of the application program module, and no hard page fault will occur. This aspect of the invention will result in more seek operations on disk, but will still allow reading of the required pages in an optimal manner, rather than the 'as needed' ordering if the pages are hard faulted into RAM. This aspect of the invention also reduces the disk space requirements over the previously mentioned aspect.

Zwiegincew, 2:43-3:49.

Further, an exemplary embodiment includes a disk compressor/decompressor 265. Well known compression algorithms may be employed to achieve approximately 50% compression with 25 MB/s decompression throughput. These results may be achieved with as little as 64 KB extra memory. Average disk transfer rates are about 8 MB/s. So, for an illustrative 3 MB pre-fetch scenario, comparative pre-fetch times are as follows:

No compression:  $0.012 \text{ s (seek)} + 3 \text{ MB} / 8 \text{ MB/s (read)} = 0.3870 \text{ s}$ .

50% compression:  $0.012 \text{ s (seek)} + 1.5 \text{ MB} / 8 \text{ MB/s (read)} + 3 \text{ MB} / 25 \text{ MB/s (decompress)} = 0.3195 \text{ s}$ .

Thus, there is a 17.5% improvement in pre-fetch time using 50% compression.

Zwiegincew

"The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form."

Zwiegincew

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

Page 97 of 128

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                          |                                                                                                                                                   |
|------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>51.</b> The system of claim 6, wherein the first memory comprises: a physical memory. | Zwiegincew, as evidenced by the example citations below, discloses “the system of claim 6, wherein the first memory comprises: a physical memory” |
|------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the first memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See Claims 27 and 39 above.*

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                              |                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Zwiegincew, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Zwiegincew, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 15, 17 and 24 above.

Zwiegincew

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

Page 100 of 128

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                        |                                                                                                                                                                                 |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>59.</b> The method of claim 8, wherein the operating system in the compressed form represents a plurality of files. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

Zwiegincew

“The method of claim 8, wherein the operating system in the compressed form represents a plurality of files.”

**Claim 59**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                     |

| <p><b>72.</b> The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Zwiegincew discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                                 |

Zwiegincew

**Claim 72**

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                     |                                                                                                                                              |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>75.</b> The method of claim 11, wherein the memory comprises: a physical memory. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 11, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See Claim 27 above.*

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                  |                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>76.</b> The method of claim 11, wherein the operating system comprises: a plurality of files. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See Claims 15, 17 and 24 above.*

Zwiegincew

**Claim 77**

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                  |                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                 |

Zwiegincew

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claim 32, 33 and 49 above.

Zwiegincew

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

|                                                                                                                 |                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>93.</b> The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data. | Zwiegincew, as evidenced by the example citations below, discloses “the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
|-----------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Zwiegincew discloses this limitation:

*See* Claim 32, 33, and 49 above.

Zwiegincew

“The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 93**

**Appendix C24**  
**Invalidity of U.S. Patent 8,880,862 based on Zwiegincew**

Zwiegincew

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C25**

### **Invalidity of U.S. Patent 8,880,862 based on Anyimi**

Anyimi, "Implementing a Plug and Play BIOS Using Intel's Boot Block Flash Memory," Feb. 1995 ("Anyimi") invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 ("the '862 Patent") pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime's proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the '862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

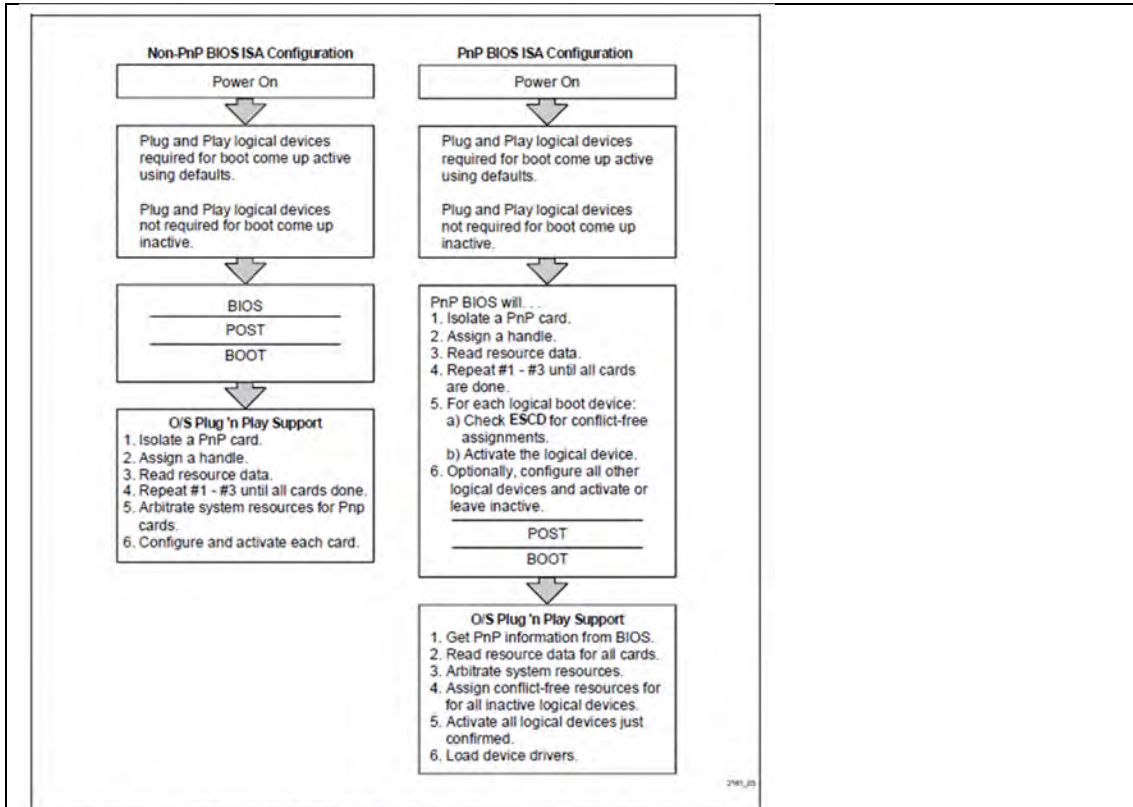

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;

Anyimi, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

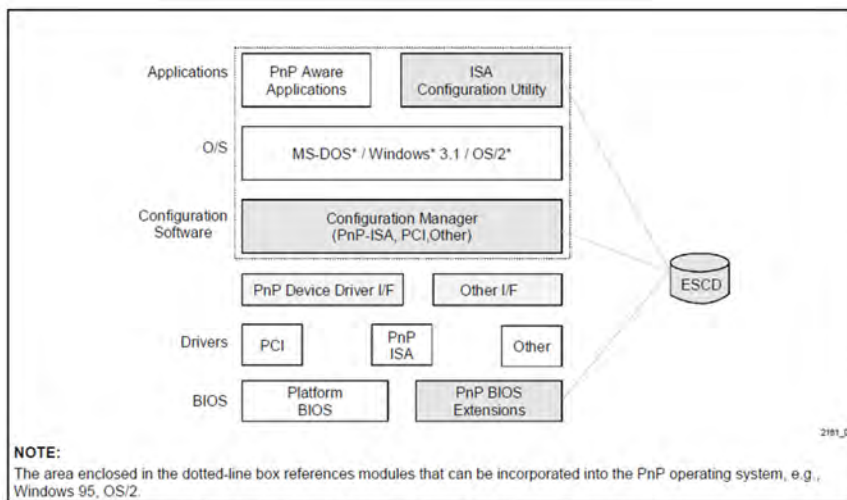

Anyimi discloses this claim limitation:

### 3.1 PnP Components

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

Anyimi, 3.1

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

Anyimi

Claim 1.1

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Page 6 of 144

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Anyimi, Fig. 2

Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.

Anyimi, 2.2

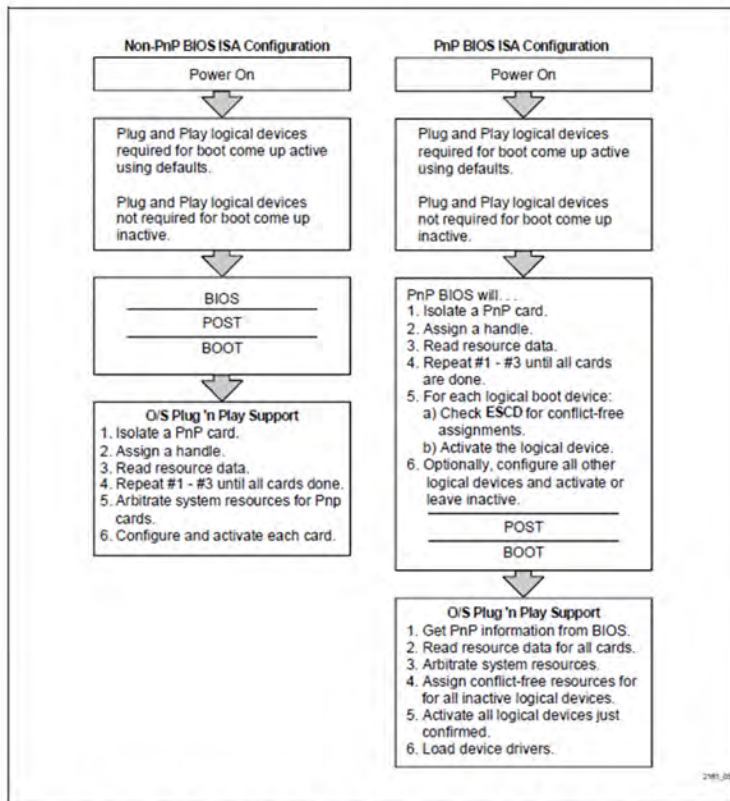

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Anyimi, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Anyimi discloses this claim limitation:</p> <p style="padding-left: 40px;">Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.</p> <p>Anyimi, 2.2</p> |                                                                                                                                                                                                                                                                                                           |

Anyimi

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

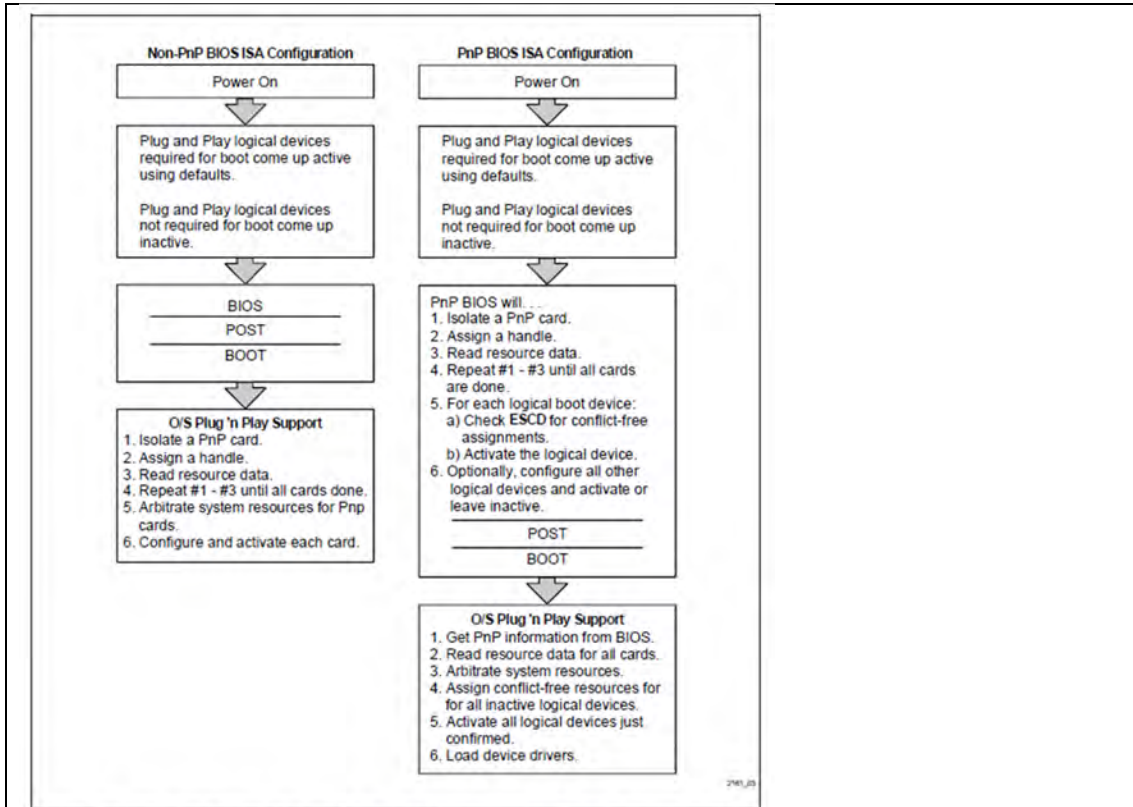

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

#### Anyimi, 3.2

#### Anyimi

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

#### Claim 1.3

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

#### Anyimi, 5.1

#### Anyimi

"decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form."

#### Claim 1.3

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Anyimi, as evidenced by the example citations below, discloses “updating the boot data list,” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this claim limitation:</p> <p>Plug and Play can make the usual experience of adding new functionality to an existing system as easy as:</p> <ol style="list-style-type: none"><li>1. Turn the system off.</li><li>2. Insert the new device.</li><li>3. Turn the system on.</li></ol> <p>PnP flash BIOS can also extend the life of the PC. By enabling simple updates to the BIOS (simply insert the upgrade disk and the software programs the new BIOS), the user can get more out of their PC investment.</p> <p>Anyimi, 1.0</p> |                                                                                               |

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

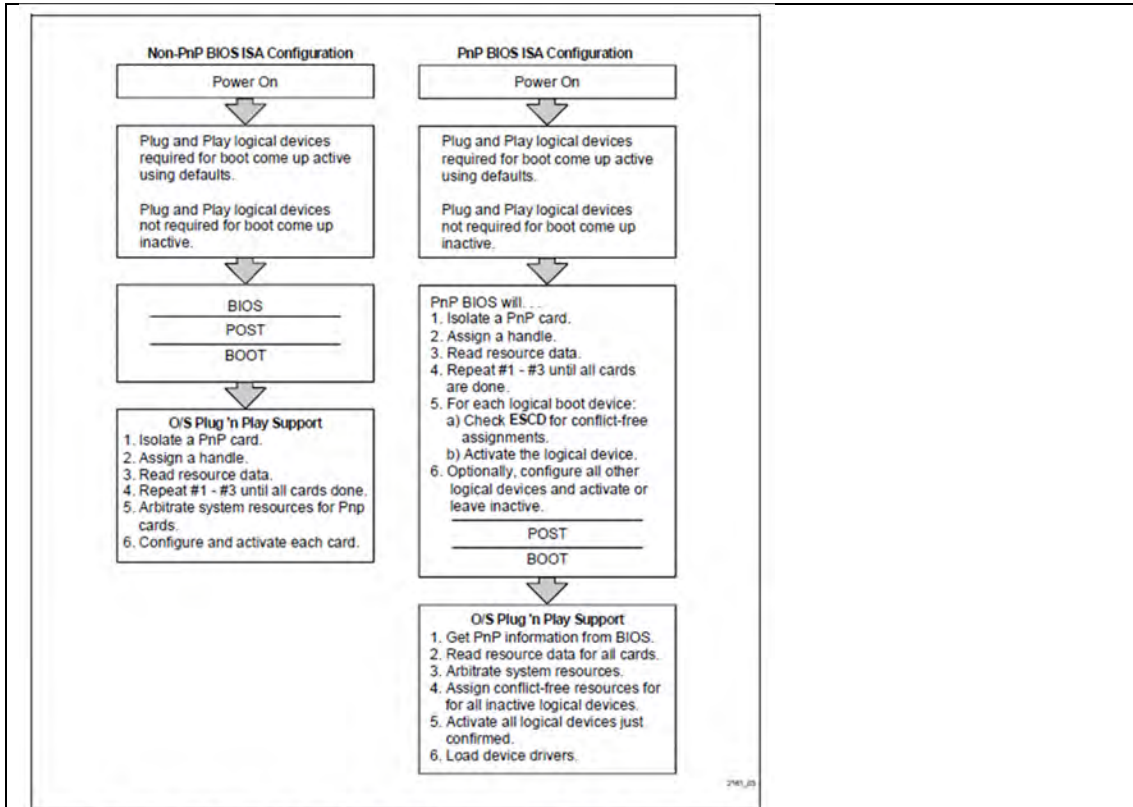

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

#### Anyimi, 3.2

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this claim limitation:</p> <p style="padding-left: 40px;">Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.</p> <p>Anyimi, 2.2</p> |                                                                                                                                                                    |

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

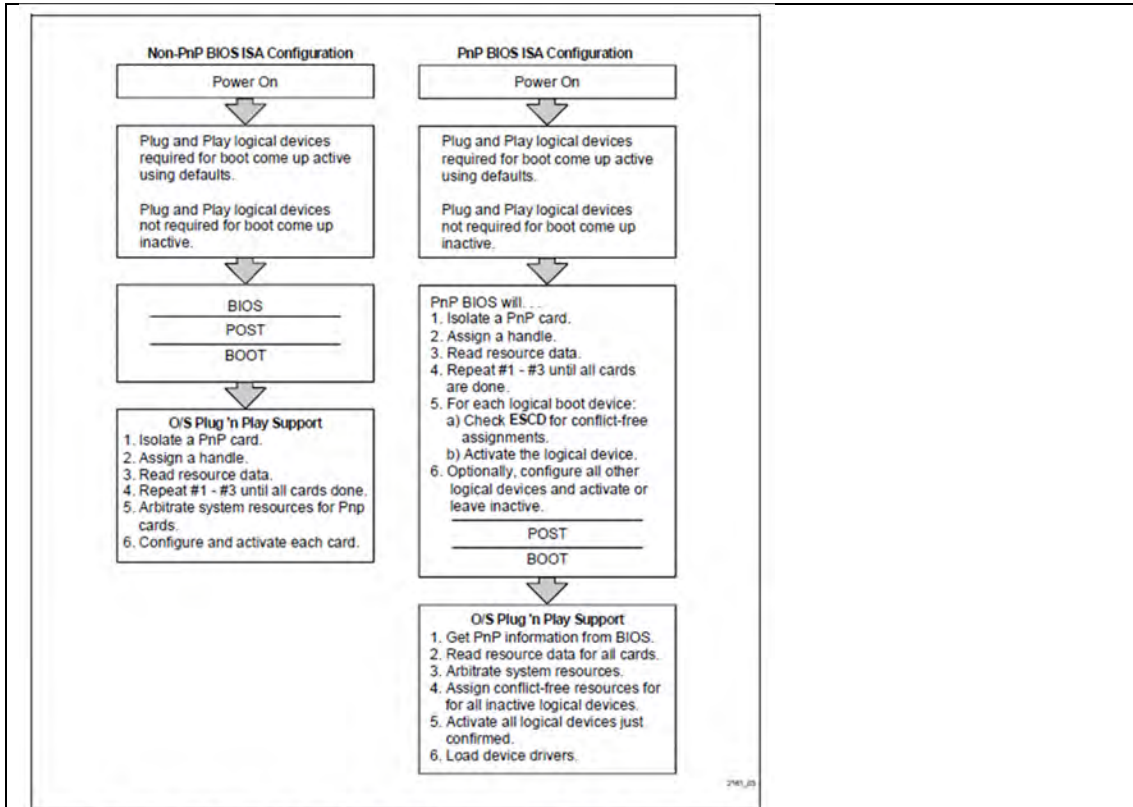

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-in Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                           |                                                                                                                                        |
|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p> | <p>Anyimi, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 1-1.4.2 above.

*See also*

Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.

Anyimi, 2.2

**3.1 PnP Components**

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

Anyimi, 3.1

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

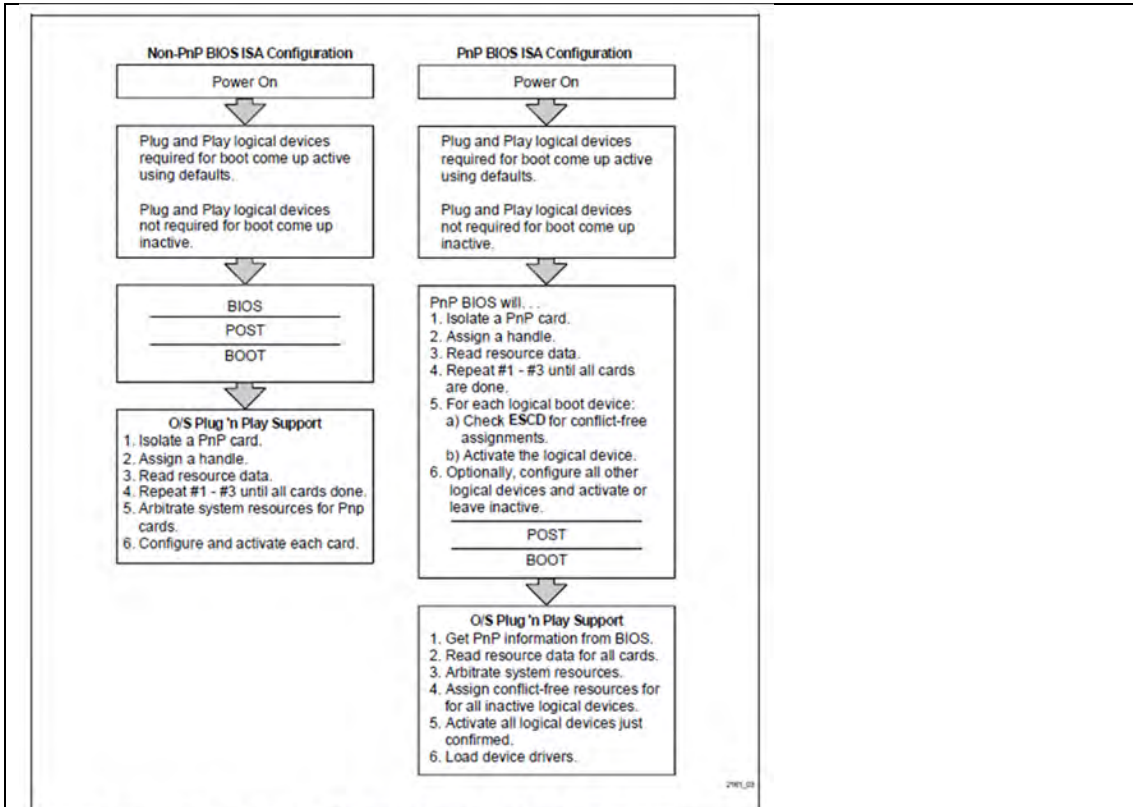

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

#### Anyimi, 3.2

Anyimi

“A method for booting a computer system, the method comprising:”

Claim 5 (Preamble)

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

| <p>5.5 utilizing the decompressed boot data to at least partially boot the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Anyimi, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p>Anyimi discloses this claim limitation:</p> <p style="padding-left: 40px;">Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.</p> <p>Anyimi, 2.2</p> |                                                                                                                                                             |

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

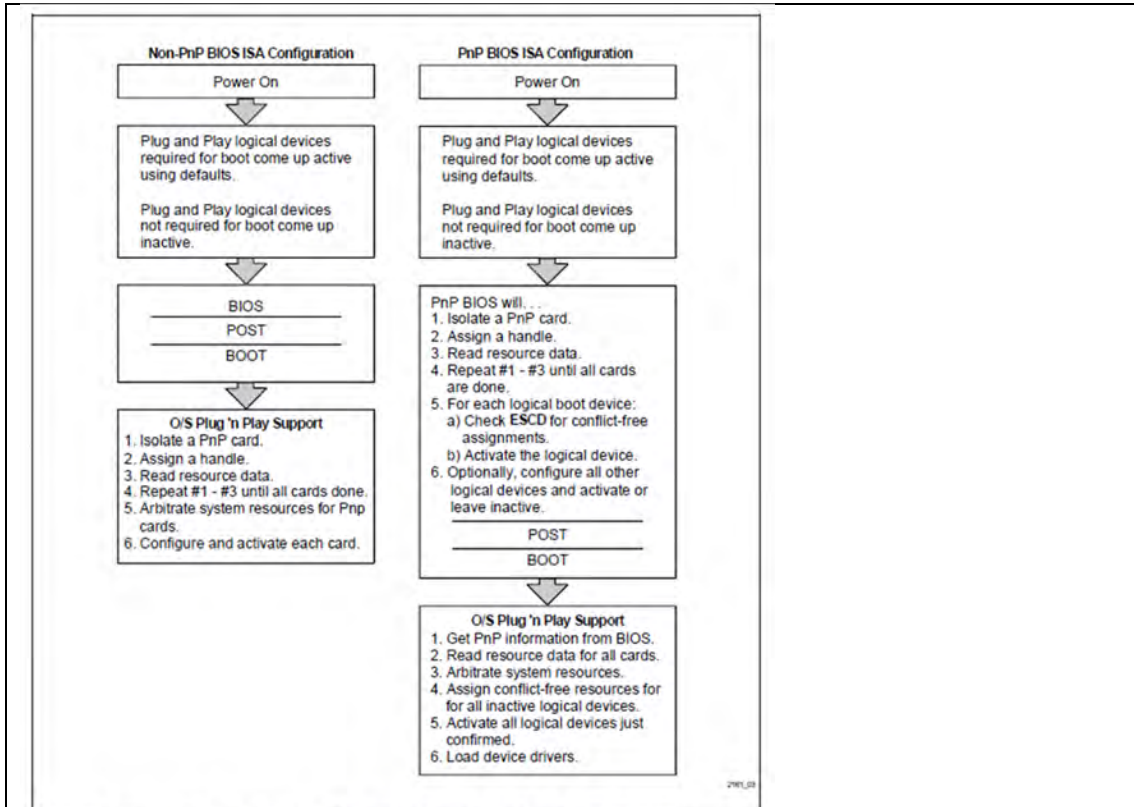

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

Anyimi

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.

Anyimi, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 1-1.3 above.

Anyimi

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

|                                                          |                                                                                                          |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>6 (Preamble)</b> A system comprising:<br>a processor; | Anyimi, as evidenced by the example citations below, discloses<br>“a system comprising:<br>a processor:” |
|----------------------------------------------------------|----------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

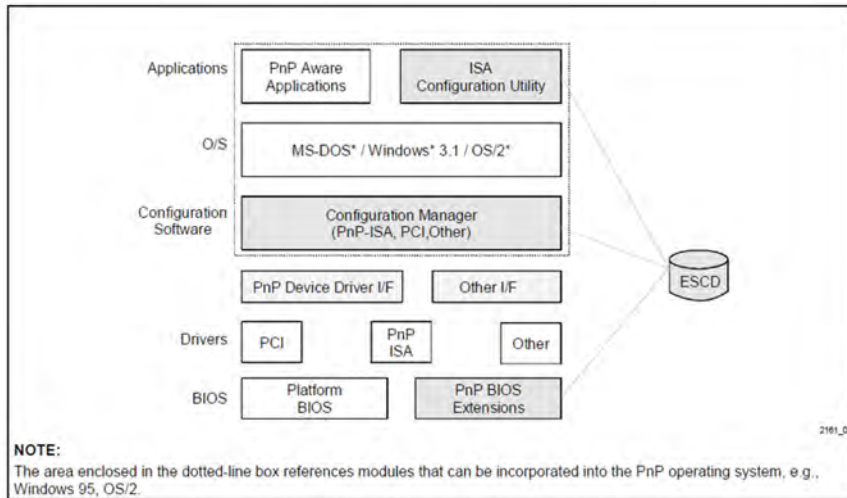

Anyimi discloses this limitation:

### 3.1 PnP Components

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

Anyimi, 3.1

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

Anyimi, Fig. 2

**Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow.** Note the importance of the ESCD in the Plug and Play Configuration Flow

Anyimi, Fig. 3

Anyimi

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

Claim 6.2

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

|                                          |                                                                                                       |
|------------------------------------------|-------------------------------------------------------------------------------------------------------|
| 6.3 wherein the processor is configured: | Anyimi, as evidenced by the example citations below, discloses “wherein the processor is configured:” |
|------------------------------------------|-------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

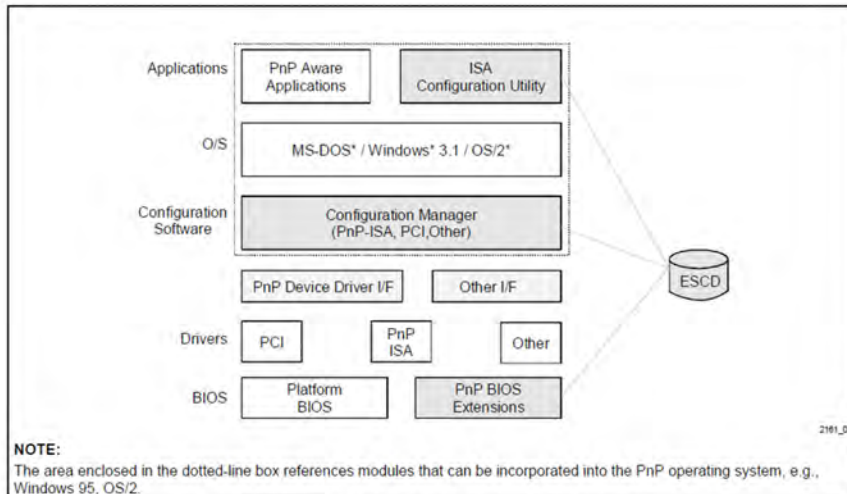

Anyimi discloses this limitation:

### 3.1 PnP Components

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

Anyimi, 3.1

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

Anyimi  
“wherein the processor is configured”

Claim 6.3

Claim 6.3

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

6.4 to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory,

Anyimi, as evidenced by the example citations below, discloses “to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 1.1 above.*

Anyimi

Claim 6.4

“to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory”

Anyimi  
“to access the loaded portion of the boot data in the compressed form”

Claim 6.5

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                   |                                                                                                                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.6 to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data, and | Anyimi, as evidenced by the example citations below, discloses<br>“to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data” |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claim 1.3 above.

Anyimi

Claim 6.6

“to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data, and”

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------|
| 6.7 to update the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Anyimi, as evidenced by the example citations below, discloses “to update the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to update the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                               |

Anyimi  
“to update the boot data list.”

Claim 6.7

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                        |                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>8 (Preamble)</b> A method of loading an operating system for booting a computer system, comprising: | Anyimi, as evidenced by the example citations below, discloses<br>“A method of loading an operating system for booting a computer system, comprising:” |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method of loading an operating system for booting a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claim 1 (Preamble) above.

Anyimi

“A method of loading an operating system for booting a computer system, comprising:”

**Claim 8 (Preamble)**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.1 storing a portion of the operating system in a compressed form in a first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Anyimi, as evidenced by the example citations below, discloses “storing a portion of the operating system in a compressed form in a first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing a portion of the operating system in a compressed form in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. Anyimi

“decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system”

Claim 8.4

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                    |                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and | Anyimi, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system” |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

*See also*

Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.

Anyimi, 2.2

Anyimi

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

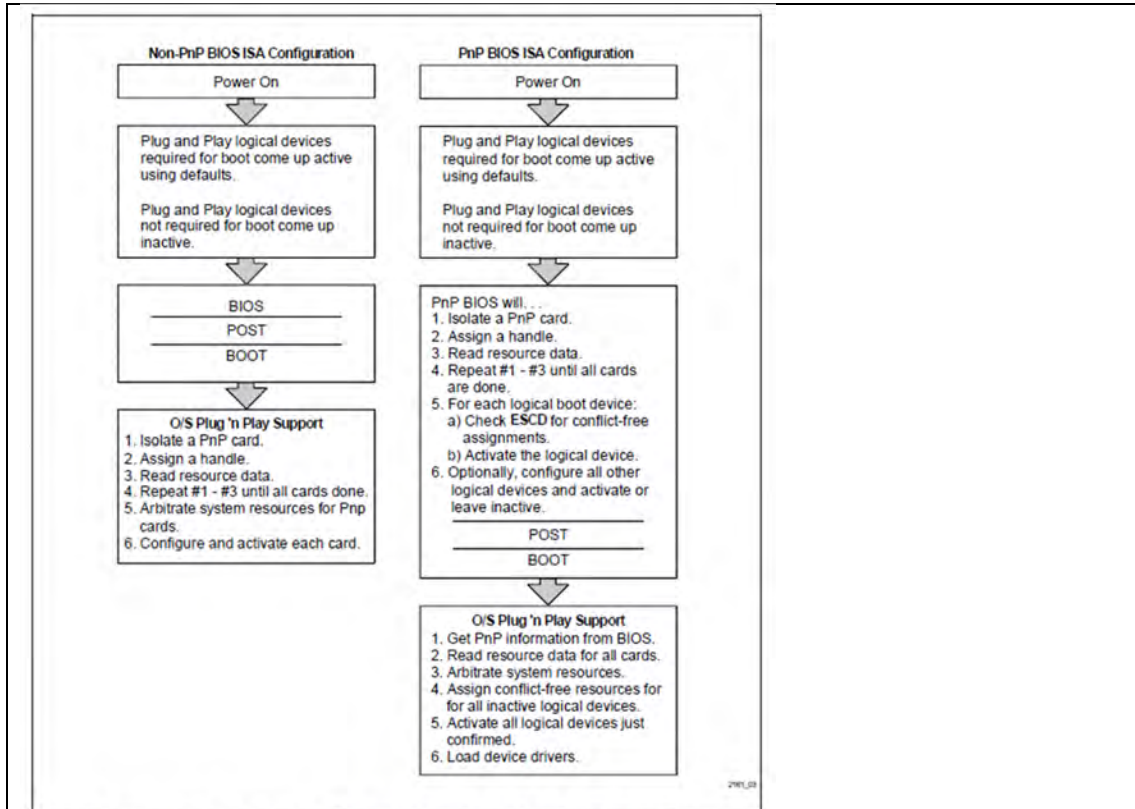

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

Anyimi, 3.2

Anyimi

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

#### Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

**Claim 11 (Preamble)**

“A method for providing accelerated loading of an operating system in a computer system, comprising”

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

|                                                                                                                                                                          |                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p> | <p>Anyimi, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

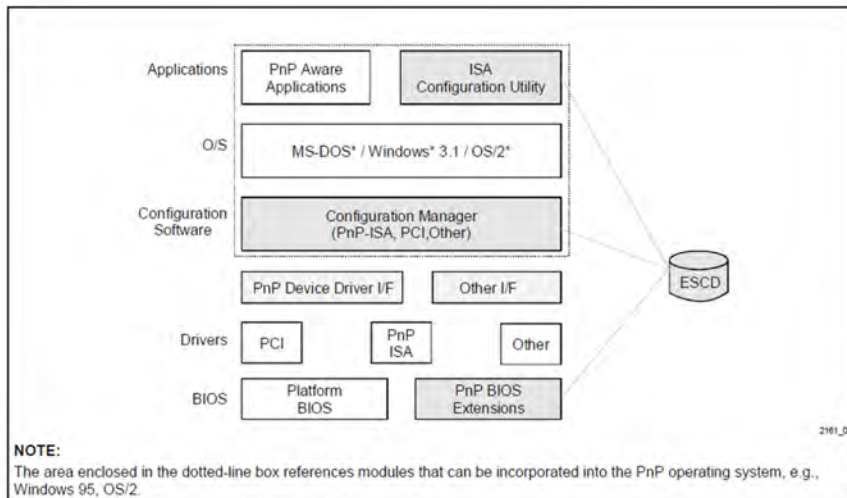

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See Claim 1.1 above.*

*See also*

Anyimi discloses this claim limitation:

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.

Anyimi, 2.2

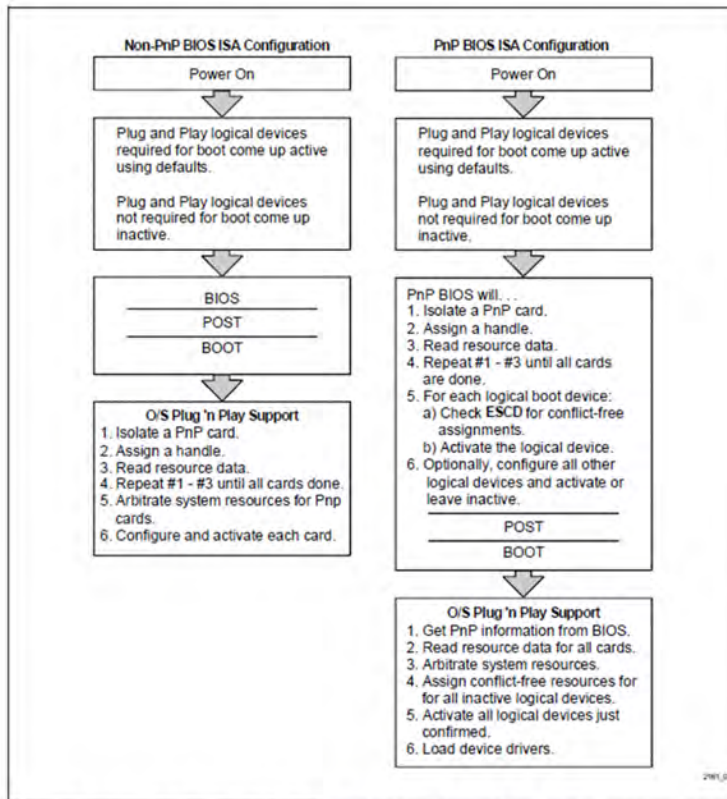

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

Claim 11.1

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

Anyimi, 3.2

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

Anyimi, 3.2

Anyimi

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

Claim 11.1

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

| <p>11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Anyimi, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Anyimi discloses this limitation:</p> <p style="padding-left: 40px;">Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.</p> <p>Anyimi, 2.2</p> |                                                                                                                                                                                         |

Anyimi

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

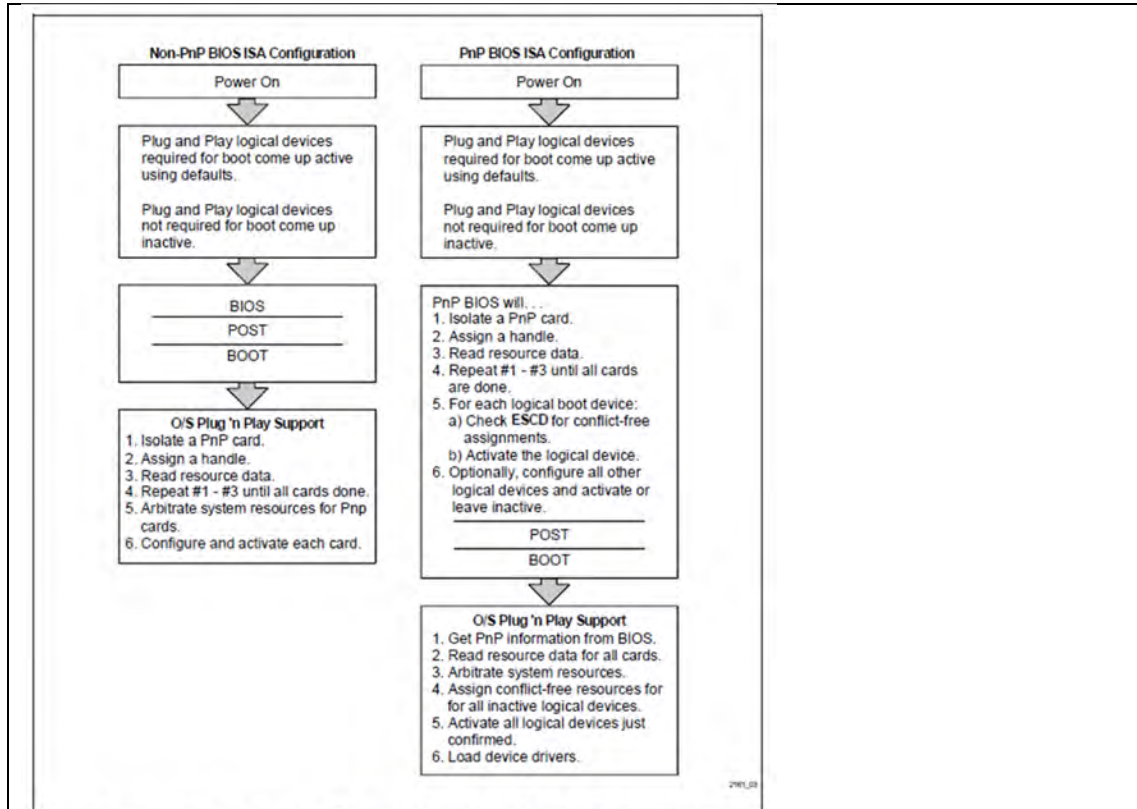

Figure 3. Possible PnP/Non-PnP BIOS ISA Add-In Card Configuration Flow. Note the importance of the ESCD in the Plug and Play Configuration Flow

#### Anyimi, Fig. 3

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

#### Anyimi, 3.2

#### Anyimi

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

#### Claim 11.4

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

Anyimi, 3.2

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**13.1** loading boot data in a compressed form that is associated with a boot data list from a boot device;

Anyimi, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 1.1 above.*

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**13.2** accessing the loaded boot data in the compressed form;

Anyimi, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 1.2 above.*

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**13.3** decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Anyimi, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claim 1.3 above.

**Claim 14.1**

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Today, PnP BIOS requirements may extend beyond 128 KB. A standard system BIOS consumes roughly 64 KB; PnP support is another 12 KB; automatic power management support adds 2 to 10 KB; PCI (Peripheral Components Interconnect) extensions hoard some 20 KB of the BIOS; and on-board VGA (Video Graphics Adapter) controllers utilize an extra 30 KB to 40 KB of space. The potential size of the BIOS for such a system is almost 150 KB. Although most of this code may be compressed, certain code segments cannot; besides even compression has its limits. Since new developments for the PC show no signs of abatement, it seems clear that a means of updating as well as expanding BIOS quickly and easily has become a necessity. Plug and Play is only one of the many technologies that can be implemented better with flash. As users realize the benefits of PnP, the demand generated will drive the number of Plug and Play systems upward.

Anyimi, 2.2

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Furthermore, the PnP BIOS is capable of event management. Through its event management interfaces, the PnP BIOS can alert the system about new devices, like a notebook docking station, added or removed during runtime.

The POST procedure of the PnP BIOS identifies, tests, and configures the system before passing control to the operating system. The POST process must maintain previous POST compatibility, configure all legacy devices known to the PnP BIOS, arbitrate resources, initialize the IPL (Initial Program Load—this is how the operating system is launched), and support both PnP and non-PnP operating systems. Upon completion of the POST process, the BIOS attempts to have all necessary system devices initialized and enabled before the operating system is loaded; the PnP BIOS aspires further to provide the operating system a conflict-free environment in which to boot.

Anyimi, 3.2

Without an ESCD, the PnP BIOS must perform resource allocation as well as conflict detection and resolution each and every time the system is booted, and any locking of devices must be done by the supporting PnP operating system. Although the need for nonvolatile storage cannot be disputed, the amount of storage required depends on whether or not the PnP system needs real time updates. Ultimately, it will be decided by the methodology selected for resource management. A static or dynamic allocation scheme requires a fixed

amount of nonvolatile memory for the ESCD and other BIOS parameters. A combined scheme for allocation constantly adds or removes from the ESCD data structure. Other parameters may need to be updated as a result. Regardless of the storage method chosen, the BIOS must know how to resolve any untimely interruption of a crucial system or BIOS function. The underlying mechanism for appeasing all these requirements is flash, and Intel's boot block flash is the solution for today's demands and tomorrow's inclinations.

Anyimi, 3.2

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

Page 81 of 144

## Appendix C25

### Invalidity of U.S. Patent 8,880,862 based on Anyimi

Figure 1 showed that either a 1-Mb or 2-Mb flash device can be used to implement BIOS. The choice of device depends on the contents of the BIOS and the level of sophistication desired in the design. The 1-Mb boot block flash memory is an established standard for implementing flash BIOS, not just for PnP. However, more BIOS space will be needed to support standardization of current features (like power management and virus aids) and impending future enhancements (like Windows 95 and Desktop Management Interfaces\*, DMI). As consumers clamor for “more bang for the buck,” more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

As consumers clamor for "more bang for the buck," more features and functions will be integrated into the standard PC. The migration beyond a 128-KB BIOS is inevitable. Already, some vendors have adopted code compression of BIOS in order to adhere to this 128-KB space limitation. This is a viable alternative that requires additional code decompression algorithms and consumes additional RAM space to store the full BIOS. Fortunately, Intel provides a secure means of code storage as well as a built-in growth path with its boot block architecture.

Anyimi, 5.1

Anyimi

**Claim 14.3**

"servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form"

Page 86 of 144

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                              |

Anyimi

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

Perhaps you are wondering why flash is the medium of choice advocated in this application note as the means for storing system BIOS, particularly for Plug and Play? From a PC user’s perspective, a PnP flash BIOS enables users to install new hardware without having to call the support number. This translates to ease-of-use:

- Easily updatable code assuring optimal BIOS performance
- No need to edit the CONFIG.SYS file.
- No need to determine system type and match, somehow, to jumper settings.
- No need to investigate available system resources and muddle through reassigning them.
- No need to fiddle with system memory reallocation.
- No need to buy a new system every time something changes (increases system’s useful lifespan).

Anyimi, 2.0

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

Anyimi, 3.1

Anyimi

“The method of claim 14, wherein the operating system comprises: a plurality of files.”

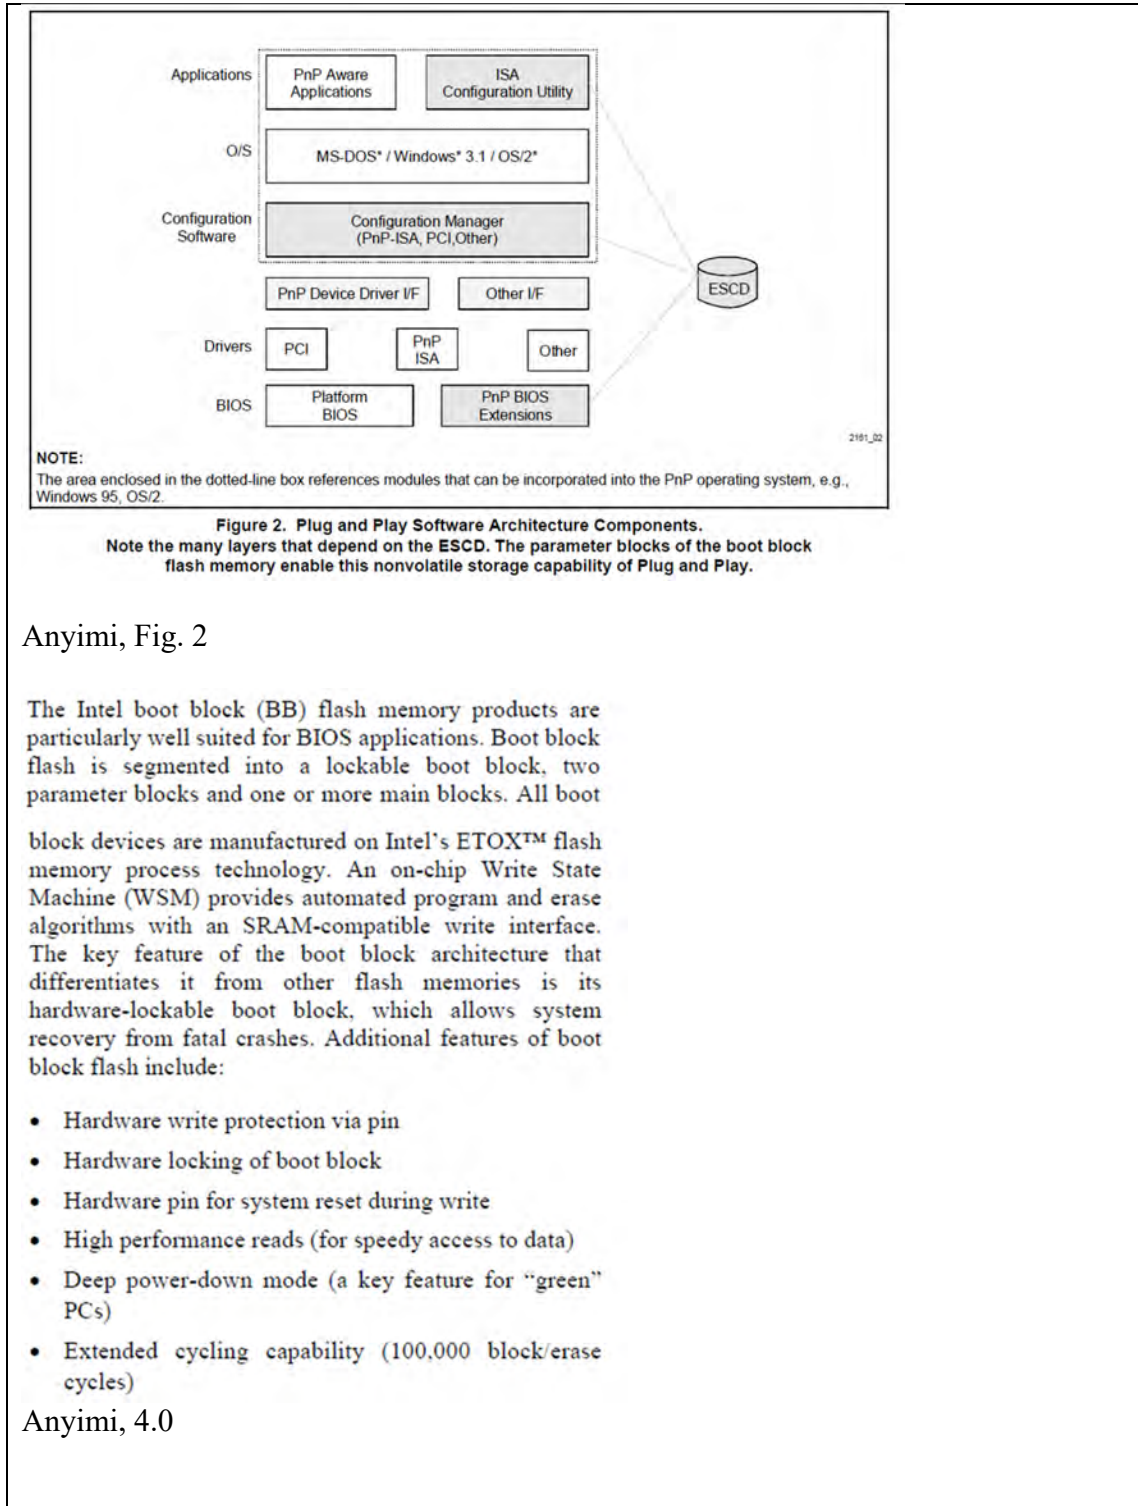

**Claim 16**

Anyimi, 2.0

For a system to be fully PnP-compliant, four basic elements are required:

1. System/PnP BIOS
2. PnP operating system
3. PnP hardware devices
4. PnP application software

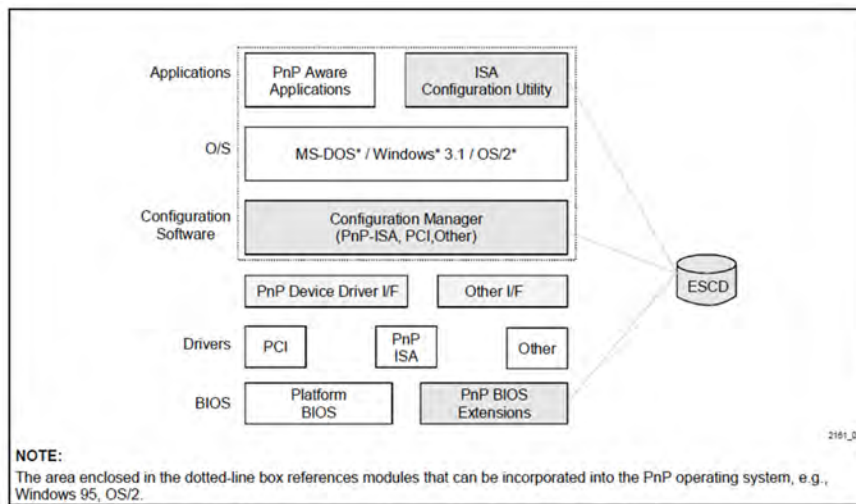

**Anyimi**

**Claim 17**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

## Appendix C25 Invalidity of U.S. Patent 8,880,862 based on Anyimi

Anyimi, 3.1

**Figure 2. Plug and Play Software Architecture Components.**  
Note the many layers that depend on the ESCD. The parameter blocks of the boot block flash memory enable this nonvolatile storage capability of Plug and Play.

Anyimi, Fig. 2

The Intel boot block (BB) flash memory products are particularly well suited for BIOS applications. Boot block flash is segmented into a lockable boot block, two parameter blocks and one or more main blocks. All boot

block devices are manufactured on Intel's ETOX™ flash memory process technology. An on-chip Write State Machine (WSM) provides automated program and erase algorithms with an SRAM-compatible write interface. The key feature of the boot block architecture that differentiates it from other flash memories is its hardware-lockable boot block, which allows system recovery from fatal crashes. Additional features of boot block flash include:

- Hardware write protection via pin
- Hardware locking of boot block
- Hardware pin for system reset during write
- High performance reads (for speedy access to data)
- Deep power-down mode (a key feature for "green" PCs)
- Extended cycling capability (100,000 block/erase cycles)

Anyimi, 4.0

Anyimi

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

**Claim 19**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                               |                                                                                                                                                                          |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.2 associating the accessed boot data that is not associated with the boot data list to the boot data list. | Anyimi, as evidenced by the example citations below, discloses “associating the accessed boot data that is not associated with the boot data list to the boot data list” |
|---------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, associating the accessed boot data that is not associated with the boot data list to the boot data list.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 2 above.*

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                             |

| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Anyimi, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See Claims 1.1 and 32 above.</i></p> |                                                                                                                                                                                                       |

Anyimi

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**35.** The method of claim 5, wherein the compressed boot data represents a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**36.** The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claims 15 and 17 above.*

**Anyimi**

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**39.** The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 1.1 and 1.2 above.

Anyimi

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                    |

Anyimi

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**44.** The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 32 above.*

**Anyimi**

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

Anyimi

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**47.** The system of claim 6, wherein the boot data in the compressed form represents a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**48.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.

Anyimi, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claims 15, 17 and 24 above.*

**Anyimi**

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.”

**Claim 48**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                    |

Anyimi

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**51.** The system of claim 6, wherein the first memory comprises: a physical memory.

Anyimi, as evidenced by the example citations below, discloses “the system of claim 6, wherein the first memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the first memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See Claims 27 and 39 above.*

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                              |                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Anyimi, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Anyimi, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 15, 17 and 24 above.

**Anyimi**

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

**Anyimi**

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Claim 60**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 27 and 38 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 15, 17 and 24 above.

Anyimi

**Claim 65**

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**67.** The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See Claim 31 above.*

**Anyimi**

“The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.”

**Claim 67**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**71.** The method of claim 11, wherein the boot data in the compressed form represents a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>84.</b> The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                             |

**Anyimi**

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 84**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**87.** The method of claim 13, wherein the memory comprises: a physical memory.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein the memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See Claim 27 above.*

**Anyimi**

“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 16 and 23 above.

Anyimi

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**89.** The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 15, 17 and 24 above.

Anyimi

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.”

**Claim 89**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>91.</b> The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See Claim 31 above.</i></p> |                                                                                                                                                                                                                 |

Anyimi

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claim 32, 33 and 49 above.

Anyimi

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**93.** The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claim 32, 33, and 49 above.

Anyimi

“The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 93**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                             |

**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 97.2 and wherein the updating comprises: associating the additional compressed boot data with the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Anyimi, as evidenced by the example citations below, discloses “and wherein the updating comprises: associating the additional compressed boot data with the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, and wherein the updating comprises: associating the additional compressed boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Anyimi discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 2, 4, 5.6, and 8.6 above.</p> |                                                                                                                                                                              |

Anyimi

“and wherein the updating comprises: associating the additional compressed boot data with the boot data list.”

**Claim 97.2**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**98.** The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Anyimi discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

Anyimi

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                            |

Anyimi

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C25**  
**Invalidity of U.S. Patent 8,880,862 based on Anyimi**

**109.** The method of claim 108, further comprising: storing the compressed additional boot data.

Anyimi, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Anyimi discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

Anyimi

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C26**

### **Invalidity of U.S. Patent 8,880,862 based on Bennett**

The publication D. Bennett, "Booting Linux from EPROM," Linux Journal, January 1997 ("Bennett") invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 ("the '862 Patent") pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime's proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the '862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                           |

This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                                                           |

Bennett

“A method for providing accelerated loading of an operating system in a computer system, the method comprising:”

**Claim 1 (Preamble)**

Page 2 of 122

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

|                                                                                                                                                                     |                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Bennett, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realttime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Bennett discloses this claim limitation:

**System Operation**

For booting, two options were considered:

- booting DOS, then running the loadlin program (to load Linux) from autoexec.bat
- installing LILO and booting Linux directly

The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.

**Bennett, 1**

When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.

**Claim 1 (Preamble)**

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Bennett, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this claim limitation:</p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"> <li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li> <li>• installing LILO and booting Linux directly</li> </ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                            |

Bennett

“A method for providing accelerated loading of an operating system in a computer system, the method comprising:”

**Claim 1 (Preamble)**

Page 6 of 122

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

#### Bennett, 4

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this claim limitation:</p> <p style="margin-left: 20px;">System Operation</p> <p style="margin-left: 20px;">For booting, two options were considered:</p> <ul style="list-style-type: none"> <li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li> <li>• installing LILO and booting Linux directly</li> </ul> <p style="margin-left: 20px;">The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> <p style="margin-left: 20px;">When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                                                                                                                                                                            |

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Bennett, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this claim limitation:</p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"> <li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li> <li>• installing LILO and booting Linux directly</li> </ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                                     |

Bennett  
 “wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

Page 11 of 122

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

#### Bennett, 4

#### Bennett

“wherein the decompressed portion of boot data comprises a portion of the operating system.”

| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Bennett, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, initializing a central processing unit of the computer system), Apple contends that one of skill in the art would understand the operation of loading of an operating system, to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art about the loading of an operating system during prosecution. <i>See</i> Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Bennett discloses this claim limitation:</p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"> <li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li> <li>• installing LILO and booting Linux directly</li> </ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> |                                                                                                                    |

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

Bennett, 2

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                            |

| 6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Bennett, as evidenced by the example citations below, discloses “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p><i>See also</i></p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"><li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li><li>• installing LILO and booting Linux directly</li></ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> |                                                                                                                                                                                                            |

Bennett

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

Claim 6.2

Page 28 of 122

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

| <p><b>10.</b> The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Bennett, as evidenced by the example citations below, discloses “the method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See Claim 9.1 above.</i></p> <p><i>See also</i></p> <p><b>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don't need to take up EPROM space. Listing 1 shows the SSD disk compression used.</b></p> <p><b><u><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243fi.png">EPROM Disk Compression</a></u></b><br/> <u><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243fi.png">(/files/linuxjournal.com/linuxjournal/articles/002/0243/0243fi.png)</a></u></p> <p>Bennett, 1</p> |                                                                                                                                                                                                                                |

Bennett

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Bennett, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p><i>See also</i></p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"><li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li><li>• installing LILO and booting Linux directly</li></ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> |                                                                                                                                                                                                                                      |

Bennett

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

| <p>11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Bennett, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Bennett discloses this claim limitation:</p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"> <li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li> <li>• installing LILO and booting Linux directly</li> </ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                                                          |

Bennett  
“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dbboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

#### Bennett, 4

Bennett

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

**Appendix C26**

| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Bennett, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p><i>See also</i></p> <p>System Operation</p> <p>For booting, two options were considered:</p> <ul style="list-style-type: none"><li>• booting DOS, then running the loadlin program (to load Linux) from autoexec.bat</li><li>• installing LILO and booting Linux directly</li></ul> <p>The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.</p> <p>Bennett, 1</p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don't need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p>Bennett, 1</p> |                                                                                                                                                                                                                                  |

Bennett

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
  - run the keyboard programming application
  - run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren't being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

#### Bennett, 4

#### Bennett

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

#### Claim 14.1

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Bennett, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Bennett discloses this limitation:

*See* Claims 1.2 and 1.3 above.

*See also*

**System Operation**

For booting, two options were considered:

- booting DOS, then running the loadlin program (to load Linux) from autoexec.bat
- installing LILO and booting Linux directly

The advantage of the second option would be a slightly shorter boot time. However, we implemented the first option, because we wanted to use a programmable keyboard—the software for programming the keyboard runs under DOS.

**Bennett, 1**

When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don’t need to take up EPROM space. Listing 1 shows the SSD disk compression used.

**Bennett**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

#### Bennett, 1

The boot sequence is:

- 
- Power up and run memory tests
- 
- load DOS which executes AUTOEXEC.BAT
- 
- run the keyboard programming application
- 
- run loadlin—this reads a linux kernel from the DOS disk & executes it
- 
- the linux kernel takes over
- 
- load the RAM disk from the EPROM disk
- 
- switch the root file system to the RAM disk
- 
- init will read inittab which executes dbboot instead of getty
- 
- the operator interface application is started

#### Bennett, 2

The first phase of disk image development was identifying the required and the desired items. The first step was to come up with a minimal system and then add the items required for the operator interface. Not being a Unix expert, coming up with the minimal system ended up being something of a trial and error process. I started with what I thought was needed, then tried running it. When an error occurred because of a missing program or library, that file was added. This process went on until the system ran happily.

The bulk of this was done by copying files from the “full” Linux partition to the 6MB partition, booting DOS and using the loadlin line:

```
loadlin zimage root=/dev/hda2 ro
```

#### Bennett, 3

Once the system was fairly stable, the 6MB partition was loaded into the RAM disk. This is very similar to how the RAM disk is loaded from EPROM, but development went faster since EPROMs weren’t being programmed. To test the system without programming EPROMs, the system booted DOS and ran loadlin with the line:

```
loadlin zimage root=/dev/hda2 ramdisk=6144 ro
```

Because of the modification to ramdisk.c, the /dev/hda2 disk image is loaded into the RAM disk, then the root file system is switched to the RAM disk. The process of refining the disk image continues until everything is “perfect”.

#### Bennett, 4

#### Bennett

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

#### Claim 14.3

| <p><b>17.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Bennett, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See Claim 15 above.</i></p> <p><i>See also</i></p> <p><i>This is a quick look at making Linux bootable from EPROM on a 486 single board computer.</i></p> <p>This article describes one way to run Linux in an embedded system with no hard disk. The application described is an Operator Interface in a monitor and display system developed by Boeing Flight Test. The airborne environment requires something fairly rugged which can withstand common power interruptions. To meet these requirements we decided to build the operator interface without a hard disk.</p> <p>Bennett, 1</p> |                                                                                                                                                                                                                   |

**Bennett**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

## Appendix C26

### Invalidity of U.S. Patent 8,880,862 based on Bennett

In order to automatically run the operator interface application, a program was written to replace getty. This program (dboot.c) will run login for a given user, and set the stdin, stdout and stderr to the specified virtual console.

The boot sequence is:

- Power up and run memory tests
- load DOS which executes AUTOEXEC.BAT
- run the keyboard programming application
- run loadlin—this reads a linux kernel from the DOS disk & executes it
- the linux kernel takes over
- load the RAM disk from the EPROM disk
- switch the root file system to the RAM disk
- init will read inittab which executes dboot instead of getty
- the operator interface application is started

Bennett, 2

Bennett

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

Claim 17

| <p><b>32.</b> The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Bennett, as evidenced by the example citations below, discloses “the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See Claim 1.1 above</i></p> <p><i>See also</i></p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don't need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p><b><u><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243fi.jpg">EPROM Disk Compression</a></u></b><br/> <u><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243fi.jpg">(/files/linuxjournal.com/linuxjournal/articles/002/0243/0243fi.jpg)</a></u></p> <p>Bennett, 1</p> |                                                                                                                                                                                                                  |

Bennett

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 32**

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                        |

| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Bennett, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See Claim 32 above.</i></p> <p><i>See also</i></p> <p>When deciding how to implement the EPROM device driver, the first idea was to create an image of a disk in the EPROM. This would provide a RAM disk of the same size as the EPROM, 3.5MB in this case (the DOS portion of the SSD takes 1/2 MB). Instead, to allow a larger RAM disk, a compressed disk image is used. The compression used is simple—any sectors which are identical are only stored once. The primary advantage this gives is blank areas of the disk image don't need to take up EPROM space. Listing 1 shows the SSD disk compression used.</p> <p><b><u><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243ft.jpg">EPROM Disk Compression</a></u></b><br/><a href="http://files.linuxjournal.com/linuxjournal/articles/002/0243/0243ft.jpg">(/files/linuxjournal.com/linuxjournal/articles/002/0243/0243ft.jpg)</a></p> <p>Bennett, 1</p> |                                                                                                                                                                                                        |

Bennett

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                  |

| <p><b>80.</b> The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Bennett, as evidenced by the example citations below, discloses “the method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Bennett discloses this limitation:</p> <p><i>See</i> Claims 32, 33 and 49 above.</p> |                                                                                                                                                                                                    |

**Bennett**

“The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.”

**Claim 80**

**Appendix C26**  
**Invalidity of U.S. Patent 8,880,862 based on Bennett**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                          |
