What does the investigator need to know about the drug?

Introduction

An investigator may be asked to conduct a study with a new molecular entity which has never been administered to man before, or else has only been administered to a small number of subjects in Phase I studies. Alternatively, he may undertake a trial during Phase II or III, when there is already a considerable amount of clinical data available.

This chapter will concentrate predominantly on the information an investigator should know before embarking on a Phase I study, with some comment about extra data that should be available to conduct later phase trials.

When an investigator is approached by a sponsoring pharmaceutical company for the first time, it is worth trying to establish the overall plan or strategy for the drug's evaluation. The data may prove to be confidential, but even an outline of the sponsoring drug company's intentions will help to put the study which the investigator is being requested to undertake, in context. It is not unusual for the sponsoring physician or the Clinical Research Associate to bring a research scientist with him on an early visit if the drug to be tested is at an early stage of development. At a later stage, the investigator may be taking part in a multi-centre trial, in which case it is quite usual to have an investigator's meeting, when critical decisions about the drug – such as primary end points, interim analyses and the remit of data safety monitoring committees – are made.

Drug development is traditionally divided into four phases:Phase I: Clinical pharmacology.

Studies in healthy volunteers or patients, according to the class of drug and its safety, to determine:

Pharmacodynamics (biological effects) where practicable, tolerability, safety, and efficacy, if in patients Pharmacokinetics: absorption, distribution, metabolism and excretion

Phases of drug development

DOCKE

3 / WHAT DOES THE INVESTIGATOR NEED TO KNOW ABOUT THE DRUG?

Phase II: Clinical investigation

Studies in patients with the target disease

Pharmacodynamics and pharmacokinetics: dose-ranging in expanding, carefully controlled studies for efficacy and safety

- Phase III: Formal therapeutic trials Randomised and controlled for efficacy in large numbers, safety, placebo and active comparator trials
- Phase IV: Post-registration
 - Marketing or user studies

Expand clinical experience for safety and efficacy; further formal therapeutic trials; comparisons with other active comparators

This classification assumes a logical, sequential approach to drug development, which rarely occurs in practice. Phase I studies initiate the clinical development programme, but some clinical pharmacology trials, e.g. bioequivalence studies, studies in special risk groups, such as hepatic and renal disease, and drug-drug interaction studies, may occur at various stages in the execution of the clinical development plans. Phases II and III often overlap, as sponsoring drug companies attempt to save time by initiating long term parallel group therapeutic trials, before the dose-range is adequately defined.

The investigator's brochure

A responsible sponsoring drug company should provide the investigator with an Investigator's Brochure containing the essential information on the drug, independently of the protocol. It is a confidential document, which can serve as a check list for the investigator to be sure that he is informed of all relevant data relating to the efficacy and safety of the drug. Its content is listed in Box 3.1 and this may be supplemented by separate documents supplied on request from the sponsoring drug company – including publications.

Key elements from the Investigator's Brochure on which the investigator must be informed will now be discussed.

Pre-clinical evaluation

Pharmacology

This section should provide a scientific rationale for development of the drug and an hypothesis which is to be tested in man. An investigator reviewing this data for the first time may find this section rather daunting and unless he has a good grounding in pharmacology, many of the terms will be confusing. Readers are directed to some of the standard texts for further information. Contents of Inv

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
