Settsu

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

memory of the information processing apparatus, 3 denotes 5 a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system I the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and liked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Settsu

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                         |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Settsu, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See</i></p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system</p> |                                                                                                                                                                                         |

Settsu

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the FI/W code module 6 stored in the ROM 1.

Settsu

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Page 86 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

Settsu

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like

Settsu

Claim 11.4

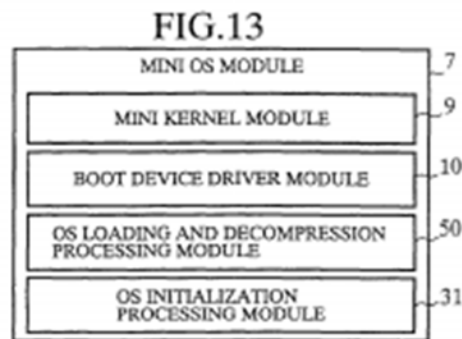

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Settsu, Fig. 13.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and

Settsu

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu

“a method for providing accelerated loading of an operating system in a computer system, comprising.”

**Claim 13 (Preamble)**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                 |                                                                                                                                                                     |
|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13.1</b> loading boot data in a compressed form that is associated with a boot data list from a boot device; | Settsu, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device” |
|-----------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claim 1.1 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                        |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Settsu, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                        |

Settsu

“A method for providing accelerated loading of an operating system in a computer system, comprising”

**Claim 14 (Preamble)**

Page 97 of 164

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                             |                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Settsu, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 1.1 and 1.2 above.

*See also*

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini

| Settsu                                                                                                                                                    | <b>Claim 14.1</b> |
| “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list” |                   |

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 1.2 and 1.3 above.

*See also*

A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.

Settsu, Abstract

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, 1:8-12.

In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files

Settsu

#### Claim 14.3

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device

Settsu

#### **Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Settsu

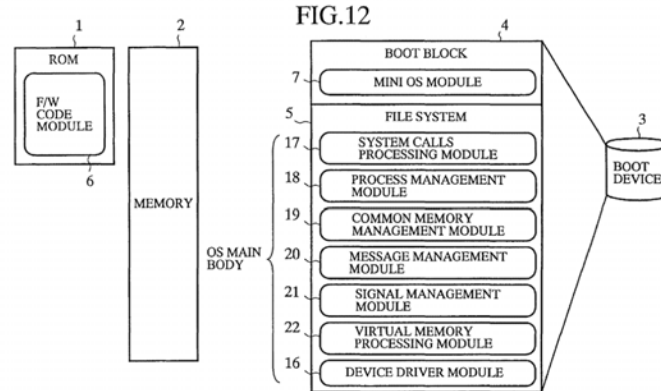

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 104 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

#### Settsu

#### Claim 14.3

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 14:58-15:5

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

Settsu

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See Claim 1 above.*

*See also*

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

In accordance with another preferred embodiment of the present invention, the OS loading and initialization processing module of the mini OS module is divided into an OS loading processing module and an OS initialization module, the OS main body module is divided into a plurality of blocks of arbitrary record size, each of which includes a loading flag consisting of a plurality of bits respectively corresponding to the plurality of functional modules included in the OS main body

Settsu

“The method of claim 14, wherein the operating system comprises: a plurality of files.”

**Claim 16**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

module. Further, the loading flag of one of the plurality of blocks including the end of any one of the plurality of functional modules has a corresponding bit set to a predetermined value. After the mini OS module is loaded into the memory, the mini OS module initializes the mini kernel module and the boot device driver module and then generates and starts execution of a thread for the OS loading processing module. After the thread for the OS loading processing module is started, the loading processing module loads each of the plurality of blocks of the OS main body module into the memory, and refers to the loading flag every time it loads each of the plurality of blocks into the memory. Only if a bit of the loading flag is set to a predetermined value, the OS loading processing module generates and starts execution of a thread for the OS initialization module. And, after the thread for the OS initialization module is started, the OS initialization module initializes a corresponding one of the plurality of functional modules loaded into the memory.

| <p>17. The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Settsu, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 15 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">The present invention is made to overcome the above problems. It is therefore an object of the present invention to provide an information processing apparatus and a method capable of reducing the time required for booting up itself when it is powered on, and also reducing the time required to start execution of applications to be started automatically when the information processing apparatus is booted up.</p> <p>Settsu, 1:44-50</p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the OS loading processing module of the mini OS module is an application (AP) execution and OS loading processing module for starting execution of at least a predetermined application module which is located in the file system and which can automatically be started and run on the operating system when booting up the information processing apparatus, and for loading each of the plurality of functional modules into the memory. Further, the predetermined application module includes a function definition file in which some functional modules required for the application module to run on the operating system are listed. After the mini OS module is loaded into the memory, the mini OS module initializes the mini kernel module and the boot device driver module and then generates and starts execution of a thread for the AP execution and OS loading processing module. After the thread for the AP execution and OS loading processing module is started, the AP execution and OS loading processing module loads the application nodule from the file system into the memory and further loads some</p> |                                                                                                                                                                                                                  |

**Claim 17**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

functional modules required for the application module into the memory according to the function definition file included in the application module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is started, the OS initialization module then initializes each of the some functional modules loaded into the memory. And, after the initialization of all of the some functional modules is completed, the application execution and OS loading processing module further loads the remainder of all functional modules included in the OS main body module into the memory and initializes the remainder using the OS initialization processing module while starting execution of the application module as a process.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claim 16 above.

Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> |                                                                                                                                                                                                       |

Settsu  
 “The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**35.** The method of claim 5, wherein the compressed boot data represents a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

Settsu

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                    |

**Claim 44**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>45.</b> The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Settsu, as evidenced by the example citations below, discloses “the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See</i> Claims 32 and 33 above.</p> |                                                                                                                                                                            |

Settsu

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                 |                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>47. The system of claim 6, wherein the boot data in the compressed form represents a plurality of files.</p> | <p>Settsu, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files”</p> |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>48.</b> The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Settsu, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                           |

Settsu

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.”

**Claim 48**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                    |

| <p><b>49.</b> The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Settsu, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 10 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> |                                                                                                                                                                                                                    |

Settsu

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Claim 49**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                            |

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Settsu, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 6 above</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> |                                                                                                                                                                                            |

Settsu  
 “The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

|                                                                                                              |                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Settsu, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Settsu, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 15, 17 and 24 above.

Settsu

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**59.** The method of claim 8, wherein the operating system in the compressed form represents a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

Settsu

“The method of claim 8, wherein the operating system in the compressed form represents a plurality of files.”

**Claim 59**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                 |

Settsu

**Claim 60**

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Settsu, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 27 and 38 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Settsu, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 15, 17 and 24 above.

Settsu

**Claim 65**

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                    |

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**76.** The method of claim 11, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

Settsu

“The method of claim 11, wherein the operating system comprises: a plurality of files.”

**Claim 76**

Page 146 of 164

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Settsu, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 15, 17 and 24 above.

Settsu

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 77**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>79.</b> The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Settsu, as evidenced by the example citations below, discloses “the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 31 above.</i></p> |                                                                                                                                                                                                                   |

Settsu

“The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.”

**Claim 79**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                   |

| <p><b>81.</b> The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Settsu, as evidenced by the example citations below, discloses “the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See</i> Claims 32, 33 and 49 above.</p> |                                                                                                                                                                                         |

Settsu

“The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.”

**Claim 81**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Settsu, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

Settsu

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

Settsu

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 84**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                     |                                                                                                                                          |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>87.</b> The method of claim 13, wherein the memory comprises: a physical memory. | Settsu, as evidenced by the example citations below, discloses “the method of claim 13, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See Claim 27 above.*

Settsu

“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Settsu, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 16 and 23 above.

Settsu

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                     |

Settsu

“and wherein the updating comprises: associating the additional compressed boot data with the boot data list.”

**Claim 97.2**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

**98.** The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.

Settsu, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

Settsu

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                            |

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                           |                                                                                                                                                                               |
|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>108.</b> The method of claim 2, further comprising: compressing at least a portion of the additional boot data.</p> | <p>Settsu, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data”</p> |
|---------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 1.1, 5, 9.1 and 8 above.

*See also*

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

## **Appendix C18**

### **Invalidity of U.S. Patent 8,880,862 based on Shinjo**

U.S. Patent Number 5,269,022 to Shinjo (“Shinjo”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

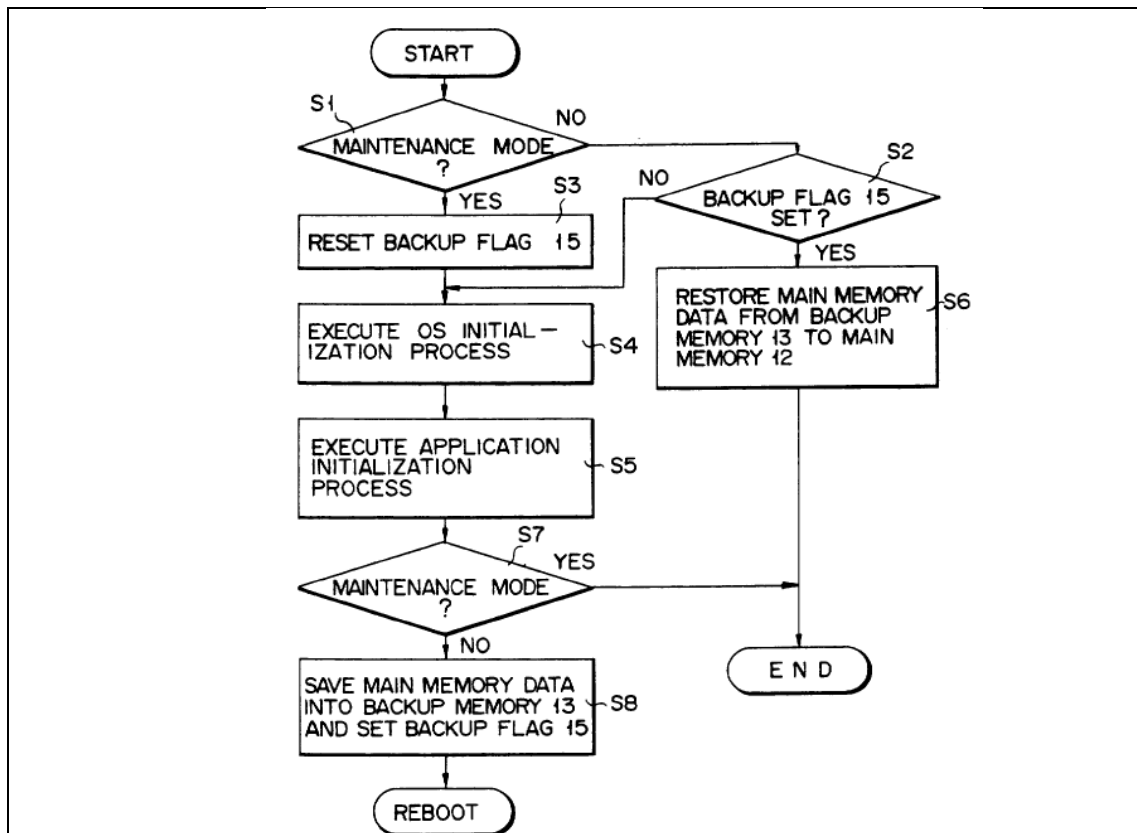

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

**F I G. 2**

Shinjo, Figure 2

The above-described process requires long time since the number of times of access to a recording medium such as a disk is very large and an overhead for retrieval of file, production of process or the like is increased. In other words, boot time required until an operation as a computer system starts, is lengthened. It is thus desirable to achieve an apparatus capable of booting a computer system at high speed.

Shinjo, 1:22-29

It is an object of the present invention to provide a method and an apparatus for booting a computer system.

Shinjo, 1:32-34

According to one aspect of the present invention, there is provided a method for booting a computer system, the method comprising the steps of: setting a boot mode for booting the computer system; determining whether or not the set boot mode is a normal mode; determining whether or not a flag is set when the boot mode is the normal mode, the flag representing whether or not backup data is

Shinjo

“A method for providing accelerated loading of an operating system in a computer system, the method comprising:”

**Claim 1 (Preamble)**

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

restorable; storing main memory data to be stored in a main memory immediately after the computer system is booted, as the backup data, into a backup memory when the flag is reset; and restoring the backup data stored in the backup memory, as the main memory data, into the main memory when the flag is set.

Shinjo, 1:32-48

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

Therefore, the boot process of the present invention can be executed at higher speed than the conventional boot process.

Shinjo, 3:62-64

As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.

Shinjo, 4:45-57

Page 4 of 129

## **Appendix C18**

### **Invalidity of U.S. Patent 8,880,862 based on Shinjo**

In the conventional system, a very large number of times of disk access are necessary for the OS initialization process such as setting of the running environment of an OS and for the application initialization process such as setting of the running environment of an application program, and long time is required for the boot process. In the present invention, however, the system can be booted at high speed.

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Shinjo, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">In the initialization process, a resident load module is loaded into a main memory, various control blocks are produced, the running environment of an operating system (OS) is set, and the running environment of an application system is set (for example, a control process is produced).</p> <p>Shinjo, 1:16-21</p> <p style="padding-left: 40px;">According to one aspect of the present invention, there is provided a method for booting a computer system, the method comprising the steps of: setting a boot mode for booting the computer system; determining whether or not the set boot mode is a normal mode; determining whether or not a flag is set when the boot mode is the normal mode, the flag representing whether or not backup data is restorable; storing main memory data to be stored in a main memory immediately after the computer system is booted, as the backup data, into a backup memory when the flag is reset; and restoring the backup data stored in the backup memory, as the main memory data, into the main memory when the flag is set.</p> <p>Shinjo, 1:35-48</p> <p style="padding-left: 40px;">In step S7, when the designated boot mode is not the maintenance mode, i.e., when it is the normal mode, the saving mode is selected, and the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data and the backup flag 15 of the backup memory 13 is set (step S8). The process of step S8 is completed and then a reboot is executed.</p> <p>Shinjo, 3:28-34</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start</p> |                                                                                                                                                                                                                                  |

Shinjo  
“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

Shinjo

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Shinjo, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">In a computer system, when the system is first booted in a normal mode, main memory data stored in a main memory immediately after the system is booted, is stored as backup data in a backup memory or the like. A backup flag representing whether or not the backup data can be restored is set and the system is rebooted. When the system is next booted in the normal mode, the backup data stored in the backup memory or the like is restored as the main memory data in the main memory. The backup flag is automatically reset in a maintenance mode.</p> <p>Shinjo, Abstract</p> <p style="padding-left: 40px;">According to one aspect of the present invention, there is provided a method for booting a computer system, the method comprising the steps of: setting a boot mode for booting the computer system; determining whether or not the set boot mode is a normal mode; determining whether or not a flag is set when the boot mode is the normal mode, the flag representing whether or not backup data is restorable; storing main memory data to be stored in a main memory immediately after the computer system is booted, as the backup data, into a backup memory when the flag is reset; and restoring the backup data stored in the backup memory, as the main memory data, into the main memory when the flag is set.</p> <p>Shinjo, 1:32-48</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected</p> |                                                                                                                                                           |

Shinjo

Claim 1.2

“accessing the loaded portion of the boot data in the compressed form from memory.”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.

Shinjo, 4:9-24

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Shinjo, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">Therefore, the boot process of the present invention can be executed at higher speed than the conventional boot process.</p> <p>Shinjo, 3:62-64</p> <p style="padding-left: 40px;">In the conventional system, a very large number of times of disk access are necessary for the OS initialization process such as setting of the running environment of an OS and for the application initialization process such as setting of the running environment of an application program, and long time is required for the boot process. In the present invention, however, the system can be booted at high speed.</p> <p>Shinjo, 4:58-65</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.</p> <p>Shinjo, 2:52-68</p> |                                                                                                                                                                                                                                                                                                           |

Shinjo

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

**Shinjo**

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Claim 1.3**

| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Shinjo, as evidenced by the example citations below, discloses “updating the boot data list,” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.</p> <p>Shinjo, 2:52-68</p> <p style="padding-left: 40px;">When software maintenance such as replacement of programs and patch is performed, the boot process is executed in the maintenance mode and thus the backup data cannot be automatically restored. When the system is next booted, the saving mode is selected again. Therefore, the update backup data can always be stored in the backup memory (backup file).</p> <p>Shinjo, 5:3-9</p> |                                                                                               |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                    |

| <p><b>3.</b> The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Shinjo, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claim 1.4.1 above.</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.</p> <p>Shinjo, 3:35-45</p> |                                                                                                                                                                                                                             |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                          |

Shinjo

“A method for booting a computer system, the method comprising:”

**Claim 5 (Preamble)**

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

backup memory is restored as the main memory data into the main memory when the boot mode is the normal mode and the flag is set.

Shinjo, 1:49-64

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-68

When a boot command is output from the boot mode setting unit 17 to the CPU 11, an operation using the initial program loader (IPL) program is started by the CPU 11.

Shinjo, 3:4-7

In step S1, it is determined whether or not the boot mode designated by the boot command output from the boot mode setting unit 17 is the maintenance mode. If the boot mode is not the maintenance mode, i.e., if it is the normal mode, it is determined whether or not the backup flag 15 of the backup memory 13 is set (step S2). That is, it is determined whether a boot process is executed in the quick start mode or saving mode.

Shinjo, 3:8-15

In step S2, when the backup flag 15 is reset, it is determined that the backup data stored in the backup memory 13 cannot be restored. Since this determination is made in the first boot process, the same boot process as a conventional one is executed. In other words, the operating system (OS) initialization process and the application initialization process are executed by the initialization program (steps S4 and S5).

Shinjo, 3:16-23

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.

Shinjo, 4:45-67

| <p>5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Shinjo, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claim 1.1 above.</p> <p style="padding-left: 40px;">In a computer system, when the system is first booted in a normal mode, main memory data stored in a main memory immediately after the system is booted, is stored as backup data in a backup memory or the like. A backup flag representing whether or not the backup data can be restored is set and the system is rebooted. When the system is next booted in the normal mode, the backup data stored in the backup memory or the like is restored as the main memory data in the main memory. The backup flag is automatically reset in a maintenance mode.</p> <p>Shinjo, Abstract</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.</p> <p>Shinjo, 3:35-45</p> |                                                                                                                                                                                        |

Shinjo

“storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory”

Claim 5.1

Page 20 of 129

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                |

| <p>5.5 utilizing the decompressed boot data to at least partially boot the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Shinjo, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.</p> <p>Shinjo, 2:51-2:68</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.</p> <p>Shinjo, 3:35-45</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. Shinjo

Claim 5.5

“utilizing the decompressed boot data to at least partially boot the computer system”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

In step S7, when the designated boot mode is not the maintenance mode, i.e., when it is the normal mode, the saving mode is selected, and the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data and the backup flag 15 of the backup memory 13 is set (step S8). The process of step S8 is completed and then a reboot is executed.

Shinjo, 3:28-34

In a system according to the third embodiment as shown in FIG. 4, the memory 14 includes the backup memory 13, and the disk unit 19 includes the backup file 23. In the saving mode, therefore, the main memory data stored in the main memory 12 can be saved as backup data into the backup memory 13 and backup file 23, and the backup flags 15 and 25 can be set.

Shinjo, 4:24-31

Shinjo

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

| <p>5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.</p> | <p>Shinjo, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shinjo discloses this limitation:

*See* Claims 1-1.3 above.

Therefore, the boot process of the present invention can be executed at higher speed than the conventional boot process.

Shinjo, 3:62-64

In the conventional system, a very large number of times of disk access are necessary for the OS initialization process such as setting of the running environment of an OS and for the application initialization process such as setting of the running environment of an application program, and long time is required for the boot process. In the present invention, however, the system can be booted at high speed.

Shinjo, 4:58-65

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the

| <p>8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Shinjo, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.</p> <p>Shinjo, 2:51-2:68</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.</p> <p>Shinjo, 3:35-45</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. Shinjo

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

In step S7, when the designated boot mode is not the maintenance mode, i.e., when it is the normal mode, the saving mode is selected, and the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data and the backup flag 15 of the backup memory 13 is set (step S8). The process of step S8 is completed and then a reboot is executed.

Shinjo, 3:28-34

In a system according to the third embodiment as shown in FIG. 4, the memory 14 includes the backup memory 13, and the disk unit 19 includes the backup file 23. In the saving mode, therefore, the main memory data stored in the main memory 12 can be saved as backup data into the backup memory 13 and backup file 23, and the backup flags 15 and 25 can be set.

Shinjo, 4:24-31

“updating the boot data list”

Claim 8.6

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>8.7 wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Shinjo, as evidenced by the example citations below, discloses<br/> “wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See Claims 1-1.3 and 5.7 above.</i></p> |                                                                                                                                                                                                                                                                                                                                                                    |

Shinjo

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                             |

Shinjo

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

not the boot mode is a normal mode; a flag to be set/reset in accordance with a determination result by the determining means; and a backup memory for storing the main memory data to be stored in the main memory immediately after the computer system is booted, as backup data when the boot mode is the normal mode and the flag is reset, and wherein the backup data stored in the backup memory is restored as the main memory data into the main memory when the boot mode is the normal mode and the flag is set.

Shinjo, 1:49-64

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-68

When a boot command is output from the boot mode setting unit 17 to the CPU 11, an operation using the initial program loader (IPL) program is started by the CPU 11.

Shinjo, 3:4-7

In step S1, it is determined whether or not the boot mode designated by the boot command output from the boot mode setting unit 17 is the maintenance mode. If the boot mode is not the maintenance mode, i.e., if it is the normal mode, it is determined whether or not the backup flag 15 of the backup memory 13 is set (step S2). That is, it is determined whether a boot process is executed in the quick start mode or saving mode.

Shinjo, 3:8-15

In step S2, when the backup flag 15 is reset, it is determined that the backup data stored in the backup memory 13 cannot be restored. Since this determination is made in the first boot process, the same boot process as a conventional one is executed. In other words, the operating system (OS) initialization process and the application initialization process are executed by the initialization program (steps S4 and S5).

Shinjo, 3:16-23

Shinjo

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.

Shinjo, 4:45-67

Shinjo

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

| <p><b>10.</b> The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.</p> | <p>Shinjo, as evidenced by the example citations below, discloses “the method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.”</p> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shinjo discloses this limitation:

*See Claim 9.1 above.*

The present invention relates to a method and an apparatus for booting a computer system.

Shinjo, 1:9-10

In a computer system, generally, whenever the system is booted, a boot process for loading firmware, an initial program loader (IPL) program and an initialize (INZ) program, an initial program loader process, and an initialization process are executed.

Shinjo, 1:11-16

According to one aspect of the present invention, there is provided a method for booting a computer system, the method comprising the steps of: setting a boot mode for booting the computer system; determining whether or not the set boot mode is a normal mode; determining whether or not a flag is set when the boot mode is the normal mode, the flag representing whether or not backup data is restorable; storing main memory data to be stored in a main memory immediately after the computer system is booted, as the backup data, into a backup memory when the flag is reset; and restoring the backup data stored in the backup memory, as the main memory data, into the main memory when the flag is set.

Shinjo, 1:35-48

According to another aspect of the present invention, there is provided an apparatus for booting a computer system, the apparatus comprising: a main memory for storing main memory data; means for setting a boot mode for booting the computer system; determining means for determining whether or

Shinjo

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

not the boot mode is a normal mode; a flag to be set/reset in accordance with a determination result by the determining means; and a backup memory for storing the main memory data to be stored in the main memory immediately after the computer system is booted, as backup data when the boot mode is the normal mode and the flag is reset, and wherein the backup data stored in the backup memory is restored as the main memory data into the main memory when the boot mode is the normal mode and the flag is set.

Shinjo, 1:49-64

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-68

When a boot command is output from the boot mode setting unit 17 to the CPU 11, an operation using the initial program loader (IPL) program is started by the CPU 11.

Shinjo, 3:4-7

In step S1, it is determined whether or not the boot mode designated by the boot command output from the boot mode setting unit 17 is the maintenance mode. If the boot mode is not the maintenance mode, i.e., if it is the normal mode, it is determined whether or not the backup flag 15 of the backup memory 13 is set (step S2). That is, it is determined whether a boot process is executed in the quick start mode or saving mode.

Shinjo, 3:8-15

In step S2, when the backup flag 15 is reset, it is determined that the backup data stored in the backup memory 13 cannot be restored. Since this determination is made in the first boot process, the same boot process as a conventional one is executed. In other words, the operating system (OS) initialization process and the application initialization process are executed by the initialization program (steps S4 and S5).

Shinjo, 3:16-23

Shinjo

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.

Shinjo, 4:45-67

Shinjo

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

**Appendix C18**

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.</p> <p>Shinjo, 2:51-2:68</p> <p style="padding-left: 40px;">Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.</p> <p>Shinjo, 3:35-45</p> <p style="padding-left: 40px;">The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. Shinjo

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

In step S7, when the designated boot mode is not the maintenance mode, i.e., when it is the normal mode, the saving mode is selected, and the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data and the backup flag 15 of the backup memory 13 is set (step S8). The process of step S8 is completed and then a reboot is executed.

Shinjo, 3:28-34

In a system according to the third embodiment as shown in FIG. 4, the memory 14 includes the backup memory 13, and the disk unit 19 includes the backup file 23. In the saving mode, therefore, the main memory data stored in the main memory 12 can be saved as backup data into the backup memory 13 and backup file 23, and the backup flags 15 and 25 can be set.

Shinjo, 4:24-31

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| 11.5 updating the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Shinjo, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                              |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Shinjo, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claim 1 (Preamble) above.</p> |                                                                                                                                                                     |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13.1</b> loading boot data in a compressed form that is associated with a boot data list from a boot device;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Shinjo, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claim 1.1 above.</p> |                                                                                                                                                                     |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Shinjo, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                        |

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                                                                                      |

Shinjo

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

determination result by the determining means; and a backup memory for storing the main memory data to be stored in the main memory immediately after the computer system is booted, as backup data when the boot mode is the normal mode and the flag is reset, and wherein the backup data stored in the backup memory is restored as the main memory data into the main memory when the boot mode is the normal mode and the flag is set.

Shinjo, 1:49-64

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-68

When a boot command is output from the boot mode setting unit 17 to the CPU 11, an operation using the initial program loader (IPL) program is started by the CPU 11.

Shinjo, 3:4-7

In step S1, it is determined whether or not the boot mode designated by the boot command output from the boot mode setting unit 17 is the maintenance mode. If the boot mode is not the maintenance mode, i.e., if it is the normal mode, it is determined whether or not the backup flag 15 of the backup memory 13 is set (step S2). That is, it is determined whether a boot process is executed in the quick start mode or saving mode.

Shinjo, 3:8-15

In step S2, when the backup flag 15 is reset, it is determined that the backup data stored in the backup memory 13 cannot be restored. Since this determination is made in the first boot process, the same boot process as a conventional one is executed. In other words, the operating system (OS) initialization process and the application initialization process are executed by the initialization program (steps S4 and S5).

Shinjo, 3:16-23

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

Page 68 of 129

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the OS initialization process of step S3 or the application initialization process of step S4.

Shinjo, 3:35-45

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.

Shinjo, 4:45-67

Shinjo

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Shinjo, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shinjo discloses this limitation:

*See* Claims 1.2 and 1.3 above.

When a boot command is output from the boot mode setting unit 17 to the CPU 11, an operation using the initial program loader (IPL) program is started by the CPU 11.

Shinjo, 3:4-7

In step S1, it is determined whether or not the boot mode designated by the boot command output from the boot mode setting unit 17 is the maintenance mode. If the boot mode is not the maintenance mode, i.e., if it is the normal mode, it is determined whether or not the backup flag 15 of the backup memory 13 is set (step S2). That is, it is determined whether a boot process is executed in the quick start mode or saving mode.

Shinjo, 3:8-15

Since the backup flag 15 has been set, the boot process is started in the quick start mode through steps S1 and S2 after the reboot. That is, in step S6, the backup data stored in the backup memory 13 is restored into the main memory 12 as the main memory data. Since the computer system is thus restored to the state immediately after the boot process and the running environment is set, the boot process of the computer system can be completed without executing the

Shinjo

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C18**

| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shinjo, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claims 1 (Preamble) and 1.1 above.</p> <p style="padding-left: 40px;">In the initialization process, a resident load module is loaded into a main memory, various control blocks are produced, the running environment of an operating system (OS) is set, and the running environment of an application system is set (for example, a control process is produced).</p> <p>Shinjo, 1:16-21</p> <p style="padding-left: 40px;">In step S2, when the backup flag 15 is reset, it is determined that the backup data stored in the backup memory 13 cannot be restored. Since this determination is made in the first boot process, the same boot process as a conventional one is executed. In other words, the operating system (OS) initialization process and the application initialization process are executed by the initialization program (steps S4 and S5).</p> <p>Shinjo, 3:16-23</p> <p style="padding-left: 40px;">After the backup flag 15 is reset in step S3, the boot process is executed as in the conventional system, i.e., the OS initialization process and the application initialization process are executed (steps S4 and S5).</p> <p>Shinjo, 3:54-57</p> |                                                                                                                                                                                       |

Shinjo

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                   |

| <p><b>16.</b> The method of claim 14, wherein the operating system comprises: a plurality of files.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Shinjo, as evidenced by the example citations below, discloses<br/>“the method of claim 14, wherein the operating system comprises: a plurality of files.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.</p> <p>Shinjo, 4:9-24</p> <p style="padding-left: 40px;">In a system according to the third embodiment as shown in FIG. 4, the memory 14 includes the backup memory 13, and the disk unit 19 includes the backup file 23. In the saving mode, therefore, the main memory data stored in the main memory 12 can be saved as backup data into the backup memory 13 and backup file 23, and the backup flags 15 and 25 can be set.</p> <p>Shinjo, 4:24-37</p> <p style="padding-left: 40px;">As described above, according to the present invention, when the system is first booted, the saving mode is selected. Immediately after the system is booted, the main memory data stored in the main memory is saved as backup data into the backup memory (backup file), and the backup flag is set. The system is then rebooted. Therefore, when the system is next booted in the normal mode, the quick start mode is selected and the backup data saved into the backup memory (backup file) is restored as the main memory data in the main memory. The boot process of the system is completed only by the above process, and the state immediately after the system is booted is restored.</p> <p>Shinjo, 4:45-57</p> |                                                                                                                                                                   |

Shinjo

“The method of claim 14, wherein the operating system comprises: a plurality of files.”

**Claim 16**

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                  |

| <p><b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Shinjo, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">The disk unit 16 is constituted of, for example, a magnetic disk unit and stores various programs, data or the like which are to be booted.</p> <p>Shinjo, 2:48-51</p> <p style="padding-left: 40px;">A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.</p> <p>Shinjo, 4:9-23</p> |                                                                                                                                                      |

| <p><b>31.</b> The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Shinjo, as evidenced by the example citations below, discloses “the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p style="padding-left: 40px;">A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.</p> <p>Shinjo, 4:9-24</p> |                                                                                                                                                                                                                               |

Shinjo

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

**Claim 31**

**Appendix C18**  
**Invalidity of U.S. Patent 8,880,862 based on Shinjo**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                     |

| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Shinjo, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shinjo discloses this limitation:</p> <p style="padding-left: 40px;">The disk unit 16 is constituted of, for example, a magnetic disk unit and stores various programs, data or the like which are to be booted.<br/> Shinjo, 2:48-51</p> <p style="padding-left: 40px;">A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.<br/> Shinjo, 4:9-23</p> <p style="padding-left: 40px;">The memory 14 includes a main memory 12 and a backup memory 13. The main memory 12 stores various programs and data as main memory data. The backup memory 13 stores the main memory data, which is stored in the main memory 12, as backup data. Since the backup memory 13 has approximately the same memory capacity as the main memory 12, the memory capacity of the memory 14 is about twice as large as that of the main memory 12.<br/> Shinjo, 2:33-42</p> |                                                                                                                                                                                                                                                                            |

Shinjo

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

## Appendix C18

### Invalidity of U.S. Patent 8,880,862 based on Shinjo

The backup memory 13 includes a backup flag 15. The backup flag 15 is used to indicate whether or not the backup data stored in the backup memory 13 can be restored into the main memory 12 as the main memory data.

Shinjo, 2:43-47

The boot mode setting unit 17 is constituted of, for example, a service processor (SVP) and used to set a boot mode in the computer system. The boot mode includes a maintenance mode for software maintenance such as replacement of the programs and patch and a mode (normal mode) other than the maintenance mode. The normal mode includes a quick start mode in which a high speed boot can be executed using the backup data and a saving mode in which the main memory data stored in the main memory 12 is saved in the backup memory 13 as the backup data, immediately after a normal boot is executed. It depends upon the set/reset state of the backup flag 15 which of the quick start mode and the saving mode is selected. More specifically, in the normal mode, when the backup flag 15 is set, the quick start mode is selected and, when the backup flag 15 is reset, the saving mode is selected.

Shinjo, 2:51-2:68

In step S7, when the designated boot mode is not the maintenance mode, i.e., when it is the normal mode, the saving mode is selected, and the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data and the backup flag 15 of the backup memory 13 is set (step S8). The process of step S8 is completed and then a reboot is executed.

Shinjo, 3:28-34

In the computer system according to the first embodiment wherein the main memory data stored in the main memory 12 is saved into the backup memory 13 as the backup data, when the system power source is turned off, the backup data is erased. It is thus necessary to boot the system in the same manner as the conventional apparatus and save the main memory data stored in the main memory 12 into the backup memory 13 as the backup data immediately after the system is booted. By backing up the backup memory 13 by a battery or the like, such boot process in the system is executed only at the first time.

Shinjo, 3:65-4:8

In a system according to the third embodiment as shown in FIG. 4, the memory 14 includes the backup memory 13, and the disk unit 19 includes the backup file 23. In the saving mode, therefore, the main memory data stored in the main memory 12 can be saved as backup data into the backup memory 13 and backup file 23, and the backup flags 15 and 25 can be set.

Shinjo, 4:24-31

Shinjo

**Claim 39**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

| <p><b>107.</b> The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Shinjo, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shinjo discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">The disk unit 16 is constituted of, for example, a magnetic disk unit and stores various programs, data or the like which are to be booted.<br/> Shinjo, 2:48-51</p> <p style="padding-left: 40px;">A disk unit 19 of a computer system according to the second embodiment as shown in FIG. 3 can be used in place of the backup memory 13 shown in FIG. 1. The disk unit 19 includes a backup file 23 for storing the main memory data stored in the main memory 12 as backup data and a backup flag 25. Even through the system power source is turned off, the backup data stored in the backup file 23 is not erased. In the system according to the second embodiment, since the backup data as the main memory data is saved and restored between the main memory 12 and disk unit 19, disk access occurs. Therefore, the time required for the boot process of the system according to the first embodiment is longer than the time required for that of the system according to the first embodiment.<br/> Shinjo, 4:9-23</p> |                                                                                                                                                                            |

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

U.S. Patent No. 5,671,413 to Shipman (“Shipman”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C19 Invalidity of U.S. Patent 8,880,862 based on Shipman

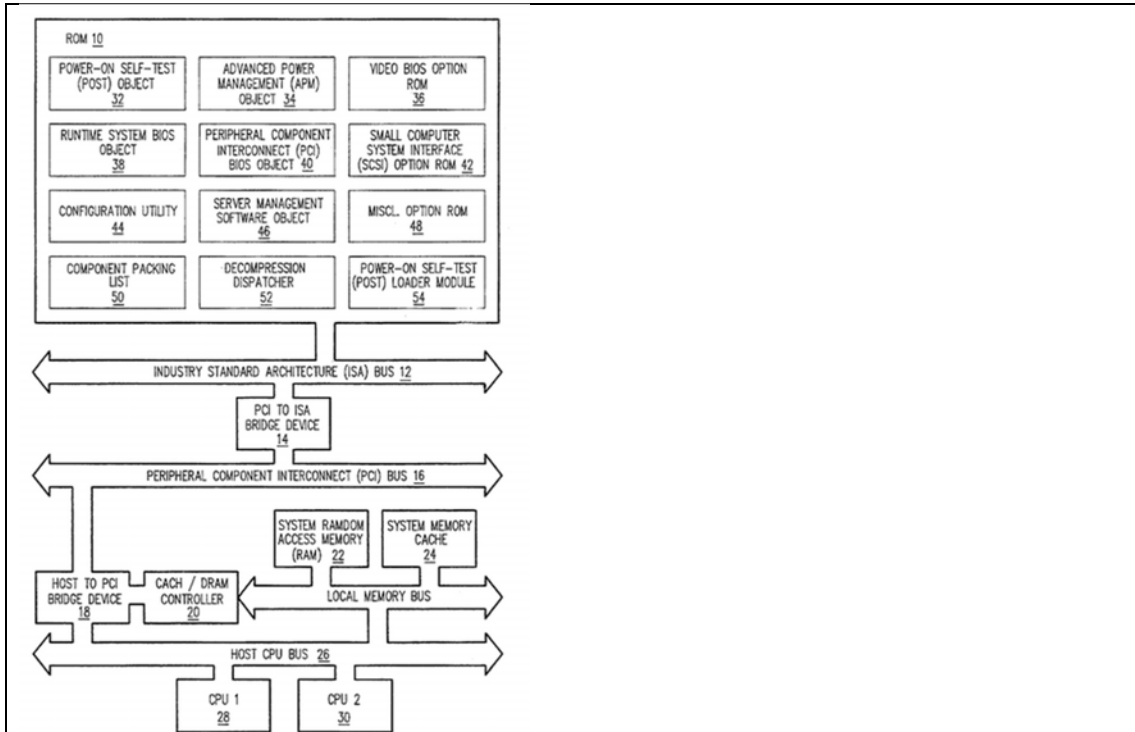

FIG. 1

Shipman, Fig. 1

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in

a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

|                                                                                                                                                                     |                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Shipman, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 7 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

Shipman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 8 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

#### Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

#### Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched

#### Shipman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

#### Claim 1.1

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

(506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

Shipman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Shipman

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

Page 12 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Shipman

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

Page 13 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

Component Dispatching

Shipman

"accessing the loaded portion of the boot data in the compressed form from memory."

Claim 1.2

Page 14 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510).

Shipman

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

Page 15 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to be decompressed. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Shipman, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p style="padding-left: 40px;">The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.</p> <p>Shipman, Abstract</p> <p style="padding-left: 40px;">In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.</p> <p>Shipman, 1:12-22</p> |                                                                                                                                                                                                                                                                                                            |

Shipman

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as

Shipman

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

Page 19 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Shipman

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

Page 20 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is

Shipman

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Page 21 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to be decompressed. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an

A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.</p> <p>Shipman, 3:55-65</p> |                                                                                                |

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Shipman, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p style="padding-left: 40px;">The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.</p> <p>Shipman, Abstract</p> <p style="padding-left: 40px;">In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.</p> <p>Shipman, 1:12-22</p> <p style="padding-left: 40px;">The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Shipman

“wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

Page 28 of 174

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

| <p>2. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Shipman, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                                                                                    |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>3.</b> The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shipman, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                                                                                                                                              |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                           |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>4.</b> The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Shipman, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claims 1.4.1, and 2 above.</i></p> |                                                                                                                                                                                                                           |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                         |

The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.</p> <p>Shipman, 2:14-22</p> <p style="padding-left: 40px;">FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image</p> |                                                                                                                                         |

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

(1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

*See also* Shipman, Figs. 1-13

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic

input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

| 5.5 utilizing the decompressed boot data to at least partially boot the computer system; | Shipman, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system” |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Claim 5.5

Page 43 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

Page 44 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

#### Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

#### Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

(508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

| <p>8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shipman, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.</p> <p>Shipman, Abstract</p> <p style="padding-left: 40px;">In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.</p> <p>Shipman, 1:12-22</p> <p style="padding-left: 40px;">The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently</p> |                                                                                                                                                                                    |

Shipman

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as

Claim 8.5

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Shipman

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Shipman

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

Shipman

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

| <p>8.7 wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Shipman, as evidenced by the example citations below, discloses<br/> “wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See</i> Claims 1-1.3 and 5.7 above.</p> <p style="padding-left: 40px;">In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.</p> <p>Shipman, 1:12-22</p> |                                                                                                                                                                                                                                                                                                                                                                     |

Shipman

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                              |

Shipman

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

Claim 9.1

## Appendix C19 Invalidity of U.S. Patent 8,880,862 based on Shipman

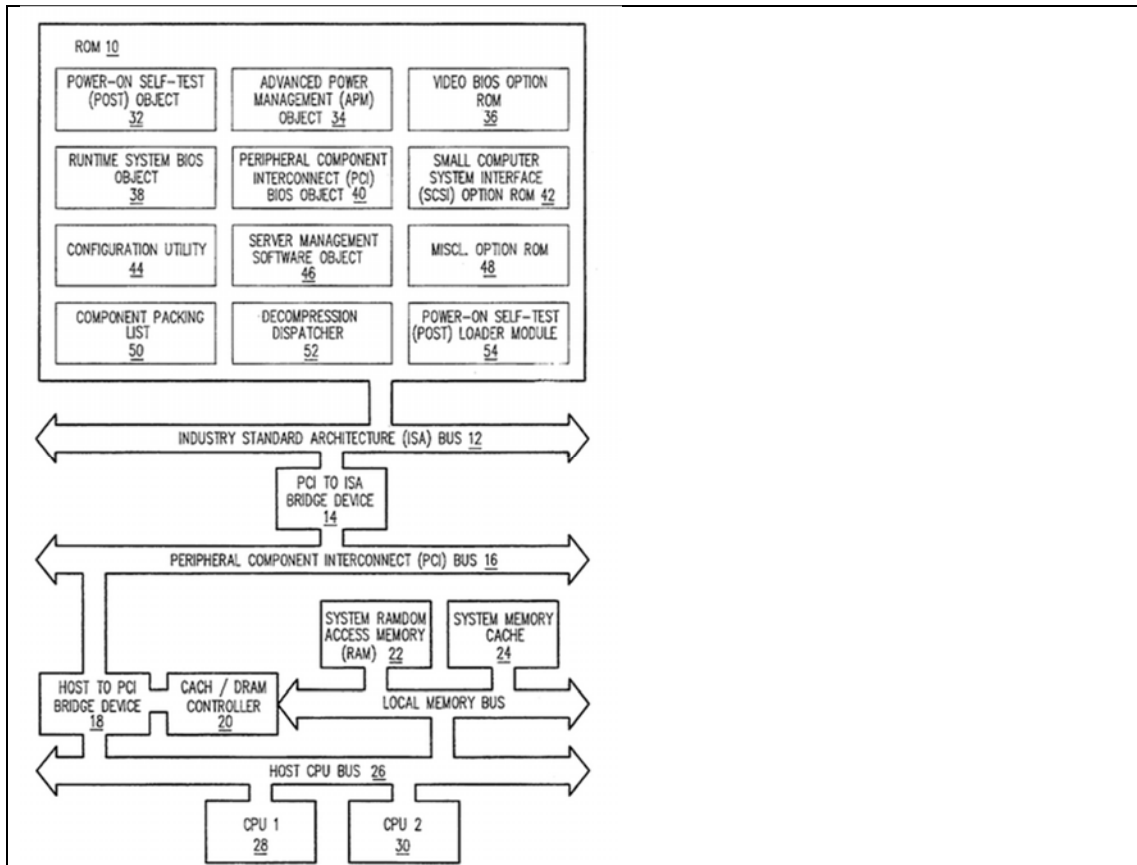

FIG. 1

Shipman, Fig. 1

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass

Shipman

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 14:15-41

*See also* Shipman, Figs. 2-13

The BIOS is organized into a set of components, each being dispatched as an independent executable object. Components fall into three major types: initialization components, runtime components and functional components. Initialization components are dispatched during what is commonly referred to as the Power On Self Test (POST) cycle. These components are active during initialization and terminated prior to loading the Operating System.

Initialization components may contain direct runtime dependencies but these dependencies are limited to objects of the same Component Class. For the illustrated embodiment, all initialization components are segment relocatable. An example of an initialization component is the POST Object.

Runtime components are objects that are uncompressed or remain decompressed and executable after loading of the Operating System. Typically, runtime components are combined to form the 64K System BIOS image located in the F0000h segment. For the illustrated embodiment, runtime are segment relocatable components do not contain any direct dependencies to any other component regardless of its type or class, but may contain indirect dependencies to other runtime components. An example of a runtime component is the Runtime System BIOS Object.

Functional components are dispatched on an as needed basis. For the illustrated embodiment, a Functional component does not contain any direct dependencies to any other component regardless of type or class. An example of a Functional component is the Configuration Utility.

| <p>9.2 storing the additional portion of the operating system in the first memory, and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Shipman, as evidenced by the example citations below, discloses<br/> “storing the additional portion of the operating system in the first memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing the additional portion of the operating system in the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 8.1 above.</i></p> <p>The BIOS is organized into a set of components, each being dispatched as an independent executable object. Components fall into three major types: initialization components, runtime components and functional components. Initialization components are dispatched during what is commonly referred to as the Power On Self Test (POST) cycle. These components are active during initialization and terminated prior to loading the Operating System.</p> <p>Initialization components may contain direct runtime dependencies but these dependencies are limited to objects of the same Component Class. For the illustrated embodiment, all initialization components are segment relocatable. An example of an initialization component is the POST Object.</p> <p>Runtime components are objects that are uncompressed or remain decompressed and executable after loading of the Operating System. Typically, runtime components are combined to form the 64K System BIOS image located in the F0000h segment. For the illustrated embodiment, runtime are segment relocatable components do not contain any direct dependencies to any other component regardless of its type or class, but may contain indirect dependencies to other runtime components. An example of a runtime component is the Runtime System BIOS Object.</p> <p>Functional components are dispatched on an as needed basis. For the illustrated embodiment, a Functional component does not contain any direct dependencies to any other component regardless of type or class. An example of a Functional component is the Configuration Utility.</p> <p>Shipman, 4:40-5:2</p> |                                                                                                                                                          |

Shipman

“storing the additional portion of the operating system in the first memory”

Claim 9.2

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                  |

| <p>9.3 wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Shipman, as evidenced by the example citations below, discloses “wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 8.5 above.</i></p> <p>The BIOS is organized into a set of components, each being dispatched as an independent executable object. Components fall into three major types: initialization components, runtime components and functional components. Initialization components are dispatched during what is commonly referred to as the Power On Self Test (POST) cycle. These components are active during initialization and terminated prior to loading the Operating System.</p> <p>Initialization components may contain direct runtime dependencies but these dependencies are limited to objects of the same Component Class. For the illustrated embodiment, all initialization components are segment relocatable. An example of an initialization component is the POST Object.</p> <p>Runtime components are objects that are uncompressed or remain decompressed and executable after loading of the Operating System. Typically, runtime components are combined to form the 64K System BIOS image located in the F0000h segment. For the illustrated embodiment, runtime are segment relocatable components do not contain any direct dependencies to any other component regardless of its type or class, but may contain indirect dependencies to other runtime components. An example of a runtime component is the Runtime System BIOS Object.</p> <p>Functional components are dispatched on an as needed basis. For the illustrated embodiment, a Functional component does not contain any direct dependencies to any other component regardless of type or class. An example of a Functional component is the Configuration Utility.</p> <p>Shipman, 4:40-5:2</p> |                                                                                                                                                                                                                                  |

Shipman

Claim 9.3

“wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                |

Shipman

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C19 Invalidity of U.S. Patent 8,880,862 based on Shipman

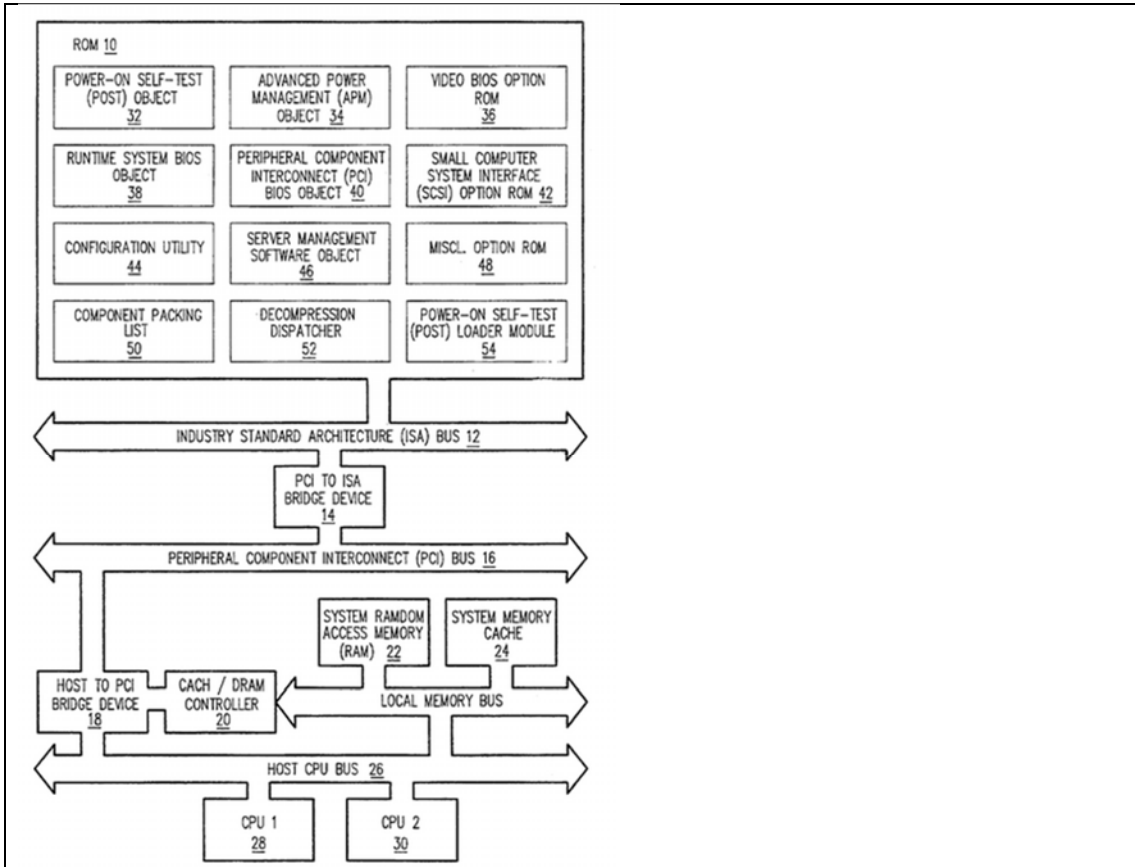

FIG. 1

Shipman, Fig. 1

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the

Shipman

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## **Appendix C19**

### **Invalidity of U.S. Patent 8,880,862 based on Shipman**

service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass

Shipman

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompressed. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shipman, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 1.1 and 6(Preamble) above.</i></p> <p style="padding-left: 40px;">Initialization components are dispatched during what is commonly referred to as the Power On Self Test (POST) cycle. These components are active during initialization and terminated prior to loading the Operating System. Initialization components may contain direct runtime dependencies but these dependencies are limited to objects of the same Component Class. For the illustrated embodiment, all initialization components are segment relocatable. An example of an initialization component is the POST Object.</p> <p>Shipman, 4:46-4:54</p> <p style="padding-left: 40px;">Power On Self Test</p> <p style="padding-left: 40px;">The Power On Self Test component (32) is the main POST executable, and is responsible for initialization of the system, and causing all necessary components to be dispatched. This component resides in a compressed state in the ROM image, and as described earlier, this component is decompressed and dispatched into DRAM by the decompression dispatcher.</p> <p>Shipman, 6:60-6:67</p> <p style="padding-left: 40px;">System BIOS Runtime Executable</p> <p style="padding-left: 40px;">The System BIOS Runtime Executable component is responsible for all compatible System Services including Interrupt and Device Service Routines. This component contains the Shutdown Handler responsible for handling all software related resets and dispatching the POST Loader as needed. This</p> |                                                                                                                                                                                                                                      |

Shipman

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

component resides in a compressed state in the ROM state, and it is decompressed and dispatched into DRAM by the decompression dispatcher.

Shipman, 7:1-7:10

**Shipman**

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Claim 11.1**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------|
| 11.2 accessing the loaded boot data in compressed form from the memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Shipman, as evidenced by the example citations below, discloses “accessing the loaded boot data in compressed form from the memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in compressed form from the memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                                     |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                            |

Shipman

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

Claim 11.3

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                           |                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Shipman, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM, accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the

Shipman

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Shipman

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

Component Dispatching

Shipman

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510).

Shipman

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

| <p><b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shipman, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 1 (Preamble) above.</i></p> |                                                                                                                                                                             |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**13.1** loading boot data in a compressed form that is associated with a boot data list from a boot device;

Shipman, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See Claim 1.1 above.*

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                         |

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                             |                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Shipman, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 1.1 and 1.2 above.

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility

Shipman

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

(1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image (1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end

Shipman

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

Page 106 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are placed in the ROM uncompressed have identical Compressed and

Shipman

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

Page 107 of 174

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 1.2 and 1.3 above.

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

In IBM compatible personal computers a set of programs called basic input/output system (BIOS) are encoded in read-only memory (ROM). The BIOS facilitates the transfer of data and instructions between a central processing unit (CPU) and peripheral devices such as disk drives. Computer systems are designed to perform functional tests of the BIOS every time the computer is turned on. When the computer is turned on, BIOS is copied to an area of random access memory (RAM) set aside for it. Since a RAM is much faster acting than a ROM,

**Shipman**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

accessing the BIOS code from RAM results in much faster initialization of the computer.

Shipman, 1:12-22

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:35-59

The BIOS stored in a read only memory (ROM) is organized into a set of components, each being dispatched as an independent executable object after being copied to a shadow memory portion of a random access memory (RAM). Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis.

Shipman, 1:60-2:7

Shipman

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 111 of 174

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 2:14-22

Refer to FIG. 1 which is a block diagram of a computer system in which the present invention is embodied. The computer includes a read only memory, or ROM, (10), a dynamic random access memory, or DRAM, (22), a system memory cache (24), a cache/DRAM controller (20), and central processing units (28, 30). A set of programs called basic input/output system (BIOS) are encoded in ROM (10). The BIOS facilitates the transfer of data and instructions between the central processing units (28, 30) and peripheral devices. In the present invention the BIOS is organized into a set of BIOS components (32 through 54), each of which is capable of being dispatched as an independent executable object. Each BIOS component is a self-contained (link independent) binary image that performs a certain task or function. The BIOS components fall into three major types: initialization components, runtime components and functional components.

Shipman, 2:63-3:12

Compressed code is the code that resides in the ROM in a compressed state. Decompressed code is code that has been decompressed from its compressed state inside the ROM and now resides in DRAM (22) shadowed memory, in a decompressed state. Uncompressed code is code that resides inside the ROM in an uncompressed state. This is code that was never compressed.

Shipman, 3:22-28

FIG. 13 is a flow diagram of a BIOS build process that automates compressing and packing components into a final ROM binary image. A list of binary images and associated attributes to include in the final ROM image (1300) and a number of binary image files (1302) are provided to a ROM Packing Utility (1304). The ROM Packing Utility (1304) creates a packed ROM image (1306) and a packing list (1308) that are merged by a merge utility (1310) into a final ROM image

Shipman

#### Claim 14.3

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

(1312) and a packing map (1314) that are stored in the ROM (10) shown in FIG. 1.

Shipman, 3:55-65

Packing List--The Packing List is generated by the Packing Utility and describes all the attributes of the packed ROM image. This list is used by the decompression dispatcher to dispatch components.

Shipman, 4:33-36

#### Component Dispatching

Components are dispatched through a utility called the decompression dispatcher. There are two types of dispatching supported by the decompression dispatcher, active and passive.

...

When dispatching components the decompression dispatcher works from a Packing List provided in the ROM image by the BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The Packing List provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 5:3-34

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

If the required size is available (322), then the memory allocation table is updated (330). If the end of the component list in the packing list has not been reached (332), then the flow returns to block (310). If the end

Shipman

#### Claim 14.3

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C19

### Invalidity of U.S. Patent 8,880,862 based on Shipman

of the component list in the packing list has been reached (332), then the flow ends (334).

Shipman, 12:17-35

Refer to FIG. 5 which is a flow diagram of how components are dispatched. The dispatcher assumes only one component from a class is being loaded, and hence the count of components is set to 1. The counter is used as an index into the packing list. The component of a class might contain a number of components referenced by a subclass identifier. A check (504) is made to determine if all components of the class are to be loaded. If yes, then the first subclass identifier is fetched (506) as described in FIG. 7. If the subclass is found in the packing list (508) then the count of the subclass index counter is incremented (510). If the subclass is not found in the packing list (508), then the count of the subclass index counter is not incremented and the flow proceeds to get packing information for the component indexed by the count of the component counter (512). The procedure next decompresses the component at the index count and places the decompressed Code in RAM (514). The details of block (514) are shown in more detail in FIG. 12. At the end of the decompressing procedure, a check (516) is made to determine if there are more components in this class to decompress. If yes, the component index counter is decremented (518). If no, a check (520) is made to determine if this is the last component actively dispatched or if an option ROM is present. If not, the flow ends (524). If yes, then the return address is adjusted to execute the dispatched component (522).

Shipman, 12:49-13:7

Refer to FIG. 12 which is a flow diagram of the procedure for getting a specified component transferred and stored in RAM in an uncompressed and executable state.

A RAM memory block large enough to hold the specified component is found (1202) and allocated. After the memory space is allocated (1204), the size field in the packing list is accessed to get the size information (1206). The compressed and decompressed size information is obtained from the packing list entry (1206). The Compressed Size field specifies the amount of space (in bytes) consumed by a component when it is in the ROM image. Uninitialized Data components use this field to specify the maximum amount of memory required and that they be aligned on a 64K boundary. The Decompressed Size field specifies the amount of space (in bytes) consumed by a component after it has been decompressed and dispatched. As described earlier, components that are

Shipman

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 114 of 174

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

placed in the ROM uncompressed have identical Compressed and Decompressed sizes. Uninitialized Data components specify this field to be identical to the Compressed Size field.

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:15-41

| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p> | <p>Shipman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
|---------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

The BIOS is organized into a set of components, each being dispatched as an independent executable object. Components fall into three major types: initialization components, runtime components and functional components. Initialization components are dispatched during what is commonly referred to as the Power On Self Test (POST) cycle. These components are active during initialization and terminated prior to loading the Operating System.

Initialization components may contain direct runtime dependencies but these dependencies are limited to objects of the same Component Class. For the illustrated embodiment, all initialization components are segment relocatable. An example of an initialization component is the POST Object.

Runtime components are objects that are uncompressed or remain decompressed and executable after loading of the Operating System. Typically, runtime components are combined to form the 64K System BIOS image located in the F0000h segment. For the illustrated embodiment, runtime are segment relocatable components do not contain any direct dependencies to any other component regardless of its type or class, but may contain indirect dependencies to other runtime components. An example of a runtime component is the Runtime System BIOS Object.

Functional components are dispatched on an as needed basis. For the illustrated embodiment, a Functional component does not contain any direct dependencies to any other component regardless of type or class. An example of a Functional component is the Configuration Utility.

Shipman, 4:40-5:2

**Shipman**

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

The decompression dispatcher component (52) dispatches a Component into memory (22). Each Component is identified by a unique Class/Sub-Class code combination. Dispatched Components are recorded in an Allocation Table kept by the Memory Manager. The actual base address of a Component may be retrieved at any time by calling a Get Physical Address() function.

**Claim 24**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                             |                                                                                                                                           |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| 27. The method of claim 1, wherein the memory comprises: a physical memory. | Shipman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the memory comprises: a physical memory.” |
|-----------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 1.1 and 1.2 above

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and optionally removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, Abstract

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, 1:35-46

The ROM (10) is a non-volatile device used to store the BIOS components, some in a compressed state and some in an uncompressed state. The DRAM (22) stores a shadow RAM binary image of selected components stored in the ROM. For those components stored in the compressed state, they are decompressed before storing in the shadow RAM. In Intel 80386 and 80486

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

computers, shadow RAM is a portion of upper memory area set aside for programs retrieved from ROM.

Shipman, 3:13-21

If the component is not compressed, then the component is copied (1212) to RAM from the non-volatile storage device used to store the compressed or uncompressed BIOS code. If the component is compressed, then the component is decompressed (1210), stored in an uncompressed state in the shadowed memory portion of RAM, and the procedure stops (1216).

Shipman, 14:35-41

Shipman

“The method of claim 1, wherein the memory comprises: a physical memory”

**Claim 27**

Page 126 of 174

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claims 1.1 and 32 above.</i></p> |                                                                                                                                                                                                        |

**Shipman**

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**35.** The method of claim 5, wherein the compressed boot data represents a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**36.** The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.

Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See Claims 15 and 17 above.*

**Shipman**

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                             |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p> | <p>Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 1.1 and 1.2 above

The ROM (10) is a non-volatile device used to store the BIOS components, some in a compressed state and some in an uncompressed state. The DRAM (22) stores a shadow RAM binary image of selected components stored in the ROM. For those components stored in the compressed state, they are decompressed before storing in the shadow RAM. In Intel 80386 and 80486 computers, shadow RAM is a portion of upper memory area set aside for programs retrieved from ROM.

Shipman, 3:13-21

Shipman

**Claim 39**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**43.** The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.

Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See Claim 31 above.*

**Shipman**

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>44.</b> The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claim 32 above.</i></p> |                                                                                                                                                                                       |

**Shipman**

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 44**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                |                                                                                                                                                                      |
|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>45.</b> The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data. | Shipman, as evidenced by the example citations below, discloses “the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
|----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 32 and 33 above.

**Shipman**

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**47.** The system of claim 6, wherein the boot data in the compressed form represents a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                            |

Three types of components are defined, initialization components, runtime components and functional components. The initialization components are dispatched during a Power On Self Test (POST) cycle such that the initialization components are active during initialization. The initialization components are terminated prior to loading an operating system. The runtime components are maintained in the uncompressed/decompressed state and executable after loading of the operating system. The functional components are decompressed and dispatched on an as needed basis. The components can be actively or passively dispatched. Control over a dispatched object is returned to a requester by the decompression dispatcher upon a condition that the component is to be passively dispatched and the passively dispatched component is recorded in a memory manager. Control over a dispatched object is passed to the decompressed component upon a condition that the component</p> |                                                                                                                                                                                                                     |

**Shipman**

**Claim 49**

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

is to be actively dispatched. When dispatching components the decompression dispatcher works from a packing list provided in the ROM image by a BIOS build process. To optimize device usage, the binary images that comprise the different components are packed into the final ROM image. The packing list provides a detailed description of the packing as well as other important pieces of information regarding the types of components that have been packed into the ROM.

Shipman, 1:60-2:22

**Shipman**

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Claim 49**

Page 142 of 174

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**50.** The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.

Shipman, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

The services to be provided by a basic input/output system (BIOS) of a computer system are implemented via a number of independently executable service components. Additionally, the BIOS is provided with a decompression dispatcher for decompressing and dispatching the service components into random access memory (RAM) of the computer system for execution on an as needed basis, and removing the dispatched service components when they are no longer needed. As a result, the service components may be stored in a non-volatile storage in a compressed state, allowing more services to be implemented without requiring more non-volatile storage.

Shipman, 1:34-46

More specifically, different basic input/output system (BIOS) functions are split into components, or objects, and selected ones of the components are stored in a compressed state and these compressed components are only decompressed and executed when needed. A decompression dispatcher software takes a request from currently executing BIOS code to decompress another portion of BIOS code that may be needed. The requester can specify whether or not to just decompress the portion of code into memory or to decompress and initialize the decompressed BIOS. The decompression dispatcher can be used to dispatch different portions of BIOS code to different processors in a multi-processor system.

Shipman, 1:47-59

Shipman

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**51.** The system of claim 6, wherein the first memory comprises: a physical memory.

Shipman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the first memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the first memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See Claims 27 and 39 above.*

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                              |                                                                                                                                                                    |

| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Shipman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Shipman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 15, 17 and 24 above.

| <p><b>60.</b> The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Shipman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Shipman discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                                  |

**Shipman**

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Claim 60**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Shipman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 27 and 38 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                 |                                                                                                                                                       |
|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>64.</b> The method of claim 8, wherein the operating system comprises: a plurality of files. | Shipman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files” |
|-------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Shipman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 15, 17 and 24 above.

**Shipman**

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 65**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                                                                     |

**Shipman**

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 72**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                     |                                                                                                                                           |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>75.</b> The method of claim 11, wherein the memory comprises: a physical memory. | Shipman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See Claim 27 above.*

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**76.** The method of claim 11, wherein the operating system comprises: a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Shipman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See Claims 15, 17 and 24 above.*

**Shipman**

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 77**

Shipman

“The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.”

**Claim 80**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                             |                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>81.</b> The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form. | Shipman, as evidenced by the example citations below, discloses “the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form” |
|-----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 32, 33 and 49 above.

**Shipman**

“The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.”

**Claim 81**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                  |                                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

Shipman

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

Shipman

**Claim 84**

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system.”

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                     |                                                                                                                                           |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>87.</b> The method of claim 13, wherein the memory comprises: a physical memory. | Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See Claim 27 above.*

**Shipman**

“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 16 and 23 above.

**Shipman**

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**89.** The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.

Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claims 15, 17 and 24 above.

**Shipman**

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.”

**Claim 89**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**Shipman**

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claim 32, 33 and 49 above.

**Shipman**

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                 |                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>93.</b> The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data. | Shipman, as evidenced by the example citations below, discloses “the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
|-----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Shipman discloses this limitation:

*See* Claim 32, 33, and 49 above.

**Shipman**

“The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 93**

**Appendix C19**  
**Invalidity of U.S. Patent 8,880,862 based on Shipman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                              |

| <p><b>109.</b> The method of claim 108, further comprising: storing the compressed additional boot data.</p> | <p>Shipman, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”</p> |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Shipman discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

Refer to FIG. 3 which is a flow diagram of initializing the decompression dispatcher of FIG. 2. The dispatcher data and executable code is copied (302) from the ROM to the RAM. The dispatcher interrupt vector is installed (304), the memory allocation table is cleared (306) and the component handle table is cleared (308). The compressed BIOS component information in the packing list is fetched from RAM (310). The relocation type field is examined to find what type of relocation is supported, below 1 meg. (312, 314), above 1 meg. (316, 318), or anywhere (320). If the required size is not available (322) allocation error flags are set (324). If the specified load address is not available (326) allocation error flags are set (328).

Shipman, 12:17-29

The ROM (10) is a non-volatile device used to store the BIOS components, some in a compressed state and some in an uncompressed state. The DRAM (22) stores a shadow RAM binary image of selected components stored in the ROM. For those components stored in the compressed state, they are decompressed before storing in the shadow RAM. In Intel 80386 and 80486 computers, shadow RAM is a portion of upper memory area set aside for programs retrieved from ROM.

Shipman, 3:13-21

Shipman  
 “The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

U.S. Patent No. 5,860,083 to Sukegawa (“Sukegawa”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

In addition, Apple incorporates by reference, as if set forth fully herein, all arguments related to Sukegawa in pending inter partes review petitions IPR2016-1365, IPR2016-01366, IPR2016-01737, and IPR2016-01738.

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

|                                                                                                                                           |                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>1 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, the method comprising:</p> | <p>Sukegawa, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”</p> |
|-------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this claim limitation:

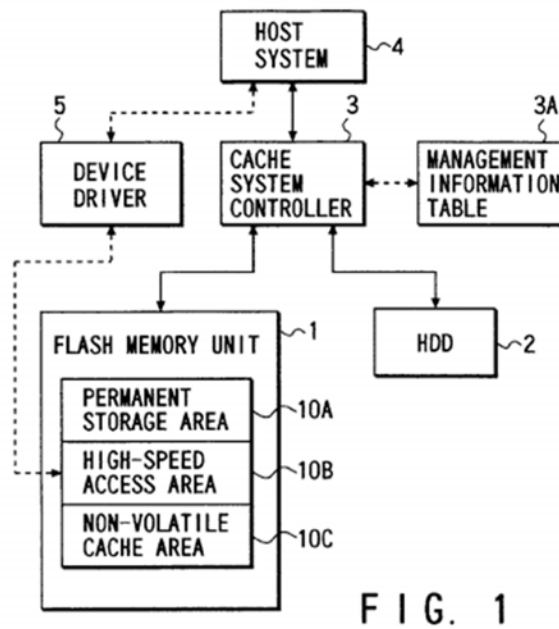

FIG. 1

Sukegawa, Fig. 1. See also Sukegawa, 5:14-6:17, 6:19-58, 7:28-55.

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Sukegawa, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Sukegawa discloses this claim limitation:</p> <p>“(Data Storage System)<br/> It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.</p> <p>The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”</p> <p>The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”</p> <p>Sukegawa, 4:1-30.</p> |                                                                                                                                                                                                                                    |

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 1, Fig. 4, Fig. 5.

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Sukegawa, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Sukegawa discloses this claim limitation:</p> <p style="padding-left: 40px;">“(Data Storage System)<br/> It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.</p> <p style="padding-left: 40px;">The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”</p> <p>Sukegawa, 4:1-21.</p> <p style="padding-left: 40px;">“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”</p> <p>Sukegawa, 5:10-12.</p> <p style="padding-left: 40px;">“(First Modification of the First Embodiment)<br/> FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data</p> |                                                                                                                                                             |

Sukegawa

“accessing the loaded portion of the boot data in the compressed form from memory;”

Claim 1.2

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Sukegawa, as evidenced by the example citations below, discloses<br/> “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Sukegawa discloses this claim limitation:</p> <p style="padding-left: 40px;">“(Data Storage System)<br/> It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.</p> <p style="padding-left: 40px;">The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”</p> <p>Sukegawa, 4:1-21.</p> <p style="padding-left: 40px;">“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”</p> <p>Sukegawa, 5:10-12.</p> |                                                                                                                                                                                                                                                                                                                  |

Sukegawa

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form;

and”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

“(First Modification of the First Embodiment)  
 FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                 |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                         | Sukegawa, as evidenced by the example citations below, discloses “updating the boot data list,” |
| To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s |                                                                                                 |

Sukegawa Claim 1.3  
 “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form;  
 and”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

Invalidity Contentions.

Sukegawa discloses this claim limitation:

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

“The permanent storage area 10A and non-volatile cache area 10C function as cache memory areas of the HDD 2. Normally, each time the data in the cache memory area is updated, the updated data is written in the HDD 2. In this embodiment, the user can set the mode of each of the areas 10A and 10C, thereby determining whether or not the updated data should be written in the HDD 2 each time the data is updated.”

Sukegawa, 9:19-29.

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Sukegawa, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Sukegawa discloses this claim limitation:</p> <p style="padding-left: 40px;">“(First Modification of the First Embodiment)<br/>         FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”</p> <p>Sukegawa, 6:18-26.</p> <p style="padding-left: 40px;">“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”</p> <p>Sukegawa, 6:35-42.</p> <p style="padding-left: 40px;">“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”</p> |                                                                                                                                                                      |

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>3.</b> The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Sukegawa, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                                                                                                                                               |

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                            |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>4. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Sukegawa, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See Claims 1.4.1, and 2 above.</i></p> |                                                                                                                                                                                                                            |

Sukegawa

“The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”

Claim 4

Page 15 of 136

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                           |                                                                                                                                          |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 1-1.4.2 above.

*See also*

Sukegawa discloses this claim limitation:

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
 FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa

“A method for booting a computer system, the method comprising:”

**Claim 5 (Preamble)**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

| 5.4 decompressing the accessed compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Sukegawa, as evidenced by the example citations below, discloses “decompressing the accessed compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See Claim 1.3 above.</i></p> |                                                                                                                    |

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

5.5 utilizing the decompressed boot data to at least partially boot the computer system;

Sukegawa, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

*See also*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control (to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:1-30.

Sukegawa

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

Page 22 of 136

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”

Sukegawa, 5:10-12.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.

Sukegawa, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 1-1.3 above.

Sukegawa

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**6 (Preamble)** A system comprising:  
a processor;

Sukegawa, as evidenced by the example citations below, discloses  
“a system comprising:  
a processor:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

See *Add disclosure from ‘608 Patent Claim 1.2*

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                             |

Sukegawa

Claim 6.2

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

information necessary for starting the OS read out from the HDD.  
Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

Sukegawa  
“wherein the processor is configured”

Claim 6.3

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

Sukegawa  
“to access the loaded portion of the boot data in the compressed form”

Claim 6.5

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

6.6 to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data, and

Sukegawa, as evidenced by the example citations below, discloses  
“to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 1.3 above.

Sukegawa

“to decompress the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the system relative to booting the system with uncompressed boot data, and”

Claim 6.6

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| 6.7 to update the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Sukegawa, as evidenced by the example citations below, discloses “to update the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to update the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. Sukegawa  
“storing a portion of the operating system in a compressed form in a first memory”

Claim 8.1

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

8.2 loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list;

Sukegawa, as evidenced by the example citations below, discloses “loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 1.1 above.*

Sukegawa

“loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list”

Claim 8.2

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                         |                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.3 accessing the loaded portion of the operating system from the second memory in the compressed form; | Sukegawa, as evidenced by the example citations below, discloses “accessing the loaded portion of the operating system from the second memory in the compressed form” |
|---------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the operating system from the second memory in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 1.2 above.

Sukegawa

Claim 8.3

“accessing the loaded portion of the operating system from the second memory in the compressed form”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                         |

Sukegawa

“decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system”

Claim 8.4

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                    |                                                                                                                                                                              |
|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and | Sukegawa, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system” |
|--------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

*See also*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

Sukegawa, 4:1-30.

“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”

Sukegawa, 5:10-12.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*See also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig 1, Fig. 4, Fig. 5.

Sukegawa

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**9.1** The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list; and

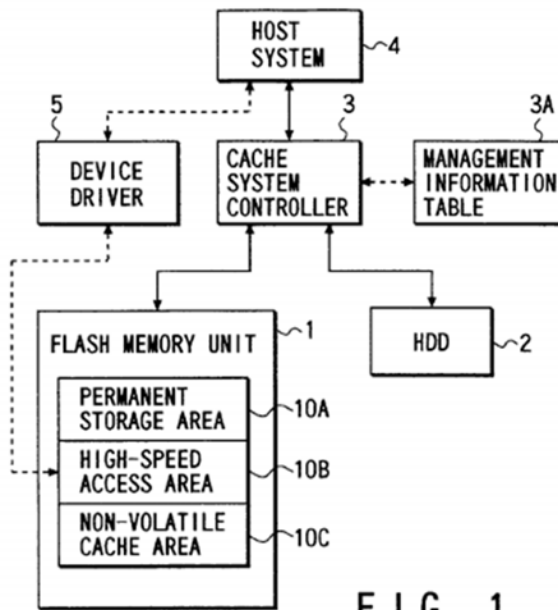

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

See Claim 1.1 above.

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as

Sukegawa

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control (to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

Sukegawa, 4:1-21.

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode (data storage mode) for storing the control information necessary for starting the OS in the permanent storage area IOA of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 4, Fig. 5.

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as

Sukegawa

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control (to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

Sukegawa, 4:1-21.

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode (data storage mode) for storing the control information necessary for starting the OS in the permanent storage area IOA of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 4, Fig. 5.

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Sukegawa, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p><i>See also</i></p> <p>“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”</p> <p>Sukegawa, 4:22-30.</p> <p>“(First Modification of the First Embodiment)<br/>         FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”</p> <p>Sukegawa, 6:18-26.</p> <p>“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control</p> |                                                                                                                                                                                                                                       |

Sukegawa

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

information necessary for starting the OS read out from the HDD.  
Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

11.3 decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Sukegawa, as evidenced by the example citations below, discloses “decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 1.3 above.*

Sukegawa

Claim 11.3

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                           |                                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Sukegawa, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:1-30.

Sukegawa

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”

Sukegawa, 5:10-12.

“(First Modification of the First Embodiment)

FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising: | Sukegawa, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
|--------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 1 (Preamble) above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**13.1** loading boot data in a compressed form that is associated with a boot data list from a boot device;

Sukegawa, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claim 1.1 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**13.2** accessing the loaded boot data in the compressed form;

Sukegawa, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 1.2 above.*

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**13.3** decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Sukegawa, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 1.3 above.

Sukegawa discloses this limitation:

*See* Claim 1 (Preamble) above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                             |                                                                                                                                                                                                                                   |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 1.1 and 1.2 above.

*See also*

“The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:22-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
 FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 1, Fig. 4, Fig. 5.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 1.2 and 1.3 above.

*See also*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area 10B or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

Sukegawa

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

Sukegawa, 4:1-21.

“The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area.”

Sukegawa, 5:10-12.

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*See also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig 1, Fig. 4, Fig. 5.

Sukegawa

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**15.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

Sukegawa

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

Claims 1 (Preamble) and 1.1 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                     |                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>17. The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 15 above.*

*See also*

The first embodiment relates to a system wherein the permanent storage area IOA of flash memory unit 1 is used as a cache memory area. In this embodiment, it is supposed that the user desires to start a frequently used application program (AP) at high speed at all times.

The user starts a data storage utility program of the cache system controller 3 via a user interface provided in the host system 4 (step S1). The data storage utility program reads specified data from the HDD 2 and stores the read data in a specified storage area in the flash memory unit 1. In this case, it is assumed that the user sets the permanent storage area 10A in the flash memory unit 1 as the data storage area, at the time of instructing the start of the data storage utility program (step S2).

Then, the user instructs the host system 4 to start the AP (step S3). The host system 4, upon receiving the AP start instruction, issues a read command to the controller 3 in order to read control information necessary for the start of the AP from the HDD 2.

The controller 3 controls the HDD 2, reads out the control information necessary for the start of the AP and transfers the read-out control information to the host system 4 (step S4). At this time, according to the started-up data storage utility program, the controller 3 stores the AP control information read out from the HDD 2 in the permanent storage area 10A of flash memory unit 1 (step S5). When the AP has been prepared to start, the data storage utility program is stopped by the instruction from the user ("YES" in step S6; step S7). Through these

|                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>19.1</b> The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa

**Claim 19**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

Sukegawa, 4:1-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 1, Fig. 4, Fig. 5

Sukegawa

Sukegawa

“The method of claim 1, wherein the portion of the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 24**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

27. The method of claim 1, wherein the memory comprises: a physical memory.

Sukegawa, as evidenced by the example citations below, discloses  
 “the method of claim 1, wherein the memory comprises: a physical memory.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:1-30.

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are

Sukegawa

“The method of claim 1, wherein the memory comprises: a physical memory”

**Claim 27**

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 1, Fig. 4, Fig. 5

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claim 16 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**29.** The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claims 15 and 17 above.*

Sukegawa

“The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 29**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                          |                                                                                                                                                                                                                                 |

| <p><b>31.</b> The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:1-30.

Sukegawa

**Claim 31**

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3;

“(First Modification of the First Embodiment)  
FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of operations from the turn-on of power to the completion of the starting operation.”

Sukegawa, 6:18-26.

“According to the data storage utility program, the control information, which is pre-stored in the HDD 2 and necessary for starting the OS, is read out and stored in the permanent storage area 10A (steps S16 and S17). The controller 3 transfers to the host system 4 the control information necessary for starting the OS read out from the HDD. Based on the control information, the host system 4 starts the OS.”

Sukegawa, 6:35-42.

“According to this system, when the OS is automatically started by the control information read out from the HDD 2 at the time of turning-on of power, the control information is stored in the permanent storage area 10 used as the cache memory area for the HDD 2. Accordingly, when the OS is started at the time of the next turning-on of power, the control information necessary for starting the OS is read out not from the HDD 2 but from the permanent storage area 10 or cache memory area, and the read-out control information is transferred to the host system 4. Thus, the control information can be accessed from the permanent storage area 10A in the flash memory unit 1 having a higher access speed than the HDD 2. As a result, the OS can be started at higher speed.”

Sukegawa, 6:45-58.

*see also* Sukegawa 5:1-7:2, 7:28-55, 9:1-10, 10:33-52, 11:7-19, Fig. 1, Fig. 4, Fig. 5.

Sukegawa

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

| <p><b>32.</b> The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.</p> | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
|------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See also*

“(Data Storage System)

It is assumed that the data storage system of the present invention is applied to a computer system such as a personal computer. Thus, as shown in FIG. 1, this data storage system has a flash memory unit 1 constituted by a flash EEPROM, a disk drive or an HDD (Hard Disk Drive) 2, and a controller. The controller includes a cache system controller 3 (hereinafter called "controller") for performing a cache function of using the flash memory unit 1 as a cache memory, and a device driver (software) 5 with no cache function.

The device driver 5 has a function of controlling the flash memory unit 1 under the management of the OS (Operation System) of a host system 4. In this invention, in particular, the device driver 5 performs the access control ( to be described later) of a highspeed access area IOB or a specific storage area in the flash memory unit 1. The controller 3 performs data input/output control (including cache operation control) for the flash memory unit 1 and HDD 2 via respective device drivers (i.e. a flash memory driver and a hard disk driver).”

The host system 4 refers to a computer body comprising a CPU of the computer system, a main memory storing the OS and an application program (AP), and other various structural elements. The controller 3 is provided between the host system 4 and the storage units 1 and 2. The controller 3 controls the flash memory unit 1 and HDD 2, as an integrated storage system, in accordance with access requests (read/write commands) issued from the host system 4 to the HDD.”

Sukegawa, 4:1-30.

Sukegawa

**Claim 32**

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

## Appendix C20

### Invalidity of U.S. Patent 8,880,862 based on Sukegawa

“According to this system, for example, control information necessary for starting an application program (AP) and an OS, which are frequently used, is stored in the first storage area. Thus, the storage area of the flash memory can be effectively used in accordance with the function and the condition of use of data.”

Sukegawa, 2:65-3:3

The first embodiment relates to a system wherein the permanent storage area 10A of flash memory unit 1 is used as a cache memory area. In this embodiment, it is supposed that the user desires to start a frequently used application program (AP) at high speed at all times.

The user starts a data storage utility program of the cache system controller 3 via a user interface provided in the host system 4 (step S1). The data storage utility program reads specified data from the HDD 2 and stores the read data in a specified storage area in the flash memory unit 1. In this case, it is assumed that the user sets the permanent storage area 10A in the flash memory unit 1 as the data storage area, at the time of instructing the start of the data storage utility program (step S2).

Then, the user instructs the host system 4 to start the AP (step S3). The host system 4, upon receiving the AP start instruction, issues a read command to the controller 3 in order to read control information necessary for the start of the AP from the HDD 2.

The controller 3 controls the HDD 2, reads out the control information necessary for the start of the AP and transfers the read-out control information to the host system 4 (step S4). At this time, according to the started-up data storage utility program, the controller 3 stores the AP control information read out from the HDD 2 in the permanent storage area 10A of flash memory unit 1 (step S5). When the AP has been prepared to start, the data storage utility program is stopped by the instruction from the user ("YES" in step S6; step S7). Through these operations, the control information necessary for starting the AP is stored in the permanent storage area 10A in the flash memory unit 1.

Sukegawa 5:10-40

“(First Modification of the First Embodiment)

FIG. 4 is a flow chart illustrating a first modification of the first embodiment. This modification relates to a system having a mode ( data storage mode) for storing the control information necessary for starting the OS in the permanent storage area 10A of flash memory unit 1, for example, when the OS of the host system 4 is started in a series of

Sukegawa

Sukegawa

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**44.** The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claim 32 above.

Sukegawa

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 44**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**45.** The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 32 and 33 above.

Sukegawa

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

47. The system of claim 6, wherein the boot data in the compressed form represents a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                             |

Sukegawa

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                          |                                                                                                                                                 |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>51.</b> The system of claim 6, wherein the first memory comprises: a physical memory. | Sukegawa, as evidenced by the example citations below, discloses “the system of claim 6, wherein the first memory comprises: a physical memory” |
|------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the first memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 27 and 39 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                              |                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Sukegawa, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Sukegawa, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 15, 17 and 24 above.

Sukegawa

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**59.** The method of claim 8, wherein the operating system in the compressed form represents a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

Sukegawa

“The method of claim 8, wherein the operating system in the compressed form represents a plurality of files.”

**Claim 59**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                   |

Sukegawa

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Claim 60**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 27 and 38 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 15, 17 and 24 above.

Sukegawa

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 65**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                      |

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                     |                                                                                                                                               |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>75.</b> The method of claim 11, wherein the memory comprises: a physical memory. | Sukegawa, as evidenced by the example citations below, discloses<br>“the method of claim 11, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See Claim 27 above.*

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**76.** The method of claim 11, wherein the operating system comprises: a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claims 15, 17 and 24 above.*

Sukegawa

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 77**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**79.** The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.

Sukegawa, as evidenced by the example citations below, discloses  
“the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 31 above.*

Sukegawa

“The method of claim 11, wherein the accessing comprises: accessing the boot data in the compressed form from the memory via direct memory access.”

**Claim 79**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                     |

Sukegawa

“The method of claim 11, wherein a form of dictionary encoding was utilized to encode the boot data in the compressed form.”

**Claim 80**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                             |                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>81.</b> The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form. | Sukegawa, as evidenced by the example citations below, discloses “the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form” |
|-----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 32, 33 and 49 above.

Sukegawa

“The method of claim 11, wherein Lempel-Ziv encoding was utilized to encode the boot data in the compressed form.”

**Claim 81**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**83.** The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

Sukegawa

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                               |

|                                                                                     |                                                                                                                                               |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>87.</b> The method of claim 13, wherein the memory comprises: a physical memory. | Sukegawa, as evidenced by the example citations below, discloses<br>“the method of claim 13, wherein the memory comprises: a physical memory” |
|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See Claim 27 above.*

Sukegawa

“The method of claim 13, wherein the memory comprises: a physical memory.”

**Claim 87**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**88.** The method of claim 13, wherein the operating system comprises: a plurality of files.

Sukegawa, as evidenced by the example citations below, discloses  
“the method of claim 13, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 16 and 23 above.

Sukegawa

“The method of claim 13, wherein the operating system comprises: a plurality of files.”

**Claim 88**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**89.** The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claims 15, 17 and 24 above.

Sukegawa

“The method of claim 13, wherein the boot data in the compressed form comprises: a program code associated with the operating system and application program.”

**Claim 89**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                   |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>91.</b> The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See Claim 31 above.</i></p> |                                                                                                                                                                                                                   |

Sukegawa

“The method of claim 13, wherein the accessing comprises: accessing the loaded boot data in the compressed form via direct memory access.”

**Claim 91**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**92.** The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 32, 33 and 49 above.

Sukegawa

“The method of claim 13, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 92**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**93.** The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Sukegawa discloses this limitation:

*See* Claim 32, 33, and 49 above.

Sukegawa

“The method of claim 13, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 93**

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>97.1</b> The method of claim 5, further comprising: accessing additional compressed boot data that is not associated with the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Sukegawa, as evidenced by the example citations below, discloses “the method of claim 5, further comprising: accessing additional compressed boot data that is not associated with the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, further comprising: accessing additional compressed boot data that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. | <p><b>108.</b> The method of claim 2, further comprising: compressing at least a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Sukegawa, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Sukegawa discloses this limitation:</p> <p><i>See</i> Claims 1.1, 5, 9.1 and 8 above.</p> |                                                                                                                                                                                 |

Sukegawa

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C20**  
**Invalidity of U.S. Patent 8,880,862 based on Sukegawa**

**109.** The method of claim 108, further comprising: storing the compressed additional boot data.

Sukegawa, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Sukegawa discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

Sukegawa

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C21**

### **Invalidity of U.S. Patent 8,880,862 based on Surine**

U.S. Patent No. 6,212,632 to Surine (“Surine”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>1 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Surine, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p style="padding-left: 40px;">“At power-up, boot code stored in the non-volatile memory is executed and begins instantiating the initial operating environment of the embedded computer system. A function pointer table is instantiated in the volatile memory, wherein the function pointer table includes a plurality of entries for a corresponding plurality of instantiated functions, wherein at least one entry is for operating system code stored in the non-volatile memory.”</p> <p>Surine, Abstract.</p> <p style="padding-left: 40px;">“At boot time, or power-up, boot code 202 executes, decompresses compressed code 201 into camera system code 203 and loads camera system code 203 into RAM 102.”</p> <p>Surine, 2:4-7, Fig. 2.</p> |                                                                                                                                                                                          |

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                     |                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Surine, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

“Typically, as shown in FIG. 2, the camera system code 203 (e.g., operating system software and its associated data structures, resources, etc.) is stored as compressed code 201 in non-volatile ROM 104.”

Surine, 2:1-4, Fig. 2.

“At boot time, or power-up, boot code 202 executes, decompresses compressed code 201 into camera system code 203 and loads camera system code 203 into RAM 102.”

Surine, 2:4-7, Fig. 2.

“Consequently, these digital cameras and other performance-oriented types of embedded system consumer electronic devices transfer a compressed image of their system code from a non-volatile ROM to a faster RAM at power up. The system code then executes from RAM.”

Surine, 2:21-25.

“Referring now to FIG. 4, a memory diagram depicting the contents of ROM 310 and RAM 315 is shown. As shown in FIG. 4, ROM 310 stores software including boot code 401, compressed high-use functions 402, and operating system code 403.”

Surine, 5:15-19.

“Patch manager 405 subsequently executes. Patch manager 405 includes decompression software which decompresses compressed high-use functions 402 and, as described in greater detail in the discussion of FIG.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

5 below, loads the resulting decompressed high-use functions 416 into RAM 315.”

Surine, 5:35-40.

“Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for high-use functions 416.”

Surine: 6:32-34.

Surine

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 4 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                           |

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Surine, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p style="padding-left: 40px;">“At boot time, or power-up, boot code 202 executes, decompresses compressed code 201 into camera system code 203 and loads camera system code 203 into RAM 102.”</p> <p>Surine, 2:4-7, Fig. 2.</p> <p style="padding-left: 40px;">“Consequently, these digital cameras and other performance-oriented types of embedded system consumer electronic devices transfer a compressed image of their system code from a non-volatile ROM to a faster RAM at power up. The system code then executes from RAM.”</p> <p>Surine, 2:21-25.</p> <p style="padding-left: 40px;">“In this embodiment, in addition to instantiating certain high-use functions, a memory configuration manager decompresses new software functions out of ROM, instantiates them in RAM, and updates the function pointer table to link them dynamically, as the capability of the new software functions are needed.”</p> <p>Surine, 3:27-32.</p> <p style="padding-left: 40px;">“Patch manager 405 subsequently executes. Patch manager 405 includes decompression software which decompresses compressed high-use functions 402 and, as described in greater detail in the discussion of FIG. 5 below, loads the resulting decompressed high-use functions 416 into RAM 315.”</p> <p>Surine, 5:35-40.</p> <p style="padding-left: 40px;">“Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for</p> |                                                                                                                                                           |

Surine  
“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

high-use functions 416.”

Surine: 6:32-34.

Surine

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Surine, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p style="padding-left: 40px;">“At least one high-use function is decompressed out of the non-volatile memory and instantiated in volatile memory. The function pointer table is updated using a patch manager to incorporate an entry for the high-use function(s). The operating system code is executed from the non-volatile memory while the high-use function is executed from the volatile memory.”</p> <p>Surine, Abstract.</p> <p style="padding-left: 40px;">“At boot time, or power-up, boot code 202 executes, decompresses compressed code 201 into camera system code 203 and loads camera system code 203 into RAM 102.”</p> <p>Surine, 2:4-7, Fig. 2.</p> <p style="padding-left: 40px;">“Additionally, the system of the present invention maintains the speed and responsiveness of the device while reducing the amount of RAM used in the device. In comparison to prior art embedded system devices, a device in accordance with the present invention either uses less RAM and is thus less expensive, or runs faster using the same amount of RAM.”</p> <p>Surine, 2:49-55.</p> <p style="padding-left: 40px;">“In this embodiment, in addition to instantiating certain high-use functions, a memory configuration manager decompresses new software</p> |                                                                                                                                                                                                                                                                                                           |

Surine

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

## Appendix C21

### Invalidity of U.S. Patent 8,880,862 based on Surine

functions out of ROM, instantiates them in RAM, and updates the function pointer table to link them dynamically, as the capability of the new software functions are needed.”

Surine, 3:27-32.

“Additionally, the system of the present invention maintains the speed and responsiveness of the device while reducing the amount of RAM used in the device. In comparison to prior art embedded system devices, a device in accordance with the present invention either uses less RAM and is thus less expensive, or runs faster using the same amount of RAM.”

Surine, 3:39-45.

“In accordance with the present invention, the size of RAM 315 is minimized by running the majority of the software of embedded system 300 (e.g., boot code 401 and operating system code 403) from ROM 310. However, the overall speed of system 300 is largely maintained by running the most frequently-used software (e.g., high-use functions 416) from RAM 315”

Surine, 5:24-30.

“Patch manager 405 subsequently executes. Patch manager 405 includes decompression software which decompresses compressed high-use functions 402 and, as described in greater detail in the discussion of FIG. 5 below, loads the resulting decompressed high-use functions 416 into RAM 315.”

Surine, 5:35-40.

“Consequently, since RAM 315 is accessed at least three times faster than ROM 310, system 300 runs much faster than a prior art embedded system running the entirety of its operating system code from ROM. The majority of RAM 315 is occupied by capture buffer 414, display buffer 415, and working memory 420. By using a relatively small portion of RAM 315 to run the uncompressed high-use functions 416, the speed of computer system 300 is greatly increased.”

Surine, 5:62-6:3.

“Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for high-use functions 416.”

Surine: 6:32-34. *See also* 8:14-17, 8:36-43.

Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for high-use functions 416.”</p> <p>Surine, 6:29-35.</p> <p style="padding-left: 40px;">“Memory configuration manager then dynamically updates function pointer table 510 with entries reflecting review &amp; play code 751.”</p> <p>Surine, 8:23-25.</p> <p style="padding-left: 40px;">“If software for the new mode overwrites software for the previous mode, Memory configuration manager updates the function pointer table to de-link those functions which have been replaced (e.g., written over).”</p> <p>Surine, 9: 59-63.</p> <p style="padding-left: 40px;">“In step 1052, any processing for review &amp; play mode is completed, and in step 1053, memory configuration manager 755 updates function pointer table 510 is updated to de-link the review &amp; play code 751.”</p> <p>Surine, 10:44-48.</p> |                                                                                                                                                                                                                             |

Surine

Claim 3

“The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”

Page 13 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

4. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.

Surine, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claims 1.4.1, and 2 above.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                 |

execution to the memory address of a selected routine. The function pointers of function pointer table allow instantiated functions, whether executing from ROM 310 or RAM 315, to call one another. Initially, the function pointers are initialized to addresses in ROM 310, but after copying to RAM 315, the high-use function pointers are updated to addresses in RAM 315.”

Surine, 6:24-29. *See also* 8:54-56.

|                                                                                                                     |                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory; | Surine, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory” |
|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claim 1.1 above.*

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                          |                                                                                                                                                      |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.5 utilizing the decompressed boot data to at least partially boot the computer system; | Surine, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system” |
|------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

*See also*

“At least one high-use function is decompressed out of the non-volatile memory and instantiated in volatile memory. The function pointer table is updated using a patch manager to incorporate an entry for the high-use function(s). The operating system code is executed from the non-volatile memory while the high-use function is executed from the volatile memory.”

Surine, Abstract.

“In accordance with the present invention, a set of high-use functions are decompressed out of ROM and instantiated in RAM using a patch manager.”

Surine, 3:7-9. *See also* 8:14-17, 8:36-43.

| <p>6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Surine, as evidenced by the example citations below, discloses<br/> “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“At power-up, boot code stored in the non-volatile memory is executed and begins instantiating the initial operating environment of the embedded computer system. A function pointer table is instantiated in the volatile memory, wherein the function pointer table includes a plurality of entries for a corresponding plurality of instantiated functions, wherein at least one entry is for operating system code stored in the non-volatile memory.”</p> <p>Surine, Abstract.</p> <p style="padding-left: 40px;">“At power-up, boot code stored in the ROM is executed and begins instantiating the initial operating environment of the embedded system. A function pointer table is instantiated in the RAM. The function pointer table has entries, or function pointers, for each instantiated function such that they can each call each other and pass execution. The function pointer table has entries for functions which are instantiated in ROM and entries for functions which are instantiated in RAM.”</p> <p>Surine, 2:66-3:7.</p> <p style="padding-left: 40px;">“Referring now to FIG. 4, a memory diagram depicting the contents of ROM 310 and RAM 315 is shown. As shown in FIG. 4, ROM 310 stores software including boot code 401, compressed high-use functions 402, and operating system code 403.”</p> |                                                                                                                                                                                                                       |

Surine

Claim 6.2

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

Surine, 5:15-19.

“Function pointer table 510 includes a plurality of entries, or function pointers, which, when called by processing unit 305, redirect program execution to the memory address of a selected routine. The function pointers of function pointer table allow instantiated functions, whether executing from ROM 310 or RAM 315, to call one another. Initially, the function pointers are initialized to addresses in ROM 310, but after copying to RAM 315, the high-use function pointers are updated to addresses in RAM 315.”

Surine, 6:24-29. *See also* 8:54-56.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                       |

| 6.3 wherein the processor is configured:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Surine, as evidenced by the example citations below, discloses “wherein the processor is configured.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p style="padding-left: 40px;">“At power-up, boot code stored in the non-volatile memory is executed and begins instantiating the initial operating environment of the embedded computer system. A function pointer table is instantiated in the volatile memory, wherein the function pointer table includes a plurality of entries for a corresponding plurality of instantiated functions, wherein at least one entry is for operating system code stored in the non-volatile memory.”</p> <p>Surine, Abstract.</p> <p style="padding-left: 40px;">“At power-up, boot code stored in the ROM is executed and begins instantiating the initial operating environment of the embedded system. A function pointer table is instantiated in the RAM. The function pointer table has entries, or function pointers, for each instantiated function such that they can each call each other and pass execution. The function pointer table has entries for functions which are instantiated in ROM and entries for functions which are instantiated in RAM.”</p> <p>Surine, 2:66-3:7.</p> <p style="padding-left: 40px;">“Referring now to FIG. 4, a memory diagram depicting the contents of ROM 310 and RAM 315 is shown. As shown in FIG. 4, ROM 310 stores software including boot code 401, compressed high-use functions 402, and operating system code 403.”</p> <p>Surine, 5:15-19.</p> <p style="padding-left: 40px;">“Function pointer table 510 includes a plurality of entries, or function pointers, which, when called by processing unit 305, redirect program execution to the memory address of a selected routine. The function pointers of function pointer table allow instantiated functions, whether executing from ROM 310 or RAM 315, to call one another. Initially, the function pointers are initialized to addresses in ROM 310, but after</p> |                                                                                                       |

Surine  
“wherein the processor is configured”

Claim 6.3

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

copying to RAM 315, the high-use function pointers are updated to addresses in RAM 315.”

Surine, 6:24-29. *See also* 8:54-56.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                              |

Surine

“decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system”

Claim 8.4

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and

Surine, as evidenced by the example citations below, discloses  
“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

“At least one high-use function is decompressed out of the non-volatile memory and instantiated in volatile memory. The function pointer table is updated using a patch manager to incorporate an entry for the high-use function(s). The operating system code is executed from the non-volatile memory while the high-use function is executed from the volatile memory.”

Surine, Abstract.

“In accordance with the present invention, a set of high-use functions are decompressed out of ROM and instantiated in RAM using a patch manager.”

Surine, 3:7-9. *See also* 8:14-17, 8:36-43.

Surine

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| 8.6 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Surine, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                              |

Surine  
“updating the boot data list”

Claim 8.6

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                               |

Surine

Claim 9.3

“wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**10.** The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.

Surine, as evidenced by the example citations below, discloses “the method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 9.1 above.*

Surine

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

Claim 10

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                      |

Surine

**Claim 11 (Preamble)**

“A method for providing accelerated loading of an operating system in a computer system, comprising”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                   |                                                                                                                                                                                                                              |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system; | Surine, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system” |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claim 1.1 above.*

“At power-up, boot code stored in the non-volatile memory is executed and begins instantiating the initial operating environment of the embedded computer system. A function pointer table is instantiated in the volatile memory, wherein the function pointer table includes a plurality of entries for a corresponding plurality of instantiated functions, wherein at least one entry is for operating system code stored in the non-volatile memory.”

Surine, Abstract.

“At power-up, boot code stored in the ROM is executed and begins instantiating the initial operating environment of the embedded system. A function pointer table is instantiated in the RAM. The function pointer table has entries, or function pointers, for each instantiated function such that they can each call each other and pass execution. The function pointer table has entries for functions which are instantiated in ROM and entries for functions which are instantiated in RAM.”

Surine, 2:66-3:7.

“Referring now to FIG. 4, a memory diagram depicting the contents of ROM 310 and RAM 315 is shown. As shown in FIG. 4, ROM 310 stores software including boot code 401, compressed high-use functions 402, and operating system code 403.”

Surine, 5:15-19.

Surine

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

“Function pointer table 510 includes a plurality of entries, or function pointers, which, when called by processing unit 305, redirect program execution to the memory address of a selected routine. The function pointers of function pointer table allow instantiated functions, whether executing from ROM 310 or RAM 315, to call one another. Initially, the function pointers are initialized to addresses in ROM 310, but after copying to RAM 315, the high-use function pointers are updated to addresses in RAM 315.”

Surine, 6:24-29. *See also* 8:54-56.

Surine

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                    |

See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See Claim 1.3 above.</i></p> |                                                                                                                                                                                                                                                                                  |

Surine

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

Claim 11.3

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                           |                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Surine, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

“At least one high-use function is decompressed out of the non-volatile memory and instantiated in volatile memory. The function pointer table is updated using a patch manager to incorporate an entry for the high-use function(s). The operating system code is executed from the non-volatile memory while the high-use function is executed from the volatile memory.”

Surine, Abstract.

“In accordance with the present invention, a set of high-use functions are decompressed out of ROM and instantiated in RAM using a patch manager.”

Surine, 3:7-9. *See also* 8:14-17, 8:36-43.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**13.1** loading boot data in a compressed form that is associated with a boot data list from a boot device;

Surine, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claim 1.1 above.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**13.3** decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Surine, as evidenced by the example citations below, discloses “decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 1.3 above.*

Surine

“decompressing the accessed boot data in the compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Claim 13.3**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                             |                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Surine, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claims 1.1 and 1.2 above.

“At power-up, boot code stored in the non-volatile memory is executed and begins instantiating the initial operating environment of the embedded computer system. A function pointer table is instantiated in the volatile memory, wherein the function pointer table includes a plurality of entries for a corresponding plurality of instantiated functions, wherein at least one entry is for operating system code stored in the non-volatile memory.”

Surine, Abstract.

“At power-up, boot code stored in the ROM is executed and begins instantiating the initial operating environment of the embedded system. A function pointer table is instantiated in the RAM. The function pointer table has entries, or function pointers, for each instantiated function such that they can each call each other and pass execution. The function pointer table has entries for functions which are instantiated in ROM and entries for functions which are instantiated in RAM.”

Surine, 2:66-3:7.

“Referring now to FIG. 4, a memory diagram depicting the contents of ROM 310 and RAM 315 is shown. As shown in FIG. 4, ROM 310 stores software including boot code 401, compressed high-use functions 402, and operating system code 403.”

Surine, 5:15-19.

“Function pointer table 510 includes a plurality of entries, or function

Surine

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

pointers, which, when called by processing unit 305, redirect program execution to the memory address of a selected routine. The function pointers of function pointer table allow instantiated functions, whether executing from ROM 310 or RAM 315, to call one another. Initially, the function pointers are initialized to addresses in ROM 310, but after copying to RAM 315, the high-use function pointers are updated to addresses in RAM 315.”

Surine, 6:24-29. *See also* 8:54-56.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Surine, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 1.2 and 1.3 above.

“At least one high-use function is decompressed out of the non-volatile memory and instantiated in volatile memory. The function pointer table is updated using a patch manager to incorporate an entry for the high-use function(s). The operating system code is executed from the non-volatile memory while the high-use function is executed from the volatile memory.”

Surine, Abstract.

“At boot time, or power-up, boot code 202 executes, decompresses compressed code 201 into camera system code 203 and loads camera system code 203 into RAM 102.”

Surine, 2:4-7, Fig. 2.

“Consequently, these digital cameras and other performance-oriented types of embedded system consumer electronic devices transfer a compressed image of their system code from a non-volatile ROM to a faster RAM at power up. The system code then executes from RAM.”

Surine

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C21

### Invalidity of U.S. Patent 8,880,862 based on Surine

Surine, 2:21-25.

“Additionally, the system of the present invention maintains the speed and responsiveness of the device while reducing the amount of RAM used in the device. In comparison to prior art embedded system devices, a device in accordance with the present invention either uses less RAM and is thus less expensive, or runs faster using the same amount of RAM.”

Surine, 2:49-55.

“In accordance with the present invention, a set of high-use functions are decompressed out of ROM and instantiated in RAM using a patch manager.”

Surine, 3:7-9.

“In this embodiment, in addition to instantiating certain high-use functions, a memory configuration manager decompresses new software functions out of ROM, instantiates them in RAM, and updates the function pointer table to link them dynamically, as the capability of the new software functions are needed.”

Surine, 3:27-32.

“Additionally, the system of the present invention maintains the speed and responsiveness of the device while reducing the amount of RAM used in the device. In comparison to prior art embedded system devices, a device in accordance with the present invention either uses less RAM and is thus less expensive, or runs faster using the same amount of RAM.”

Surine, 3:39-45.

“In accordance with the present invention, the size of RAM 315 is minimized by running the majority of the software of embedded system 300 (e.g., boot code 401 and operating system code 403) from ROM 310. However, the overall speed of system 300 is largely maintained by running the most frequently-used software (e.g., high-use functions 416) from RAM 315”

Surine, 5:24-30.

“Patch manager 405 subsequently executes. Patch manager 405 includes decompression software which decompresses compressed high-use functions 402 and, as described in greater detail in the discussion of FIG.

Surine

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 64 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

5 below, loads the resulting decompressed high-use functions 416 into RAM 315.”

Surine, 5:35-40.

“Consequently, since RAM 315 is accessed at least three times faster than ROM 310, system 300 runs much faster than a prior art embedded system running the entirety of its operating system code from ROM. The majority of RAM 315 is occupied by capture buffer 414, display buffer 415, and working memory 420. By using a relatively small portion of RAM 315 to run the uncompressed high-use functions 416, the speed of computer system 300 is greatly increased.”

Surine, 5:62-6:3.

“Patch manager 405 then loads the decompressed high-use functions 416 into RAM 315 and updates function pointer table 510 with entries for high-use functions 416.”

Surine, 6:32-34. *See also* Surine, 7:5-43, 8:14-17, 8:36-43.

Surine

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

| <b>14.4</b> updating the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Surine, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                              |

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**15.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.

Surine, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

Surine

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**16.** The method of claim 14, wherein the operating system comprises: a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

“Typically, as shown in FIG. 2, the camera system code 203 (e.g., operating system software and its associated data structures, resources, etc.) is stored as compressed code 201 in non-volatile ROM 104.”

Surine, 2:1-4.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**17.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.

Surine, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 15 above.*

Surine

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

Surine

“The method of claim 1, wherein the portion of the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 24**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| <b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Surine, as evidenced by the example citations below, discloses “the method of claim 1, wherein the memory comprises: a physical memory.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> |                                                                                                                                          |

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claim 16 above.*

Surine

“The method of claim 1, wherein the operating system comprises: a plurality of files”

Surine

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 32**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Surine, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> |                                                                                                                                                                                                       |

Surine

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

Page 79 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**35.** The method of claim 5, wherein the compressed boot data represents a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

Surine

“The method of claim 5, wherein the compressed boot data represents a plurality of files.”

**Claim 35**

Page 80 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**36.** The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.

Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claims 15 and 17 above.*

Surine

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p> | <p>Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claims 1.1 and 1.2 above.*

Surine

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

Surine

“The method of claim 36, wherein the operating system comprises: a plurality of files.”

**Claim 40**

Page 83 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**43.** The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.

Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claim 31 above.*

Surine

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                               |

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                     |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>45.</b> The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Surine, as evidenced by the example citations below, discloses “the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See Claims 32 and 33 above.</i></p> |                                                                                                                                                                     |

Surine

“The method of claim 5, wherein Lempel-Ziv encoding was utilized to encode the compressed boot data.”

**Claim 45**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                 |                                                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>47.</b> The system of claim 6, wherein the boot data in the compressed form represents a plurality of files. | Surine, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form represents a plurality of files” |
|-----------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**48.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.

Surine, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claims 15, 17 and 24 above.*

Surine

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system.”

**Claim 48**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>49.</b> The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Surine, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Surine discloses this limitation:</p> <p><i>See Claim 10 above.</i></p> |                                                                                                                                                                                                                    |

Surine

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Claim 49**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**50.** The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.

Surine, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

“Patch manager 405 includes decompression software which decompresses compressed high-use functions 402 and, as described in greater detail in the discussion of FIG. 5 below, loads the resulting decompressed high-use functions 416 into RAM 315. This is shown by arrow 410.”

Surine, 5:36-41.

Surine

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                          |                                                                                                                                               |
|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>51.</b> The system of claim 6, wherein the first memory comprises: a physical memory. | Surine, as evidenced by the example citations below, discloses “the system of claim 6, wherein the first memory comprises: a physical memory” |
|------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the first memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claims 27 and 39 above.*

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                              |                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Surine, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Surine, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 15, 17 and 24 above.

Surine

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                             |

Surine

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Claim 60**

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Surine, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See Claims 27 and 38 above.*

Surine

“The method of claim 8, wherein the second memory comprises: a physical memory.”

**Claim 63**

Page 96 of 121

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Surine, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Surine discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C21**  
**Invalidity of U.S. Patent 8,880,862 based on Surine**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Surine, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Surine discloses this limitation:

*See Claims 15, 17 and 24 above.*
