

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

Makinen, 1:10-19

According to a first aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) with a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), the method comprising reading a set of compressed RISC operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions.

Makinen, 1:63-2:4

According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.

The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.

Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.

Makinen, 2:18-39

Preferably, the method of the above first or second aspect of the invention comprises writing the decompressed instruction set to a random access memory (RAM). Thereafter, the decompressed instructions are read from the RAM by the CPU. It is noted that RAM typically offers high access speeds compared to slow (e.g. flash) ROM memory, giving a significant increase in system performance. In this case, increased speed also offers reduced power consumption compared

Makinen

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

to systems which use slow ROM memory and in which power is consumed even when the system is waiting to access the ROM.

Makinen, 2:40-50

According to a third aspect of the present invention there is provided apparatus having a central processing unit (CPU) a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), there being stored in the ROM a set of compressed RISC operating instructions, the CPU being arranged in use to read the compressed instructions from the ROM, to decompress these instructions, and subsequently to operate the apparatus in accordance with the decompressed instructions.

Makinen, 2:51-59

According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.

Makinen, 2:60-3:3:2

The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program

Makinen, 3:45-50

In order to enable the microprocessor 1 to decompress the stored compressed instructions, the flash ROM 4 additionally stores a set of instructions, in uncompressed form, which define the Pkzip decompression program. FIG. 2 shows a memory map of the ROM 4 prior to booting the computer, where a part of the memory space is occupied by the compressed instructions 6 and a part is occupied by the uncompressed Pkzip instructions 7. In FIG. 2, the ROM 4 is shown

Makinen

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

coupled to the microprocessor 1, as is the RAM 3 which at this stage remains empty.

Makinen, 3:56-65

Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6' is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:9

It will be appreciated that the operating system of the computer may be altered by directly accessing the flash ROM 5 to erase and/or rewrite compressed instructions 6 stored therein. However, in some circumstances it may be desirable for the end-user to be able to alter the compressed operating instructions 6, or indeed for the computer itself to be able to 'dynamically' alter the instructions. To this end, the Pkzip compression method may also be stored in the flash ROM 4.

Makinen, 4:10-17

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

Makinen, 4:18-32

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Makinen discloses this limitation:

*See Claim 9.1 above.*

A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6’,8’) to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8’), and writing these to the flash ROM (4).

Makinen, Abstract

At the heart of most modern electronic devices is a microprocessor or central processing unit which operates in accordance with a set of software operating instructions which together form an executable program. The instructions are stored in a digital memory which may be internal to the microprocessor or, as is more usually the case, externally connected to the microprocessor. The set of operating instructions generally define the basic input/output system (BIOS) of the microprocessor together with device drivers, libraries, and user applications.

Makinen

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

Makinen, 1:10-19

According to a first aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) with a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), the method comprising reading a set of compressed RISC operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions.

Makinen, 1:63-2:4

According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.

The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.

Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.

Makinen, 2:18-39

Preferably, the method of the above first or second aspect of the invention comprises writing the decompressed instruction set to a random access memory (RAM). Thereafter, the decompressed instructions are read from the RAM by the CPU. It is noted that RAM typically offers high access speeds compared to slow (e.g. flash) ROM memory, giving a significant increase in system performance. In this case, increased speed also offers reduced power consumption compared

Makinen

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

to systems which use slow ROM memory and in which power is consumed even when the system is waiting to access the ROM.

Makinen, 2:40-50

According to a third aspect of the present invention there is provided apparatus having a central processing unit (CPU) a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), there being stored in the ROM a set of compressed RISC operating instructions, the CPU being arranged in use to read the compressed instructions from the ROM, to decompress these instructions, and subsequently to operate the apparatus in accordance with the decompressed instructions.

Makinen, 2:51-59

According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.

Makinen, 2:60-3:3:2

The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program

Makinen, 3:45-50

In order to enable the microprocessor 1 to decompress the stored compressed instructions, the flash ROM 4 additionally stores a set of instructions, in uncompressed form, which define the Pkzip decompression program. FIG. 2 shows a memory map of the ROM 4 prior to booting the computer, where a part of the memory space is occupied by the compressed instructions 6 and a part is occupied by the uncompressed Pkzip instructions 7. In FIG. 2, the ROM 4 is shown

Makinen

Claim 10

“The method of claim 9, wherein the compressing comprises: compressing the additional portion of the operating system with a data compression encoder”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

coupled to the microprocessor 1, as is the RAM 3 which at this stage remains empty.

Makinen, 3:56-65

Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6' is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:9

It will be appreciated that the operating system of the computer may be altered by directly accessing the flash ROM 5 to erase and/or rewrite compressed instructions 6 stored therein. However, in some circumstances it may be desirable for the end-user to be able to alter the compressed operating instructions 6, or indeed for the computer itself to be able to 'dynamically' alter the instructions. To this end, the Pkzip compression method may also be stored in the flash ROM 4.

Makinen, 4:10-17

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

Makinen, 4:18-32

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Makinen, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claim 1.1 and 6(Preamble) above.</i></p> <p style="padding-left: 40px;">Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6’ is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6’.</p> <p>Makinen, 3:66-4:9</p> |                                                                                                                                                                                                                                      |

Makinen

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                     |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Makinen discloses this limitation:</p> <p style="padding-left: 40px;">A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6’,8’) to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8’), and writing these to the flash ROM (4).</p> <p>Makinen, Abstract</p> <p style="padding-left: 40px;">At the heart of most modern electronic devices is a microprocessor or central processing unit which operates in accordance with a set of software operating instructions which together form an executable program. The instructions are stored in a digital memory which may be internal to the microprocessor or, as is more usually the case, externally connected to the microprocessor. The set of operating instructions generally define the basic input/output system (BIOS) of the microprocessor together with device drivers, libraries, and user applications.</p> <p>Makinen, 1:10-19</p> |                                                                                                                                                                                          |

Makinen

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## **Appendix C13**

### **Invalidity of U.S. Patent 8,880,862 based on Makinen**

According to a first aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) with a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), the method comprising reading a set of compressed RISC operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions.

Makinen, 1:63-2:4

According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.

The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.

Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.

Makinen, 2:18-39

Preferably, the method of the above first or second aspect of the invention comprises writing the decompressed instruction set to a random access memory (RAM). Thereafter, the decompressed instructions are read from the RAM by the CPU. It is noted that RAM typically offers high access speeds compared to slow (e.g. flash) ROM memory, giving a significant increase in system performance. In this case, increased speed also offers reduced power consumption compared to systems which use slow ROM memory and in which power is consumed even when the system is waiting to access the ROM.

Makinen, 2:40-50

Makinen

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

According to a third aspect of the present invention there is provided apparatus having a central processing unit (CPU) a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), there being stored in the ROM a set of compressed RISC operating instructions, the CPU being arranged in use to read the compressed instructions from the ROM, to decompress these instructions, and subsequently to operate the apparatus in accordance with the decompressed instructions.

Makinen, 2:51-59

According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.

Makinen, 2:60-3:3:2

The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program

Makinen, 3:45-50

In order to enable the microprocessor 1 to decompress the stored compressed instructions, the flash ROM 4 additionally stores a set of instructions, in uncompressed form, which define the Pkzip decompression program. FIG. 2 shows a memory map of the ROM 4 prior to booting the computer, where a part of the memory space is occupied by the compressed instructions 6 and a part is occupied by the uncompressed Pkzip instructions 7. In FIG. 2, the ROM 4 is shown coupled to the microprocessor 1, as is the RAM 3 which at this stage remains empty.

Makinen, 3:56-65

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

Page 83 of 158

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6' is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:9

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

Makinen, 4:18-32

| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Makinen, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p style="padding-left: 40px;">A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6’,8’) to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8’), and writing these to the flash ROM (4).</p> <p>Makinen, Abstract</p> <p style="padding-left: 40px;">According to a first aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) with a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), the method comprising reading a set of compressed RISC operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions.</p> <p>Makinen, 1:63-2:4</p> |                                                                                                                                                                                                                                  |

**Makinen**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

## **Appendix C13**

### **Invalidity of U.S. Patent 8,880,862 based on Makinen**

According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.

The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.

Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.

Makinen, 2:18-39

Preferably, the method of the above first or second aspect of the invention comprises writing the decompressed instruction set to a random access memory (RAM). Thereafter, the decompressed instructions are read from the RAM by the CPU. It is noted that RAM typically offers high access speeds compared to slow (e.g. flash) ROM memory, giving a significant increase in system performance. In this case, increased speed also offers reduced power consumption compared to systems which use slow ROM memory and in which power is consumed even when the system is waiting to access the ROM.

Makinen, 2:40-50

According to a third aspect of the present invention there is provided apparatus having a central processing unit (CPU) a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), there being stored in the ROM a set of compressed RISC operating instructions, the CPU being arranged in use to read the compressed instructions from the ROM, to decompress these instructions, and subsequently to operate the apparatus in accordance with the decompressed instructions.

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Claim 14.1**

Page 93 of 158

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

Makinen, 2:51-59

According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.

Makinen, 2:60-3:3:2

The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program

Makinen, 3:45-50

It will be appreciated that the operating system of the computer may be altered by directly accessing the flash ROM 5 to erase and/or rewrite compressed instructions 6 stored therein. However, in some circumstances it may be desirable for the end-user to be able to alter the compressed operating instructions 6, or indeed for the computer itself to be able to 'dynamically' alter the instructions. To this end, the Pkzip compression method may also be stored in the flash ROM 4.

Makinen, 4:10-17

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Makinen discloses this limitation:

*See* Claims 1.2 and 1.3 above.

A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6',8') to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8'), and writing these to the flash ROM (4).

Makinen, Abstract

At the heart of most modern electronic devices is a microprocessor or central processing unit which operates in accordance with a set of software operating instructions which together form an executable

**Makinen**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

program. The instructions are stored in a digital memory which may be internal to the microprocessor or, as is more usually the case, externally connected to the microprocessor. The set of operating instructions generally define the basic input/output system (BIOS) of the microprocessor together with device drivers, libraries, and user applications.

Makinen, 1:10-19

According to a first aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) with a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), the method comprising reading a set of compressed RISC operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions.

Makinen, 1:63-2:4

According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.

The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.

Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.

Makinen, 2:18-39

Makinen

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 97 of 158

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

Preferably, the method of the above first or second aspect of the invention comprises writing the decompressed instruction set to a random access memory (RAM). Thereafter, the decompressed instructions are read from the RAM by the CPU. It is noted that RAM typically offers high access speeds compared to slow (e.g. flash) ROM memory, giving a significant increase in system performance. In this case, increased speed also offers reduced power consumption compared to systems which use slow ROM memory and in which power is consumed even when the system is waiting to access the ROM.

Makinen, 2:40-50

According to a third aspect of the present invention there is provided apparatus having a central processing unit (CPU) a reduced instruction set computer (RISC) architecture, and a read only memory (ROM), there being stored in the ROM a set of compressed RISC operating instructions, the CPU being arranged in use to read the compressed instructions from the ROM, to decompress these instructions, and subsequently to operate the apparatus in accordance with the decompressed instructions.

Makinen, 2:51-59

According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.

Makinen, 2:60-3:3:2

The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program

Makinen, 3:45-50

Makinen

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

Page 98 of 158

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

In order to enable the microprocessor 1 to decompress the stored compressed instructions, the flash ROM 4 additionally stores a set of instructions, in uncompressed form, which define the Pkzip decompression program. FIG. 2 shows a memory map of the ROM 4 prior to booting the computer, where a part of the memory space is occupied by the compressed instructions 6 and a part is occupied by the uncompressed Pkzip instructions 7. In FIG. 2, the ROM 4 is shown coupled to the microprocessor 1, as is the RAM 3 which at this stage remains empty.

Makinen, 3:56-65

Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6' is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:9

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

Makinen, 4:18-32

| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1 (Preamble) and 1.1 above.</p> <p style="padding-left: 40px;">Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6’ is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6’.</p> <p>Makinen, 3:66-4:9</p> <p style="padding-left: 40px;">It will be appreciated that the operating system of the computer may be altered by directly accessing the flash ROM 5 to erase and/or rewrite compressed instructions 6 stored therein. However, in some circumstances it may be desirable for the end-user to be able to alter the compressed operating instructions 6, or indeed for the computer itself to be able to ‘dynamically’ alter the instructions. To this end, the Pkzip compression method may also be stored in the flash ROM 4.</p> <p>Makinen, 4:10-4:17</p> |                                                                                                                                                                                        |

Makinen

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                    |

| <p><b>17.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claim 15 above.</i></p> <p style="padding-left: 40px;">At the heart of most modern electronic devices is a microprocessor or central processing unit which operates in accordance with a set of software operating instructions which together form an executable program. The instructions are stored in a digital memory which may be internal to the microprocessor or, as is more usually the case, externally connected to the microprocessor. The set of operating instructions generally define the basic input/output system (BIOS) of the microprocessor together with device drivers, libraries, and user applications.</p> <p>Makinen, 1:10-19</p> <p style="padding-left: 40px;">The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program. The compressed instructions occupy considerably less flash ROM space than would the corresponding uncompressed instructions, e.g. ½ to ⅓ of the memory space. Such a high compression ratio results from the particular structure of RISC instructions.</p> <p>Makinen, 3:46-55</p> |                                                                                                                                                                                                                   |

**Makinen**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

## Appendix C13

### Invalidity of U.S. Patent 8,880,862 based on Makinen

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                                                                     |

| <p><b>19.1</b> The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above</p> <p style="padding-left: 40px;">Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilises a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer's CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.</p> <p>Makinen, 1:34-55</p> <p style="padding-left: 40px;">Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6' is then stored in the RAM 3 as shown in FIG. 3. The last</p> |                                                                                                                                                                                                                                                                     |

**Makinen**

**Claim 19**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code. Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:28

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

Makinen, 4:18-4:31

| <p>19.2 associating the accessed boot data that is not associated with the boot data list to the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Makinen, as evidenced by the example citations below, discloses “associating the accessed boot data that is not associated with the boot data list to the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, associating the accessed boot data that is not associated with the boot data list to the boot data list.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claim 2 above.</i></p> <p style="padding-left: 40px;">Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilises a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer’s CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.</p> <p>Makinen, 1:34-55</p> <p style="padding-left: 40px;">Upon booting of the computer, the microprocessor 1 is directed by hardwired logic to read the first instruction of the decompressed instruction set 7, from the ROM 4. Thereafter the microprocessor is directed, by the decompressed set, to read and decompress the compressed instruction set 6. The expanded instruction set 6’ is then stored in the RAM 3 as shown in FIG. 3. The last operation that the set of decompression instructions perform is to cause the microprocessor 1 to jump to the first instruction in the decompressed code.</p> |                                                                                                                                                                                  |

Makinen

**Claim 19.2**

“associating the accessed boot data that is not associated with the boot data list to the boot data list.”

Page 106 of 158

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

Thereafter, the computer is operated in accordance with the decompressed operating instructions 6'.

Makinen, 3:66-4:28

In order to reduce memory requirements, the corresponding Pkzip instructions may be stored in compressed form 8 as illustrated in FIG. 4. During booting, the compressed Pkzip instructions 8 are read from the flash ROM 4 by the microprocessor 1, decompressed, and stored in the RAM 3 as decompressed instructions 8' together with the decompressed operating instructions 6' (FIG. 4). Alternatively, the compressed Pkzip instructions 8 may only be read from the flash ROM 4, and subsequently decompressed, when a specific request is made to alter the compressed instructions 6,8. In either case, the microprocessor 1 employs the decompressed Pkzip method to compress an amended version of the operating instructions 6',8' and writes the compressed instructions to the corresponding areas of the flash ROM.

| <p><b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Makinen, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above</i></p> <p style="padding-left: 40px;">A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6’,8’) to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8’), and writing these to the flash ROM (4).</p> <p>Makinen, Abstract</p> <p style="padding-left: 40px;">Software instructions defining the basic operation of a microprocessor are usually stored in non-volatile read only memory (ROM). Until recently, the preferred choice for storing operating instructions was UV light erasable programmable read only memory. More recently however, the preferred choice for storing operating instructions, especially in embedded devices (e.g. mobile phones, personal digital assistants, etc) has become flash ROM. Flash ROM is both non-volatile and electrically erasable and is used, to a large extent, because it can be programmed following assembly of the PCB containing the flash ROM prior of the completed device. A further advantage is that it is possible to upgrade operating instruction stored in the flash ROM at some future date.</p> <p>Makinen, 1:20-33</p> |                                                                                                                                                       |

Makinen

“The method of claim 1, wherein the memory comprises: a physical memory”

**Claim 27**

## **Appendix C13**

### **Invalidity of U.S. Patent 8,880,862 based on Makinen**

Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilises a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer's CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.

Makinen, 1:34-55

| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 32 above.</p> <p style="padding-left: 40px;">The flash ROM 4 is used to store a set of RISC operating instructions which define the basic input/output system (BIOS) of the microprocessor as well as the device drivers, libraries, and user applications. The instructions are in compressed form, having previously been compressed using the Pkzip compression program. The compressed instructions occupy considerably less flash ROM space than would the corresponding uncompressed instructions, e.g. ½ to ⅓ of the memory space. Such a high compression ratio results from the particular structure of RISC instructions.</p> <p>Makinen, 3:46-55</p> <p style="padding-left: 40px;">It will be appreciated by the person of skill in the art that other modifications may be made to the embodiments described above without departing from the scope of the present invention. For example, compression algorithms other than Pkzip may be used, including Gzip-9, Zoo-a, and Arj-a. Compression methods may also be optimised for ARM (Trade Mark) processors.</p> <p>Makinen, 4:38-45</p> |                                                                                                                                                                                                        |

| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above</i></p> <p>Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilises a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer’s CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.</p> <p>Makinen 1:34-55</p> |                                                                                                                                                                                                                                                                             |

**Makinen**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                   |

| <p><b>49.</b> The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Makinen, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See Claim 10 above.</i></p> <p>Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilizes a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer's CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.</p> <p>Makinen, 1:34-55</p> |                                                                                                                                                                                                                     |

**Makinen**

“The system of claim 6, further comprising: an encoder configured to compress the boot data to provide the boot data in the compressed form.”

**Claim 49**

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                             |

| <p><b>50.</b> The system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Makinen, as evidenced by the example citations below, discloses “the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form”</p> |
| <p>To the extent that Realtme contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, further comprising: a decoder configured to decompress the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p>Compared to conventional ROM, flash ROM remains expensive. There therefore exists a desire to reduce the amount of flash ROM used in individual products. Furthermore, accessing flash ROM is relatively slow, significantly reducing the performance of electronic devices. Conventional computer architectures rely upon a complex instruction set computer (CISC) architecture. This utilises a large number (e.g. 1000) of instructions which define very specific tasks. The instructions are of variable length and are decoded by the computer's CPU before execution. There is described in Japanese non-examined patent publication no. 55-131848 a data processing unit which comprises a central processing unit, a main memory unit, and an external memory unit. A compressed program is stored in the external memory unit and, before commencing processing operations, the compressed program is read from the external memory unit in blocks and decompressed. The decompressed program is then written to the main memory unit. However, the compression ratio which can be achieved with CISC code is relatively low and it is not believed that the disclosure of JP-131848 has been widely used.</p> <p>Makinen, 1:34-55</p> |                                                                                                                                                                                             |

| <p><b>98.</b> The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">A computer having a reduced instruction computer (RISC) architecture has a RISC central processing unit (CPU)(1) coupled to a RAM memory (3) and to a flash ROM memory (4). A set of compressed operating instructions (6,8), including a subset defining a compression method (8), are stored in the flash ROM (4) together with a set of uncompressed instructions (7) defining a compression algorithm. Upon booting of the computer, the uncompressed instructions (7) are read from the ROM (4) by the CPU (1) which then also reads the compressed instructions (6,8), decompresses them according to the decompression process (7), and writes the decompressed instructions (6’,8’) to the RAM (3). The compressed instructions (6,8) can be dynamically altered by the CPU (1), by generating an altered set of uncompressed instructions, compressing these in accordance with the now decompressed compression method (8’), and writing these to the flash ROM (4).</p> <p>Makinen, Abstract</p> <p style="padding-left: 40px;">It will be appreciated that the operating system of the computer may be altered by directly accessing the flash ROM 5 to erase and/or rewrite compressed instructions 6 stored therein. However, in some circumstances it may be desirable for the end-user to be able to alter the compressed operating instructions 6, or indeed for the computer itself to be able to ‘dynamically’ alter the instructions. To this end, the Pkzip compression method may also be stored in the flash ROM 4.</p> <p>Makinen, 4:10-17</p> |                                                                                                                                                                                               |

Makinen

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                             |

| <p><b>107.</b> The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">Software instructions defining the basic operation of a microprocessor are usually stored in non-volatile read only memory (ROM). Until recently, the preferred choice for storing operating instructions was UV light erasable programmable read only memory. More recently however, the preferred choice for storing operating instructions, especially in embedded devices (e.g. mobile phones, personal digital assistants, etc) has become flash ROM. Flash ROM is both non-volatile and electrically erasable and is used, to a large extent, because it can be programmed following assembly of the PCB containing the flash ROM prior of the completed device. A further advantage is that it is possible to upgrade operating instruction stored in the flash ROM at some future date.</p> <p>Makinen, 1:20-33</p> |                                                                                                                                                                             |

Makinen

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                                                                                                                                                                         |

| <b>108.</b> The method of claim 2, further comprising: compressing at least a portion of the additional boot data.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Makinen, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 1.1, 5, 9.1 and 8 above.</p> <p style="padding-left: 40px;">The above second aspect of the present invention makes it possible to amend the stored compressed instructions in a dynamic manner. This may, for example, allow a user to configure the computer according to his specific needs.</p> <p style="padding-left: 40px;">Preferably, the method comprises the step of reading a set of operating instructions from the ROM into the CPU, which instructions define a program for compressing said replacement or additional instruction(s). More preferably, the instructions defining the compression program form part of said set of compressed operating instructions.</p> <p>Makinen, 2:29-39</p> |                                                                                                                                                                         |

Makinen

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C13**  
**Invalidity of U.S. Patent 8,880,862 based on Makinen**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                                                                                                                                                                   |

| <p><b>109.</b> The method of claim 108, further comprising: storing the compressed additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Makinen, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Makinen discloses this limitation:</p> <p><i>See</i> Claims 5.1, 8.1 and 9.1 above.</p> <p style="padding-left: 40px;">According to a second aspect of the present invention there is provided a method of operating apparatus having a central processing unit (CPU) and a read only memory (ROM), the method comprising reading a set of compressed operating instructions from the ROM into the CPU, decompressing the compressed instructions in the CPU, and thereafter operating the apparatus in accordance with the decompressed instructions, the method further comprising generating one or more replacement or additional compressed instructions in the CPU and writing the compressed instruction(s) to the ROM.</p> <p>Makinen, 2:18-28</p> <p style="padding-left: 40px;">According to a fourth aspect of the present invention there is provided apparatus comprising a central processing unit (CPU), a read only memory (ROM), and a set of compressed operating instructions stored in the ROM, the CPU being arranged in use to read the compressed instructions from the ROM, decompress the compressed instructions, and thereafter operate the apparatus in accordance with the decompressed instructions, the apparatus being further arranged in use to compress replacement or additional operating instructions and to write these compressed instructions to the ROM.</p> <p>Makinen, 2:60-3:2</p> |                                                                                                                                                                   |

Makinen

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C14**

### **Invalidity of U.S. Patent 8,880,862 based on Noll**

U.S. Patent No. 5,793,943 to Noll (“Noll”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

| <p><b>1 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Noll, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the following detailed description and accompanying figures.”</p> <p>Noll, 1:29-42.</p> <p style="padding-left: 40px;">“The present invention is embodied in a system for the automatic</p> |                                                                                                                                                                                        |

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Noll, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable</p> |                                                                                                                                                                                                                                |

## Appendix C14

### Invalidity of U.S. Patent 8,880,862 based on Noll

the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Noll

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Noll, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the</p> |                                                                                                                                                         |

Noll  
“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Noll

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Noll, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the</p> |                                                                                                                                                                                                                                                                                                         |

Noll

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

following detailed description and accompanying figures.”

Noll, 1:29-42.

“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Noll

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Noll, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the</p> |                                                                                                                                                                  |

| <p>2. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list.</p> | <p>Noll, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list.”</p> |
|----------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Noll discloses this limitation:

See Claim 1.4.1 above.

The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather the first BIOS memory.

Noll, 1:14-26

In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the first BIOS memory is reprogrammed using the series of computer instructions that have been copied into the RAM. The first BIOS memory may be a flash

Claim 2

“The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list.”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

programmable read-only memory. Although not necessary, the second BIOS memory may also be a flash-programmable read-only memory.

Noll, 1:64-2:13

An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.

Noll, 5:2-24

Noll

"The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list."

Claim 2

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                           |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>3.</b> The method of claim 1, wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>Noll, as evidenced by the example citations below, discloses “wherein the updating comprises: removing an association of additional boot data that is associated with the boot data list from the boot data list.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein removing an association of additional boot data that is associated with the boot data list from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> <p>FIGS. 2A and 2B are flowcharts illustrating the software controlling the operation of the CPU 12 in the preferred embodiment of the present invention. At a start 200, the computer 10 (see FIG. 1) has been turned on, or reset such that the computer will undergo an initialization. In step 201, the CPU 12 resets the error flag 20. In step 202, the CPU 12 checks to determine whether the primary BIOS ROM 22 contains a data error. If there is no data error, the result of decision 202 is NO. In that event, the computer 10 continues with the POST procedure in step 204 and boots the computer 10 in the conventional fashion. If the primary BIOS ROM 22 contains an error, the result of decision 202 is YES. In that event, the CPU 12 sets the error flag 20 in step 206. In step 210, the CPU 12 causes the chip enable circuit 36 to change the level of the ROMSEL2 control line 42, thus disabling operation of the primary BIOS ROM 22 and enabling operating of the secondary BIOS ROM 30.</p> <p>Noll, 6:65- 7:14</p> |                                                                                                                                                                                                                           |

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |                                                                                                                                                                                                                        |

| <p><b>4.</b> The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Noll, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, and 2 above.</p> <p style="padding-left: 40px;">An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.</p> <p>Noll, 5:2-24</p> |                                                                                                                                                                                                                        |

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                      |

| <p><b>5 (Preamble)</b> A method for booting a computer system, the method comprising:</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Noll, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claims 1-1.4.2 above.</i></p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the</p> |                                                                                                                                      |

second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the following detailed description and accompanying figures.”

Noll, 1:29-42.

| <p>5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Noll, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p style="padding-left: 40px;">Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it. An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.</p> <p>Noll, 4:66-5:24</p> |                                                                                                                                                                                      |

| <p>To the extent that Realtme contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claims 1.3 and 1.4.2 above.</i></p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the</p> |                                                                                                                                                           |

| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Noll, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
| <p>To the extent that Realtme contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the following detailed description and accompanying figures.”</p> <p>Noll, 1:29-42.</p> |                                                                                                                 |

## Appendix C14

### Invalidity of U.S. Patent 8,880,862 based on Noll

|                                                                                                                                              |                                                                                                                                                                                                         |
|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor | Noll, as evidenced by the example citations below, discloses “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor” |
|----------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Noll discloses this limitation:

*See* Claims 1.1, 1.2, and Claim 6 (Preamble) above.

A typical computer contains a single BIOS ROM (not shown) that contains a series of instructions to initialize the computer. If the BIOS ROM fails for whatever reason, the computer will not function properly. In contrast, the present invention has a backup, or secondary BIOS ROM that is automatically enabled upon detection of an error in the first or primary BIOS ROM. At the same time, the primary BIOS ROM is disabled. While the examples presented herein illustrate separate devices for the primary and secondary BIOS ROMs, it is possible to have a single memory device with one portion used as the primary BIOS and a second portion used as the secondary BIOS.

Noll, 2:33-44

The computer 10 also includes a secondary or backup BIOS ROM 30. The secondary BIOS ROM could be the same chip type as the primary BIOS ROM 22 to reduce the number of different components required to assemble the computer 10. However, successful operation of the computer 10 does not require that the secondary BIOS ROM 30 be programmable. The secondary BIOS ROM 30 also has a chip enable input 32 to activate operation of the secondary BIOS ROM.

Noll, 3:17-25

Thus, the instructions contained within the primary BIOS ROM 22 are copied into the RAM 14 so that the instructions may be executed more rapidly by the CPU 12. Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.

Noll

Claim 6.2

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

Noll, 4:63-5:2

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the</p> |                                                                                                                                                                                      |

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

following detailed description and accompanying figures.”

Noll, 1:29-42.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Claim 8.7

“wherein the portion of the operating system is accessed and decompressed at a rate that is faster than accessing the loaded portion of the operating system from the first memory if the portion of the operating system was to be stored in the first memory in an uncompressed form”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                            |                                                                                                                                                                                                                           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>9.1</b> The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list; and</p> | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”</p> |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Noll discloses this limitation:

*See* Claim 1.1 above.

“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”

Noll, Abstract.

“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the

Noll

Claim 9.1

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather than the first BIOS memory.”

Noll, 1:44-63.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Noll

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

Claim 9.1

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing the additional portion of the operating system in the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claim 8.1 above.</i></p> <p style="padding-left: 40px;">In one embodiment, the present invention is embodied in a computer 10 illustrated in the functional block diagram of FIG. 1. The computer 10 includes a central processing unit (CPU) 12, such as an Intel Pentium® microprocessor. The computer 10 also includes a random access memory (RAM) 14 and a low power RAM 18, such as a CMOS RAM. The CMOS RAM 18 is used to store configuration data for the computer 10 and is typically powered by a back-up battery (not shown) when the computer is turned off. As will be discussed in detail below, a memory location in the CMOS RAM 18 stores an error flag 20 as an error signal that is written into the CMOS RAM 18 when the computer 10 detects errors. However, the error flag 20 can be stored in the RAM 14 or other suitable storage location.</p> <p>Noll, 1:64-2:13</p> |                                                                                                                                                  |

Noll  
“storing the additional portion of the operating system in the first memory”

Claim 9.2

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                               |

| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>Noll, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claim 1.1 and 6(Preamble) above.</i></p> <p style="padding-left: 40px;">As discussed above, the contents of the primary BIOS ROM 22 are copied into the low portion of the RAM 14 as part of the shadowing POST procedure. However, if an error was detected in the primary BIOS ROM 22, the secondary BIOS ROM 30 is activated. Thus, it is the data contents of the secondary BIOS ROM 30 that are copied into the low portion of the RAM 14. Initialization and operation of the computer 10 proceed as described above with respect to the primary BIOS ROM 22, with the exception that the instructions themselves are provided by the secondary BIOS ROM 30. The error detection circuit 54 also performs an error detection test on the secondary BIOS ROM 30 using the definition of error previously discussed with respect to the primary BIOS ROM 22. If errors are detected in both the primary BIOS ROM 22 and the secondary BIOS ROM 30, the computer 10 cannot be properly initialized. However, a simultaneous failure of both devices is not likely to occur.</p> <p>Noll, 6:1-17</p> |                                                                                                                                                                                                                                   |

Noll

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                  |

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p style="padding-left: 40px;">“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”</p> <p>Noll, Abstract.</p> <p style="padding-left: 40px;">“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system, such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the</p> |                                                                                                                                                                                            |

**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                             |                                                                                                                                                                                                                               |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.1</b> accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;</p> | <p>Noll, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Noll discloses this limitation:

See Claims 1.1 and 1.2 above.

“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”

Noll, Abstract.

“The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is

Noll

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Noll discloses this limitation:

See Claims 1.2 and 1.3 above.

“A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.”

Noll, Abstract.

“For example, when the computer is first powered up or reset, a software program, typically designated as a "basic input-output system" (BIOS) initializes the computer and permits the startup of an operating system,

Noll

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

such as Microsoft MS-DOS®. The BIOS program typically resides in a read-only memory (ROM). If the BIOS ROM is defective for any reason, the computer will not function properly. Therefore, it can be appreciated that there is a significant need for a system to recover from a BIOS ROM failure in a manner that does not require user intervention. The present invention provides this and other advantages as will be apparent from the following detailed description and accompanying figures.”

Noll, 1:29-42.

“Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it.”

Noll, 4:66-5:2.

Noll

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

| <p><b>15.</b> The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See</i> Claims 1 (Preamble) and 1.1 above.</p> <p style="padding-left: 40px;">A computer system includes a dual basic input-output system (BIOS) read-only memory (ROM) system to initialize the computer. When the computer is first powered on or reset, the primary BIOS ROM is initially enabled. The computer analyzes the entire program contents of the primary BIOS memory to detect data errors. If a data error is detected, a chip enable circuit disables the primary BIOS ROM and enables a secondary BIOS ROM containing essentially the same initialization instructions as the primary BIOS ROM. If no errors are detected in the secondary BIOS ROM, the initialization of the computer proceeds using the secondary BIOS ROM. As part of the initialization procedure, the contents of the secondary BIOS ROM are copied to a random access memory. The primary BIOS ROM can then be reprogrammed with the contents of the secondary BIOS ROM using the copy in random access memory, or from the secondary BIOS ROM itself.</p> <p>Noll, Abstract</p> |                                                                                                                                                                                     |

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                                                               |                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>19.1</b> The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:</p> | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Noll discloses this limitation:

*See* Claims 1.1 and 1.2 above

The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather the first BIOS memory.

Noll, 1:14-26

In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS

Noll

**Claim 19**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

## Appendix C14

### Invalidity of U.S. Patent 8,880,862 based on Noll

memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the first BIOS memory is reprogrammed using the series of computer instructions that have been copied into the RAM. The first BIOS memory may be a flash programmable read-only memory. Although not necessary, the second BIOS memory may also be a flash-programmable read-only memory.

Noll, 1:64-2:13

An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.

Noll, 5:2-24

Noll

"The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:"

**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                               |                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 19.2 associating the accessed boot data that is not associated with the boot data list to the boot data list. | Noll, as evidenced by the example citations below, discloses “associating the accessed boot data that is not associated with the boot data list to the boot data list” |
|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, associating the accessed boot data that is not associated with the boot data list to the boot data list.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Noll discloses this limitation:

*See Claim 2 above.*

The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather the first BIOS memory.

Noll, 1:14-26

In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the first BIOS memory is reprogrammed using the series of computer instructions that have been copied into the RAM. The first BIOS memory may be a flash

| <p><b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Noll, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above</i></p> <p style="padding-left: 40px;">In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the first BIOS memory is reprogrammed using the series of computer instructions that have been copied into the RAM. The first BIOS memory may be a flash programmable read-only memory. Although not necessary, the second BIOS memory may also be a flash-programmable read-only memory.</p> <p>Noll, 1:64-2:13</p> |                                                                                                                                                    |

Noll

“The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 29**

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

|                                                                                                                                                                          |                                                                                                                                                                                                                             |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>31.</b> The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.</p> | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Noll discloses this limitation:

*See* Claims 1.1 and 1.2 above

As part of the normal setup procedures, instructions contained within the primary BIOS ROM 22 cause the CPU 12 to perform a "Power-On Self Test" (POST). The POST procedure may include routines such as a check of the RAM 14, peripheral devices (not shown), and the like. The POST procedure is well known to those of ordinary skill in the art, and need not be described in detail herein. As part of the POST procedure, the data in the primary BIOS ROM 22 is copied to the RAM 14. This process is sometimes known as shadowing to reflect the fact that a complete copy of the data in the primary BIOS ROM 22 is copied or shadowed into the RAM 14. One reason for copying the primary BIOS ROM 22 into the RAM 14 is that the access time for the RAM is typically much less than the access time for the primary BIOS ROM. Thus, the instructions contained within the primary BIOS ROM 22 are copied into the RAM 14 so that the instructions may be executed more rapidly by the CPU 12. Another reason that the primary BIOS ROM 22 is copied into the RAM 14 is that some data in the primary BIOS ROM may be in a compressed format and must be decompressed before the CPU 12 can use it. An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not

Noll

**Claim 31**

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.

Noll, 4:49-5:24

Noll

“The method of claim 1, wherein the accessing comprises: accessing the loaded portion of the boot data in the compressed form via direct memory access.”

| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above</i></p> <p style="padding-left: 40px;">A typical computer contains a single BIOS ROM (not shown) that contains a series of instructions to initialize the computer. If the BIOS ROM fails for whatever reason, the computer will not function properly. In contrast, the present invention has a backup, or secondary BIOS ROM that is automatically enabled upon detection of an error in the first or primary BIOS ROM. At the same time, the primary BIOS ROM is disabled. While the examples presented herein illustrate separate devices for the primary and secondary BIOS ROMs, it is possible to have a single memory device with one portion used as the primary BIOS and a second portion used as the secondary BIOS.</p> <p>Noll, 2:33-44</p> <p style="padding-left: 40px;">The computer 10 also includes a secondary or backup BIOS ROM 30. The secondary BIOS ROM could be the same chip type as the primary BIOS ROM 22 to reduce the number of different components required to assemble the computer 10. However, successful operation of the computer 10 does not require that the secondary BIOS ROM 30 be programmable. The secondary BIOS ROM 30 also has a chip enable input 32 to activate operation of the secondary BIOS ROM.</p> <p>Noll, 3:17-25</p> |                                                                                                                                                                                                                                                                          |

| <p><b>98.</b> The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather the first BIOS memory.</p> <p>Noll, 1:14-26</p> <p style="padding-left: 40px;">In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the</p> |                                                                                                                                                                                            |

Noll

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

## Appendix C14

### Invalidity of U.S. Patent 8,880,862 based on Noll

first BIOS memory is reprogrammed using the series of computer instructions that have been copied into the RAM. The first BIOS memory may be a flash programmable read-only memory. Although not necessary, the second BIOS memory may also be a flash-programmable read-only memory.

Noll, 1:64-2:13

An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.

| <p><b>107.</b> The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Noll, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Noll discloses this limitation:</p> <p><i>See</i> Claims 1.4.1, 5.6, and 8.6 above.</p> <p style="padding-left: 40px;">The present invention is embodied in a system for the automatic recovery of a BIOS ROM failure. In one embodiment, the system includes a first BIOS memory that contains a series of computer instructions to initialize the computer. The first BIOS memory has a chip enable input that is initially enabled. An error detection circuit analyzes data contained within the first BIOS memory and detects errors therein. The error detection circuit generates an error signal upon detection of errors in the first BIOS memory. The system also includes a second BIOS memory containing the series of computer instructions to initialize the computer and also having a chip enable input. An enabling circuit is included to disable the first BIOS memory chip enable input and to enable the second BIOS memory chip enable input in response to the error signal. This effectively causes the computer system to switch to the second BIOS memory so that the series of computer instructions to initialize the computer are executed from the second BIOS memory rather the first BIOS memory.</p> <p>Noll, 1:14-26</p> <p style="padding-left: 40px;">In one embodiment, the first BIOS memory is programmable and has a programming enable input. The error detection circuit verifies that the second BIOS memory does not have altered data and reprograms the first BIOS memory using the computer instructions stored within the second BIOS memory. As part of the computer instructions to initialize the computer, the computer executes a power-on self-test (POST). During the POST, the computer copies the series of computer instructions from the second BIOS memory to a random access memory (RAM). In this embodiment, the system includes a memory loader to copy the series of instructions to the RAM, and the first BIOS memory is reprogrammed using the series of computer instructions</p> |                                                                                                                                                                          |

Noll

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

**Appendix C14**  
**Invalidity of U.S. Patent 8,880,862 based on Noll**

that have been copied into the RAM. The first BIOS memory may be a flash programmable read-only memory. Although not necessary, the second BIOS memory may also be a flash-programmable read-only memory.

Noll, 1:64-2:13

An exact copy of the data in the primary BIOS ROM 22 is initially copied into a low address portion of the RAM 14. After the primary BIOS ROM 22 has been copied into the low address portion of the RAM 14, the chip enable circuit 36 sets the ROMSEL1 control line 40 to a low level, thus disabling both the primary BIOS ROM 22 and the secondary BIOS ROM 30. The CPU 12 subsequently executes instructions from the low address portion of the RAM 14. A different portion (not shown) of the RAM 14, typically having an address space that overlap with the address space of the primary BIOS ROM 22, is designated as a "shadow RAM." Once the CPU 12 is executing instructions from the low address portion of the RAM 14, the data in the low address portion is decompressed if necessary and copied to the shadow RAM (not shown). At this point in time, the CPU 12 will begin executing instructions from the addresses in the RAM 14 that correspond with the addresses in the BIOS ROM 22 until the POST procedure is completed. The computer 10 can use the shadow RAM address space because the primary BIOS ROM 22 and the secondary BIOS ROM 30 have both been disabled by the low logic level on the ROMSEL1 control line 40. At that point, the computer 10 will boot the operating system, such as MS-DOS®.

**Claim 109**

## **Appendix C15**

### **Invalidity of U.S. Patent 8,880,862 based on Pearce**

U.S. Patent No. 5,828,877 to Pearce (“Pearce”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

## Appendix C15 Invalidity of U.S. Patent 8,880,862 based on Pearce

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                                                                                                                                                                                          |

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                     |                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Pearce, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Pearce discloses this limitation:

Pearce discloses this claim limitation.

“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it was when power was interrupted.”

Pearce, 1:65-2:10.

“Accordingly, a first embodiment of the present invention provides, in a computer system having a CPU, a main memory (either real or virtual) divisible into allocable units, a secondary storage unit and an operating system for allocating the allocable units to tasks for use thereby, a suspend circuit for creating an optimized compressed image of data in the main memory.”

Pearce, 2:36-43.

“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back

Pearce

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

into the main memory 210, allowing the CPU 200 to continue processing at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

“Execution begins in a start block 500 wherein the portable PC 100 boots, loading initial portions of code commonly stored in nonvolatile memory within the portable PC 100.”

Pearce, 8:39-41, Fig. 5.

Pearce

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Pearce, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it was when power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> <p style="padding-left: 40px;">“Accordingly, a first embodiment of the present invention provides, in a computer system having a CPU, a main memory (either real or virtual) divisible into allocable units, a secondary storage unit and an operating system for allocating the allocable units to tasks for use thereby, a suspend circuit for creating an optimized compressed image of data in the main memory.”</p> <p>Pearce, 2:36-43.</p> <p style="padding-left: 40px;">“Once the contents of main memory have been compressed and stored as an image in the secondary storage device, power to the computer system is interrupted.”</p> <p>Pearce, 2:57-59.</p> <p style="padding-left: 40px;">“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power</p> |                                                                                                                                                           |

Pearce

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

Page 6 of 120

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back into the main memory 210, allowing the CPU 200 to continue processing at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

Pearce

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Pearce, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it was when power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> <p style="padding-left: 40px;">“In a preferred embodiment, the suspend circuit further comprises a circuit for restoring the main memory by decompressing the compressed image into the main memory. The allocable units allocated to the reducing task are designated as unallocated units in the decompressed image.”</p> <p>Pearce, 3:47-52.</p> <p style="padding-left: 40px;">“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back into the main memory 210, allowing the CPU 200 to continue processing</p> |                                                                                                                                                                                                                                                                                                           |

Pearce

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Page 8 of 120

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

“If a compressed image file is detected, execution proceeds to a block 515, Wherein a corresponding (e.g., run length decoding) decompression routine decompresses and restores the main memory 210 to the state in which it was prior to shutdown. In the first embodiment, the units previously allocated to the reducing task remain filled with the bit pattern. In the second embodiment, the stored record is retrieved and used as a guide by the decompression routine to restore the compressed allocable units to their proper position in main memory.”

Pearce, 8:52-61, Fig. 5.

Pearce

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

| <p>5.5 utilizing the decompressed boot data to at least partially boot the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <p>Pearce, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it Was When power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> <p style="padding-left: 40px;">“In a preferred embodiment, the suspend circuit further comprises a circuit for restoring the main memory by decompressing the compressed image into the main memory. The allocable units allocated to the reducing task are designated as unallocated units in the decompressed image.”</p> <p>Pearce, 3:47-52.</p> <p style="padding-left: 40px;">“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back into the main memory 210, allowing the CPU 200 to continue processing</p> |                                                                                                                                                             |

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

“If a compressed image file is detected, execution proceeds to a block 515, wherein a corresponding (e.g., run length decoding) decompression routine decompresses and restores the main memory 210 to the state in which it was prior to shutdown. In the first embodiment, the units previously allocated to the reducing task remain filled with the bit pattern. In the second embodiment, the stored record is retrieved and used as a guide by the decompression routine to restore the compressed allocable units to their proper position in main memory.”

Pearce, 8:52-61, Fig. 5.

**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Pearce, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See Claims 1-1.3 above.</i></p> |                                                                                                                                                                                                                                                                                                                 |

Pearce

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                   |

## Appendix C15

### Invalidity of U.S. Patent 8,880,862 based on Pearce

6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor

Pearce, as evidenced by the example citations below, discloses “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Pearce discloses this limitation:

See Claims 1.1 and 1.2 above.

| 6.3 wherein the processor is configured:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Pearce, as evidenced by the example citations below, discloses<br>“wherein the processor is configured:” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it Was When power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> |                                                                                                          |

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                                                                                                                                                                                                  |

**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.2 loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Pearce, as evidenced by the example citations below, discloses “loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> |                                                                                                                                                                                                                                   |

Pearce

“loading the portion of the operating system from the first memory to a second memory, the portion of the operating system being associated with a boot data list”

Claim 8.2

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                     |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.3 accessing the loaded portion of the operating system from the second memory in the compressed form;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Pearce, as evidenced by the example citations below, discloses “accessing the loaded portion of the operating system from the second memory in the compressed form” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the operating system from the second memory in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                                                                     |

Pearce

Claim 8.3

“accessing the loaded portion of the operating system from the second memory in the compressed form”

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                                       |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.4 decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Pearce, as evidenced by the example citations below, discloses “decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> |                                                                                                                                                                                       |

Pearce

“decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system”

Claim 8.4

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                   |

| <p>8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Pearce, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it Was When power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> <p style="padding-left: 40px;">“In a preferred embodiment, the suspend circuit further comprises a circuit for restoring the main memory by decompressing the compressed image into the main memory. The allocable units allocated to the reducing task are designated as unallocated units in the decompressed image.”</p> <p>Pearce, 3:47-52.</p> <p style="padding-left: 40px;">“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back</p> |                                                                                                                                                                                   |

Pearce

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

into the main memory 210, allowing the CPU 200 to continue processing at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

“If a compressed image file is detected, execution proceeds to a block 515, wherein a corresponding (e.g., run length decoding) decompression routine decompresses and restores the main memory 210 to the state in which it was prior to shutdown. In the first embodiment, the units previously allocated to the reducing task remain filled with the bit pattern. In the second embodiment, the stored record is retrieved and used as a guide by the decompression routine to restore the compressed allocable units to their proper position in main memory.”

Pearce, 8:52-61, Fig. 5.

Pearce

“A method for providing accelerated loading of an operating system in a computer system, comprising”

**Claim 11 (Preamble)**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                          |                                                                                                                                                                                                                                     |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;</p> | <p>Pearce, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Pearce discloses this limitation:

See Claim 1.1 above.

See also *Look for additional references where loading occurs upon initialization of the computer system*

See also *Add disclosure from ‘608 Patent Claim 1.2*

“Execution begins in a start block 500 Wherein the portable PC 100 boots, loading initial portions of code commonly stored in nonvolatile memory Within the portable PC 100.”

Pearce, 8:39-41.

“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it Was When power was interrupted.”

Pearce, 1:65-2:10.

Pearce

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| 11.2 accessing the loaded boot data in compressed form from the memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Pearce, as evidenced by the example citations below, discloses “accessing the loaded boot data in compressed form from the memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in compressed form from the memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. | <p>11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Pearce, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Pearce discloses this limitation:</p> <p style="padding-left: 40px;">“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it Was When power was interrupted.”</p> <p>Pearce, 1:65-2:10.</p> <p style="padding-left: 40px;">“In a preferred embodiment, the suspend circuit further comprises a circuit for restoring the main memory by decompressing the compressed image into the main memory. The allocable units allocated to the reducing task are designated as unallocated units in the decompressed image.”</p> <p>Pearce, 3:47-52.</p> <p style="padding-left: 40px;">“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back into the main memory 210, allowing the CPU 200 to continue processing at the point where it stopped prior to interruption of power.”</p> <p>Pearce, 5:36-44.</p> |                                                                                                                                                                                         |

Pearce  
“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

Claim 11.4

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

“If a compressed image file is detected, execution proceeds to a block 515, wherein a corresponding (e.g., run length decoding) decompression routine decompresses and restores the main memory 210 to the state in which it was prior to shutdown. In the first embodiment, the units previously allocated to the reducing task remain filled with the bit pattern. In the second embodiment, the stored record is retrieved and used as a guide by the decompression routine to restore the compressed allocable units to their proper position in main memory.”

Pearce, 8:52-61, Fig. 5.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Pearce discloses this limitation:

*See* Claims 1.2 and 1.3 above.

*See also*

“The most effective solution to power saving following a long period of user inactivity is to turn off the PC completely. However, it is unacceptable simply to interrupt has not yet been stored in non-volatile memory, particularly the hard disk drive. Rather, it is advantageous to store the contents of the volatile main memory of the PC as an image in the nonvolatile secondary storage device (a so-called “suspend-to-disk” or “STD”). When the user restores power to the PC, the image is restored to the main memory (a “resume-from-disk” or “RFD”), placing the PC in exactly the same functional state as it was when power was interrupted.”

Pearce, 1:65-2:10.

“Accordingly, a first embodiment of the present invention provides, in a computer system having a CPU, a main memory (either real or virtual) divisible into allocable units, a secondary storage unit and an operating system for allocating the allocable units to tasks for use thereby, a suspend circuit for creating an optimized compressed image of data in the

**Pearce**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Claim 14.3**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

main memory.”

Pearce, 2:36-43.

“In a preferred embodiment, the suspend circuit further comprises a circuit for restoring the main memory by decompressing the compressed image into the main memory. The allocable units allocated to the reducing task are designated as unallocated units in the decompressed image.”

Pearce, 3:47-52.

“The present invention is designed to conserve computer power by storing the pertinent contents of the main memory 210 as a compressed image in the nonvolatile secondary storage device 260, allowing power to be interrupted to the portable PC 100 in its entirety. When the user so directs, power is restored to the PC, and the image is decompressed back into the main memory 210, allowing the CPU 200 to continue processing at the point where it stopped prior to interruption of power.”

Pearce, 5:36-44.

“If a compressed image file is detected, execution proceeds to a block 515, wherein a corresponding (e.g., run length decoding) decompression routine decompresses and restores the main memory 210 to the state in which it was prior to shutdown. In the first embodiment, the units previously allocated to the reducing task remain filled with the bit pattern. In the second embodiment, the stored record is retrieved and used as a guide by the decompression routine to restore the compressed allocable units to their proper position in main memory.”

Pearce, 8:52-61, Fig. 5.

Pearce

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Pearce**

“The method of claim 1, wherein the portion of the boot data in the compressed form comprises: a program code associated with the operating system.”

**Claim 24**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                           |                                                                                                                                                      |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>27.</b> The method of claim 1, wherein the memory comprises: a physical memory.</p> | <p>Pearce, as evidenced by the example citations below, discloses<br/> “the method of claim 1, wherein the memory comprises: a physical memory.”</p> |
|-------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Pearce discloses this limitation:

See Claims 1.1 and 1.2.

Fig. 2.

“The present invention is directed, in general, to computer systems and, more particularly, to a circuit and method for conserving power used by the computer system by storing a compressed image of the contents of the computer system’s main memory on a nonvolatile secondary storage device, allowing power to the main memory to be interrupted.”

**Pearce**

“The method of claim 5, wherein the compressed boot data comprises: a program code associated with an operating system of the computer system.”

**Claim 36**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

**39.** The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.

Pearce, as evidenced by the example citations below, discloses  
 “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Pearce discloses this limitation:

*Fig. 2*

Pearce, Fig. 2

Pearce

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

“The present invention is directed, in general, to computer systems and, more particularly, to a circuit and method for conserving power used by the computer system by storing a compressed image of the contents of the computer system’s main memory on a nonvolatile secondary storage device, allowing power to the main memory to be interrupted.”

Pearce, 1:6-11.

**Pearce**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C15**  
**Invalidity of U.S. Patent 8,880,862 based on Pearce**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>40.</b> The method of claim 36, wherein the operating system comprises: a plurality of files.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <p>Pearce, as evidenced by the example citations below, discloses<br/>“the method of claim 36, wherein the operating system comprises: a plurality of files”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Pearce discloses this limitation:</p> <p><i>See</i> Claims 16 and 23 above.</p> |                                                                                                                                                                  |

Pearce

“The method of claim 36, wherein the operating system comprises: a plurality of files.”

Pearce

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C16**

### **Invalidity of U.S. Patent 8,880,862 based on Rahman**

U.S. Patent No. 5,901,310 Rahman (“Rahman”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

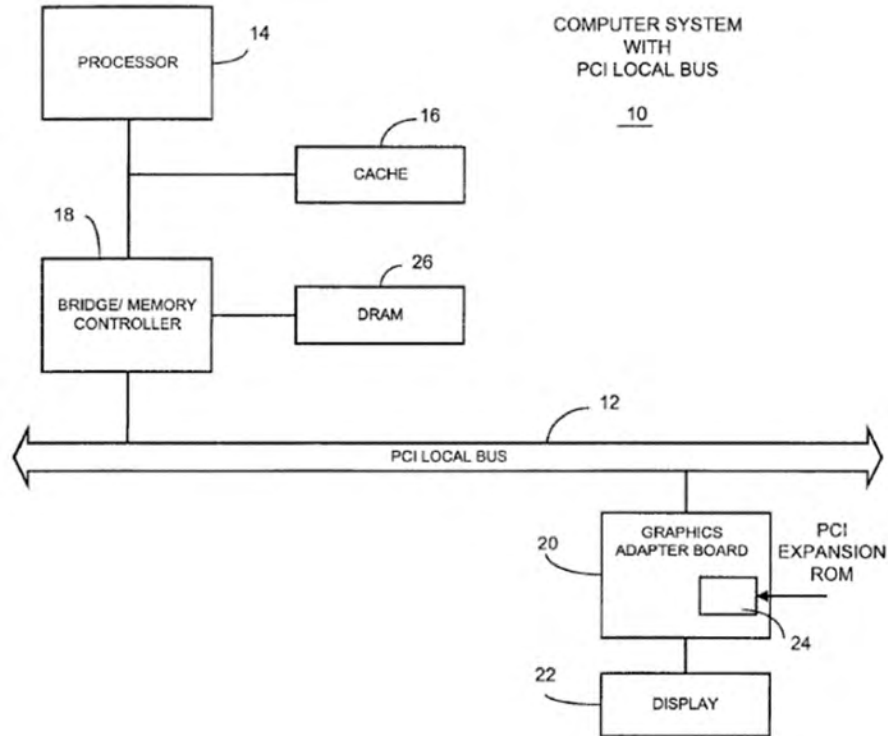

## Appendix C16 Invalidity of U.S. Patent 8,880,862 based on Rahman

**1 (Preamble)** A method for providing accelerated loading of an operating system in a computer system, the method comprising:

Rahman, as evidenced by the exemplary citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, the method comprising:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accelerated loading of an operating system in a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for

Rahman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

initializing and configuring the adapter board.”

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 3 of 122

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;

Rahman, as evidenced by the example citations below, discloses  
“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory.”

Rahman, Abstract.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p>Rahman, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p style="padding-left: 40px;">“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”</p> <p>Rahman, 1:48-56.</p> <p style="padding-left: 40px;">“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and</p> |                                                                                                                                                           |

Rahman  
“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p style="padding-left: 40px;">“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”</p> <p>Rahman, 1:48-56.</p> <p style="padding-left: 40px;">“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”</p> |                                                                                                                                                                                                                                                                                                           |

Rahman

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

**Rahman**

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

**Claim 1.3**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |                                                                                                                                                                    |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <p>Rahman, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p style="padding-left: 40px;">“The firmware may be the BIOS for initializing and configuring a personal computer.”</p> <p>Rahman, 2:1-2.</p> <p style="padding-left: 40px;">“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”</p> <p>Rahman, 2:66-3:11.</p> <p style="padding-left: 40px;">“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”</p> <p>Rahman, 4:63-5:3.</p> |                                                                                                                                                                    |

Rahman

“wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                   |                                                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>4. The method of claim 1, wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.</p> | <p>Rahman, as evidenced by the example citations below, discloses “wherein the updating comprises: associating additional boot data with the boot data list; and compressing a portion of the additional boot data.”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating wherein associating additional boot data with the boot data list; and compressing a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See* Claims 1.4.1, and 2 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

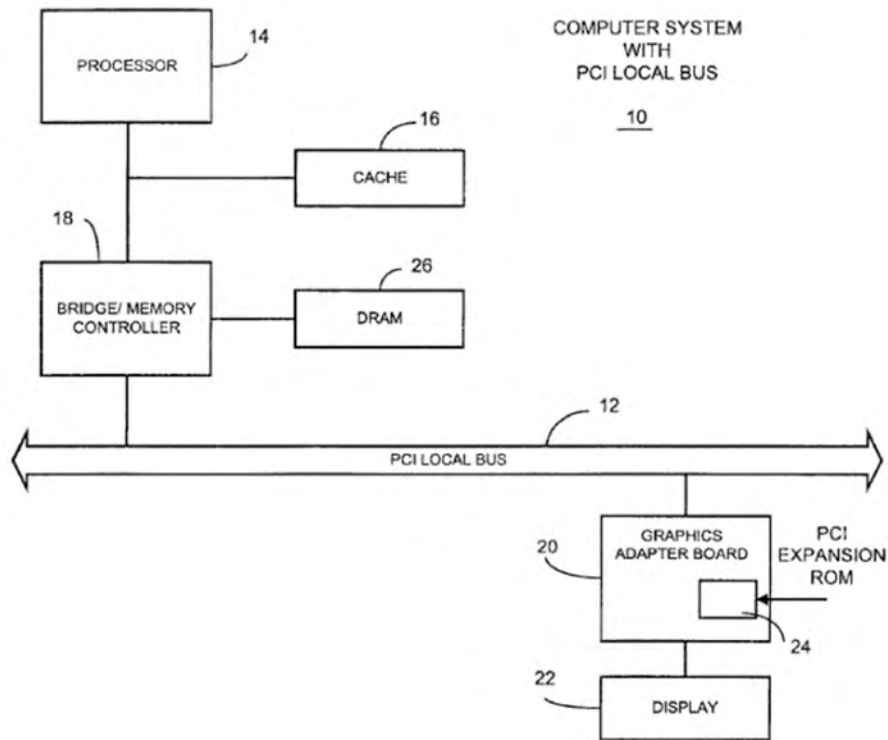

**5 (Preamble)** A method for booting a computer system, the method comprising:

Rahman, as evidenced by the example citations below, discloses “a method for booting a computer system, the method comprising:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

See Claims 1-1.4.2 above.

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically

## Appendix C16

### Invalidity of U.S. Patent 8,880,862 based on Rahman

located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

“A method for booting a computer system, the method comprising:”

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”</p> <p>Rahman, 1:48-56.</p> <p style="padding-left: 40px;">“The firmware may be the BIOS for initializing and configuring a personal computer.”</p> <p>Rahman, 2:1-2.</p> <p style="padding-left: 40px;">“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression</p> |                                                                                                                                                             |

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

**Rahman**

**Claim 5.7**

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

## Appendix C16

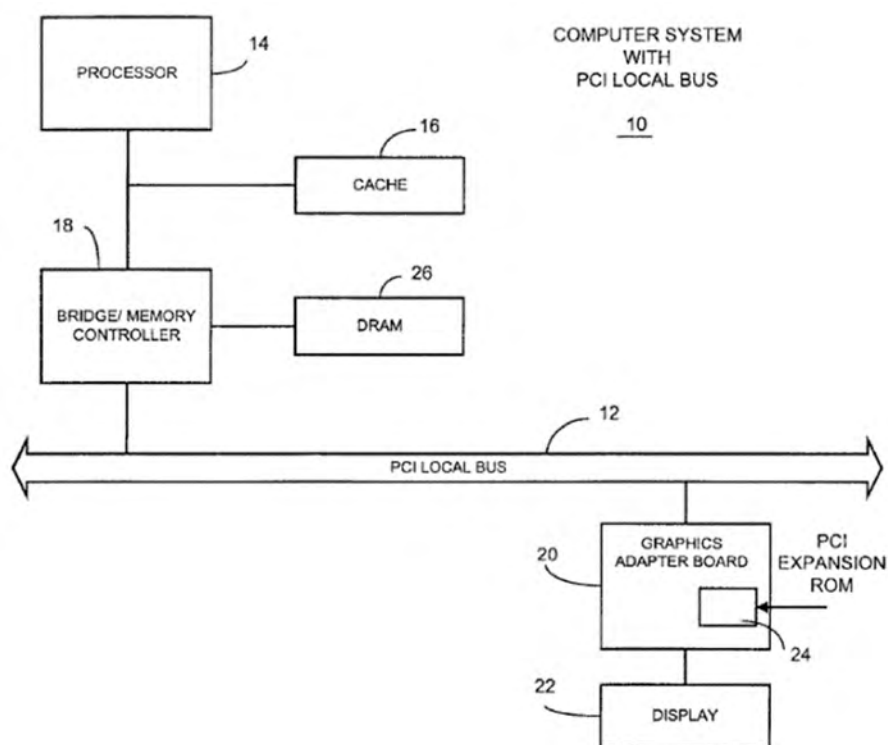

### Invalidity of U.S. Patent 8,880,862 based on Rahman

**6 (Preamble)** A system comprising:  
a processor;

Rahman, as evidenced by the example citations below, discloses  
“a system comprising:  
a processor:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

## Appendix C16

### Invalidity of U.S. Patent 8,880,862 based on Rahman

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                           |

| 6.1 a memory; and                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Rahman, as evidenced by the example citations below, discloses “a memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a memory.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above.</i></p> |                                                                           |

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

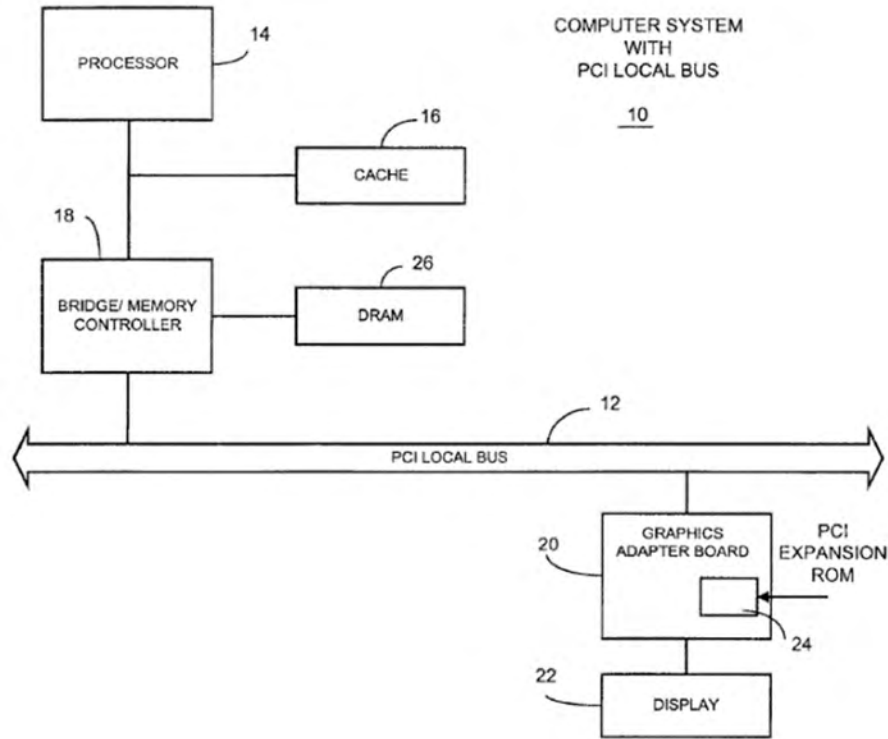

6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor

Rahman, as evidenced by the example citations below, discloses “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

See Claims 1.1 and 1.2 above.

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the

## Appendix C16

### Invalidity of U.S. Patent 8,880,862 based on Rahman

firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

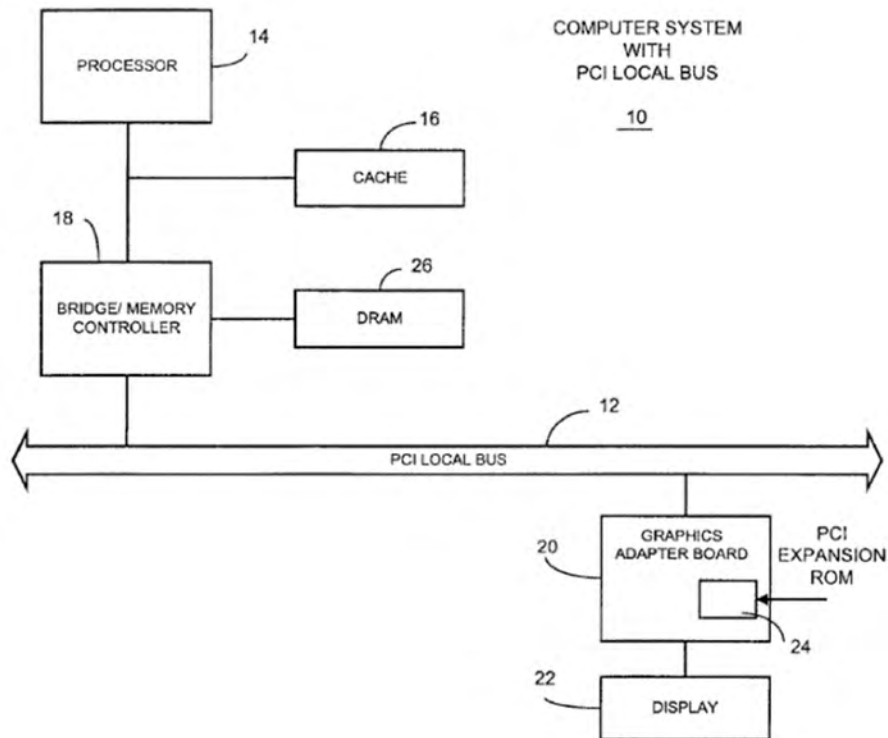

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

6.3 wherein the processor is configured:

Rahman, as evidenced by the example citations below, discloses “wherein the processor is configured:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

Rahman  
 “wherein the processor is configured”

Claim 6.3

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

“wherein the processor is configured”

Claim 6.3

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

6.4 to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory,

Rahman, as evidenced by the example citations below, discloses “to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, to load a portion of the boot data in the compressed form that is associated with a boot data list used for booting the system into the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 1.1 above.*

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p style="padding-left: 40px;">“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”</p> <p>Rahman, 1:48-56.</p> <p style="padding-left: 40px;">“The firmware may be the BIOS for initializing and configuring a personal computer.”</p> <p>Rahman, 2:1-2.</p> <p style="padding-left: 40px;">“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code</p> |                                                                                                                                                                                   |

Rahman

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

**Claim 11 (Preamble)**

“A method for providing accelerated loading of an operating system in a computer system, comprising”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

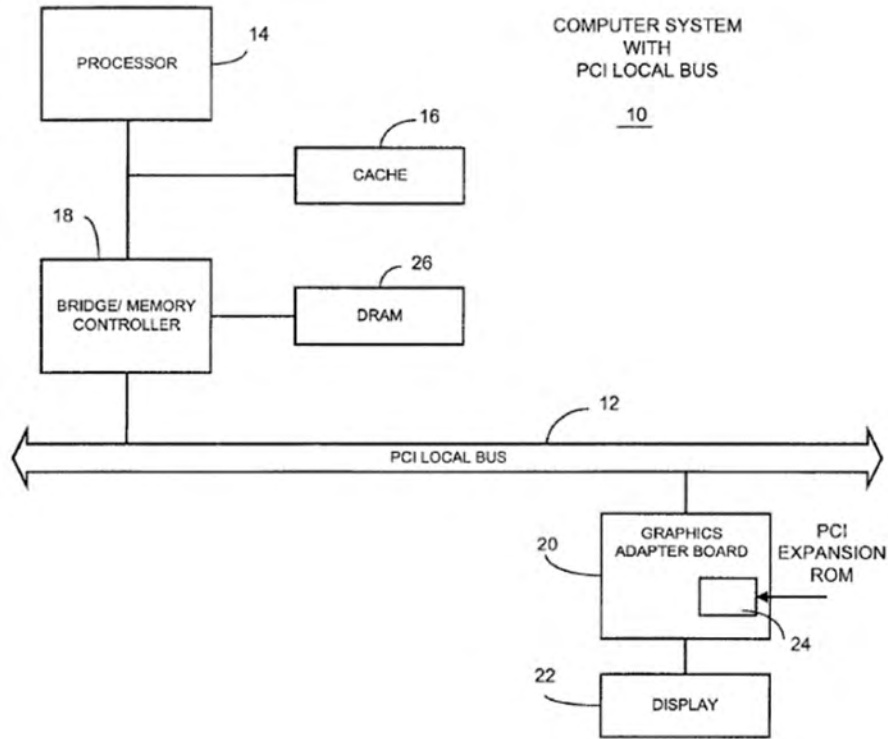

11.1 loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system;

Rahman, as evidenced by the example citations below, discloses “loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

See Claim 1.1 above.

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the

Rahman

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

## Appendix C16

### Invalidity of U.S. Patent 8,880,862 based on Rahman

firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

Claim 11.1

“loading boot data in a compressed form that is associated with a boot data list from a boot device into a memory upon initialization of the computer system”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                    |

| 11.2 accessing the loaded boot data in compressed form from the memory;                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Rahman, as evidenced by the example citations below, discloses “accessing the loaded boot data in compressed form from the memory” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded boot data in compressed form from the memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See Claim 1.2 above.</i></p> |                                                                                                                                    |

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

11.3 decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form;

Rahman, as evidenced by the example citations below, discloses “decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 1.3 above.*

Rahman

“decompressing the accessed boot data in compressed form at a rate that decreases a time to load the operating system relative to loading the operating system with the boot data in an uncompressed form”

Claim 11.3

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                           |                                                                                                                                                                                  |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11.4 utilizing the decompressed boot data to load at least a portion of the operating system for the computer system; and | Rahman, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to load at least a portion of the operating system for the computer system” |
|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to load at least a portion of the operating system for the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory.”

Rahman, Abstract.

“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”

Rahman, Abstract.

“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”

Rahman, 1:48-56.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The

Claim 11.4

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

**Rahman**

“utilizing the decompressed boot data to load at least a portion of the operating system for the computer system”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**14.1** accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list;

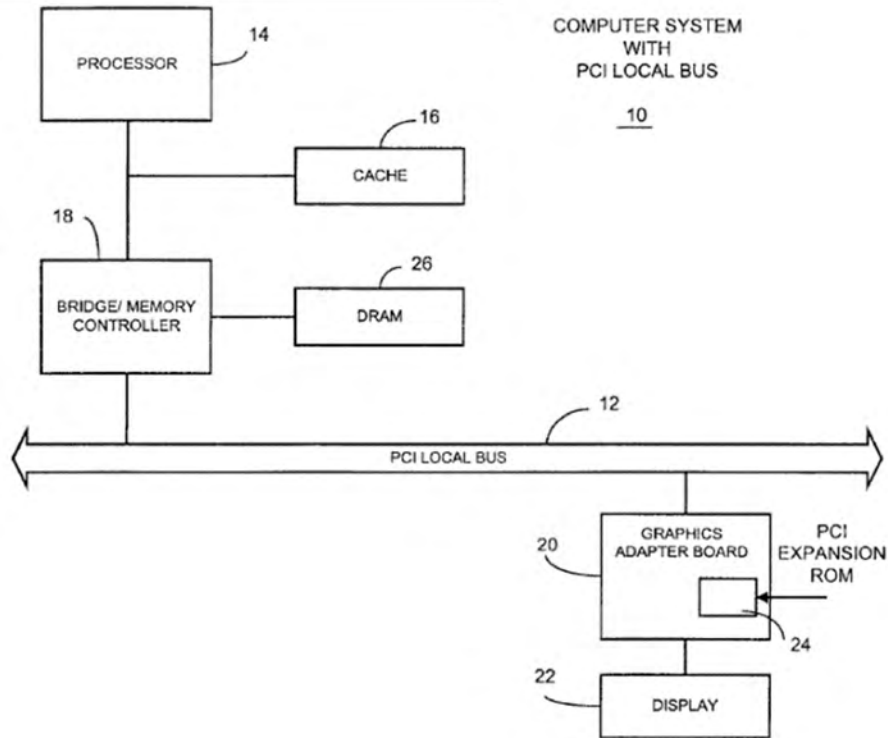

Rahman, as evidenced by the example citations below, discloses “accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

See Claims 1.1 and 1.2 above.

See Add disclosure from ‘608 Patent Claim 1.1

Rahman, Fig. 1.

“Initializing and configuring computer hardware with firmware stored in compressed form in nonvolatile semiconductor memory. Upon startup of the computer hardware, decompression software decompress the

Rahman

**Claim 14.1**

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

## Appendix C16

### Invalidity of U.S. Patent 8,880,862 based on Rahman

firmware, which is then stored in another memory. The computer hardware may be an adapter board (e.g., a graphics board connected to PCI bus), the nonvolatile semiconductor memory may be physically located on the adapter board, and the firmware may be firmware for initializing and configuring the adapter board.”

Rahman, Abstract.

“The firmware may be the BIOS for initializing and configuring a personal computer.”

Rahman, 2:1-2.

“Devices that connect to the PCI bus provide initialization code and runtime code for the device. This code resides in ROM 24 on the device. When the computer system starts up or initializes, it detects the device, reads the code from ROM into the host system memory, such as a RAM or dynamic random access memory 26 (DRAM), and interprets the code.”

Rahman, 2:51-57.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

“accessing boot data for booting the computer system, wherein a portion of the boot data is in a compressed form and is associated with a boot data list”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>14.3</b> servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form; and</p> | <p>Rahman, as evidenced by the example citations below, discloses “servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”</p> |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 1.2 and 1.3 above.

“Upon startup of the computer hardware, decompression software decompress the firmware, which is then stored in another memory.”

Rahman, Abstract.

“The invention virtually increases the size of the nonvolatile semiconductor memory (e.g., a ROM) available for storing firmware by storing the firmware in compressed form and quickly decompressing it on startup. This permits the firmware memory to hold more instructions than would otherwise be possible. The invention is able to decompress firmware quickly, reliably, and fully automatically, so that the fact of the firmware being compressed is substantially invisible to the end-user.”

Rahman, 1:48-56.

“When the computer system starts up or initializes, it detects the adapter board connected to the PCI bus. It then locates the decompression code 29 in the adapter board's ROM. The computer system processor runs an FCode interpreter, which interprets the instructions in the decompression program as it reads the code from the adapter board's ROM. The

**Rahman**

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

compressed code 28 is decompressed, using the computer system's memory (such as RAM or DRAM 26) to store the image. After the image is decompressed, the system recognizes the decompressed image as a device driver that configures and initializes the adapter board, and supplies the runtime set of instructions for the adapter board.”

Rahman, 2:66-3:11.

“Other embodiments are within the scope of the following claims. For example, a personal computer's basic input/output system (BIOS) is firmware stored in ROM and could be stored in a compressed format. Furthermore, other types of nonvolatile semiconductor memory, such as programmable ROMs (PROMS) and erasable programmable ROMs (EPROMs), could be used to store the compressed firmware.”

Rahman, 4:63-5:3.

Rahman

**Claim 14.3**

“servicing a request for the boot data from the computer system to access the loaded compressed boot data and to decompress the accessed compressed boot data at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing the boot data in an uncompressed form”

| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See Claim 1.4.1 above.</i></p> |                                                                                              |

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**15.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system.

Rahman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 1 (Preamble) and 1.1 above.

**Rahman**

“the method of claim 14, wherein the boot data comprises: a program code associated with the operating system”

**Claim 15**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                  |                                                                                                                                                        |
|--------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>16.</b> The method of claim 14, wherein the operating system comprises: a plurality of files. | Rahman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the operating system comprises: a plurality of files.” |
|--------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**17.** The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.

Rahman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 15 above.*

**Rahman**

“The method of claim 14, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 17**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**19.1** The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:

Rahman, as evidenced by the example citations below, discloses “the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

**Rahman**

“The method of claim 14, wherein the request for the boot data comprises: a request to access boot data that is not associated with the boot data list, and wherein the updating comprises:”

**Claim 19**

Rahman

“The method of claim 1, wherein the memory comprises: a physical memory”

**Claim 27**

Page 75 of 122

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**28.** The method of claim 1, wherein the operating system comprises: a plurality of files.

Rahman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See Claim 16 above.*

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**29.** The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.

Rahman, as evidenced by the example citations below, discloses “the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claims 15 and 17 above.*

**Rahman**

“The method of claim 1, wherein the boot data comprises: a program code associated with the operating system and an application program.”

**Claim 29**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |                                                                                                                                                                                                                               |

| <p><b>32.</b> The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Rahman, as evidenced by the example citations below, discloses “the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p style="padding-left: 40px;">“The compression technique used may include both run-length encoding and pattern compression, and may operate at the bit level.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“Compression techniques using both run-length encoding and pattern compression may be used (e.g., the Ross Compression technique). The compression technique may scan an input file. First, it may determine if it can perform run-length-encoding compression on the current character. If not, the compression technique may determine if it can compress a pattern of characters. If the run-length-encoding and pattern matching Were not successful, the compression technique may copy the character directly to the compressed file.”</p> <p>Rahman, 2:7-16.</p> <p style="padding-left: 40px;">“The compression and decompression techniques utilize four 3-byte formats. FIG. 3 illustrates the formats, which are a short run-length-encoded format 30, a long run-length encoded format 32, a short patterned format 34, and a long patterned format 36.”</p> <p>Rahman, 3:12-16. <i>See also</i> 3:17-17, Appendix.</p> |                                                                                                                                                                                                                 |

Rahman

“The method of claim 1, wherein a form of dictionary encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 32**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                       |

| <p><b>33.</b> The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>Rahman, as evidenced by the example citations below, discloses “the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See Claim 32 above.</i></p> <p style="padding-left: 40px;">“The compression technique used may include both run-length encoding and pattern compression, and may operate at the bit level.”</p> <p>Rahman, Abstract.</p> <p style="padding-left: 40px;">“Compression techniques using both run-length encoding and pattern compression may be used (e.g., the Ross Compression technique). The compression technique may scan an input file. First, it may determine if it can perform run-length-encoding compression on the current character. If not, the compression technique may determine if it can compress a pattern of characters. If the run-length-encoding and pattern matching Were not successful, the compression technique may copy the character directly to the compressed file.”</p> <p>Rahman, 2:7-16.</p> <p style="padding-left: 40px;">“The compression and decompression techniques utilize four 3-byte formats. FIG. 3 illustrates the formats, which are a short run-length-encoded format 30, a long run-length encoded format 32, a short patterned format 34, and a long patterned format 36.”</p> <p>Rahman, 3:12-16. <i>See also</i> 3:17-17, Appendix.</p> |                                                                                                                                                                                                       |

**Rahman**

“The method of claim 1, wherein Lempel-Ziv encoding was utilized to encode the portion of the boot data in the compressed form.”

**Claim 33**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**35.** The method of claim 5, wherein the compressed boot data represents a plurality of files.

Rahman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the compressed boot data represents a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the compressed boot data represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                                                                                      |

| <p><b>39.</b> The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Rahman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Rahman discloses this limitation:</p> <p><i>See Claims 1.1 and 1.2 above.</i></p> |                                                                                                                                                                                                                                                                            |

**Rahman**

“The method of claim 5, wherein the loading comprises: loading the stored compressed boot data from the first memory to a second memory, and wherein the second memory comprises: a physical memory.”

**Claim 39**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**40.** The method of claim 36, wherein the operating system comprises: a plurality of files.

Rahman, as evidenced by the example citations below, discloses “the method of claim 36, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 36, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**43.** The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.

Rahman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 31 above.*

**Rahman**

“The method of claim 5, wherein the accessing comprises: accessing the loaded compressed boot data via direct memory access.”

**Claim 43**

Page 85 of 122

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**44.** The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.

Rahman, as evidenced by the example citations below, discloses “the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 32 above.*

**Rahman**

“The method of claim 5, wherein a form of dictionary encoding was utilized to encode the compressed boot data.”

**Claim 44**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                              |                                                                                                                                                                   |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>52.</b> The system of claim 6, wherein the boot data the compressed form comprises: a plurality of files. | Rahman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files” |
|--------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data the compressed form comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**53.** The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.

Rahman, as evidenced by the example citations below, discloses “the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See* Claims 15, 17 and 24 above.

**Rahman**

“The system of claim 6, wherein the boot data in the compressed form comprises: a program code associated with an operating system of the system and an application program.”

**Claim 53**

Rahman

“The method of claim 8, wherein the operating system in the compressed form comprises: program code associated with the operating system.”

**Claim 60**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**63.** The method of claim 8, wherein the second memory comprises: a physical memory.

Rahman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the second memory comprises: a physical memory”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the second memory comprises: a physical memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See Claims 27 and 38 above.*

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**64.** The method of claim 8, wherein the operating system comprises: a plurality of files.

Rahman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**65.** The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.

Rahman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claims 15, 17 and 24 above.*

**Rahman**

“The method of claim 8, wherein the operating system in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 65**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**67.** The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.

Rahman, as evidenced by the example citations below, discloses “the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claim 31 above.*

**Rahman**

“The method of claim 8, wherein the accessing comprises: accessing the loaded first portion from the second memory via direct memory access.”

**Claim 67**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>71.</b> The method of claim 11, wherein the boot data in the compressed form represents a plurality of files. | Rahman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                             |

Rahman

“The method of claim 11, wherein the memory comprises: a physical memory.”

**Claim 75**

Page 103 of 122

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**76.** The method of claim 11, wherein the operating system comprises: a plurality of files.

Rahman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the operating system comprises: a plurality of files”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the operating system comprises: a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

77. The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.

Rahman, as evidenced by the example citations below, discloses “the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See Claims 15, 17 and 24 above.*

**Rahman**

“The method of claim 11, wherein the boot data in the compressed form comprises: a program code associated with the operating system and an application program.”

**Claim 77**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                  |                                                                                                                                                                       |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>83.</b> The method of claim 13, wherein the boot data in the compressed form represents a plurality of files. | Rahman, as evidenced by the example citations below, discloses “the method of claim 13, wherein the boot data in the compressed form represents a plurality of files” |
|------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 13, wherein the boot data in the compressed form represents a plurality of files), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 16 and 23 above.

**Rahman**

**Claim 83**

“The method of claim 13, wherein the boot data in the compressed form represents a plurality of files.”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**Rahman**

“and wherein the updating comprises: associating the additional compressed boot data with the boot data list.”

**Claim 97.2**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

|                                                                                                                                  |                                                                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>98.</b> The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list. | Rahman, as evidenced by the example citations below, discloses “the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list” |
|----------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

**Rahman**

“The method of claim 5, wherein the updating comprises: disassociating non accessed boot data from the boot data list.”

**Claim 98**

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**107.** The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.

Rahman, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: storing the updated boot list in a non-volatile memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 1.4.1, 5.6, and 8.6 above.

**Rahman**

**Claim 107**

“The method of claim 2, further comprising: storing the updated boot list in a non-volatile memory.”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**108.** The method of claim 2, further comprising: compressing at least a portion of the additional boot data.

Rahman, as evidenced by the example citations below, discloses “the method of claim 2, further comprising: compressing at least a portion of the additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 2, further comprising: compressing at least a portion of the additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Rahman discloses this limitation:

*See* Claims 1.1, 5, 9.1 and 8 above.

Rahman

**Claim 108**

“The method of claim 2, further comprising: compressing at least a portion of the additional boot data.”

**Appendix C16**  
**Invalidity of U.S. Patent 8,880,862 based on Rahman**

**109.** The method of claim 108, further comprising: storing the compressed additional boot data.

Rahman, as evidenced by the example citations below, discloses “the method of claim 108, further comprising: storing the compressed additional boot data”

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, the method of claim 108, further comprising: storing the compressed additional boot data), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Rahman discloses this limitation:

*See* Claims 5.1, 8.1 and 9.1 above.

**Rahman**

“The method of claim 108, further comprising: storing the compressed additional boot data.”

**Claim 109**

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

U.S. Patent No. 6,374,353 to Settsu (“Settsu”) invalidates claims 1-6, 8-11, 13-17, 19, 23-24, 27-29, 31-33, 35-36, 39-40, 43-45, 47-53, 59-60, 63-65, 67, 71-72, 75-77, 79-81, 83-84, 87-89, 91-93, 97-98, and 107-109 of United States Patent No. 8,880,862 (“the ’862 Patent”) pursuant to 35 U.S.C. § 102 and/or 35 U.S.C. § 103 either alone or in combination with other prior art references, and/or in combination with the knowledge of a person of ordinary skill.

The analysis provided in this chart may in some instances uses Realtime’s proposed (or implied) claim constructions, and Apple reserves all rights to challenge these proposed (or implied) constructions. To the extent any of the charted prior art should fail to disclose an element of any claims of the ’862 Patent, Apple reserves the right to rely upon the knowledge of one skilled in the art, or any other disclosed prior art, alone or in combination, whether produced by Apple or by Realtime, to show the element and thereby invalidate those claims. Citations given in the chart below are merely representative of the respective elements and are not meant to be exhaustive.

In addition, Apple incorporates by reference, as if set forth fully herein, all arguments related to Settsu in pending inter partes review petitions IPR2016-01737, IPR2016-01738, and IPR2016-01739.

|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>1.1 loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;</p> | <p>Settsu, as evidenced by the example citations below, discloses “loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory;”</p> |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this claim limitation:

A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.

Settsu, Abstract

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu, 1:8-12.

In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the FI/W code module 6 stored in the ROM 1.

Settsu

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

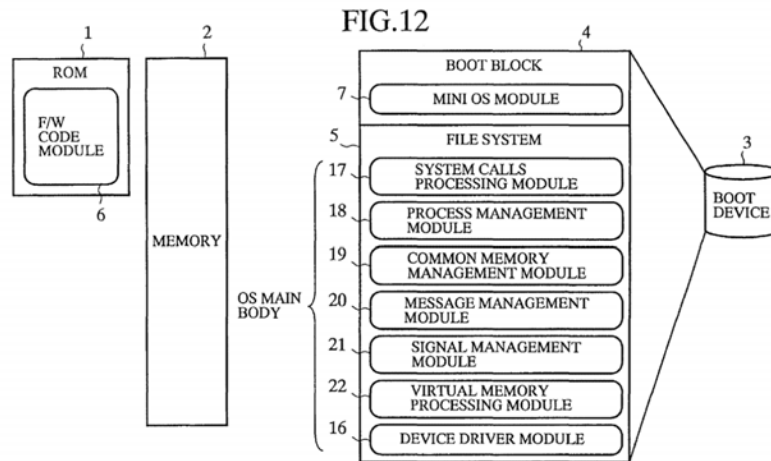

Page 4 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Settsu

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

Page 5 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of

Settsu

“loading a portion of boot data in a compressed form that is associated with a portion of a boot data list for booting the computer system into a memory.”

Claim 1.1

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

| <p>1.2 accessing the loaded portion of the boot data in the compressed form from memory;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <p>Settsu, as evidenced by the example citations below, discloses “accessing the loaded portion of the boot data in the compressed form from memory;”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, accessing the loaded portion of the boot data in the compressed form from memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this claim limitation:</p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .</p> <p>Settsu, 1:51-57</p> |                                                                                                                                                           |

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded

Settsu

“accessing the loaded portion of the boot data in the compressed form from memory.”

Claim 1.2

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

| <p>1.3 decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <p>Settsu, as evidenced by the example citations below, discloses “decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form; and”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this claim limitation:</p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .</p> |                                                                                                                                                                                                                                                                                                           |

Settsu

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS

Settsu

Claim 1.3

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

Page 12 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 14:58-15:5

Settsu

“decompressing the accessed portion of the boot data in the compressed form at a rate that decreases a boot time of the operating system relative to loading the operating system utilizing boot data in an uncompressed form.”

| 1.4.1 updating the boot data list,                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Settsu, as evidenced by the example citations below, discloses “updating the boot data list,” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, updating the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this claim limitation:</p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the mini OS module further includes an address resolve table used for linking the mini OS module with the OS main body module. Further, after the mini OS module generates and starts execution of a thread for the OS loading and initialization processing module, the OS loading and initialization processing module loads the OS main body module into the memory and then initializes it, loads a first process to be executed first, into the memory, loads code portions of the mini kernel module and the boot device driver module into the memory, and writes addresses of the code portions loaded into the memory into the address resolve table.</p> <p>Settsu, 5:39-51</p> |                                                                                               |

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

The OS loading and decompression processing module 50 then, in step ST185, checks whether or not the whole of the main body of the OS has been loaded, that is, whether or not all the functional modules 16 to 22 have been loaded into the memory 2. If all the functional modules 16 to 22 have not been loaded into the memory 2 yet, the OS loading and decompression processing module 50 returns to step ST181 in which it continues to load the remaining functional modules of the OS main body.

Settsu, 14:44-52

| <p>1.4.2 wherein the decompressed portion of boot data comprises a portion of the operating system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Settsu, as evidenced by the example citations below, discloses “wherein the decompressed portion of boot data comprises a portion of the operating system.”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the decompressed portion of boot data comprises a portion of the operating system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this claim limitation:</p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .</p> <p>Settsu, 1:51-57</p> |                                                                                                                                                                    |

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded

Settsu

“wherein the decompressed portion of boot data comprises a portion of the operating system.”

Claim 1.4.2

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, booting a computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 1-1.4.2 above.

*See also*

A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.

Settsu, Abstract

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu, 1:8-12.

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or F/W code module stored in the ROM 1. The

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and liked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7

then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

“A method for booting a computer system, the method comprising:”

**Claim 5 (Preamble)**

Page 25 of 164

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                     |                                                                                                                                                                                 |
|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 5.1 storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory; | Settsu, as evidenced by the example citations below, discloses “storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory” |
|---------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing boot data in a compressed form that is associated with a portion of a boot data list in a first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claim 1.1 above.

*See also*

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>5.5 utilizing the decompressed boot data to at least partially boot the computer system;</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Settsu, as evidenced by the example citations below, discloses “utilizing the decompressed boot data to at least partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed boot data to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See</i> Claims 1.3 and 1.4.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system</p> |                                                                                                                                                             |

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the FI/W code module 6 stored in the ROM 1.

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

Page 33 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

Settsu

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

Page 34 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Settsu, Fig. 12

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be

Settsu

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Settsu, Fig. 13.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body

Settsu

“utilizing the decompressed boot data to at least partially boot the computer system”

Claim 5.5

Page 36 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

|                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                 |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>5.7 wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.</p> | <p>Settsu, as evidenced by the example citations below, discloses “wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form”</p> |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.

Settsu discloses this limitation:

*See* Claims 1-1.3 above.

*See also*

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu, 1:8-12.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Settsu Claim 5.7  
“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system **5** of the boot device. Further, the OS loading and decompression processing module **50** decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 14:58-15:5

Settsu

Claim 5.7

“wherein the loading, the accessing, and the decompressing occur within a period of time which is less than a time to access the boot data from the first memory if the boot data was stored in the first memory in an uncompressed form.”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                  |                                                                                                                   |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|
| <p><b>6 (Preamble)</b> A system comprising:<br/>a processor;</p> | <p>Settsu, as evidenced by the example citations below, discloses<br/>“a system comprising:<br/>a processor:”</p> |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a system comprising: a processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See*

A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.

Settsu, Abstract

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu, 1:8-12.

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according to a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |                                                                                                                                                                                                                  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>6.2 a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>Settsu, as evidenced by the example citations below, discloses “a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See</i> Claims 1.1 and 1.2 above.</p> <p><i>See also</i></p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of th present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes 5 a boot</p> |                                                                                                                                                                                                                  |

Settsu

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

Claim 6.2

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or F/W code module stored in the ROM 1. The F/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing

Settsu

Claim 6.2

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

Page 47 of 164

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention.

Settsu

“a second memory configured to store boot data in a compressed form for booting the system and a logic code associated with the processor”

Claim 6.2

Page 48 of 164

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

| 6.3 wherein the processor is configured:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Settsu, as evidenced by the example citations below, discloses “wherein the processor is configured.” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the processor is configured), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.</p> <p>Settsu discloses this limitation:</p> <p style="padding-left: 40px;">A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.</p> <p>Settsu, Abstract</p> <p style="padding-left: 40px;">The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.</p> <p>Settsu, 1:8-12.</p> <p style="padding-left: 40px;">Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or F/W code module stored in the ROM 1. The F/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register.</p> |                                                                                                       |

Settsu  
“wherein the processor is configured”

Claim 6.3

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are

Settsu  
“wherein the processor is configured”

Claim 6.3

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according to a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression

Settsu

“decompressing the accessed portion of the operating system to provide a decompressed portion of the operating system”

Claim 8.4

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                    |                                                                                                                                                                            |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 8.5 utilizing the decompressed portion of the operating system to at least partially boot the computer system; and | Settsu, as evidenced by the example citations below, discloses “utilizing the decompressed portion of the operating system to at least partially boot the computer system” |
|--------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, utilizing the decompressed portion of the operating system to at least partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidation Contentions.

Settsu discloses this limitation:

*See* Claims 1.3 and 1.4.2 above.

*See also*

A method of booting up an information processing apparatus is provided. An operating system is divided into a mini operating system (OS) module having a function of bootstrap and an OS main body module having functions other than the function of bootstrap. The mini OS module can be located in a boot block of a boot device, whereas the OS main body module can be located in a file system of the boot device. A firmware or F/W code module stored in a ROM loads the mini OS module into memory when booting up the information processing apparatus. The mini OS module then loads the OS main body module into memory and then initializes the OS main body module.

Settsu, Abstract

The present invention relates to an information processing apparatus capable of reducing the time required for booting itself when it is powered on, and a method of booting an information processing apparatus at a high speed.

Settsu, 1:8-12.

In accordance with an aspect of the present invention, there is provided an information processing apparatus comprising: a boot device divided into a boot block in which a mini operating system (OS) module having a function required for bootstrap processing is located and a file system

Settsu

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

in which an operating system (OS) main body module having functions other than the function of bootstrap. . . .

Settsu, 1:51-57

In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.

Settsu, 3:6-25

Referring next to FIG. 1, there is illustrated a block diagram showing the structure of an information processing apparatus according to a first embodiment of the present invention. In the figure, reference numeral 1 denotes a ROM of the information processing apparatus, 2 denotes a memory of the information processing apparatus, 3 denotes a boot device of the information processing apparatus, 4 denotes a boot block in the boot device 3, 5 denotes a file system in the boot device 3, and 6 denotes a firmware or FI/W code module stored in the ROM 1. The FI/W code module 6 is directly executed on the ROM 1 so as to load data from the boot block 4 in the boot device 3 into the memory 2 and then assume that the loaded data is a code and execute the code after setting up and running diagnostic checks on a hardware or H/W register. Further, reference numeral 7 denotes a mini operating system (OS) module compiled and linked in the same way as ordinary program files and located in the boot block 4 within the boot device, the mini OS module having OS functions required for bootstrap processing, and 8 denotes an OS main body module located in the file system 5 within the boot device and provided with OS functions except the OS functions included in the mini OS module 7. When the information processing

Settsu

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## **Appendix C17**

### **Invalidity of U.S. Patent 8,880,862 based on Settsu**

apparatus is powered on, it goes through initialization and transfers control to the F/W code module 6 stored in the ROM 1.

Referring next to FIG. 2, there is illustrated a diagram showing the structure of the mini OS module 7 stored in the boot block of the boot device of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the mini OS module 7 consists of a mini kernel module 9 which is a basic part of the OS, a boot device driver module 10 for performing I/O operations on the boot device 3, and an OS loading and initialization processing module 11 for loading the OS main body module 8 from the boot device 3 into the memory 2 and for executing the initialization of the OS main body module 8.

Settsu, 7:65-8:35

Referring next to FIG. 3, there is illustrated a diagram showing the structure of the OS main body module 8 of the information processing apparatus according to the first embodiment of the present invention. As shown in the figure, the OS main body module 8 consists of a kernel module 15 having kernel functions except the functions included in the mini kernel module 9 of FIG. 2, and a device driver module 16 for performing I/O operations on devices (not shown) except the boot device 3. . . . The OS main body module 8 is located within the file system 5 of the boot device 3 and is loaded into the memory 2 by the mini OS module 7. The OS main body module 8 then goes through initialization.

Settsu, 8:47-9:3

Referring next to FIG. 4, there is illustrated a flow chart showing operations of the mini OS module 7 of the information processing apparatus according to the first embodiment of the present invention. The F/W code module 6 loads the mini OS module 7 into the memory 2 and transfers control to the mini OS module 7. The mini OS module 7 then, in step ST101, executes initialization of the mini kernel module 9. In this case, the thread management module 12, the I/O management module 13, and the thread communication management module 14 are initialized and their functions are available now. Next, the mini OS module 7, in step ST102, executes initialization of the boot device driver module 10. The boot device driver module 10 registers an interrupt request from the boot device into an interrupt table of the I/O management module 13 so as to handle the interrupt request, and generates and starts execution of a thread for boot device I/O processing by using the thread management module 12.

Settsu

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Settsu, 9:7-21.

The mini OS module 7, in step ST103, generates a thread for the OS loading and initialization processing module 11 by using the thread management module 12. The mini OS module 7 further, in step ST104, starts execution of the thread by using the thread management module 12. The OS loading and initialization processing module 11 is thus started up as the thread. After that, the mini OS module 7 transfers control to the OS loading and initialization processing module 11.

Settsu, 9:30-39.

As previously mentioned, in accordance with the second embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according to a plurality of functions to be performed by the main body of the OS. Further, the plurality of functional modules are separately stored in the file system 5. In addition, the OS load processing and the OS initialization processing can be performed in parallel with each other after any one of the plurality of functional modules of the OS main body is loaded into the memory. As a result, while the CPU waits for the occurrence of an event in performing the OS load or initialization processing, the CPU does not idle but the CPU performs another processing. Accordingly, the second embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

Settsu, 12:1-16.

Settsu, Fig. 12

Claim 8.5

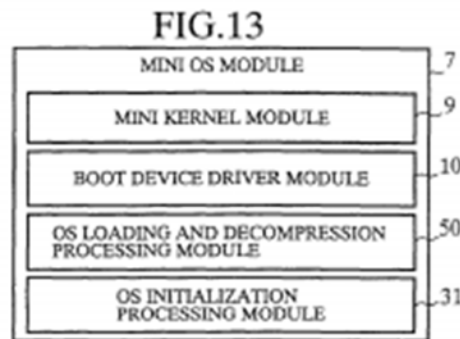

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 12, there is illustrated a block diagram showing the structure of an information processing apparatus according to a fourth embodiment of the present invention. In the figure, the same reference numerals as shown in FIG. 5 designate the same or like elements, and therefore the description of those elements will be omitted hereinafter. Like the OS of the second embodiment, the OS of the second embodiment is divided into a mini OS module 7 and a main body of the OS, and the main body is further divided into a plurality of functional modules, such as a system call processing module 17, a process management module 18, a common memory management module 19, a message management module 20, a signal management module 21, a virtual memory processing module 22, and a device driver module 16. The plurality of functional modules are separately stored as compressed files in a file system 5 of a boot device 3.

Settsu, 13:55-65

Settsu, Fig. 13.

Referring next to FIG. 13, there is illustrated a block diagram showing the structure of the mini OS module 7 of the information processing apparatus according to the fourth embodiment of the present invention. Like the mini OS module 7 of the second embodiment as shown in FIG. 6, the mini OS module 7 of the fourth embodiment is provided with a mini kernel module 9, a boot device driver module 10, and an OS initialization processing module 31. The mini OS module 7 of the fourth embodiment further comprises an OS loading and decompression processing module 50 having a function of decompressing a loaded functional module in addition to the function of the OS load processing module 30 of the second embodiment, instead of the OS load processing module 30.

Settsu, 13:66-14:12

Settsu

Claim 8.5

“utilizing the decompressed portion of the operating system to at least partially boot the computer system”

## Appendix C17

### Invalidity of U.S. Patent 8,880,862 based on Settsu

Referring next to FIG. 14, there is illustrated a flow chart showing operations of the OS loading and decompression processing module 50 of the information processing apparatus according to the fourth embodiment of the present invention. The OS loading and decompression processing module 50 to which control from the mini OS module 7 has been transferred, in step ST181, loads the main body of the OS stored in the file system 5 of the boot device 3, such as the system call processing module 17, the process management module 18, the common memory management module 19, the message management module 20, the signal management module 21, the virtual memory processing module 22, and the device driver module 16, into the memory 2. In performing step ST181, the OS loading and decompression processing module 50 loads any one of those functional modules 16 to 22 first. The OS loading and decompression processing module 50 then, in step ST182, decompresses one functional module loaded into the memory. Since the plurality of functional modules 16 to 22 are stored as compressed files in the file system 5 of the boot device, the functional module loaded into the memory 2 is compressed data. Therefore, in performing step ST182, the OS loading and decompression processing module 50 decompresses the compressed data so as to convert it into executable code and data.

Settsu, 14:13-37

As previously mentioned, in accordance with the fourth embodiment of the present invention, the main body of the OS is divided into a plurality of functional modules according a plurality of functions to be performed by the main body, and the plurality of functional modules are stored as compressed files in the file system 5 of the boot device. Further, the OS loading and decompression processing module 50 decompresses each of the plurality of functional modules each time it loads each of them into memory. As a result, the time required for I/O processing can be reduced. Accordingly, the fourth embodiment of the present invention provides an advantage of being able to further reduce the time required for booting up the information processing apparatus.

| <p><b>9.1</b> The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list; and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <p>Settsu, as evidenced by the example citations below, discloses “the method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, compressing an additional portion of the operating system that is not associated with the boot data list), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 1.1 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> |                                                                                                                                                                                                                             |

Settsu

“The method of claim 8, further comprising: compressing an additional portion of the operating system that is not associated with the boot data list”

Claim 9.1

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |                                                                                                                                                    |

| <p>9.2 storing the additional portion of the operating system in the first memory, and</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Settsu, as evidenced by the example citations below, discloses “storing the additional portion of the operating system in the first memory”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, storing the additional portion of the operating system in the first memory), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 8.1 above.</i></p> <p><i>See also</i></p> <p>In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> <p>In accordance with another preferred embodiment of the present invention, the OS loading and initialization processing module of the mini OS module is divided into an OS loading processing module and an OS initialization module, the OS main body module is divided into a plurality of blocks of arbitrary record size, each of which includes a loading flag consisting of a plurality of bits respectively corresponding to the plurality of functional modules included in the OS main body module. Further, the loading flag of one of the plurality of blocks</p> |                                                                                                                                                    |

Settsu  
“storing the additional portion of the operating system in the first memory”

Claim 9.2

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

including the end of any one of the plurality of functional modules has a corresponding bit set to a predetermined value. After the mini OS module is loaded into the memory, the mini OS module initializes the mini kernel module and the boot device driver module and then generates and starts execution of a thread for the OS loading processing module. After the thread for the OS loading processing module is started, the loading processing module loads each of the plurality of blocks of the OS main body module into the memory, and refers to the loading flag every time it loads each of the plurality of blocks into the memory. Only if a bit of the loading flag is set to a predetermined value, the OS loading processing module generates and starts execution of a thread for the OS initialization module. And, after the thread for the OS initialization module is started, the OS initialization module initializes a corresponding one of the plurality of functional modules loaded into the memory.

| <p>9.3 wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <p>Settsu, as evidenced by the example citations below, discloses “wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”</p> |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 8.5 above.</i></p> <p><i>See also</i></p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the plurality of functional modules, into which the OS main body module is divided, are stored as compressed files in the file system and the loading and initialization processing module of the mini OS module is divided into an OS loading and decompression processing module and an OS initialization module. Further, the mini OS module generates and starts execution of a thread for the OS loading and decompression processing module after the mini OS module initializes the mini kernel module and the boot device driver module. After the thread for the OS loading and decompression processing module is started, the OS loading and decompression processing module loads each of the plurality of functional modules into the memory and decompresses the loaded functional module, and then generates and starts execution of a thread for the OS initialization module. After the thread for the OS initialization module is executed, the OS initialization module initializes each of the plurality of functional modules loaded into the memory and decompressed.</p> <p>Settsu, 3:6-25</p> <p style="padding-left: 40px;">In accordance with another preferred embodiment of the present invention, the OS loading and initialization processing module of the mini OS module is divided into an OS loading processing module and an OS initialization module, the OS main body module is divided into a plurality of blocks of arbitrary record size, each of which includes a</p> |                                                                                                                                                                                                                                 |

Settsu

Claim 9.3

“wherein the utilizing comprises: utilizing the stored additional portion of the operating system to at least further partially boot the computer system”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

loading flag consisting of a plurality of bits respectively corresponding to the plurality of functional modules included in the OS main body module. Further, the loading flag of one of the plurality of blocks including the end of any one of the plurality of functional modules has a corresponding bit set to a predetermined value. After the mini OS module is loaded into the memory, the mini OS module initializes the mini kernel module and the boot device driver module and then generates and starts execution of a thread for the OS loading processing module. After the thread for the OS loading processing module is started, the loading processing module loads each of the plurality of blocks of the OS main body module into the memory, and refers to the loading flag every time it loads each of the plurality of blocks into the memory. Only if a bit of the loading flag is set to a predetermined value, the OS loading processing module generates and starts execution of a thread for the OS initialization module. And, after the thread for the OS initialization module is started, the OS initialization module initializes a corresponding one of the plurality of functional modules loaded into the memory.

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                      |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>11 (Preamble)</b> A method for providing accelerated loading of an operating system in a computer system, comprising:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Settsu, as evidenced by the example citations below, discloses “a method for providing accelerated loading of an operating system in a computer system, comprising:” |
| <p>To the extent that Realtime contends this reference does not explicitly disclose this element of this claim (for example, a method for providing accelerated loading of an operating system in a computer system, comprising), Apple contends that one of skill in the art would understand the operation of booting a computer system to include the element that is missing similar to the manner in which the patentee relied upon such knowledge of skill in the art during prosecution. See Sections VI. and VII. of Apple’s Invalidity Contentions.</p> <p>Settsu discloses this limitation:</p> <p><i>See Claim 1 (Preamble) above.</i></p> |                                                                                                                                                                      |

Settsu

**Claim 11 (Preamble)**

“A method for providing accelerated loading of an operating system in a computer system, comprising”

**Appendix C17**  
**Invalidity of U.S. Patent 8,880,862 based on Settsu**

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |                                                                                                                                                                                                                                     |
