**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

The publication Michael Burrows, Charles Jerian, Butler Lampson, and Timothy Mann, On-line data compression in a log-structured file System (“Burrows”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Burrows, as evidenced by the example citations below, discloses<br/> “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“The module that reads a disk block given its logical address needs a way to find the physical address of the compressed bytes. We keep a logical block map for each segment, which is simply an array indexed by compression block number, whose entries are the physical byte addresses of the blocks relative to the start of the segment. The block map is constructed in memory as the segment is being compressed, and written to the end of the segment when the segment is full. The maps are needed for all file reads, so they are cached in memory whenever possible.”</p> <p>Burrows, 5.</p> <p style="padding-left: 40px;">“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading</p> |                                                                                                                                                                                                                                        |

Burrows

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 3 of 117

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Burrows, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p style="padding-left: 40px;">“The module that reads a disk block given its logical address needs a way to find the physical address of the compressed bytes. We keep a logical block map for each segment, which is simply an array indexed by compression block number, whose entries are the physical byte addresses of the blocks relative to the start of the segment. The block map is constructed in memory as the segment is being compressed, and written to the end of the segment when the segment is full. The maps are needed for all file reads, so they are cached in memory whenever possible.”</p> <p>Burrows, 5.</p> <p style="padding-left: 40px;">“The procedure for finding the compressed data associated with a logical address is as follows:</p> <ol style="list-style-type: none"><li>1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.</li><li>2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.</li><li>3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.</li><li>4. Read the compressed data from the disk and decompress it.</li><li>5. Extract the sector number from the logical address. Use it to identify the desired sector within the decompressed block.”</li></ol> |                                                                                                                                                            |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“Hardware compression devices mesh well with this design. Chips are already available that operate at speeds exceeding disk transfer rates, which indicates that hardware compression would not only remove the performance degradation we observed, but might well increase the effective disk transfer rate beyond that obtainable from a system without compression.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“Building a file system that compresses the data it stores on disk is clearly an attractive idea. First, more data would fit on the disk. Also, if a fast hardware data compressor could be put into the data path to disk, it would increase the effective disk transfer rate by the compression factor, thus speeding up the system.”</p> <p>Burrows, 1.</p> <p style="padding-left: 40px;">“The procedure for finding the compressed data associated with a logical</p> |                                                                                                                                                                                                                                                                                                            |

Burrows

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C27

### Invalidity of U.S. Patent 8,880,862 based on Burrows

address is as follows:

1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.
2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.
3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.
4. Read the compressed data from the disk and decompress it.
5. Extract the sector number from the logical address. Use it to identify the desired sector within the decompressed block.”

Burrows, 5-6.

“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

Burrows

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Burrows, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                                                                                  |

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                 |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| 5.2 loading the stored compressed boot data from the first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Burrows, as evidenced by the example citations below, discloses “loading the stored compressed boot data from the first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the stored compressed boot data from the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                                 |

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| 5.3 accessing the loaded compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Burrows, as evidenced by the example citations below, discloses “accessing the loaded compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                             |

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                   |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| 5.4 decompressing the accessed compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Burrows, as evidenced by the example citations below, discloses “decompressing the accessed compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See Claim 1.3 above.</i></p> |                                                                                                                   |

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                       |

| 5.5 utilizing the decompressed boot data to at least partially boot the computer system;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Burrows, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“The procedure for finding the compressed data associated with a logical address is as follows:</p> <ol style="list-style-type: none"><li>1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.</li><li>2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.</li><li>3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.</li><li>4. Read the compressed data from the disk and decompress it.</li><li>5. Extract the sector number from the logical address. Use it to identify the desired sector within the decompressed block.”</li></ol> |                                                                                                                                                       |

Burrows  
“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

Burrows, 5-6.

“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“The procedure for finding the compressed data associated with a logical address is as follows:</p> <ol style="list-style-type: none"> <li>1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.</li> <li>2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.</li> <li>3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.</li> <li>4. Read the compressed data from the disk and decompress it.</li> <li>5. Extract the sector number from the logical address. Use it to</li> </ol> |                                                                                                                                                                                    |

Burrows

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

identify the desired sector within the decompressed block.”

Burrows, 5-6.

“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

Burrows

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Burrows discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“The module that reads a disk block given its logical address needs a way to find the physical address of the compressed bytes. We keep a logical block map for each segment, which is simply an array indexed by compression block number, whose entries are the physical byte addresses of the blocks relative to the start of the segment. The block map is constructed in memory as the segment is being compressed, and written to the end of the segment when the segment is full. The maps are needed for all file reads, so they are cached in memory whenever possible.”</p> <p>Burrows, 5.</p> |                                                                                                                                                                                                                              |

Burrows

Claim 9.3

“wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

|                                                                                                                                                                         |                                                                                                                                                                                                                                    |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>10.</b> The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.</p> | <p>Burrows, as evidenced by the example citations below, discloses<br/>“the method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.”</p> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Burrows discloses this limitation:

*See* Claim 9.1 above.

“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”

Burrows, Abstract.

“The module that reads a disk block given its logical address needs a way to find the physical address of the compressed bytes. We keep a logical block map for each segment, which is simply an array indexed by compression block number, whose entries are the physical byte addresses of the blocks relative to the start of the segment. The block map is constructed in memory as the segment is being compressed, and written to the end of the segment when the segment is full. The maps are needed for all file reads, so they are cached in memory whenever possible.”

Burrows, 5.

Burrows

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Burrows discloses this limitation:</p> <p style="padding-left: 40px;">“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”</p> <p>Burrows, Abstract.</p> <p style="padding-left: 40px;">“The procedure for finding the compressed data associated with a logical address is as follows:</p> <ol style="list-style-type: none"> <li>1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.</li> <li>2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.</li> <li>3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.</li> <li>4. Read the compressed data from the disk and decompress it.</li> <li>5. Extract the sector number from the logical address. Use it to identify the desired sector within the decompressed block.”</li> </ol> <p>Burrows, 5-6.</p> <p style="padding-left: 40px;">“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such</p> |                                                                                                                                                                                               |

Burrows

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

## **Appendix C27**

### **Invalidity of U.S. Patent 8,880,862 based on Burrows**

as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Burrows discloses this limitation:

See Claims 1.2 and 1.3 above.

See **Add disclosure from ‘608 Patent Claim 1.4**

“We have incorporated on-line data compression into the low levels of a log-structured file system (Rosenblum’s Sprite LFS). Each block of data or meta-data is compressed as it is written to the disk and decompressed as it is read.”

Burrows, Abstract.

“Hardware compression devices mesh well with this design. Chips are already available that operate at speeds exceeding disk transfer rates, which indicates that hardware compression would not only remove the performance degradation we observed, but might well increase the effective disk transfer rate beyond that obtainable from a system without compression.”

Burrows, Abstract.

**Burrows**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Claim 14.3**

## Appendix C27

### Invalidity of U.S. Patent 8,880,862 based on Burrows

“Building a file system that compresses the data it stores on disk is clearly an attractive idea. First, more data would fit on the disk. Also, if a fast hardware data compressor could be put into the data path to disk, it would increase the effective disk transfer rate by the compression factor, thus speeding up the system.”

Burrows, 1.

“The module that reads a disk block given its logical address needs a way to find the physical address of the compressed bytes. We keep a logical block map for each segment, which is simply an array indexed by compression block number, whose entries are the physical byte addresses of the blocks relative to the start of the segment. The block map is constructed in memory as the segment is being compressed, and written to the end of the segment when the segment is full. The maps are needed for all file reads, so they are cached in memory whenever possible.”

Burrows, 5.

“The procedure for finding the compressed data associated with a logical address is as follows:

1. Extract the segment number from the logical address. Use it to find the logical block map for the segment.
2. Extract the compression block number from the address. Use it to index the logical block map. This yields the physical byte offset of the compressed data within the segment.
3. Examine the next entry in the map, to find the start of the next block. This determines how much data should be read from the disk.
4. Read the compressed data from the disk and decompress it.
5. Extract the sector number from the logical address. Use it to identify the desired sector within the decompressed block.”

Burrows, 5-6.

“Unfortunately, this procedure reads and decompresses a full compression block even if the caller wanted only some smaller unit, such as a file system block or a physical sector. We alleviate this problem by caching the entire decompressed block in memory, rather than just

**Burrows**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 60 of 117

**Appendix C27**  
**Invalidity of U.S. Patent 8,880,862 based on Burrows**

caching the requested sectors. The data could be placed in the file system buffer cache, but for simplicity in our prototype, we cached the last decompressed block within the read routine. Sprite LFS reads files sequentially in 4 KByte units, so this simple caching strategy typically achieves three hits for each 16 KByte compression block when reading large files.

When the file system is reading non-sequentially, the additional time to read a full compression block cannot be hidden by caching. Fortunately, this time is small compared to the rotational latency. The time needed to decompress the full block in software is several milliseconds; it would be much smaller if decompression were implemented in hardware.”

Burrows, 6.

Burrows

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Claim 109**

## **Appendix C28**

### **Invalidity of U.S. Patent 8,880,862 based on Cheng**

The publication Cheng et al., Fast and highly reliable IBMLZ1 compression chip and algorithm for storage, Hot Chips V11, August 1995 (“Cheng”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                         |

## Appendix C28

### Invalidity of U.S. Patent 8,880,862 based on Cheng

Cheng, 155.

“If the data is compressed as it enters the subsystem, see Fig. 1, the cache resource has effectively been tripled. Customers can benefit either from improved performance due to better hit ratios, or reduce their cost by configuring smaller amounts of cache. An added benefit of data compression upon entry to the subsystem is the reduced utilization of internal buses and DASD paths as data flows through the subsystem. Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155. *See also* Fig. 1.

“The IBMLZI algorithm and technology was designed for high compression/decompression throughput with efficient hardware implementation, high reliability, low system overhead, and robust compression. Data integrity and reliability are ensured by coupled compression-decompression checking, scrubbing operation, and extensive build-in checkings. Extremely low CPB= $1^6$  compression and decompression have been achieved. The extremely high compressing/decompressing throughput of 30 MB/sec-50 MB/sec allows transparent mode of operation and hence achieved minimal system overhead. The IBMLZI algorithm compresses well over the VM, MVS, RS6000, and PC test cases.”

Cheng, 163.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                   |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| 1.2 accessing the loaded portion of the boot data in the compressed form from memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Cheng, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;” |
| To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions. |                                                                                                                                                   |

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Cheng, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Cheng discloses this limitation:</p> <p style="padding-left: 40px;">“Data compression allows more efficient use of storage media and communication bandwidth. Standard compression offerings for tape storage have been well-established since the late 1980s.”</p> <p>Cheng, 155.</p> <p style="padding-left: 40px;">“The desire to extend these cost/performance benefits to higher data-rate media and broader media forms, such as DASD storage subsystems, motivated the design and development of the IBMLZ1 compression algorithm and technology.”</p> <p>Cheng, 155.</p> <p style="padding-left: 40px;">“The addition of compression capability to the DASD subsystem facilitates more efficient use of subsystem resources: cache, data path bandwidth, and disk capacity in a transparent manner to the system storing the data.”</p> <p>Cheng, 155.</p> <p style="padding-left: 40px;">“If the data is compressed as it enters the subsystem, see Fig. 1, the cache resource has effectively been tripled. Customers can benefit either from improved performance due to better hit ratios, or reduce their cost by configuring smaller amounts of cache. An added benefit of data compression upon entry to the subsystem is the reduced utilization of internal buses and DASD paths as data flows through the subsystem.</p> |                                                                                                                                                                                                                                                                                                          |

Cheng

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C28

### Invalidity of U.S. Patent 8,880,862 based on Cheng

Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by th compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155. *See also*, Fig. 1.

“If the data is compressed as it enters the subsystem, see Fig. 1, the cache resource has effectively been tripled.”

Cheng, 155.

“Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155.

“The IBMLZI algorithm and technology was designed for high compression/decompression throughput with efficient hardware implementation, high reliability, low system overhead, and robust compression. Data integrity and reliability are ensured by coupled compression-decompression checking, scrubbing operation, and extensive build-in checkings. Extremely low CPB= $1^6$  compression and decompression have been achieved. The extremely high compressing/decompressing throughput of 30 MB/sec-50 MB/sec allows transparent mode of operation and hence achieved minimal system overhead. The IBMLZI algorithm compresses well over the VM, MVS, RS6000, and PC test cases.”

Cheng, 163.

Cheng

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Cheng, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Cheng discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                                                                                |

Cheng

“storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory”

Claim 5.1

Page 14 of 117

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 5.2 loading the stored compressed boot data from the first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Cheng, as evidenced by the example citations below, discloses “loading the stored compressed boot data from the first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the stored compressed boot data from the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Cheng discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                               |

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| 5.3 accessing the loaded compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Cheng, as evidenced by the example citations below, discloses “accessing the loaded compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Cheng discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                           |

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 5.4 decompressing the accessed compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Cheng, as evidenced by the example citations below, discloses “decompressing the accessed compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Cheng discloses this limitation:</p> <p><i>See Claim 1.3 above.</i></p> |                                                                                                                 |

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                     |

**Cheng**

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Claim 5.7**

## Appendix C28

### Invalidity of U.S. Patent 8,880,862 based on Cheng

Cheng, 155.

“The addition of compression capability to the DASD subsystem facilitates more efficient use of subsystem resources: cache, data path bandwidth, and disk capacity in a transparent manner to the system storing the data.”

Cheng, 155.

“Compression allows existing platforms and applications to benefit from a lower storage cost and potentially higher performance without any change to system hardware or software.”

Cheng, 155.

“If the data is compressed as it enters the subsystem, see Fig. 1, the cache resource has effectively been tripled. Customers can benefit either from improved performance due to better hit ratios, or reduce their cost by configuring smaller amounts of cache. An added benefit of data compression upon entry to the subsystem is the reduced utilization of internal buses and DASD paths as data flows through the subsystem. Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155. *See also* Fig. 1.

“Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155.

“The IBMLZI algorithm and technology was designed for high compression/decompression throughput with efficient hardware implementation, high reliability, low system overhead, and robust compression. Data integrity and reliability are ensured by coupled

Cheng

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

compression-decompression checking, scrubbing operation, and extensive build-in checkings. Extremely low CPB= $1^6$  compression and decompression have been achieved. The extremely high compressing/decompressing throughput of 30 MB/sec-50 MB/sec allows transparent mode of operation and hence achieved minimal system overhead. The IBMLZI algorithm compresses well over the VM, MVS, RS6000, and PC test cases.”

Cheng, 163.

**Cheng**

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Claim 5.7**

Standard compression offerings for tape storage have been well-established since the late 1980s.”</p> <p>Cheng, 155.</p> <p style="padding-left: 40px;">“The desire to extend these cost/performance benefits to higher data-rate media and broader media forms, such as DASD storage subsystems,</p> |                                                                                                                                                                                                                                                                                                                                                                   |

Cheng

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

## Appendix C28

### Invalidity of U.S. Patent 8,880,862 based on Cheng

motivated the design and development of the IBMLZ1 compression algorithm and technology.”

Cheng, 155.

“The addition of compression capability to the DASD subsystem facilitates more efficient use of subsystem resources: cache, data path bandwidth, and disk capacity in a transparent manner to the system storing the data.”

Cheng, 155.

“Compression allows existing platforms and applications to benefit from a lower storage cost and potentially higher performance without any change to system hardware or software.”

Cheng, 155.

“If the data is compressed as it enters the subsystem, see Fig. 1, the cache resource has effectively been tripled. Customers can benefit either from improved performance due to better hit ratios, or reduce their cost by configuring smaller amounts of cache. An added benefit of data compression upon entry to the subsystem is the reduced utilization of internal buses and DASD paths as data flows through the subsystem. Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155. *See also* Fig. 1.

“Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

Cheng, 155.

“The IBMLZI algorithm and technology was designed for high compression/decompression throughput with efficient hardware implementation, high reliability, low system overhead, and robust compression. Data integrity and reliability are ensured by coupled compression-decompression checking, scrubbing operation, and extensive build-in checkings. Extremely low CPB= $1^6$  compression and decompression have been achieved. The extremely high compressing/decompressing throughput of 30 MB/sec-50 MB/sec allows transparent mode of operation and hence achieved minimal system overhead. The IBMLZI algorithm compresses well over the VM, MVS, RS6000, and PC test cases.”

Cheng, 163.

Cheng

| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Cheng, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Cheng discloses this limitation:

*See* Claims 1.2 and 1.3 above.

“Data compression allows more efficient use of storage media and communication bandwidth. Standard compression offerings for tape storage have been well-established since the late 1980s.”

Cheng, 155.

“The addition of compression capability to the DASD subsystem facilitates more efficient use of subsystem resources: cache, data path bandwidth, and disk capacity in a transparent manner to the system storing the data.”

Cheng, 155.

“Compression allows existing platforms and applications to benefit from a lower storage cost and potentially higher performance without any change to system hardware or software.”

Cheng, 155.

“If the data is compressed as it enters the subsystem, see Fig. 1, the cache

**Cheng**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C28

### Invalidity of U.S. Patent 8,880,862 based on Cheng

resource has effectively been tripled. Customers can benefit either from improved performance due to better hit ratios, or reduce their cost by configuring smaller amounts of cache. An added benefit of data compression upon entry to the subsystem is the reduced utilization of internal buses and DASD paths as data flows through the subsystem. Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155. *See also* Fig. 1.

“Finally, sequential performance can be improved. In general, on high end systems with ESCON attached DASD, the throughput of sequential operations is gated by the DASD data rate, typically less than the 18 MB/sec capability of the channel. When the device is transferring compressed data, the transfer rate is effectively multiplied by the compression ratio, allowing the full capability of the channel to be realized.”

Cheng, 155.

“The IBMLZI algorithm and technology was designed for high compression/decompression throughput with efficient hardware implementation, high reliability, low system overhead, and robust compression. Data integrity and reliability are ensured by coupled compression-decompression checking, scrubbing operation, and extensive build-in checkings. Extremely low CPB= $1^6$  compression and decompression have been achieved. The extremely high compressing/decompressing throughput of 30 MB/sec-50 MB/sec allows transparent mode of operation and hence achieved minimal system overhead. The IBMLZI algorithm compresses well over the VM, MVS, RS6000, and PC test cases.”

Cheng, 163.

Cheng

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

| <p><b>32.</b> The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Cheng, as evidenced by the example citations below, discloses “the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form”</p> |                            |                              |              |                                    |                    |                                             |                    |  |                    |             |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Cheng discloses this limitation:</p> <p style="padding-left: 40px;">“DASO (DISK) Controller Compression and IBMLZ23</p> <ul style="list-style-type: none"> <li>•Lossless and General-Purpose Compression</li> <li>•Simple Algorithm Format and Robust</li> <li>• Optimized for High-Thruput Hardware Execution: 1 Byte/Cycle, 40MH/sec.</li> <li>• Algorithm Accepted as QIC 154 Standard”</li> </ul> <p>Cheng, 144.</p> <p style="padding-left: 40px;">“IBMLZ1 Algorithm and Hardware Development Paradigm</p> <table style="width: 100%; border: none;"> <tr> <td style="width: 50%;">Extremely High Reliability</td> <td>One undetected Error in 1030</td> </tr> <tr> <td>Efficiencies</td> <td>Robust Compression, Speed, Latency</td> </tr> <tr> <td>System Requirement</td> <td>Intra-Parallel instead Inter-Parallel, good</td> </tr> <tr> <td>Compression, Speed</td> <td></td> </tr> <tr> <td>Silicon Technology</td> <td>Regularity”</td> </tr> </table> <p>Cheng, 146. <i>See also generally</i>, Cheng, 147-154.</p> <p style="padding-left: 40px;">“The IBMLZ1 compression algorithm was designed not only for robust</p> |                                                                                                                                                                                                                | Extremely High Reliability | One undetected Error in 1030 | Efficiencies | Robust Compression, Speed, Latency | System Requirement | Intra-Parallel instead Inter-Parallel, good | Compression, Speed |  | Silicon Technology | Regularity” |

Cheng

**Claim 32**

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Appendix C28**  
**Invalidity of U.S. Patent 8,880,862 based on Cheng**

and highly efficient compression, but also for extremely high reliability. As compression removes redundancy in the source, the compressed data becomes extremely vulnerable to data corruption. Key design objectives for the IBMLZ1 development were: efficient hardware execution and efficient use of silicon technology; and minimum system integration overhead. Through new observations of pattern matching match-length distribution and use of graph vertex coloring for evaluating data flows, the IBMLZ1 compression algorithm and technology achieved the above objectives.”

Cheng, 155.

“The LZ1 and the LZ2 compression algorithms are commonly regarded as Lempel and Ziv's compression algorithm 1 [ ZL 77 ] and algorithm 2 [ ZL 78 ] . The LZ1 and the LZ2, in their original form, expressed the notion of coding Model and bounds on compression. Professor Lempel noted that more than 90 percent of the compression software in the PC world is derived from either LZ1 or LZ2 class algorithms.”

Cheng, 157. *See also generally*, Cheng, 157-165.

**Claim 109**

## **Appendix C29**

### **Invalidity of U.S. Patent 8,880,862 based on Craft**

The publication Craft, A Fast hardware data compression algorithm and some algorithmic extension, IBM J. Res. Develop., Vol 43, Nov. 1998, (“Craft”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C29

### Invalidity of U.S. Patent 8,880,862 based on Craft

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>1 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Craft, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Craft discloses this limitation:</p> <p style="padding-left: 40px;">“This paper reports on work at IBM's Austin and Burlington laboratories concerning fast hardware implementations of general-purpose lossless data compression algorithms, particularly for use in enhancing the data capacity of computer storage devices or systems, and transmission data rates for networking or telecommunications channels”</p> <p>Craft, 733.</p> <p style="padding-left: 40px;">“The scope of the work quickly expanded, however, as it became apparent that data compression technology could have tremendous implications for some major IBM business segments. In particular, its deployment within computer systems to enhance DASD storage capacity, or to increase the effective bandwidth of networking data channels, would present a major competitive advantage.”</p> <p>Craft, 734.</p> |                                                                                                                                                                                         |

Craft

“A method for providing accelerated loading of an operating system in a computer system, the method comprising:”

Craft

“storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory”

Claim 5.1

Page 12 of 111

**Appendix C29**  
**Invalidity of U.S. Patent 8,880,862 based on Craft**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 5.2 loading the stored compressed boot data from the first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Craft, as evidenced by the example citations below, discloses “loading the stored compressed boot data from the first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the stored compressed boot data from the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Craft discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                               |

**Appendix C29**  
**Invalidity of U.S. Patent 8,880,862 based on Craft**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| 5.3 accessing the loaded compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Craft, as evidenced by the example citations below, discloses “accessing the loaded compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Craft discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                           |

**Appendix C29**  
**Invalidity of U.S. Patent 8,880,862 based on Craft**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 5.4 decompressing the accessed compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Craft, as evidenced by the example citations below, discloses “decompressing the accessed compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. **Appendix C29**  
**Invalidity of U.S. Patent 8,880,862 based on Craft**

|                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Craft, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Craft discloses this limitation:

See Claims 1.2 and 1.3 above.

“This paper reports on work at IBM's Austin and Burlington laboratories concerning fast hardware implementations of general-purpose lossless data compression algorithms, particularly for use in enhancing the data capacity of computer storage devices or systems, and transmission data rates for networking or telecommunications channels”

Craft, 733.

“The scope of the work quickly expanded, however, as it became apparent that data compression technology could have tremendous implications for some major IBM business segments. In particular, its deployment within computer systems to enhance DASD storage capacity, or to increase the effective bandwidth of networking data channels, would present a major competitive advantage.”

Craft, 734.

Craft

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C29**  
**Invalidity of U.S. Patent 8,880,862 based on Craft**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Craft, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Craft discloses this limitation:</p> <p style="padding-left: 40px;">“However, in our later designs, we chose to add a conventional address decoder to the CAM so that it can also function as an SRAM during an LZ1 decode function. This results in a very compact hardware encoder/decoder, which we call a CRAM design, as it combines a compression engine CAM and a decompression engine RAM into one silicon array.”</p> <p>Craft, 738.</p> <p style="padding-left: 40px;">“An LZ1 decompressor builds and maintains an identical history copy, which it updates in the same manner as the encoder, as each LITERAL or COPY_POINTER is processed.”</p> <p>Craft, 738.</p> <p style="padding-left: 40px;">“The code byte-stream output from this preprocessor is then fed into a standard ALDC-1 encoder. For decompression, an ALDC decoder generates code byte values which are then fed into a hardware postprocessor to reconstruct the original data bit stream.”</p> <p>Craft, 741.</p> <p style="padding-left: 40px;">“LZ1 decompression is relatively simple, requiring only a byte-wide SRAM of the same size as the history. An address counter is used, in much the same way as the WS pointer in the CAM, to store each output data byte sequentially into this SRAM. This satisfies the history update requirement. Decoding of COPY-POINTERS simply requires that the specified string be copied out of the SRAM once its start address and the byte count have been decoded. Output of each decompressed data</p> |                                                                                                                                                                                           |

| <b>109.</b> The method of claim 108, further comprising: storing the compressed additional boot data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Craft, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Craft discloses this limitation:</p> <p><i>See</i> Claims 5.1, 8.1 and 9.1 above.</p> |                                                                                                                                                          |

Craft

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C30**

### **Invalidity of U.S. Patent 8,880,862 based on Douglis**

Douglis, “One the Role of Compression in Distributed Systems” (“Douglis 1”) and Douglis, “The Compression Cache: Using On-Line Compression to Extend Physical Memory,” Winter 1993 USENIX Conference, Jan 1993 (“Douglis 2”) (collectively, “Douglis”), alone or in combination, invalidate claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                           |

First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                                                           |

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougkis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougkis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Douglis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Douglis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                     |                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Douglis, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Douglis discloses this claim limitation:

**Abstract**

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Douglis 1, Abstract

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>2</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Douglis, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this claim limitation:</p> <p style="text-align: center;"><b>Abstract</b></p> <p style="text-align: center;">Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                            |

### Invalidity of U.S. Patent 8,880,862 based on Douglis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougkis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougkis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Douglis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Douglis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

### Invalidity of U.S. Patent 8,880,862 based on Douglis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this claim limitation:</p> <p style="text-align: center;"><b>Abstract</b></p> <p style="text-align: center;">Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                                                                                                                                                                            |

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

Page 15 of 156

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougkis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougkis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougkis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this claim limitation:</p> <p style="text-align: center;"><b>Abstract</b></p> <p style="text-align: center;">Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                                     |

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Douglis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Douglis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

| <p>3. The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Douglis, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel’s virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the <i>oldest</i> physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.</p> <p>Douglis 2</p> |                                                                                                                                                                                                                              |

Douglis

“The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”

Claim 3

Page 24 of 156

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                                                            |

The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Dougliis, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, and 2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel’s virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the <i>oldest</i> physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.</p> <p>Dougliis 2</p> |                                                                                                                                                                                                                            |

#### Abstract

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Douglis 1, Abstract

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

Dougliis 2, Abstract

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of "anonymous FTP" archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

Dougkis 1, at 1

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougkis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Claim 5 (Preamble)

Page 28 of 156

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

#### Douglis 1, 3.1

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. #### Abstract

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Dougliis 1, Abstract

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                    |

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

Claim 6 (Preamble)

Page 42 of 156

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p>See Claims 1.3 and 1.4.2 above.</p> <p style="text-align: center;"><b>Abstract</b></p> <p>Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                                                         |

Douglis Claim 8.5  
“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Douglis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Douglis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

Douglis 2, 4

Douglis

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

Claim 8.5

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                               |

| <p>8.7 wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Douglis, as evidenced by the example citations below, discloses<br/> “wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claims 1-1.3 and 5.7 above.</i></p> <p><b>3.1 Overview</b><br/> There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.</p> <p>Douglis 1</p> <p>Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.</p> <p>Douglis 1</p> |                                                                                                                                                                                                                                                                                                                                                                     |

Douglis

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

**Compression speed.** Compressing a page, and later decompressing it, must be significantly faster than transferring it to or from backing store. Otherwise, one might as well do traditional paging without compression.

Dougkis 2

- To service a page fault for a page that is not already uncompressed and resident in memory, the VM system checks to see whether the page is compressed in memory or on the backing store. If it is on backing store, it is first brought into memory and stored in the compression cache, then it is decompressed and made accessible to the faulting process. The compressed copy in memory can be freed at any time, since there is already a copy on backing store.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Dougliis discloses this limitation:

See Claim 1.1 above.

**Abstract**

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Dougliis 1, Abstract

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

Claim 9.1

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

Dougliis

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### Dougliis 1, 3.1

As was mentioned above, the *CCACHE* is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the *CCACHE* extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the *CCACHE*, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size *CCACHE*, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte *CCACHE* was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

#### Claim 9.1

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

Douglis 2, 4

*See also*

There is also overhead for the space managed by the compression cache itself. This uses 8 bytes per page in the range of addresses the compression cache might occupy (as in Figure 2). This overhead is determined at boot time based on the maximum possible size of the cache. The kernel also allocates a 24-byte header within each physical page frame mapped into the cache (0.6% overhead), and a 36-byte header for each virtual page that is compressed and placed in the cache. These overheads occur only when the compression cache contains data in it, and are offset by the savings in memory usage due to compression.

| <p><b>10.</b> The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.</p> | <p>Dougliis, as evidenced by the example citations below, discloses “the method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder.”</p> |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Dougliis discloses this limitation:

See Claim 9.1 above.

**Abstract**

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Dougliis 1, Abstract

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

Dougliis

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### Dougliis 1, 3.1

As was mentioned above, the *CCACHE* is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the *CCACHE* extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the *CCACHE*, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size *CCACHE*, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte *CCACHE* was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

### Invalidity of U.S. Patent 8,880,862 based on Douglis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

Douglis 2, 4

*See also*

Burrows *et al.* integrated compression with Sprite LFS [12], also primarily to reduce disk space requirements [4]. They argued that LFS is a better vehicle for compressing files than traditional file systems, since files are not overwritten in place and a change to one block within a file would not cause changes to compressed data later in the file. Multiple file blocks may be compressed as a unit, providing better compression than if each block were compressed separately using a dynamic compression algorithm such as LZRW1 [16]. Burrows *et al.* found that on-line compression halved disk space requirements, as in Cate and Gross's system, without the delays that could be incurred by decompressing a large file as a single unit. The system had an acceptable performance degradation when compression was performed in software, and was well-suited to hardware compression.

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Douglis, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claim 1.1 and 6(Preamble) above.</i></p> <p>There is also overhead for the space managed by the compression cache itself. The kernel uses 8 bytes per page in the range of addresses the compression cache might occupy (as shown in Figure 2). This overhead is determined at boot time based on the maximum possible size of the cache. The kernel also allocates a 24-byte header within each physical page frame that is mapped into the cache (0.6% overhead), and a 36-byte header for each virtual page that has been compressed and placed in the cache. These overheads occur only when the compression cache has data in it, and are offset by the savings in memory usage due to compression.</p> <p><b>Douglis 2</b></p> <p>The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.</p> <p><b>Douglis 2</b></p> |                                                                                                                                                                                                                                      |

Douglis

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

Claim 11.1

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                     |

First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1, Abstract</p> <p>Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications. Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of “anonymous FTP” archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially</p> <p>Douglis 1, at 1</p> |                                                                                                                                                                                          |

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Dougliis 1, 2

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

Claim 11.4

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Dougliis 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Dougliis 1, 3.4

##### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

Page 82 of 156

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------|
| 11.5 updating the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Dougliis, as evidenced by the example citations below, discloses “updating the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                |

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                       |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Dougliis, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See</i> Claim 1 (Preamble) above.</p> |                                                                                                                                                                       |

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>13.1</b> loading boot data in a compressed form that is associated with a boot data list from a boot device;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Dougliis, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See</i> Claim 1.1 above.</p> |                                                                                                                                                                       |

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>13.2</b> accessing the loaded boot data in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Douglis, as evidenced by the example citations below, discloses “accessing the loaded boot data in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                         |

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                       |

| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Dougliis, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Dougliis discloses this limitation:

See Claims 1.1 and 1.2 above.

#### Abstract

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Dougliis 1, Abstract

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

Dougliis

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

Douglis 1, 3.2

#### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

Douglis 2, Abstract

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

See Sections VI. and VII. of Apple’s Invalidity Contentions.

Douglis discloses this limitation:

See Claims 1.2 and 1.3 above.

**Abstract**

Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.

Douglis 1, Abstact

Douglis

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

Data compression has long been used as a method to reduce the number of bits being stored or transmitted [7], but stored where and transmitted over what? The answer to this question is changing as the gap between processing speed and I/O bandwidth increases, and the uses for computers shift toward multimedia and other high-data-rate applications.

Traditionally, compression was used to reduce disk storage demands, by selectively compressing files that had not been accessed for a long time, and to reduce bandwidth requirements over such media as wide-area networks and modems. Some forms of compression are now nearly ubiquitous: for example, the vast majority of "anonymous FTP" archives store all but the most trivial of files in compressed format, saving disk space while making retrievals over the Internet faster. (Other sites sometimes store the original files in uncompressed format but allow on-the-fly compression upon request.) Images impose especially

Dougliis 1, at 1

Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.

Dougliis 1, 2

memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a *compression cache* (CCACHE).

One question, of course, is whether paging is even interesting or desirable. In some environments, paging is largely passé due to the large amounts of memory available [4]. However, I believe there are still systems and applications that could benefit greatly from a cheaper method of paging. Mobile computers are especially likely to have less memory available than needed, and the cost of paging over a wireless network or onto a small local disk might be much more than the cost of compressing the page. Even in a workstation-based environment, a main-memory database that is within a factor of two or three of the size of available physical memory might fit completely in memory in compressed format. The important issues are how effective compression is at saving memory and how costly compression is by comparison to network or disk I/O.

In the best case, compression can be done in hardware, and the cost of compression will be limited only by memory-to-memory bandwidth. In this case I would expect the CCACHE to provide a substantial improvement in performance. Beyond this, however, I argue that on-line compression in software can still provide benefits to a wide class of applications if designed properly. In this section I describe an implementation of the CCACHE in software, and the performance of some benchmarks, to support this claim.

Claim 14.3

"servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form"

Page 94 of 156

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglas

There are a number of potential benefits of using a compression cache. First, compressing a page and retaining it in memory can be cheaper than writing it to backing store. Second, reading it back from memory is likely to be much cheaper than reading it from backing store, even taking the cost of decompression into account. Finally, if the page is eventually written to backing store, it can be written in compressed format, requiring less bandwidth.

The CCACHE has some potential disadvantages as well. Most importantly, it competes with user processes (and perhaps the file system cache) for memory. Putting a page in the CCACHE has the effect of freeing up only part of a page, so more pages must be transferred from uncompressed memory to the CCACHE in order to make room for one new page. Processes will take additional page faults because they are given less memory. (This suggests that the CCACHE should be of a variable size, and should be used only when its presence improves performance rather than degrading it.) Additionally, the CCACHE adds overhead in the form of added complexity during page faults, as well as extra code and data associated with the cache.

#### Douglas 1, 3.1

As was mentioned above, the CCACHE is primarily targeted for mobile computers, which typically have less memory than desk-based computers of the same generation. Nevertheless, the idea of the CCACHE extends naturally to any environment that pages when applications use more virtual memory than physical memory. I have added a compression cache to the

Sprite operating system [8], running on DECstation<sup>2</sup> 5000/200 workstations (approximately 18 SPECmarks, running a 25 MHz MIPS R3000 processor). Sprite is a particularly suitable system for the CCACHE, because it already supports the idea of trading physical memory between the virtual memory system and the file system [6]. Trading memory a third way, including the compression cache, would be a natural extension of this technique.

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

#### Douglas 1, 3.2

As a second test, I ran an application that responds to queries based on the contents of a hash table. The database containing the hash table was over 40 Mbytes, all of which was cached in memory, and the total address space of the process was over 60 Mbytes. The benchmark consisted of running a set of 9 queries against this database; the queries were run once to load the process's address space with the appropriate parts of its database and a second time to evaluate performance. The benchmark was run on the same DECstation as the previous measurements, but without the artificial restriction, so it had about 25 Mbytes of memory available. Running with a 12-Mbyte CCACHE was 32% faster than without the compression cache (9.28 minutes versus 13.7).

#### Douglas 1, 3.4

#### Douglas

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

#### Claim 14.3

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### Abstract

This paper describes a method for trading off computation for disk or network I/O by using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior and the relative costs of compression and I/O. Measurements using Sprite on a DECstation<sup>1</sup> 5000/200 workstation with a local disk indicate that some memory intensive applications running with a compression cache can run two to three times faster than on an unmodified system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

Dougliis 2, Abstract

#### 4 Design

This section describes the design and implementation of a compression cache in Sprite. Sprite is largely compatible with 4.3 BSD UNIX, but its virtual memory system has an interesting difference from most versions of UNIX: physical memory is traded dynamically between VM for application processes and the file system's buffer cache [9]. Since the compression cache must vary in size dynamically as well, Sprite provides a good framework for prototyping the compression cache. The idea of the compression cache should extend naturally to UNIX,<sup>3</sup> Mach, or other systems; in fact, Mach's external pager interface [7] should be an excellent foundation for future work in this area.

The target environment for this research consists of mobile computers with limited memory and network bandwidth, and with small local disks or no disks at all. Because of the limited availability of Sprite, the compression cache has been prototyped in a workstation environment, running on DECstation 5000/200 workstations, paging to a local RZ57 disk. The Sprite kernel is configurable at boot-time to allow the system to use a variable amount of physical memory, so a 32-Mbyte machine can behave as though it has as little as 12 Mbytes. About 6 Mbytes are used by the kernel for code, page tables, and some forms of tracing that cannot currently be disabled.

| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Dougliis, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Dougliis discloses this limitation:</p> <p>See Claims 1 (Preamble) and 1.1 above.</p> <p><b>3 The Compression Cache: Extending Memory via Compression</b><br/> Another way in which distributed systems can benefit from compression is when compression allows computers to avoid slow I/O completely. Just like compressing data on disk can allow a user to save larger files (or more files) without buying another disk, compressing data in memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a <i>compression cache</i> (CCACHE).</p> <p>Dougliis 1</p> <p>The sharp leap in speedup when all pages fit in memory, as in Figure 1(b), demonstrates the potential difference between the compression cache and a system that compresses pages en route to the backing store. In practice, this improvement is not fully realized, because access patterns are not so pathological. The performance of sample applications is given after the description of a specific implementation of a compression cache for the Sprite operating system [11].</p> <p>Dougliis 2</p> |                                                                                                                                                                                         |

Dougliis  
“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                |

| <p><b>16.</b> The method of claim 14, wherein the operating system comprises: a plurality of files.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Douglis, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><b>2.1 File Systems</b></p> <p>A number of systems have replaced individual users’ <i>ad hoc</i> techniques for manual compression with a mechanism for automatically compressing some or all files. Cate and Gross used compressed files as a level in a hierarchy, with recently-accessed files being in uncompressed and less-recently-used ones compressed [5]. Since frequently-used files were never compressed and compression was performed in the background, the overall impact on interactive performance (delays due to decompression) was minimal: less than 50 seconds per user per day. At that time, disk space requirements were roughly halved.</p> <p>Burrows <i>et al.</i> integrated compression with Sprite LFS [12], also primarily to reduce disk space requirements [4]. They argued that LFS is a better vehicle for compressing files than traditional file systems, since files are not overwritten in place and a change to one block in a file would not cause changes to compressed data later in the file. Multiple file blocks in a file were compressed as a unit, providing better compression than if each block were compressed separately using a dynamic compression algorithm such as LZRW1 [16]. Burrows <i>et al.</i> found that file compression halved disk space requirements, as in Cate and Gross’s system, without the delay that could be incurred by decompressing a large file as a single unit. The system had an acceptable performance degradation when compression was performed in software, and was well-suited to hardware compression.</p> <p>Douglis 1</p> |                                                                                                                                                                |

Douglis  
 “The method of claim 14, wherein the operating system comprises: a plurality of files.”

**Claim 16**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                   |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p>See Claim 15 above.</p> <p><b>3.3 Target Applications</b></p> <p>I next address the issue of what applications might make effective use of a compression cache. Obviously, many applications will fit into memory without the need for compression and other applications may cause excessive I/O even with compression. The applications that can best make use of a compression cache are those that will not comfortably fit into physical memory without compression but will fit if some of their pages are compressed.</p> <p>One can imagine a contrived scenario in which the compression cache would provide significant performance benefits: if an application cycles linearly through a working set that is or larger than the maximum number of pages allowed to be resident, and a least-recently-used algorithm is used for page replacement, then the process will take a page fault on each page. With the compression cache, the process will still fault on each page, but each fault will be satisfied by a compression and a decompression rather than a pair of disk I/Os.</p> <p>Another scenario, as mentioned above, is the application that spreads its accesses uniformly in an address space much larger than physical memory. Although taking space in memory for the compression cache will result in additional page faults that would otherwise not occur, the average cost of a page fault will be less with the compression cache in use as long as compression is much less expensive than disk I/O (say, one-third the cost) and the hit rate in the compression cache is reasonably high (say, 80-90%).</p> <p>Douglis 1</p> |                                                                                                                                                                                                                   |

**Claim 17**

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

#### Abstract

This paper describes a method for trading off computation for disk or network I/O using less expensive on-line compression. By using some memory to store data in compressed format, it may be possible to fit the working set of one or more large applications in relatively small memory. For working sets that are too large to fit in memory even when compressed, compression still provides a benefit by reducing bandwidth and space requirements.

Overall, the effectiveness of this *compression cache* depends on application behavior, the relative costs of compression and I/O. Measurements using Sprite on a DECstation 5000/200 workstation with a local disk indicate that some memory-intensive applications running with a compression cache can run two to three times faster than on an uncompressed system. Better speedups would be expected in a system with a greater disparity between the speed of its processor and the bandwidth to its backing store.

Douglis 2

#### 1 Introduction

Over the past decade, the processing power and physical memory size of typical computers have increased dramatically. Even as workstation memory sizes are increasing, however, a technology trend is pushing toward small memories: mobile computers that are smaller than their desk-top counterparts and are typically configured with significantly less memory. Application designers are sometimes forced to squeeze their applications to fit into available memory, and they may not succeed. Therefore, in a general-purpose mobile computer, as with many computers, performance is needed to enable a wider range of applications to run—as long as it can be performed efficiently.

Douglis 2

The potential benefits of the compression cache depend on the relationship between the speed of compression and the I/O bandwidth of the system, as well as the compression ratio (anywhere from barely over 1:1 to about 4:1 in the experiments reported below). If the cost of compressing and copying a page were negligible, and pages compressed well, the compression cache could be used to give a computer the appearance of having additional physical memory. In practice, compressing and copying have costs associated with them, and the benefit of reducing traffic to the backing store is offset by the overhead of the compression cache. Overhead comes not only from the compression itself but from the additional page faults an application will experience when some memory is used for compressed pages (as well as the data structures used to support compressed pages). Furthermore, as mentioned above, not all applications compress well: for poorly suited applications, the effort to compress memory will be wasted and degrade rather than improve performance. Thus, depending on the application and the hardware environment, the benefits of reduced I/O may outweigh the costs of compression and additional faults, or vice-versa. Configuring the compression cache to improve performance in the first case while staying out of the way in the second case is an interesting, and difficult, problem.

See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above</i></p> <p style="padding-left: 40px;">The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size CCACHE, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].</p> <p>Douglis 1</p> |                                                                                                                                                                                                                                                                     |

Douglis

**Claim 19**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                           |

| <p>27. The method of claim 1, wherein the memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Douglis, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Douglis discloses this limitation:</p> <p>See Claims 1.1 and 1.2 above</p> <p style="text-align: center;"><b>Abstract</b></p> <p>Compression has been used in numerous ways for many years, but recently two factors have combined in a way to push compression to the forefront of distributed systems. First, the disparity between processor speeds and I/O rates is ever-increasing, making it possible to perform compression in software to a much greater extent than was previously feasible. Second, the growth of new applications demanding enormous data rates, such as digital video and audio, makes hardware compression increasingly desirable. I discuss the importance of compression in various environments and describe how compression may be used not only to reduce the demand for disk space, disk bandwidth, and network bandwidth, but also to appear to extend physical memory.</p> <p>Douglis 1</p> <p><b>3 The Compression Cache: Extending Memory via Compression</b></p> <p>Another way in which distributed systems can benefit from compression is when compression allows computers to avoid slow I/O completely. Just like compressing data on disk can allow</p> <p>a user to save larger files (or more files) without buying another disk, compressing data in memory can allow a user to run larger processes without buying more memory. In this case, virtual memory pages would be compressed and written back into physical memory rather than to a backing store. This idea was briefly mentioned by Appel and Li, who claimed that user-level support for compression would be more effective than generic operating system support [1]. Nevertheless, I believe that OS support for compressed virtual memory can prove useful. I refer to the technique of trading regular physical memory for data stored in compressed format as a <i>compression cache</i> (CCACHE).</p> <p>Douglis 1</p> <p style="text-align: center;">The Compression Cache: Using On-line Compression<br/> to Extend Physical Memory*</p> <p>Douglis 2</p> |                                                                                                                                                       |

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougli

#### 1 Introduction

Over the past decade, the processing power and physical memory size of typical computers have increased dramatically. Even as workstation memory sizes are increasing, however, a new technology trend is pushing toward small memories: mobile computers that are smaller than their desk-top counterparts and are typically configured with significantly less memory. Application designers are sometimes forced to squeeze their applications to fit into available memory, and may not succeed. Therefore, in a general-purpose mobile computer, as with many computers, paging is needed to enable a wider range of applications to run—as long as it can be performed efficiently.

**Dougliis**

“The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 29**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                          |                                                                                                                                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>31.</b> The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.</p> | <p>Dougliis, as evidenced by the example citations below, discloses “the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Dougliis discloses this limitation:

*See Claims 1.1 and 1.2 above*

Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel’s virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the *oldest* physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.

**Dougliis 2**

Compression is already widely used to reduce demand for secondary storage and networks. I suggest that it is now feasible to use compression to reduce the demand for memory as well. The basic idea is to take some memory that would normally be used directly by an application, and use it instead to hold a larger number of pages in compressed format. I call the area used for compressed data a *compression cache*. If the pages touched by a process could not normally fit in memory, but could fit into memory when some were stored in the compression cache, then the processor would never have to write a page to backing store (onto a local disk or over a network to another computer). Even if pages must be written to backing store, compressing them beforehand reduces the amount of data transferred.

**Dougliis 2**

**Dougliis**

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

**Claim 31**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                  |

Douglis

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 32**

## Appendix C30 Invalidity of U.S. Patent 8,880,862 based on Dougliis

**33.** The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.

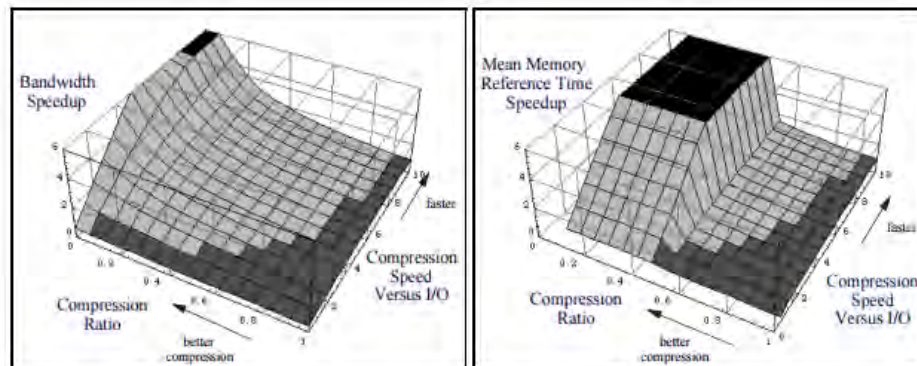

Dougliis, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Dougliis discloses this limitation:

See Claims 1.1 and 32 above.

### The Compression Cache ...

(a) Transferring compressed pages to backing store.

(b) Keeping compressed pages in memory.

**Figure 1:** Performance of compressing pages, modeled analytically. Speedups are shown as a function of the compression ratio (fraction of bytes left after compression) and the speed of compression relative to I/O. Decompression is assumed to be twice as fast as compression, as is roughly the case for algorithms such as LZRW1 [16]. There are three regions of speedup: the dark black areas at the top left show speedups that go off the top of the scale (8-fold improvement); the light areas show speedups of 1-6 relative to no compression, and the darker areas to the right show data points at which a slowdown would result.

[16] Ross N. Williams. An extremely fast ZIV-Lempel data compression algorithm. In *Data Compression Conference*, pages 362-371, April 1991.

Dougliis 2

Dougliis

**Claim 33**

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

The initial prototype of the compression cache has been simplified in a number of ways. First of all, I use a fixed-size `CCACHE`, which is configured at kernel load time. The fixed-size cache is simpler but results in unneeded overhead for applications that would otherwise fit in memory; measurements of the effects of this are presented below. Secondly, compressed pages are written out using the same number of bytes as uncompressed pages: a full 4-Kbyte file block. In the future compressed pages will be combined into a smaller number of file blocks to save disk bandwidth. Third, I use only a single LZ-based compression algorithm [11] for all data. The compression algorithm reduces pages to 30–40% of their original size on average, depending on the application mix; I would expect application-specific compression algorithms to do much better. Finally, in order to estimate the effects of compression in a system with a large gap between processor and I/O speed, I configured the test system to page to a local disk running the original Sprite file system [6] rather than the faster Sprite LFS [9].

**Dougliis**

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougli

|                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p> | <p>Dougli, as evidenced by the example citations below, discloses<br/> “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Dougli discloses this limitation:

See Claims 1.1 and 1.2 above

Compression is already widely used to reduce demand for secondary storage and networks. I suggest that it is now feasible to use compression to reduce the demand for memory as well. The basic idea is to take some memory that would normally be used directly by an application, and use it instead to hold a larger number of pages in compressed format. I call the area used for compressed data a *compression cache*. If the pages touched by a process could not normally fit in memory, but could fit into memory when some were stored in the compression cache, then the processor would never have to write a page to backing store (onto a local disk or over a network to another computer). Even if pages must be written to backing store, compressing them beforehand reduces the amount of data transferred.

Dougli 2

### 3 Design Considerations

Intuitively, the idea of trading processing (compression) for I/O is appealing: by and large, processors are improving in performance more quickly than I/O devices, especially disks.<sup>2</sup> If one can compress some pages so that they occupy little enough memory to permit all of a process’s address space to reside in memory, it might be possible to avoid I/O to the backing store completely; the process would execute correspondingly faster. Note that this technique is fundamentally different from writing a dirty page into a file system that does compression, or a disk that does compression at the driver level, because compressed pages never have to go to backing store at all. Instead, compressed pages form an intermediate level in the storage hierarchy, between uncompressed pages and the backing store.

<sup>2</sup>Paging over a network rather than to a local disk is another issue. In some environments, it is more efficient to page over a 10-Mbps Ethernet to memory on a file server than to page to a local disk [9]. Some local-area networks, such as ATM networks (*e.g.*, Autonet [13]), provide bandwidth that is at least an order of magnitude greater than an Ethernet. However, for mobile computers on wireless networks, one can expect the disparity between processing and I/O to remain for some time.

Dougli 2

Dougli

**Claim 39**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                   |

| <p><b>49.</b> The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Douglis, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See Claim 10 above.</i></p> <p><b>2.2 Virtual Memory</b></p> <p>The focus of the above systems has been disk space rather than performance. Other projects have considered ways not only to reduce disk space demands, but also to improve performance, particularly in the area of virtual memory.</p> <p>Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth [14]. Because compression of the executables was performed off-line, an especially effective (but slower) compression algorithm was available. Bandwidth improved because the cost of decompression was offset by the reduction in data transferred from the disk. As a result, the performance of program invocation improved.</p> <p>Atkinson <i>et al.</i> at Xerox PARC, considered the use of compression in order to reduce the cost of paging over wireless links [2]. Such paging might be needed in an environment with mobile computing devices that are too small to have local disks, such as the “tabs” advocated by Weiser [15]. The PARC researchers concentrated on read-only data, such as executables, because of the space and time overhead of performing on-line compression. Executables would be stored and transmitted in compressed format, and cached on a mobile computer in compressed format to increase the number of such executables that could be cached. Again, because compression would be performed off-line, an asymmetric compression algorithm could be used that would give very good compression ratios (with a correspondingly high overhead) while decompressing quickly. These researchers did consider on-line compression as well, resulting in a suggestion (reported by Appel and Li [1]) that pages be compressed and retained in memory. This idea, which they did not pursue extensively, is the primary theme of this paper.</p> <p>Douglis 2</p> |                                                                                                                                                                                                                     |

Douglis

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Claim 49**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                              |

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Dougliis, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><b>4.2 Variable Memory Allocation</b></p> <p>Initially, the compression cache was implemented as a fixed-size region of physical memory. This was done partly for simplicity and partly because the need to vary its size was not yet apparent. In this version, the compression cache consisted of a number of pages, each divided into <i>N</i> fragments (In my experiments, <i>N</i> was defined to be 8, meaning blocks of 512 bytes with a pagesize of 4 Kbytes). When a page was compressed, the system allocated enough fragments to hold the compressed data. The fragments did not need to be allocated contiguously; instead, the compression was performed into a contiguous buffer and the compressed data was then scattered into multiple fragments. To satisfy a page fault, the fragments for a page were copied into a contiguous buffer and then decompressed.</p> <p>Dougliis 2</p> |                                                                                                                                                                                              |

Dougliis

**Claim 50**

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>65.</b> The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Dougliis, as evidenced by the example citations below, discloses<br/>“the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See Claims 15, 17 and 24 above.</i></p> |                                                                                                                                                                                                                                                    |

**Dougliis**

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 65**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                               |                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>67.</b> The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.</p> | <p>Dougliis, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Dougliis discloses this limitation:

*See Claim 31 above.*

**Dougliis**

“The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.”

**Claim 67**

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                |

| 97.2 and wherein the updating comprises: associating the additional compressed boot data with the boot data list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Douglis, as evidenced by the example citations below, discloses “and wherein the updating comprises: associating the additional compressed boot data with the boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, and wherein the updating comprises: associating the additional compressed boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 2, 4, 5.6, and 8.6 above.</p> |                                                                                                                                                                               |

Douglis

“and wherein the updating comprises: associating the additional compressed boot data with the boot data list.”

**Claim 97.2**

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Douglis

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                               |

| <p><b>98.</b> The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Douglis, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Douglis discloses this limitation:</p> <p>See Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">Even today, compression buys a significant improvement in disk capacity with only a slight degradation in performance. Cate and Gross combined compression and caching in a two-level file store, which automatically compresses least-recently-used files in order to save disk space [3]. Stacker<sup>1</sup> uses compression to increase the effective capacity of a PC hard disk, sometimes improving I/O performance but often being measurably slower than without compression; the slowness is due to the relative performance of an Intel 386 chip compared to a typical PC hard drive, and can be improved with a special processor board [5]. Taunton described a mechanism for compressing binary executables on Acorn personal computers, reducing disk space requirements and improving file system bandwidth; since only decompression was being performed on-line, the processing overhead was offset by the reduction in I/O [10]. Burrows, et al., combined on-line compression with Sprite LFS [9] to compress and decompress all disk I/O automatically [2]. They used it primarily to increase effective disk capacity but expect that with hardware compression, the increase in effective disk bandwidth would improve overall system performance.</p> <p>Douglis 1</p> <p style="padding-left: 40px;">Finally, one might expect that a main-memory database would benefit from the compression cache if it fits in memory when compressed but not otherwise. Some accesses would be to data that tends to remain uncompressed (“warm” data), while others would be to less frequently used (“cold”) data, which would stay mostly compressed. Each access to compressed data would incur the overhead of decompression (and subsequent compression if the page is modified), but not a disk I/O. However, the hit rate on uncompressed data would be lower than the hit rate in a system without the compression cache, because some memory would be used for compressed pages instead of regular virtual memory. The poorer the compression ratio, the greater the penalty.</p> <p style="padding-left: 40px;">Indeed, one such database, the “index engine” for the Gold Mailer [3], compresses slightly worse than 2:1; it runs more slowly under the compression cache than on an unmodified system. This is partly due to the poor compression and partly due to the high fraction of nonsequential page accesses it encounters, each of which requires a full 4-Kbyte read from backing store. Ideally, one would use the compression cache in a system that permitted less than a 4-Kbyte read to satisfy a page fault, in which case Gold (and other applications) should benefit more generally from compression. Table 1 lists three runs of <i>gold</i>:</p> <p>Douglis 2</p> |                                                                                                                                                                                               |

Douglis

Claim 98

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Douglis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                             |

| <p><b>107.</b> The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Douglis, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p>Compression is already widely used to reduce demand for secondary storage and networks. I suggest that it is now feasible to use compression to reduce the demand for memory as well. The basic idea is to take some memory that would normally be used directly by an application, and use it instead to hold a larger number of pages in compressed format. I call the area used for compressed data a <i>compression cache</i>. If the pages touched by a process could not normally fit in memory, but could fit into memory when some were stored in the compression cache, then the processor would never have to write a page to backing store (onto a local disk or over a network to another computer). Even if pages must be written to backing store, compressing them beforehand reduces the amount of data transferred.</p> <p>The potential benefits of the compression cache depend on the relationship between the speed of compression and the I/O bandwidth of the system, as well as the compression ratio (anywhere from barely over 1:1 to about 4:1 in the experiments reported below). If the cost of compressing and copying a page were negligible, and pages compressed well, the compression cache could be used to give a computer the appearance of having additional physical memory. In practice, compressing and copying have costs associated with them, and the benefit of reducing traffic to the backing store is offset by the overhead of the compression cache. Overhead comes not only from the compression itself but from the additional page faults an application will experience when some memory is used for compressed pages (as well as the data structures used to support compressed pages). Furthermore, as mentioned above, not all applications compress well: for poorly suited applications, the effort to compress memory will be wasted and degrade rather than improve performance. Thus, depending on the application and the hardware environment, the benefits of reduced I/O may outweigh the costs of compression and additional faults, or vice-versa. Configuring the compression cache to improve performance in the first case while staying out of the way in the second case is an interesting, and difficult, problem.</p> <p>Douglis 2</p> |                                                                                                                                                                             |

Douglis

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

## Appendix C30

### Invalidity of U.S. Patent 8,880,862 based on Dougliis

#### 3 Design Considerations

Intuitively, the idea of trading processing (compression) for I/O is appealing: by and large, processors are improving in performance more quickly than I/O devices, especially disks.<sup>2</sup> If one can compress some pages so that they occupy little enough memory to permit all of a process's address space to reside in memory, it might be possible to avoid I/O to the backing store completely; the process would execute correspondingly faster. Note that this technique is fundamentally different from writing a dirty page into a file system that does compression, or a disk that does compression at the driver level, because compressed pages never have to go to backing store at all. Instead, compressed pages form an intermediate level in the storage hierarchy, between uncompressed pages and the backing store.

Keeping compressed pages in memory does not obviate the need for a backing store, however. It is possible for the collective address space of all running processes not to fit in memory even after compression. And even if they fit, it might be desirable to move some "old" pages to backing store in order to have more memory available for actively-used pages. In either case, pages could be transferred to backing store in compressed format, reducing the demand for bandwidth. This technique would be similar to paging into a file system or disk that does its own compression. The differences are:

**Reduced I/O.** With the compression cache, some pages might be faulted upon before being written to backing store. Those pages would no longer need to be written.

**Variable memory allocation.** By making compressed pages an explicit part of the memory hierarchy, the system can dynamically vary the amount of memory used for uncompressed pages, compressed pages, and file blocks. This is necessary to avoid impacting applications that do not need to compress pages, as discussed below in Section 4.2.

Dougliis 2

Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel's virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the *oldest* physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.

| <p><b>108.</b> The method of claim 2, further comprising: compressing at least a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Douglis, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Douglis discloses this limitation:</p> <p><i>See</i> Claims 1.1, 5, 9.1 and 8 above.</p> <p style="padding-left: 40px;">Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel’s virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the <i>oldest</i> physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.</p> <p>Douglis 2</p> |                                                                                                                                                                                |

Douglis

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C30**  
**Invalidity of U.S. Patent 8,880,862 based on Dougliis**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                    |

| <p><b>109.</b> The method of claim 108, further comprising: storing the compressed additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Dougliis, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Dougliis discloses this limitation:</p> <p><i>See</i> Claims 5.1, 8.1 and 9.1 above.</p> <p style="padding-left: 40px;">Instead, memory for the compression cache is now treated as a variable-sized circular buffer. Physical pages are mapped into the kernel’s virtual address space, one after another, eventually wrapping around to the start of the range of addresses for the compression cache. There is a notion of the <i>oldest</i> physical page—the one added to the cache the longest time ago—and new pages, which have been added most recently and may not contain data yet. Physical pages are added to one end of the queue and normally removed from the other end. (They may be removed from the middle if no clean pages are available at the oldest end.) When VM pages are compressed, they are compressed directly into the first unused region within the compression cache, following the last page that had been added to the cache. Before each page there is a small header that describes the page, the size it compressed to, whether it contains dirty data, a link to the next page in the cache, and other information.</p> <p>Dougliis 2</p> |                                                                                                                                                                    |

Dougliis

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C31**

### **Invalidity of U.S. Patent 8,880,862 based on Grove**

The publication Grove "System Administration," LINUX, Mar 1998. ("Grove") invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 ("the '862 Patent") pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime's proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the '862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                         |

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                     |                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Grove, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Grove discloses this claim limitation:

In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.

First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.

Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.

The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.

Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.

Grove, 4.9.1

Grove

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                          |

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Grove, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this claim limitation:</p> <div style="border: 1px solid black; padding: 10px; margin: 10px 0;"> <p>In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p>First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p>Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p>The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p>Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0``) or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> </div> <p>Grove, 4.9.1</p> |                                                                                                                                                          |

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                          |

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Grove, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this claim limitation:</p> <p style="margin-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="margin-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="margin-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="margin-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="margin-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like cp zImage /dev/fd0) or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                                                                                                                                                          |

Grove

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Claim 1.3

# Appendix C31

## Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                              |

| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Grove, as evidenced by the example citations below, discloses “updating the boot data list,” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Grove discloses this claim limitation:</p> <p><b>4.9.1 Upgrading the kernel</b></p> <p>Upgrading the kernel is a matter of obtaining the kernel sources and compiling them. This is generally a painless procedure, but you can run into problems if you try to upgrade to a development kernel, or upgrade to a new kernel version. The version of a kernel has two parts, the kernel version and patchlevel. As of the time of this writing, the latest stable kernel is version 2.0.33. The 2.0 is the kernel version and 33 is the patch level. Odd-numbered kernel versions like 2.1 are development kernels. Stay away from development kernels unless you want to live dangerously! As a general rule, you should be able to upgrade easily to another patch level, but upgrading to a new version requires the upgrade of system utilities which interact closely with the kernel.</p> <p>The Linux kernel sources may be retrieved from any of the Linux FTP sites (see page 111 for a list). On <code>sunsite.unc.edu</code>, for instance, the kernel sources are found in <code>/pub/Linux/kernel</code>, organized into subdirectories by version number.</p> <p>Kernel sources are released as a gzipped tar file. For example, the file containing the 2.0.33 kernel sources is <code>linux-2.0.33.tar.gz</code>.</p> <p>Kernel sources are unpacked in the <code>/usr/src</code> directory, creating the directory <code>/usr/src/linux</code>. It is common practice for <code>/usr/src/linux</code> to be a soft link to another directory which contains the version number, like <code>/usr/src/linux-2.0.33</code>. This way, you can install new kernel sources and test them out before removing the old kernel sources. The commands to create the kernel directory link are</p> <pre># cd /usr/src # mkdir linux-2.0.33 # ln -s linux # ln -s linux-2.0.33 linux # cat &lt;f linux-2.0.33.tar.gz</pre> |                                                                                              |

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

In order to compile the kernel, you must have the `gcc` C compiler installed on your system. `gcc` version 2.6.3 or a more recent version is required to compile the 2.0 kernel.

First `cd` to `/usr/src/linux`. The command `make config` prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing `?` and Enter.

Next, run the command `make dep` to update all of the source dependencies. This is an important step. `make clean` removes old binary files from the kernel source tree.

The command `make zImage` compiles the kernel and writes it to `/usr/src/linux/arch/i386/boot/zImage`. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that `make zImage` uses. A kernel which is too large will exit the kernel compile with the error message: `Kernel Image Too Large`. If this happens, try the command `make bzImage`, which uses a compression system that supports larger kernels. The kernel is written to `/usr/src/linux/arch/i386/boot/bzImage`.

Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like `cp zImage /dev/fd0`) or install the image so LILO will boot from your hard drive. See page 4 for more information.

Grove, 4.9.1

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                   |

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Grove, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this claim limitation:</p> <p style="margin-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="margin-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="margin-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="margin-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="margin-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                   |

Grove  
 “wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>2. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Grove, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                                                                                                  |

Grove

“The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list.”

Claim 2

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Grove, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p><i>See Claims 1-1.3 above.</i></p> |                                                                                                                                                                                                                                                                                                                |

Grove

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                  |

| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Grove, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Grove discloses this limitation:</p> <div style="border: 1px solid gray; padding: 10px; margin: 10px 0;"> <p>In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p>First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p>Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p>The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p>Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0``) or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> </div> <p>Grove, 4.9.1</p> |                                                                                                                  |

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                          |

| 6.3 wherein the processor is configured:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Grove, as evidenced by the example citations below, discloses “wherein the processor is configured:” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <div style="border: 1px solid black; padding: 10px; margin: 10px 0;"> <p>In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p>First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p>Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p>The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p>Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0``) or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> </div> <p>Grove, 4.9.1</p> |                                                                                                      |

Grove  
“wherein the processor is configured”

Claim 6.3

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                 |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p style="padding-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="padding-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="padding-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="padding-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="padding-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                                        |

Grove

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |

Grove

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                         |                                                                                                                                                              |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>16.</b> The method of claim 14, wherein the operating system comprises: a plurality of files.</p> | <p>Grove, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.”</p> |
|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Grove discloses this limitation:

In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.

First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.

Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.

The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.

Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 11 for more information.

Grove, 4.9.1

Grove

“The method of claim 14, wherein the operating system comprises: a plurality of files.”

Claim 16

Grove

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                   |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>19.1</b> The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:</p> | <p>Grove, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Grove discloses this limitation:

In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.

First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.

Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.

The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.

Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.

Grove, 4.9.1

Grove

Claim 19

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

| <p><b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Grove, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p style="padding-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="padding-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="padding-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="padding-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="padding-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                     |

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                |

| <p><b>31.</b> The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Grove, as evidenced by the example citations below, discloses “the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Grove discloses this limitation:</p> <p style="margin-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="margin-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="margin-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="margin-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="margin-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                                                                              |

Grove

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

**Claim 31**

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                |

| <p><b>32.</b> The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Grove, as evidenced by the example citations below, discloses “the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p style="margin-left: 40px;">In order to compile the kernel, you must have the <code>gcc</code> C compiler installed on your system. <code>gcc</code> version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="margin-left: 40px;">First <code>cd</code> to <code>/usr/src/linux</code>. The command <code>make config</code> prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing <code>?</code> and Enter.</p> <p style="margin-left: 40px;">Next, run the command <code>make dep</code> to update all of the source dependencies. This is an important step. <code>make clean</code> removes old binary files from the kernel source tree.</p> <p style="margin-left: 40px;">The command <code>make zImage</code> compiles the kernel and writes it to <code>/usr/src/linux/arch/i386/boot/zImage</code>. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that <code>make zImage</code> uses. A kernel which is too large will exit the kernel compile with the error message: <code>Kernel Image Too Large</code>. If this happens, try the command <code>make bzImage</code>, which uses a compression system that supports larger kernels. The kernel is written to <code>/usr/src/linux/arch/i386/boot/bzImage</code>.</p> <p style="margin-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like <code>cp zImage /dev/fd0</code>) or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                                                                |

Grove

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 32**

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                      |

Grove

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

## Appendix C31

### Invalidity of U.S. Patent 8,880,862 based on Grove

|                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p> | <p>Grove, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Grove discloses this limitation:

In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.

First cd to `/usr/src/linux`. The command `make config` prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing `?` and Enter.

Next, run the command `make dep` to update all of the source dependencies. This is an important step. `make clean` removes old binary files from the kernel source tree.

The command `make zImage` compiles the kernel and writes it to `/usr/src/linux/arch/i386/boot/zImage`. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that `make zImage` uses. A kernel which is too large will exit the kernel compile with the error message: `Kernel Image Too Large`. If this happens, try the command `make bzImage`, which uses a compression system that supports larger kernels. The kernel is written to `/usr/src/linux/arch/i386/boot/bzImage`.

Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like `cp zImage /dev/fd0`) or install the image so LILO will boot from your hard drive. See page 1 for more information.

Grove, 4.9.1

Grove

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Grove, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Grove discloses this limitation:</p> <p style="margin-left: 40px;">In order to compile the kernel, you must have the gcc C compiler installed on your system. gcc version 2.6.3 or a more recent version is required to compile the 2.0 kernel.</p> <p style="margin-left: 40px;">First cd to /usr/src/linux. The command make config prompts you for a number of configuration options. This is the step where you select the hardware that your kernel will support. The biggest mistake to avoid is not including support for your hard disk controller. Without the correct hard disk support in the kernel, the system won't even boot. If you are unsure about what a kernel option means, a short description is available by pressing ? and Enter.</p> <p style="margin-left: 40px;">Next, run the command make dep to update all of the source dependencies. This is an important step. make clean removes old binary files from the kernel source tree.</p> <p style="margin-left: 40px;">The command make zImage compiles the kernel and writes it to /usr/src/linux/arch/i386/boot/zImage. Linux kernels on Intel systems are always compressed. Sometimes the kernel you want to compile is too large to be compressed with the compression system that make zImage uses. A kernel which is too large will exit the kernel compile with the error message: Kernel Image Too Large. If this happens, try the command make bzImage, which uses a compression system that supports larger kernels. The kernel is written to /usr/src/linux/arch/i386/boot/bzImage.</p> <p style="margin-left: 40px;">Once you have the kernel compiled, you need to either copy it to a boot floppy (with a command like ``cp zImage /dev/fd0'') or install the image so LILO will boot from your hard drive. See page 1 for more information.</p> <p>Grove, 4.9.1</p> |                                                                                                                                                                                           |

Grove

“The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.”

**Claim 50**

**Appendix C31**  
**Invalidity of U.S. Patent 8,880,862 based on Grove**

Grove

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C32**

### **Invalidity of U.S. Patent 8,880,862 based on Jones**

The publication Jones, The Microsoft Interactive TV system: An Experience Report, July 1997 (“Jones”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

| <p><b>1 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Jones, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p style="padding-left: 40px;">“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”</p> <p>Jones, §4.</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, § 10.</p> |                                                                                                                                                                                         |

Jones  
“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                 |

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Jones, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p style="padding-left: 40px;">“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”</p> <p>Jones, §4.</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, § 10.</p> <p style="padding-left: 40px;">“Kanji font not in ROM. The set-top boxes we built for the NTT trial contained 1/2 MB of EPROM. This was sufficient for storing the compressed boot image but wasn't large enough to hold a Kanji font.”</p> <p>Jones, § 15.</p> |                                                                                                                                                                                                                                 |

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                          |

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Jones, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, 14 at § 10.</p> <p style="padding-left: 40px;">“Kanji font not in ROM. The set-top boxes we built for the NTT trial contained 1/2 MB of EPROM. This was sufficient for storing the compressed boot image but wasn't large enough to hold a Kanji font.”</p> <p>Jones, § 15.</p> |                                                                                                                                                          |

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Jones, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p style="padding-left: 40px;">“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”</p> <p>Jones, §4.</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, 14 at § 10.</p> |                                                                                                                                                                   |

| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Jones, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See</i> Claims 1-1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”</p> <p>Jones, §4.</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, 14 at § 10.</p> |                                                                                                                                       |

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Jones, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                                                                                |

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                               |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| 5.2 loading the stored compressed boot data from the first memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Jones, as evidenced by the example citations below, discloses “loading the stored compressed boot data from the first memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the stored compressed boot data from the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                               |

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|
| 5.3 accessing the loaded compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Jones, as evidenced by the example citations below, discloses “accessing the loaded compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                           |

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| 5.4 decompressing the accessed compressed boot data;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Jones, as evidenced by the example citations below, discloses “decompressing the accessed compressed boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See Claim 1.3 above.</i></p> |                                                                                                                 |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, § 10.</p> |                                                                                                                                                            |

| <p>8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Jones, as evidenced by the example citations below, discloses<br/> “utilizing the decompressed portion of the operating system to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, § 10.</p> |                                                                                                                                                                                       |

Jones

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |

“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”

Jones, §4.

“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”

Jones, § 10.

“Kanji font not in ROM. The set-top boxes we built for the NTT trial contained 1/2 MB of EPROM. This was sufficient for storing the compressed boot image but wasn't large enough to hold a Kanji font.”

Jones

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

Jones

Claim 11.3

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Jones, as evidenced by the example citations below, discloses<br/> “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, 14 at § 10.</p> |                                                                                                                                                                                             |

Jones  
“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |

| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Jones, as evidenced by the example citations below, discloses<br/> “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“The MMOSA real-time kernel was developed as a cooperative effort between members of the operating systems research group within Microsoft Research and a team of development staff committed to building a small, embedded-systems kernel meeting the needs of interactive television. MMOSA is the internal name for the ITV kernel: it stands for MultiMedia Operating System Architecture.”</p> <p>Jones, §4.</p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, §10.</p> |                                                                                                                                                                                                                                     |

Jones

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                     |

| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Jones, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Jones discloses this limitation:</p> <p><i>See</i> Claims 1.2 and 1.3 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“Set-top boxes boot as follows. First, a small boot loader in EPROM is run. This decompresses a boot image also in the ROM and jumps to its entry point. The ROM boot image contains the MMOSA kernel, the network protocol stack and drivers, and a network boot program. The network boot program sends a DHCP request. It waits for a DHCP reply containing not only the usual IP address, but also some MITV-specific extended results such as sets of IP addresses of Class Store servers and a boot filename to use. It then loads a new boot image from a Class Store via TFTP and jumps to it.”</p> <p>Jones, 14 at § 10.</p> |                                                                                                                                                                                                                                                                                                                                                                                           |

Jones

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Claim 14.3**

**Appendix C32**  
**Invalidity of U.S. Patent 8,880,862 based on Jones**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                             |
