Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

[0001] This application is a continuation of co-pending U.S. Application Serial No. 12/791,597, filed June 1, 2010, entitled “GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER”, having as inventors Steven Morein et al., owned by instant assignee and is incorporated herein by reference, which is a continuation of co-pending U.S. Application Serial No. 11/842,256, filed August 21, 2007, entitled “GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER”, having as inventors Steven Morein et al., owned by instant assignee and is incorporated herein by reference, which is a continuation of U.S. Application Serial No. 11/117,863, filed April 29, 2005, which has issued into U.S. Patent No. 7,327,369, entitled “GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER”, having as inventors Steven Morein et al., and owned by instant assignee and is incorporated herein by reference which is a continuation of U.S. Application Serial No. 10/718,318, filed on November 20, 2003, which has issued into U.S. Patent No. 6,897,871, entitled “GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER”, having as inventors Steven Morein et al., and owned by instant assignee and is incorporated herein by reference.

FIELD OF THE INVENTION

[0002] The present invention generally relates to graphics processors and, more particularly, to a graphics processor architecture employing a single shader.

BACKGROUND OF THE INVENTION

[0003] In computer graphics applications, complex shapes and structures are formed through the sampling, interconnection and rendering of more simple objects, referred to as

primitives. An example of such a primitive is a triangle, or other suitable polygon. These primitives, in turn, are formed by the interconnection of individual pixels. Color and texture are then applied to the individual pixels that comprise the shape based on their location within the primitive and the primitives orientation with respect to the generated shape; thereby generating the object that is rendered to a corresponding display for subsequent viewing.

[0004] The interconnection of primitives and the application of color and textures to generated shapes are generally performed by a graphics processor. Conventional graphics processors include a series of shaders that specify how and with what corresponding attributes, a final image is drawn on a screen, or suitable display device. As illustrated in FIG. 1, a conventional shader 10 can be represented as a processing block 12 that accepts a plurality of bits of input data, such as, for example, object shape data (14) in object space (x,y,z); material properties of the object, such as color (16); texture information (18); luminance information (20); and viewing angle information (22) and provides output data (28) representing the object with texture and other appearance properties applied thereto (x' , y' , z').

[0005] In exemplary fashion, as illustrated in FIGS. 2A-2B, the shader accepts the vertex coordinate data representing cube 30 (FIG. 2A) as inputs and provides data representing, for example, a perspectively corrected view of the cube 30' (FIG. 2B) as an output. The corrected view may be provided, for example, by applying an appropriate transformation matrix to the data representing the initial cube 30. More specifically, the representation illustrated in FIG. 2B is provided by a vertex shader that accepts as inputs the data representing, for example, vertices V_X , V_Y and V_Z , among others of cube 30 and providing angularly oriented vertices $V_{X'}$, $V_{Y'}$ and $V_{Z'}$, including any appearance attributes of corresponding cube 30'.

[0006] In addition to the vertex shader discussed above, a shader processing block that operates on the pixel level, referred to as a pixel shader is also used when generating an object for display. Generally, the pixel shader provides the color value associated with each pixel of a rendered object. Conventionally, both the vertex shader and pixel shader are separate components that are configured to perform only a single transformation or operation. Thus, in order to perform a position and a texture transformation of an input, at least two shading operations and hence, at least two shaders, need to be employed. Conventional graphics processors require the use of both a vertex shader and a pixel shader in order to generate an object. Because both types of shaders are required, known graphics processors are relatively large in size, with most of the real estate being taken up by the vertex and pixel shaders.

[0007] In addition to the real estate penalty associated with conventional graphics processors, there is also a corresponding performance penalty associated therewith. In conventional graphics processors, the vertex shader and the pixel shader are juxtaposed in a sequential, pipelined fashion, with the vertex shader being positioned before and operating on vertex data before the pixel shader can operate on individual pixel data.

[0008] Thus, there is a need for an improved graphics processor employing a shader that is both space efficient and computationally effective.

BRIEF DESCRIPTION OF THE DRAWINGS

[0009] The present invention and the associated advantages and features thereof, will become better understood and appreciated upon review of the following detailed description of the invention, taken in conjunction with the following drawings, where like numerals represent like elements, in which:

[0010] FIG. 1 is a schematic block diagram of a conventional shader;

[0011] FIGS. 2A-2B are graphical representations of the operations performed by the shader illustrated in FIG. 1;

[0012] FIG. 3 is a schematic block diagram of a conventional graphics processor architecture;

[0013] FIG. 4A is a schematic block diagram of a graphics processor architecture according to the present invention;

[0014] FIG. 4B is a schematic block diagram of an optional input component to the graphics processor according to an alternate embodiment of the present invention; and

[0015] FIG. 5 is an exploded schematic block diagram of the unified shader employed in the graphics processor illustrated in FIG. 4A.

DETAILED DESCRIPTION OF THE INVENTION

[0016] Briefly stated, the present invention is directed to a graphics processor that employs a unified shader that is capable of performing both the vertex operations and the pixel operations in a space saving and computationally efficient manner. In an exemplary embodiment, a graphics processor according to the present invention includes an arbiter circuit for selecting one of a plurality of inputs for processing in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs.

[0017] The shader includes a general purpose register block for storing at least the plurality of selected inputs, a sequencer for storing logical and arithmetic instructions that are used to perform vertex and pixel manipulation operations and a processor capable of executing

both floating point arithmetic and logical operations on the selected inputs according to the instructions maintained in the sequencer. The shader of the present invention is referred to as a “unified” shader because it is configured to perform both vertex and pixel operations. By employing the unified shader of the present invention, the associated graphics processor is more space efficient than conventional graphics processors because the unified shader takes up less real estate than the conventional multi-shader processor architecture.

[0018] In addition, according to the present invention, the unified shader is more computationally efficient because it allows the shader to be flexibly allocated to pixels or vertices based on workload.

[0019] Referring now to FIG. 3, illustrated therein is a graphics processor incorporating a conventional pipeline architecture. As shown, the graphics processor 40 includes a vertex fetch block 42 which receives vertex information relating to a primitive to be rendered from an off-chip memory 55 on line 41. The fetched vertex data is then transmitted to a vertex cache 44 for storage on line 43. Upon request, the vertex data maintained in the vertex cache 44 is transmitted to a vertex shader 46 on line 45. As discussed above, an example of the information that is requested by and transmitted to the vertex shader 46 includes the object shape, material properties (e.g. color), texture information, and viewing angle. Generally, the vertex shader 46 is a programmable mechanism which applies a transformation position matrix to the input position information (obtained from the vertex cache 44), thereby providing data representing a perspective corrected image of the object to be rendered, along with any texture or color coordinates thereof.

[0020] After performing the transformation operation, the data representing the transformed vertices are then provided to a vertex store 48 on line 47. The vertex store 48 then

transmits the modified vertex information contained therein to a primitive assembly block 50 on line 49. The primitive assembly block 50 assembles, or converts, the input vertex information into a plurality of primitives to be subsequently processed. Suitable methods of assembling the input vertex information into primitives is known in the art and will not be discussed in greater detail here. The assembled primitives are then transmitted to a rasterization engine 52, which converts the previously assembled primitives into pixel data through a process referred to as walking. The resulting pixel data is then transmitted to a pixel shader 54 on line 53.

[0021] The pixel shader 54 generates the color and additional appearance attributes that are to be applied to a given pixel, and applies the appearance attributes to the respective pixels. In addition, the pixel shader 54 is capable of fetching texture data from a texture map 57 as indexed by the pixel data from the rasterization engine 52 by transmitting such information on line 55 to the texture map. The requested texture data is then transmitted back from the texture map 57 on line 57' and stored in a texture cache 56 before being routed to the pixel shader on line 58. Once the texture data has been received, the pixel shader 54 then performs specified logical or arithmetic operations on the received texture data to generate the pixel color or other appearance attribute of interest. The generated pixel appearance attribute is then combined with a base color, as provided by the rasterization engine on line 53, to thereby provide a pixel color to the pixel corresponding at the position of interest. The pixel appearance attribute present on line 59 is then transmitted to post raster processing blocks (not shown).

[0022] As described above, the conventional graphics processor 40 requires the use of two separate shaders: a vertex shader 46 and a pixel shader 54. A drawback associated with such an architecture is that the overall footprint of the graphics processor is relatively large as the two

shaders take up a large amount of real estate. Another drawback associated with conventional graphics processor architectures is that can exhibit poor computational efficiency.

[0023] Referring now to FIG. 4A, in an exemplary embodiment, the graphics processor 60 of the present invention includes a multiplexer 66 having vertex (e.g. indices) data provided at a first input thereto and interpolated pixel parameter (e.g. position) data and attribute data from a rasterization engine 74 provided at a second input. A control signal generated by an arbiter 64 is transmitted to the multiplexer 66 on line 63. The arbiter 64 determines which of the two inputs to the multiplexer 66 is transmitted to a unified shader 62 for further processing. The arbitration scheme employed by the arbiter 64 is as follows: the vertex data on the first input of the multiplexer 66 is transmitted to the unified shader 62 on line 65 if there is enough resources available in the unified shader to operate on the vertex data; otherwise, the interpolated pixel parameter data present on the second input will be passed to the unified shader 62 for further processing.

[0024] Referring briefly to FIG. 5, the unified shader 62 will now be described. As illustrated, the unified shader 62 includes a general purpose register block 92, a plurality of source registers: including source register A 93, source register B 95, and source register C 97, a processor (e.g. CPU) 96 and a sequencer 99. The general purpose register block 92 includes sixty four registers, or available entries, for storing the information transmitted from the multiplexer 66 on line 65 or any other information to be maintained within the unified shader. The data present in the general purpose register block 92 is transmitted to the plurality of source registers via line 109.

[0025] The processor 96 may be comprised of a dedicated piece of hardware or can be configured as part of a general purpose computing device (i.e. personal computer). In an

exemplary embodiment, the processor 96 is adapted to perform 32-bit floating point arithmetic operations as well as a complete series of logical operations on corresponding operands. As shown, the processor is logically partitioned into two sections. Section 96 is configured to execute, for example, the 32-bit floating point arithmetic operations of the unified shader. The second section, 96A, is configured to perform scalar operations (e.g. log, exponent, reciprocal square root) of the unified shader.

[0026] The sequencer 99 includes constants block 91 and an instruction store 98. The constants block 91 contains, for example, the several transformation matrices used in connection with vertex manipulation operations. The instruction store 98 contains the necessary instructions that are executed by the processor 96 in order to perform the respective arithmetic and logic operations on the data maintained in the general purpose register block 92 as provided by the source registers 93-95. The instruction store 98 further includes memory fetch instructions that, when executed, causes the unified shader 62 to fetch texture and other types of data, from memory 82 (FIG. 4A). In operation, the sequencer 99 determines whether the next instruction to be executed (from the instruction store 98) is an arithmetic or logical instruction or a memory (e.g. texture fetch) instruction. If the next instruction is a memory instruction or request, the sequencer 99 sends the request to a fetch block (not shown) which retrieves the required information from memory 82 (FIG. 4A). The retrieved information is then transmitted to the sequencer 99, through the vertex texture cache 68 (FIG. 4A) as described in greater detail below.

[0027] If the next instruction to be executed is an arithmetic or logical instruction, the sequencer 99 causes the appropriate operands to be transferred from the general purpose register block 92 into the appropriate source registers (93, 95, 97) for execution, and an appropriate signal is sent to the processor 96 on line 101 indicating what operation or series of operations are

to be executed on the several operands present in the source registers. At this point, the processor 96 executes the instructions on the operands present in the source registers and provides the result on line 85. The information present on line 85 may be transmitted back to the general purpose register block 92 for storage, or transmitted to succeeding components of the graphics processor 60.

[0028] As discussed above, the instruction store 98 maintains both vertex manipulation instructions and pixel manipulation instructions. Therefore, the unified shader 99 of the present invention is able to perform both vertex and pixel operations, as well as execute memory fetch operations. As such, the unified shader 62 of the present invention is able to perform both the vertex shading and pixel shading operations on data in the context of a graphics controller based on information passed from the multiplexer. By being adapted to perform memory fetches, the unified shader of the present invention is able to perform additional processes that conventional vertex shaders cannot perform; while at the same time, perform pixel operations.

[0029] The unified shader 62 has ability to simultaneously perform vertex manipulation operations and pixel manipulation operations at various degrees of completion by being able to freely switch between such programs or instructions, maintained in the instruction store 98, very quickly. In application, vertex data to be processed is transmitted into the general purpose register block 92 from multiplexer 66. The instruction store 98 then passes the corresponding control signals to the processor 96 on line 101 to perform such vertex operations. However, if the general purpose register block 92 does not have enough available space therein to store the incoming vertex data, such information will not be transmitted as the arbitration scheme of the arbiter 64 is not satisfied. In this manner, any pixel calculation operations that are to be, or are currently being, performed by the processor 96 are continued, based on the instructions

maintained in the instruction store 98, until enough registers within the general purpose register block 92 become available. Thus, through the sharing of resources within the unified shader 62, processing of image data is enhanced as there is no down time associated with the processor 96.

[0030] Referring back to FIG. 4A, the graphics processor 60 further includes a cache block 70, including a parameter cache 70A and a position cache 70B which accepts the pixel based output of the unified shader 62 on line 85 and stores the respective pixel parameter and position information in the corresponding cache. The pixel information present in the cache block 70 is then transmitted to the primitive assembly block 72 on line 71. The primitive assembly block 72 is responsible for assembling the information transmitted thereto from the cache block 70 into a series of triangles, or other suitable primitives, for further processing. The assembled primitives are then transmitted on line 73 to rasterization engine block 74, where the transmitted primitives are then converted into individual pixel data information through a walking process, or any other suitable pixel generation process. The resulting pixel data from the rasterization engine block 74 is the interpolated pixel parameter data that is transmitted to the second input of the multiplexer 66 on line 75.

[0031] In those situations when vertex data is transmitted to the unified shader 62 through the multiplexer 66, the resulting vertex data generated by the processor 96, is transmitted to a render back end block 76 which converts the resulting vertex data into at least one of several formats suitable for later display on display device 84. For example, if a stained glass appearance effect is to be applied to an image, the information corresponding to such appearance effect is associated with the appropriate position data by the render back end 76. The information from the render back end 76 is then transmitted to memory 82 and a display

controller line 80 via memory controller 78. Such appropriately formatted information is then transmitted on line 83 for presentation on display device 84.

[0032] Referring now to FIG. 4B, shown therein is a vertex block 61 which is used to provide the vertex information at the first input of the multiplexer 66 according to an alternate embodiment of the present invention. The vertex block 61 includes a vertex fetch block 61A which is responsible for retrieving vertex information from memory 82, if requested, and transmitting that vertex information into the vertex cache 61B. The information stored in the vertex cache 61B comprises the vertex information that is coupled to the first input of multiplexer 66.

[0033] As discussed above, the graphics processor 60 of the present invention incorporates a unified shader 62 which is capable of performing both vertex manipulation operations and pixel manipulation operations based on the instructions stored in the instruction store 98. In this fashion, the graphics processor 60 of the present invention takes up less real estate than conventional graphics processors as separate vertex shaders and pixel shaders are no longer required. In addition, as the unified shader 62 is capable of alternating between performing vertex manipulation operations and pixel manipulation operations, graphics processing efficiency is enhanced as one type of data operations is not dependent upon another type of data operations. Therefore, any performance penalties experienced as a result of dependent operations in conventional graphics processors are overcome.

[0034] The above detailed description of the present invention and the examples described therein have been presented for the purposes of illustration and description. It is therefore contemplated that the present invention cover any and all modifications, variations and

equivalents that fall within the spirit and scope of the basic underlying principles disclosed and claimed herein.

CLAIMS

What is claimed is:

1. A method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. A unified shader, comprising:

a general purpose register block for maintaining data;

a processor unit;

a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs.

3. A unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations; and

shared resources, operatively coupled to the processor unit;

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations.

4. A unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations; and

shared resources, operatively coupled to the processor unit;

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

5. A unified shader comprising:

a processor unit;

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

6. The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

7. The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.

8. The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs.

9. The shader of claim 5, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress.

10. The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.

11. The shader of claim 7, wherein the control signal is provided by an arbiter.

12. A graphics processor comprising:
a unified shader comprising a processor unit that executes vertex calculations while the pixel calculations are still in progress.

13. The graphics processor of claim 12 wherein the unified shader comprises a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to

cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

14. The graphics processor of claim 12 comprising a vertex block operative to fetch vertex information from memory.

15. A unified shader comprising:
a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.

16. The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

[0035] A graphics processing architecture employing a single shader is disclosed. The architecture includes a circuit operative to select one of a plurality of inputs in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs. The shader includes a register block which is used to store the plurality of selected inputs, a sequencer which maintains vertex manipulation and pixel manipulations instructions and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs in response to the instructions maintained in the sequencer.

PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at <http://www.uspto.gov/web/offices/pac/doc/general/index.html>.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, <http://www.stopfakes.gov>. Part of a Department of Commerce initiative, this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4158).

LICENSE FOR FOREIGN FILING UNDER
Title 35, United States Code, Section 184
Title 37, Code of Federal Regulations, 5.11 & 5.15

GRANTED

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

NOT GRANTED

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

(54) **A graphics processing architecture employing a unified shader**

(57) A graphics processor, comprising: an arbiter circuit for selecting one of a plurality of inputs in response to a control signal; and a shader, coupled to the arbiter circuit, operative to process the selected one of the plu-

rality of inputs, the shader including means for performing vertex operations and pixel operations, and performing one of the vertex operations or pixel operations based on the selected one of the plurality of inputs, wherein the shader provides a appearance attribute.

10

FIG. 1
(PRIOR ART)

EP 2 299 408 A2

Description**FIELD OF THE INVENTION**

[0001] The present invention generally relates to graphics processors and, more particularly, to a graphics processor architecture employing a single shader.

BACKGROUND OF THE INVENTION

[0002] In computer graphics applications, complex shapes and structures are formed through the sampling, interconnection and rendering of more simple objects, referred to as primitives. An example of such a primitive is a triangle, or other suitable polygon. These primitives, in turn, are formed by the interconnection of individual pixels. Color and texture are then applied to the individual pixels that comprise the shape based on their location within the primitive and the primitives orientation with respect to the generated shape; thereby generating the object that is rendered to a corresponding display for subsequent viewing.

[0003] The interconnection of primitives and the application of color and textures to generated shapes are generally performed by a graphics processor. Conventional graphics processors include a series of shaders that specify how and with what corresponding attributes, a final image is drawn on a screen, or suitable display device. As illustrated in FIG. 1, a conventional shader 10 can be represented as a processing block 12 that accepts a plurality of bits of input data, such as, for example, object shape data (14) in object space (x,y,z); material properties of the object, such as color (16); texture information (18); luminance information (20); and viewing angle information (22) and provides output data (28) representing the object with texture and other appearance properties applied thereto (x', y', z').

[0004] In exemplary fashion, as illustrated in FIGS. 2A-2B, the shader accepts the vertex coordinate data representing cube 30 (FIG. 2A) as inputs and provides data representing, for example, a perspective corrected view of the cube 30' (FIG. 2B) as an output. The corrected view may be provided, for example, by applying an appropriate transformation matrix to the data representing the initial cube 30. More specifically, the representation illustrated in FIG. 2B is provided by a vertex shader that accepts as inputs the data representing, for example, vertices V_x , V_y and V_z , among others of cube 30 and providing angularly oriented vertices V_x' , V_y' and V_z' , including any appearance attributes of corresponding cube 30'.

[0005] In addition to the vertex shader discussed above, a shader processing block that operates on the pixel level, referred to as a pixel shader is also used when generating an object for display. Generally, the pixel shader provides the color value associated with each pixel of a rendered object. Conventionally, both the vertex shader and pixel shader are separate components that

are configured to perform only a single transformation or operation. Thus, in order to perform a position and a texture transformation of an input, at least two shading operations and hence, at least two shaders, need to be employed. Conventional graphics processors require the use of both a vertex shader and a pixel shader in order to generate an object. Because both types of shaders are required, known graphics processors are relatively large in size, with most of the real estate being taken up by the vertex and pixel shaders.

[0006] In addition to the real estate penalty associated with conventional graphics processors, there is also a corresponding performance penalty associated therewith. In conventional graphics processors, the vertex shader and the pixel shader are juxtaposed in a sequential, pipelined fashion, with the vertex shader being positioned before and operating on vertex data before the pixel shader can operate on individual pixel data.

[0007] Thus, there is a need for an improved graphics processor employing a shader that is both space efficient and computationally effective.

SUMMARY OF THE INVENTION

[0008] Briefly stated, the present invention is directed to a graphics processor that employs a unified shader that is capable of performing both the vertex operations and the pixel operations in a space saving and computationally efficient manner. In an exemplary embodiment, a graphics processor according to the present invention includes an arbiter circuit for selecting one of a plurality of inputs for processing in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs.

[0009] The shader includes a general purpose register block for storing at least the plurality of selected inputs, a sequencer for storing logical and arithmetic instructions that are used to perform vertex and pixel manipulation operations and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs according to the instructions maintained in the sequencer. The shader of the present invention is referred to as a "unified" shader because it is configured to perform both vertex and pixel operations. By employing the unified shader of the present invention, the associated graphics processor is more space efficient than conventional graphics processors because the unified shader takes up less real estate than the conventional multi-shader processor architecture.

[0010] In addition, according to the present invention, the unified shader is more computationally efficient because it allows the shader to be flexibly allocated to pixels or vertices based on workload.

BRIEF DESCRIPTION OF THE DRAWINGS

[0011] The present invention and the associated advantages and features thereof, will become better understood and appreciated upon review of the following detailed description of the invention, taken in conjunction with the following drawings, where like numerals represent like elements, in which:

FIG. 1 is a schematic block diagram of a conventional shader;

FIGS. 2A-2B are graphical representations of the operations performed by the shader illustrated in FIG. 1;

FIG. 3 is a schematic block diagram of a conventional graphics processor architecture;

FIG. 4A is a schematic block diagram of a graphics processor architecture according to the present invention;

FIG. 4B is a schematic block diagram of an optional input component to the graphics processor according to an alternate embodiment of the present invention; and

FIG. 5 is an exploded schematic block diagram of the unified shader employed in the graphics processor illustrated in FIG. 4A.

DETAILED DESCRIPTION OF THE INVENTION

[0012] FIG. 3, illustrates a graphics processor incorporating a conventional pipeline architecture. As shown, the graphics processor 40 includes a vertex fetch block 42 which receives vertex information relating to a primitive to be rendered from an off-chip memory 55 on line 41. The fetched vertex data is then transmitted to a vertex cache 44 for storage on line 43. Upon request, the vertex data maintained in the vertex cache 44 is transmitted to a vertex shader 46 on line 45. As discussed above, an example of the information that is requested by and transmitted to the vertex shader 46 includes the object shape, material properties (e.g. color), texture information, and viewing angle. Generally, the vertex shader 46 is a programmable mechanism which applies a transformation position matrix to the input position information (obtained from the vertex cache 44), thereby providing data representing a perspective corrected image of the object to be rendered, along with any texture or color coordinates thereof.

[0013] After performing the transformation operation, the data representing the transformed vertices are then provided to a vertex store 48 on line 47. The vertex store 48 then transmits the modified vertex information contained therein to a primitive assembly block 50 on line

49. The primitive assembly block 50 assembles, or converts, the input vertex information into a plurality of primitives to be subsequently processed. Suitable methods of assembling the input vertex information into primitives is known in the art and will not be discussed in greater detail here. The assembled primitives are then transmitted to a rasterization engine 52, which converts the previously assembled primitives into pixel data through a process referred to as walking. The resulting pixel data is then transmitted to a pixel shader 54 on line 53.

[0014] The pixel shader 54 generates the color and additional appearance attributes that are to be applied to a given pixel, and applies the appearance attributes to the respective pixels. In addition, the pixel shader 54 is capable of fetching texture data from a texture map 57 as indexed by the pixel data from the rasterization engine 52 by transmitting such information on line 55 to the texture map. The requested texture data is then transmitted back from the texture map 57 on line 57' and stored in a texture cache 56 before being routed to the pixel shader on line 58. Once the texture data has been received, the pixel shader 54 then performs specified logical or arithmetic operations on the received texture data to generate the pixel color or other appearance attribute of interest. The generated pixel appearance attribute is then combined with a base color, as provided by the rasterization engine on line 53, to thereby provide a pixel color to the pixel corresponding at the position of interest. The pixel appearance attribute present on line 59 is then transmitted to post raster processing blocks (not shown).

[0015] As described above, the conventional graphics processor 40 requires the use of two separate shaders: a vertex shader 46 and a pixel shader 54. A drawback associated with such an architecture is that the overall footprint of the graphics processor is relatively large as the two shaders take up a large amount of real estate. Another drawback associated with conventional graphics processor architectures is that can exhibit poor computational efficiency.

[0016] Referring now to FIG. 4A, in an exemplary embodiment, the graphics processor 60 of the present invention includes a multiplexer 66 having vertex (e.g. indices) data provided at a first input thereto and interpolated pixel parameter (e.g. position) data and attribute data from a rasterization engine 74 provided at a second input. A control signal generated by an arbiter 64 is transmitted to the multiplexer 66 on line 63. The arbiter 64 determines which of the two inputs to the multiplexer 66 is transmitted to a unified shader 62 for further processing. The arbitration scheme employed by the arbiter 64 is as follows: the vertex data on the first input of the multiplexer 66 is transmitted to the unified shader 62 on line 65 if there is enough resources available in the unified shader to operate on the vertex data; otherwise, the interpolated pixel parameter data present on the second input will be passed to the unified shader 62 for further processing.

[0017] Referring briefly to FIG. 5, the unified shader

62 will now be described. As illustrated, the unified shader 62 includes a general purpose register block 92, a plurality of source registers: including source register A 93, source register B 95, and source register C 97, a processor (e.g. CPU) 96 and a sequencer 99. The general purpose register block 92 includes sixty four registers, or available entries, for storing the information transmitted from the multiplexer 66 on line 65 or any other information to be maintained within the unified shader. The data present in the general purpose register block 92 is transmitted to the plurality of source registers via line 109.

[0018] The processor 96 may be comprised of a dedicated piece of hardware or can be configured as part of a general purpose computing device (i.e. personal computer). In an exemplary embodiment, the processor 96 is adapted to perform 32-bit floating point arithmetic operations as well as a complete series of logical operations on corresponding operands. As shown, the processor is logically partitioned into two sections. Section 96 is configured to execute, for example, the 32-bit floating point arithmetic operations of the unified shader. The second section, 96A, is configured to perform scaler operations (e.g. log, exponent, reciprocal square root) of the unified shader.

[0019] The sequencer 99 includes constants block 91 and an instruction store 98. The constants block 91 contains, for example, the several transformation matrices used in connection with vertex manipulation operations. The instruction store 98 contains the necessary instructions that are executed by the processor 96 in order to perform the respective arithmetic and logic operations on the data maintained in the general purpose register block 92 as provided by the source registers 93-95. The instruction store 98 further includes memory fetch instructions that, when executed, causes the unified shader 62 to fetch texture and other types of data, from memory 82 (FIG. 4A). In operation, the sequencer 99 determines whether the next instruction to be executed (from the instruction store 98) is an arithmetic or logical instruction or a memory (e.g. texture fetch) instruction. If the next instruction is a memory instruction or request, the sequencer 99 sends the request to a fetch block (not shown) which retrieves the required information from memory 82 (FIG. 4A). The retrieved information is then transmitted to the sequencer 99, through the vertex texture cache 68 (FIG. 4A) as described in greater detail below.

[0020] If the next instruction to be executed is an arithmetic or logical instruction, the sequencer 99 causes the appropriate operands to be transferred from the general purpose register block 92 into the appropriate source registers (93, 95, 97) for execution, and an appropriate signal is sent to the processor 96 on line 101 indicating what operation or series of operations are to be executed on the several operands present in the source registers. At this point, the processor 96 executes the instructions on the operands present in the source registers and provides the result on line 85. The information present on

line 85 may be transmitted back to the general purpose register block 92 for storage, or transmitted to succeeding components of the graphics processor 60.

[0021] As discussed above, the instruction store 98 maintains both vertex manipulation instructions and pixel manipulation instructions. Therefore, the unified shader 99 of the present invention is able to perform both vertex and pixel operations, as well as execute memory fetch operations. As such, the unified shader 62 of the present invention is able to perform both the vertex shading and pixel shading operations on data in the context of a graphics controller based on information passed from the multiplexer. By being adapted to perform memory fetches, the unified shader of the present invention is able to perform additional processes that conventional vertex shaders cannot perform; while at the same time, perform pixel operations.

[0022] The unified shader 62 has ability to simultaneously perform vertex manipulation operations and pixel manipulation operations at various degrees of completion by being able to freely switch between such programs or instructions, maintained in the instruction store 98, very quickly. In application, vertex data to be processed is transmitted into the general purpose register block 92 from multiplexer 66. The instruction store 98 then passes the corresponding control signals to the processor 96 on line 101 to perform such vertex operations. However, if the general purpose register block 92 does not have enough available space therein to store the incoming vertex data, such information will not be transmitted as the arbitration scheme of the arbiter 64 is not satisfied. In this manner, any pixel calculation operations that are to be, or are currently being, performed by the processor 96 are continued, based on the instructions maintained in the instruction store 98, until enough registers within the general purpose register block 92 become available. Thus, through the sharing of resources within the unified shader 62, processing of image data is enhanced as there is no down time associated with the processor 96.

[0023] Referring back to FIG. 4A, the graphics processor 60 further includes a cache block 70, including a parameter cache 70A and a position cache 70B which accepts the pixel based output of the unified shader 62 on line 85 and stores the respective pixel parameter and position information in the corresponding cache. The pixel information present in the cache block 70 is then transmitted to the primitive assembly block 72 on line 71. The primitive assembly block 72 is responsible for assembling the information transmitted thereto from the cache block 70 into a series of triangles, or other suitable primitives, for further processing. The assembled primitives are then transmitted on line 73 to rasterization engine block 74, where the transmitted primitives are then converted into individual pixel data information through a walking process, or any other suitable pixel generation process. The resulting pixel data from the rasterization engine block 74 is the interpolated pixel parameter data that is transmitted to the second input of the multiplexer 66 on line 75.

[0024] In those situations when vertex data is transmitted to the unified shader 62 through the multiplexer 66, the resulting vertex data generated by the processor 96, is transmitted to a render back end block 76 which converts the resulting vertex data into at least one of several formats suitable for later display on display device 84. For example, if a stained glass appearance effect is to be applied to an image, the information corresponding to such appearance effect is associated with the appropriate position data by the render back end 76. The information from the render back end 76 is then transmitted to memory 82 and a display controller line 80 via memory controller 78. Such appropriately formatted information is then transmitted on line 83 for presentation on display device 84.

[0025] Referring now to FIG. 4B, shown therein is a vertex block 61 which is used to provide the vertex information at the first input of the multiplexer 66 according to an alternate embodiment of the present invention. The vertex block 61 includes a vertex fetch block 61A which is responsible for retrieving vertex information from memory 82, if requested, and transmitting that vertex information into the vertex cache 61 B. The information stored in the vertex cache 61 B comprises the vertex information that is coupled to the first input of multiplexer 66.

[0026] As discussed above, the graphics processor 60 of the present invention incorporates a unified shader 62 which is capable of performing both vertex manipulation operations and pixel manipulation operations based on the instructions stored in the instruction store 98. In this fashion, the graphics processor 60 of the present invention takes up less real estate than conventional graphics processors as separate vertex shaders and pixel shaders are no longer required. In addition, as the unified shader 62 is capable of alternating between performing vertex manipulation operations and pixel manipulation operations, graphics processing efficiency is enhanced as one type of data operations is not dependent upon another type of data operations. Therefore, any performance penalties experienced as a result of dependent operations in conventional graphics processors are overcome.

[0027] The above detailed description of the present invention and the examples described therein have been presented for the purposes of illustration and description. It is therefore contemplated that the present invention cover any and all modifications, variations and equivalents that fall within the scope of the basic underlying principles disclosed and claimed herein.

Claims

1. A graphics processor, comprising: an arbiter circuit for selecting one of a plurality of inputs in response to a control signal; and a shader, coupled to the arbiter circuit, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel opera-

tions, and performing one of the vertex operations or pixel operations based on the selected one of the plurality of inputs, wherein the shader provides a appearance attribute.

2. The graphics processor of claim 1, further including a vertex storage block for maintaining vertex information.

3. The graphics processor of claim 2, wherein the vertex storage block further includes a parameter cache operative to maintain appearance attribute data for a corresponding vertex and a position cache operative to maintain position data for a corresponding vertex.

4. The graphics processor of claim 1, wherein the appearance attribute is color, and the color is associated with a corresponding pixel when the selected one of the plurality of inputs is pixel data.

5. The graphics processor of claim 1, wherein the appearance attribute is position, and the position attribute is associated with a corresponding vertex when the selected one of the plurality of inputs is vertex data.

6. The graphics processor of claim 5, wherein the appearance attribute is color, and the color attribute is associated with a corresponding pixel when the selected one of the plurality of inputs is pixel data.

7. The graphics processor of claim 5, wherein the appearance attribute is one of the following: color, lighting, texture, normal and position data.

8. The graphics processor of claim 1, wherein the appearance value is depth.

9. The graphics processor of claim 1, further including a selection circuit, wherein the selection circuit is a multiplexer, and the control signal is provided by an arbiter, wherein the arbiter is coupled to the multiplexer.

10. The graphics processor of claim 1, wherein the shader provides vertex position data and further including a primitive assembly block, coupled to the shader, operative to generate primitives in response to the vertex position data.

Description**FIELD OF THE INVENTION**

[0001] The present invention generally relates to graphics processors and, more particularly, to a graphics processor architecture employing a single shader.

BACKGROUND OF THE INVENTION

[0002] In computer graphics applications, complex shapes and structures are formed through the sampling, interconnection and rendering of more simple objects, referred to as primitives. An example of such a primitive is a triangle, or other suitable polygon. These primitives, in turn, are formed by the interconnection of individual pixels. Color and texture are then applied to the individual pixels that comprise the shape based on their location within the primitive and the primitives orientation with respect to the generated shape; thereby generating the object that is rendered to a corresponding display for subsequent viewing.

[0003] The interconnection of primitives and the application of color and textures to generated shapes are generally performed by a graphics processor. Conventional graphics processors include a series of shaders that specify how and with what corresponding attributes, a final image is drawn on a screen, or suitable display device. As illustrated in FIG. 1, a conventional shader 10 can be represented as a processing block 12 that accepts a plurality of bits of input data, such as, for example, object shape data (14) in object space (x,y,z); material properties of the object, such as color (16); texture information (18); luminance information (20); and viewing angle information (22) and provides output data (28) representing the object with texture and other appearance properties applied thereto (x', y', z').

[0004] In exemplary fashion, as illustrated in FIGS. 2A-2B, the shader accepts the vertex coordinate data representing cube 30 (FIG. 2A) as inputs and provides data representing, for example, a perspective corrected view of the cube 30' (FIG. 2B) as an output. The corrected view may be provided, for example, by applying an appropriate transformation matrix to the data representing the initial cube 30. More specifically, the representation illustrated in FIG. 2B is provided by a vertex shader that accepts as inputs the data representing, for example, vertices V_x , V_y and V_z , among others of cube 30 and providing angularly oriented vertices V_x , V_y and V_z , including any appearance attributes of corresponding cube 30'.

[0005] In addition to the vertex shader discussed above, a shader processing block that operates on the pixel level, referred to as a pixel shader is also used when generating an object for display. Generally, the pixel shader provides the color value associated with each pixel of a rendered object. Conventionally, both the vertex shader and pixel shader are separate components that

are configured to perform only a single transformation or operation. Thus, in order to perform a position and a texture transformation of an input, at least two shading operations and hence, at least two shaders, need to be employed. Conventional graphics processors require the use of both a vertex shader and a pixel shader in order to generate an object. Because both types of shaders are required, known graphics processors are relatively large in size, with most of the real estate being taken up by the vertex and pixel shaders.

[0006] In addition to the real estate penalty associated with conventional graphics processors, there is also a corresponding performance penalty associated therewith. In conventional graphics processors, the vertex shader and the pixel shader are juxtaposed in a sequential, pipelined fashion, with the vertex shader being positioned before and operating on vertex data before the pixel shader can operate on individual pixel data.

[0007] Thus, there is a need for an improved graphics processor employing a shader that is both space efficient and computationally effective.

SUMMARY OF THE INVENTION

[0008] Briefly stated, the present invention is directed to a graphics processor that employs a unified shader that is capable of performing both the vertex operations and the pixel operations in a space saving and computationally efficient manner. In an exemplary embodiment, a graphics processor according to the present invention includes an arbiter circuit for selecting one of a plurality of inputs for processing in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs.

[0009] The shader includes a general purpose register block for storing at least the plurality of selected inputs, a sequencer for storing logical and arithmetic instructions that are used to perform vertex and pixel manipulation operations and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs according to the instructions maintained in the sequencer. The shader of the present invention is referred to as a "unified" shader because it is configured to perform both vertex and pixel operations. By employing the unified shader of the present invention, the associated graphics processor is more space efficient than conventional graphics processors because the unified shader takes up less real estate than the conventional multi-shader processor architecture.

[0010] In addition, according to the present invention, the unified shader is more computationally efficient because it allows the shader to be flexibly allocated to pixels or vertices based on workload.

BRIEF DESCRIPTION OF THE DRAWINGS

[0011] The present invention and the associated advantages and features thereof, will become better understood and appreciated upon review of the following detailed description of the invention, taken in conjunction with the following drawings, where like numerals represent like elements, in which:

FIG. 1 is a schematic block diagram of a conventional shader;

FIGS. 2A-2B are graphical representations of the operations performed by the shader illustrated in FIG. 1;

FIG. 3 is a schematic block diagram of a conventional graphics processor architecture;

FIG. 4A is a schematic block diagram of a graphics processor architecture according to the present invention;

FIG. 4B is a schematic block diagram of an optional input component to the graphics processor according to an alternate embodiment of the present invention; and

FIG. 5 is an exploded schematic block diagram of the unified shader employed in the graphics processor illustrated in FIG. 4A.

DETAILED DESCRIPTION OF THE INVENTION

[0012] FIG. 3, illustrates a graphics processor incorporating a conventional pipeline architecture. As shown, the graphics processor 40 includes a vertex fetch block 42 which receives vertex information relating to a primitive to be rendered from an off-chip memory 55 on line 41. The fetched vertex data is then transmitted to a vertex cache 44 for storage on line 43. Upon request, the vertex data maintained in the vertex cache 44 is transmitted to a vertex shader 46 on line 45. As discussed above, an example of the information that is requested by and transmitted to the vertex shader 46 includes the object shape, material properties (e.g. color), texture information, and viewing angle. Generally, the vertex shader 46 is a programmable mechanism which applies a transformation position matrix to the input position information (obtained from the vertex cache 44), thereby providing data representing a perspective corrected image of the object to be rendered, along with any texture or color coordinates thereof.

[0013] After performing the transformation operation, the data representing the transformed vertices are then provided to a vertex store 48 on line 47. The vertex store 48 then transmits the modified vertex information contained therein to a primitive assembly block 50 on line

49. The primitive assembly block 50 assembles, or converts, the input vertex information into a plurality of primitives to be subsequently processed. Suitable methods of assembling the input vertex information into primitives is known in the art and will not be discussed in greater detail here. The assembled primitives are then transmitted to a rasterization engine 52, which converts the previously assembled primitives into pixel data through a process referred to as walking. The resulting pixel data is then transmitted to a pixel shader 54 on line 53.

[0014] The pixel shader 54 generates the color and additional appearance attributes that are to be applied to a given pixel, and applies the appearance attributes to the respective pixels. In addition, the pixel shader 54 is capable of fetching texture data from a texture map 57 as indexed by the pixel data from the rasterization engine 52 by transmitting such information on line 55 to the texture map. The requested texture data is then transmitted back from the texture map 57 on line 57' and stored in a texture cache 56 before being routed to the pixel shader on line 58. Once the texture data has been received, the pixel shader 54 then performs specified logical or arithmetic operations on the received texture data to generate the pixel color or other appearance attribute of interest. The generated pixel appearance attribute is then combined with a base color, as provided by the rasterization engine on line 53, to thereby provide a pixel color to the pixel corresponding at the position of interest. The pixel appearance attribute present on line 59 is then transmitted to post raster processing blocks (not shown).

[0015] As described above, the conventional graphics processor 40 requires the use of two separate shaders: a vertex shader 46 and a pixel shader 54. A drawback associated with such an architecture is that the overall footprint of the graphics processor is relatively large as the two shaders take up a large amount of real estate. Another drawback associated with conventional graphics processor architectures is that can exhibit poor computational efficiency.

[0016] Referring now to FIG. 4A, in an exemplary embodiment, the graphics processor 60 of the present invention includes a multiplexer 66 having vertex (e.g. indices) data provided at a first input thereto and interpolated pixel parameter (e.g. position) data and attribute data from a rasterization engine 74 provided at a second input. A control signal generated by an arbiter 64 is transmitted to the multiplexer 66 on line 63. The arbiter 64 determines which of the two inputs to the multiplexer 66 is transmitted to a unified shader 62 for further processing. The arbitration scheme employed by the arbiter 64 is as follows: the vertex data on the first input of the multiplexer 66 is transmitted to the unified shader 62 on line 65 if there is enough resources available in the unified shader to operate on the vertex data; otherwise, the interpolated pixel parameter data present on the second input will be passed to the unified shader 62 for further processing.

[0017] Referring briefly to FIG. 5, the unified shader

62 will now be described. As illustrated, the unified shader 62 includes a general purpose register block 92, a plurality of source registers: including source register A 93, source register B 95, and source register C 97, a processor (e.g. CPU) 96 and a sequencer 99. The general purpose register block 92 includes sixty four registers, or available entries, for storing the information transmitted from the multiplexer 66 on line 65 or any other information to be maintained within the unified shader. The data present in the general purpose register block 92 is transmitted to the plurality of source registers via line 109.

[0018] The processor 96 may be comprised of a dedicated piece of hardware or can be configured as part of a general purpose computing device (i.e. personal computer). In an exemplary embodiment, the processor 96 is adapted to perform 32-bit floating point arithmetic operations as well as a complete series of logical operations on corresponding operands. As shown, the processor is logically partitioned into two sections. Section 96 is configured to execute, for example, the 32-bit floating point arithmetic operations of the unified shader. The second section, 96A, is configured to perform scaler operations (e.g. log, exponent, reciprocal square root) of the unified shader.

[0019] The sequencer 99 includes constants block 91 and an instruction store 98. The constants block 91 contains, for example, the several transformation matrices used in connection with vertex manipulation operations. The instruction store 98 contains the necessary instructions that are executed by the processor 96 in order to perform the respective arithmetic and logic operations on the data maintained in the general purpose register block 92 as provided by the source registers 93-95. The instruction store 98 further includes memory fetch instructions that, when executed, causes the unified shader 62 to fetch texture and other types of data, from memory 82 (FIG. 4A). In operation, the sequencer 99 determines whether the next instruction to be executed (from the instruction store 98) is an arithmetic or logical instruction or a memory (e.g. texture fetch) instruction. If the next instruction is a memory instruction or request, the sequencer 99 sends the request to a fetch block (not shown) which retrieves the required information from memory 82 (FIG. 4A). The retrieved information is then transmitted to the sequencer 99, through the vertex texture cache 68 (FIG. 4A) as described in greater detail below.

[0020] If the next instruction to be executed is an arithmetic or logical instruction, the sequencer 99 causes the appropriate operands to be transferred from the general purpose register block 92 into the appropriate source registers (93, 95, 97) for execution, and an appropriate signal is sent to the processor 96 on line 101 indicating what operation or series of operations are to be executed on the several operands present in the source registers. At this point, the processor 96 executes the instructions on the operands present in the source registers and provides the result on line 85. The information present on

line 85 may be transmitted back to the general purpose register block 92 for storage, or transmitted to succeeding components of the graphics processor 60.

[0021] As discussed above, the instruction store 98 maintains both vertex manipulation instructions and pixel manipulation instructions. Therefore, the unified shader 99 of the present invention is able to perform both vertex and pixel operations, as well as execute memory fetch operations. As such, the unified shader 62 of the present invention is able to perform both the vertex shading and pixel shading operations on data in the context of a graphics controller based on information passed from the multiplexer. By being adapted to perform memory fetches, the unified shader of the present invention is able to perform additional processes that conventional vertex shaders cannot perform; while at the same time, perform pixel operations.

[0022] The unified shader 62 has ability to simultaneously perform vertex manipulation operations and pixel manipulation operations at various degrees of completion by being able to freely switch between such programs or instructions, maintained in the instruction store 98, very quickly. In application, vertex data to be processed is transmitted into the general purpose register block 92 from multiplexer 66. The instruction store 98 then passes the corresponding control signals to the processor 96 on line 101 to perform such vertex operations. However, if the general purpose register block 92 does not have enough available space therein to store the incoming vertex data, such information will not be transmitted as the arbitration scheme of the arbiter 64 is not satisfied. In this manner, any pixel calculation operations that are to be, or are currently being, performed by the processor 96 are continued, based on the instructions maintained in the instruction store 98, until enough registers within the general purpose register block 92 become available. Thus, through the sharing of resources within the unified shader 62, processing of image data is enhanced as there is no down time associated with the processor 96.

[0023] Referring back to FIG. 4A, the graphics processor 60 further includes a cache block 70, including a parameter cache 70A and a position cache 70B which accepts the pixel based output of the unified shader 62 on line 85 and stores the respective pixel parameter and position information in the corresponding cache. The pixel information present in the cache block 70 is then transmitted to the primitive assembly block 72 on line 71. The primitive assembly block 72 is responsible for assembling the information transmitted thereto from the cache block 70 into a series of triangles, or other suitable primitives, for further processing. The assembled primitives are then transmitted on line 73 to rasterization engine block 74, where the transmitted primitives are then converted into individual pixel data information through a walking process, or any other suitable pixel generation process. The resulting pixel data from the rasterization engine block 74 is the interpolated pixel parameter data that is transmitted to the second input of the multiplexer 66 on line 75.

[0024] In those situations when vertex data is transmitted to the unified shader 62 through the multiplexer 66, the resulting vertex data generated by the processor 96, is transmitted to a render back end block 76 which converts the resulting vertex data into at least one of several formats suitable for later display on display device 84. For example, if a stained glass appearance effect is to be applied to an image, the information corresponding to such appearance effect is associated with the appropriate position data by the render back end 76. the information from the render back end 76 is then transmitted to memory 82 and a display controller line 80 via memory controller 78. Such appropriately formatted information is then transmitted on line 83 for presentation on display device 84.

[0025] Referring now to FIG. 4B, shown therein is a vertex block 61 which is used to provide the vertex information at the first input of the multiplexer 66 according to an alternate embodiment of the present invention. The vertex block 61 includes a vertex fetch block 61A which is responsible for retrieving vertex information from memory 82, if requested, and transmitting that vertex information into the vertex cache 61 B. The information stored in the vertex cache 61 B comprises the vertex information that is coupled to the first input of multiplexer 66.

[0026] As discussed above, the graphics processor 60 of the present invention incorporates a unified shader 62 which is capable of performing both vertex manipulation operations and pixel manipulation operations based on the instructions stored in the instruction store 98. In this fashion, the graphics processor 60 of the present invention takes up less real estate than conventional graphics processors as separate vertex shaders and pixel shaders are no longer required. In addition, as the unified shader 62 is capable of alternating between performing vertex manipulation operations and pixel manipulation operations, graphics processing efficiency is enhanced as one type of data operations is not dependent upon another type of data operations. Therefore, any performance penalties experienced as a result of dependent operations in conventional graphics processors are overcome.

[0027] The above detailed description of the present invention and the examples described therein have been presented for the purposes of illustration and description. It is therefore contemplated that the present invention cover any and all modifications, variations and equivalents that fall within the scope of the basic underlying principles disclosed and claimed herein.

Claims

1. A graphics processor, comprising: an arbiter circuit for selecting one of a plurality of inputs in response to a control signal; a shader, coupled to the arbiter circuit, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations,

and performing one of the vertex operations or pixel operations based on the selected one of the plurality of inputs, wherein the shader provides a appearance attribute; a vertex storage block for maintaining vertex information; wherein the vertex storage block further includes a parameter cache operative to maintain appearance attribute data for a corresponding vertex and a position cache operative to maintain position data for a corresponding vertex; and wherein the appearance attribute is color, and the color is associated with a corresponding pixel when the selected one of the plurality inputs is pixel data.

2. The graphics processor of claim 1 wherein the appearance attribute is position, and the position attribute is associated with a corresponding vertex when the selected one of the plurality of inputs is vertex data.

(54) **A graphics processing architecture employing a unified shader**

(57) A method comprising:
performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

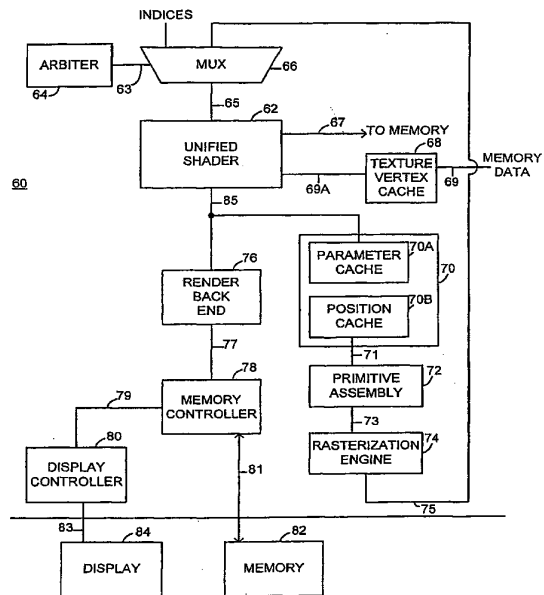

FIG. 4A

EP 2 296 116 A2

Description**FIELD OF THE INVENTION**

[0001] The present invention generally relates to graphics processors and, more particularly, to a graphics processor architecture employing a single shader.

BACKGROUND OF THE INVENTION

[0002] In computer graphics applications, complex shapes and structures are formed through the sampling, interconnection and rendering of more simple objects, referred to as primitives. An example of such a primitive is a triangle, or other suitable polygon. These primitives, in turn, are formed by the interconnection of individual pixels. Color and texture are then applied to the individual pixels that comprise the shape based on their location within the primitive and the primitives orientation with respect to the generated shape; thereby generating the object that is rendered to a corresponding display for subsequent viewing.

[0003] The interconnection of primitives and the application of color and textures to generated shapes are generally performed by a graphics processor. Conventional graphics processors include a series of shaders that specify how and with what corresponding attributes, a final image is drawn on a screen, or suitable display device. As illustrated in FIG. 1, a conventional shader 10 can be represented as a processing block 12 that accepts a plurality of bits of input data, such as, for example, object shape data (14) in object space (x,y,z); material properties of the object, such as color (16); texture information (18); luminance information (20); and viewing angle information (22) and provides output data (28) representing the object with texture and other appearance properties applied thereto (x', y', z').

[0004] In exemplary fashion, as illustrated in FIGS. 2A-2B, the shader accepts the vertex coordinate data representing cube 30 (FIG. 2A) as inputs and provides data representing, for example, a perspective corrected view of the cube 30' (FIG. 2B) as an output. The corrected view may be provided, for example, by applying an appropriate transformation matrix to the data representing the initial cube 30. More specifically, the representation illustrated in FIG. 2B is provided by a vertex shader that accepts as inputs the data representing, for example, vertices V_X , V_Y and V_Z , among others of cube 30 and providing angularly oriented vertices $V_{X'}$, $V_{Y'}$ and $V_{Z'}$, including any appearance attributes of corresponding cube 30'.

[0005] In addition to the vertex shader discussed above, a shader processing block that operates on the pixel level, referred to as a pixel shader is also used when generating an object for display. Generally, the pixel shader provides the color value associated with each pixel of a rendered object. Conventionally, both the vertex shader and pixel shader are separate components that

are configured to perform only a single transformation or operation. Thus, in order to perform a position and a texture transformation of an input, at least two shading operations and hence, at least two shaders, need to be employed. Conventional graphics processors require the use of both a vertex shader and a pixel shader in order to generate an object. Because both types of shaders are required, known graphics processors are relatively large in size, with most of the real estate being taken up by the vertex and pixel shaders.

[0006] In addition to the real estate penalty associated with conventional graphics processors, there is also a corresponding performance penalty associated therewith. In conventional graphics processors, the vertex shader and the pixel shader are juxtaposed in a sequential, pipelined fashion, with the vertex shader being positioned before and operating on vertex data before the pixel shader can operate on individual pixel data.

[0007] Thus, there is a need for an improved graphics processor employing a shader that is both space efficient and computationally effective.

SUMMARY OF THE INVENTION

[0008] Briefly stated, the present invention is directed to a graphics processor that employs a unified shader that is capable of performing both the vertex operations and the pixel operations in a space saving and computationally efficient manner. In an exemplary embodiment, a graphics processor according to the present invention includes an arbiter circuit for selecting one of a plurality of inputs for processing in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the plurality of inputs.

[0009] The shader includes a general purpose register block for storing at least the plurality of selected inputs, a sequencer for storing logical and arithmetic instructions that are used to perform vertex and pixel manipulation operations and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs according to the instructions maintained in the sequencer. The shader of the present invention is referred to as a "unified" shader because it is configured to perform both vertex and pixel operations. By employing the unified shader of the present invention, the associated graphics processor is more space efficient than conventional graphics processors because the unified shader takes up less real estate than the conventional multi-shader processor architecture.

[0010] In addition, according to the present invention, the unified shader is more computationally efficient because it allows the shader to be flexibly allocated to pixels or vertices based on workload.

BRIEF DESCRIPTION OF THE DRAWINGS

[0011] The present invention and the associated advantages and features thereof, will become better understood and appreciated upon review of the following detailed description of the invention, taken in conjunction with the following drawings, where like numerals represent like elements, in which:

FIG. 1 is a schematic block diagram of a conventional shader;

FIGS. 2A-2B are graphical representations of the operations performed by the shader illustrated in FIG. 1;

FIG. 3 is a schematic block diagram of a conventional graphics processor architecture;

FIG. 4A is a schematic block diagram of a graphics processor architecture according to the present invention;

FIG. 4B is a schematic block diagram of an optional input component to the graphics processor according to an alternate embodiment of the present invention; and

FIG. 5 is an exploded schematic block diagram of the unified shader employed in the graphics processor illustrated in FIG. 4A.

DETAILED DESCRIPTION OF THE INVENTION

[0012] FIG. 3, illustrates a graphics processor incorporating a conventional pipeline architecture. As shown, the graphics processor 40 includes a vertex fetch block 42 which receives vertex information relating to a primitive to be rendered from an off-chip memory 55 on line 41. The fetched vertex data is then transmitted to a vertex cache 44 for storage on line 43. Upon request, the vertex data maintained in the vertex cache 44 is transmitted to a vertex shader 46 on line 45. As discussed above, an example of the information that is requested by and transmitted to the vertex shader 46 includes the object shape, material properties (e.g. color), texture information, and viewing angle. Generally, the vertex shader 46 is a programmable mechanism which applies a transformation position matrix to the input position information (obtained from the vertex cache 44), thereby providing data representing a perspective corrected image of the object to be rendered, along with any texture or color coordinates thereof.

[0013] After performing the transformation operation, the data representing the transformed vertices are then provided to a vertex store 48 on line 47. The vertex store 48 then transmits the modified vertex information contained therein to a primitive assembly block 50 on line

49. The primitive assembly block 50 assembles, or converts, the input vertex information into a plurality of primitives to be subsequently processed. Suitable methods of assembling the input vertex information into primitives is known in the art and will not be discussed in greater detail here. The assembled primitives are then transmitted to a rasterization engine 52, which converts the previously assembled primitives into pixel data through a process referred to as walking. The resulting pixel data is then transmitted to a pixel shader 54 on line 53.

[0014] The pixel shader 54 generates the color and additional appearance attributes that are to be applied to a given pixel, and applies the appearance attributes to the respective pixels. In addition, the pixel shader 54 is capable of fetching texture data from a texture map 57 as indexed by the pixel data from the rasterization engine 52 by transmitting such information on line 55 to the texture map. The requested texture data is then transmitted back from the texture map 57 on line 57' and stored in a texture cache 56 before being routed to the pixel shader on line 58. Once the texture data has been received, the pixel shader 54 then performs specified logical or arithmetic operations on the received texture data to generate the pixel color or other appearance attribute of interest. The generated pixel appearance attribute is then combined with a base color, as provided by the rasterization engine on line 53, to thereby provide a pixel color to the pixel corresponding at the position of interest. The pixel appearance attribute present on line 59 is then transmitted to post raster processing blocks (not shown).

[0015] As described above, the conventional graphics processor 40 requires the use of two separate shaders: a vertex shader 46 and a pixel shader 54. A drawback associated with such an architecture is that the overall footprint of the graphics processor is relatively large as the two shaders take up a large amount of real estate. Another drawback associated with conventional graphics processor architectures is that can exhibit poor computational efficiency.

[0016] Referring now to FIG. 4A, in an exemplary embodiment, the graphics processor 60 of the present invention includes a multiplexer 66 having vertex (e.g. indices) data provided at a first input thereto and interpolated pixel parameter (e.g. position) data and attribute data from a rasterization engine 74 provided at a second input. A control signal generated by an arbiter 64 is transmitted to the multiplexer 66 on line 63. The arbiter 64 determines which of the two inputs to the multiplexer 66 is transmitted to a unified shader 62 for further processing. The arbitration scheme employed by the arbiter 64 is as follows: the vertex data on the first input of the multiplexer 66 is transmitted to the unified shader 62 on line 65 if there is enough resources available in the unified shader to operate on the vertex data; otherwise, the interpolated pixel parameter data present on the second input will be passed to the unified shader 62 for further processing.

[0017] Referring briefly to FIG. 5, the unified shader

62 will now be described. As illustrated, the unified shader 62 includes a general purpose register block 92, a plurality of source registers: including source register A 93, source register B 95, and source register C 97, a processor (e.g. CPU) 96 and a sequencer 99. The general purpose register block 92 includes sixty four registers, or available entries, for storing the information transmitted from the multiplexer 66 on line 65 or any other information to be maintained within the unified shader. The data present in the general purpose register block 92 is transmitted to the plurality of source registers via line 109.

[0018] The processor 96 may be comprised of a dedicated piece of hardware or can be configured as part of a general purpose computing device (i.e. personal computer). In an exemplary embodiment, the processor 96 is adapted to perform 32-bit floating point arithmetic operations as well as a complete series of logical operations on corresponding operands. As shown, the processor is logically partitioned into two sections. Section 96 is configured to execute, for example, the 32-bit floating point arithmetic operations of the unified shader. The second section, 96A, is configured to perform scaler operations (e.g. log, exponent, reciprocal square root) of the unified shader.

[0019] The sequencer 99 includes constants block 91 and an instruction store 98. The constants block 91 contains, for example, the several transformation matrices used in connection with vertex manipulation operations. The instruction store 98 contains the necessary instructions that are executed by the processor 96 in order to perform the respective arithmetic and logic operations on the data maintained in the general purpose register block 92 as provided by the source registers 93-95. The instruction store 98 further includes memory fetch instructions that, when executed, causes the unified shader 62 to fetch texture and other types of data, from memory 82 (FIG. 4A). In operation, the sequencer 99 determines whether the next instruction to be executed (from the instruction store 98) is an arithmetic or logical instruction or a memory (e.g. texture fetch) instruction. If the next instruction is a memory instruction or request, the sequencer 99 sends the request to a fetch block (not shown) which retrieves the required information from memory 82 (FIG. 4A). The retrieved information is then transmitted to the sequencer 99, through the vertex texture cache 68 (FIG. 4A) as described in greater detail below.

[0020] If the next instruction to be executed is an arithmetic or logical instruction, the sequencer 99 causes the appropriate operands to be transferred from the general purpose register block 92 into the appropriate source registers (93, 95, 97) for execution, and an appropriate signal is sent to the processor 96 on line 101 indicating what operation or series of operations are to be executed on the several operands present in the source registers. At this point, the processor 96 executes the instructions on the operands present in the source registers and provides the result on line 85. The information present on

line 85 may be transmitted back to the general purpose register block 92 for storage, or transmitted to succeeding components of the graphics processor 60.

[0021] As discussed above, the instruction store 98 maintains both vertex manipulation instructions and pixel manipulation instructions. Therefore, the unified shader 99 of the present invention is able to perform both vertex and pixel operations, as well as execute memory fetch operations. As such, the unified shader 62 of the present invention is able to perform both the vertex shading and pixel shading operations on data in the context of a graphics controller based on information passed from the multiplexer. By being adapted to perform memory fetches, the unified shader of the present invention is able to perform additional processes that conventional vertex shaders cannot perform; while at the same time, perform pixel operations.

[0022] The unified shader 62 has ability to simultaneously perform vertex manipulation operations and pixel manipulation operations at various degrees of completion by being able to freely switch between such programs or instructions, maintained in the instruction store 98, very quickly. In application, vertex data to be processed is transmitted into the general purpose register block 92 from multiplexer 66. The instruction store 98 then passes the corresponding control signals to the processor 96 on line 101 to perform such vertex operations. However, if the general purpose register block 92 does not have enough available space therein to store the incoming vertex data, such information will not be transmitted as the arbitration scheme of the arbiter 64 is not satisfied. In this manner, any pixel calculation operations that are to be, or are currently being, performed by the processor 96 are continued, based on the instructions maintained in the instruction store 98, until enough registers within the general purpose register block 92 become available. Thus, through the sharing of resources within the unified shader 62, processing of image data is enhanced as there is no down time associated with the processor 96.

[0023] Referring back to FIG. 4A, the graphics processor 60 further includes a cache block 70, including a parameter cache 70A and a position cache 70B which accepts the pixel based output of the unified shader 62 on line 85 and stores the respective pixel parameter and position information in the corresponding cache. The pixel information present in the cache block 70 is then transmitted to the primitive assembly block 72 on line 71. The primitive assembly block 72 is responsible for assembling the information transmitted thereto from the cache block 70 into a series of triangles, or other suitable primitives, for further processing. The assembled primitives are then transmitted on line 73 to rasterization engine block 74, where the transmitted primitives are then converted into individual pixel data information through a walking process, or any other suitable pixel generation process. The resulting pixel data from the rasterization engine block 74 is the interpolated pixel parameter data that is transmitted to the second input of the multiplexer 66 on line 75.

[0024] In those situations when vertex data is transmitted to the unified shader 62 through the multiplexer 66, the resulting vertex data generated by the processor 96, is transmitted to a render back end block 76 which converts the resulting vertex data into at least one of several formats suitable for later display on display device 84. For example, if a stained glass appearance effect is to be applied to an image, the information corresponding to such appearance effect is associated with the appropriate position data by the render back end 76. The information from the render back end 76 is then transmitted to memory 82 and a display controller line 80 via memory controller 78. Such appropriately formatted information is then transmitted on line 83 for presentation on display device 84.

[0025] Referring now to FIG. 4B, shown therein is a vertex block 61 which is used to provide the vertex information at the first input of the multiplexer 66 according to an alternate embodiment of the present invention. The vertex block 61 includes a vertex fetch block 61A which is responsible for retrieving vertex information from memory 82, if requested, and transmitting that vertex information into the vertex cache 61 B. The information stored in the vertex cache 61 B comprises the vertex information that is coupled to the first input of multiplexer 66.

[0026] As discussed above, the graphics processor 60 of the present invention incorporates a unified shader 62 which is capable of performing both vertex manipulation operations and pixel manipulation operations based on the instructions stored in the instruction store 98. In this fashion, the graphics processor 60 of the present invention takes up less real estate than conventional graphics processors as separate vertex shaders and pixel shaders are no longer required. In addition, as the unified shader 62 is capable of alternating between performing vertex manipulation operations and pixel manipulation operations, graphics processing efficiency is enhanced as one type of data operations is not dependent upon another type of data operations. Therefore, any performance penalties experienced as a result of dependent operations in conventional graphics processors are overcome.

[0027] The above detailed description of the present invention and the examples described therein have been presented for the purposes of illustration and description. It is therefore contemplated that the present invention cover any and all modifications, variations and equivalents that fall within the scope of the basic underlying principles disclosed and claimed herein.

Claims

1. A method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex

data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. A unified shader, comprising:

a general purpose register block for maintaining data;

a processor unit operative to:

perform vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and perform vertex operations on the vertex data unless the general purpose register block does not have enough available space therein to store incoming vertex data and continue pixel calculation operations that are to be or are currently being performed based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

Form PCT/ISA/210 (patent family annex) (January 2004)

PATENT COOPERATION TREATY

From the
INTERNATIONAL SEARCHING AUTHORITY

To:

see form PCT/ISA/220

PCT

**WRITTEN OPINION OF THE
INTERNATIONAL SEARCHING AUTHORITY
(PCT Rule 43bis.1)**

Date of mailing
(day/month/year) see form PCT/ISA/210 (second sheet)

Applicant's or agent's file reference see form PCT/ISA/220		FOR FURTHER ACTION See paragraph 2 below	
International application No. PCT/IB2004/003821	International filing date (day/month/year) 19.11.2004	Priority date (day/month/year) 20.11.2003	
International Patent Classification (IPC) or both national classification and IPC G06T15/00			
Applicant ATI TECHNOLOGIES, INC			

1. This opinion contains indications relating to the following items:

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

2. **FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA"). However, this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 56.1bis(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of three months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

3. For further details, see notes to Form PCT/ISA/220.

**WRITTEN OPINION OF THE
INTERNATIONAL SEARCHING AUTHORITY**

International application No.
PCT/B2004/003821

Box No. | Basis of the opinion

1. With regard to the **language**, this opinion has been established on the basis of the international application in the language in which it was filed, unless otherwise indicated under this item.
 - This opinion has been established on the basis of a translation from the original language into the following language , which is the language of a translation furnished for the purposes of international search (under Rules 12.3 and 23.1(b)).
2. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application and necessary to the claimed invention, this opinion has been established on the basis of:
 - a. type of material:
 - a sequence listing
 - table(s) related to the sequence listing
 - b. format of material:
 - in written format
 - in computer readable form
 - c. time of filing/furnishing:
 - contained in the international application as filed.
 - filed together with the international application in computer readable form.
 - furnished subsequently to this Authority for the purposes of search.
3. In addition, in the case that more than one version or copy of a sequence listing and/or table relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
4. Additional comments:

 - D4 : BRETERNITZ M ET AL: "Compilation, architectural support, and evaluation of SIMD graphics pipeline programs on a general-purpose CPU" 27 September 2003 (2003-09-27), PARALLEL ARCHITECTURES AND COMPILATION TECHNIQUES, 2003. PACT 2003. PROCEEDINGS. 12TH INTERNATIONAL CONFERENCE ON 27 SEPT. - 1 OCT. 2003, PISCATAWAY, NJ, USA, IEEE, PAGE(S) 135-145 , XP010662182 ISBN: 0-7695-2021-9

- 2 Document D1, which is considered to represent the most relevant state of the art for the subject-matter of claim 1, discloses (the references in parentheses applying to this document) a graphics processor comprising a shader ("Shading Unit", see paragraph 79) connected to a "Pixel Unit" by a private data path. A "Vertex Shading Unit" performs the vertex operations on the vertices entered in double buffered input buffers in round robin fashion.
An arbiter (in the "Context Unit", see paragraph 102) selects one of a plurality of

From this, the subject-matter of independent claim 1 differs in that the shader performs both vertex operations and pixel operations (performing one of the vertex operations or pixel operations based on a selected input), thus constituting a "unified shader" in the sense of the application and providing an appearance attribute.

2.1 The subject-matter of claim 1 is therefore novel (Article 33(2) PCT)

3 Document D2, which is considered to represent the most relevant state of the art for the subject-matter of claim 14, discloses (the references in parentheses applying to this document):

D2 discloses a sequencer ("main sequencer" 515) controlling instructions for inter alia the shader unit (360).

A similar system is disclosed in D3.

From this, the subject-matter of independent claim 1 differs in that the sequencer is in a unified shader in the sense of the application.

- 3.1 The subject-matter of claim 14 is therefore novel (Article 33(2) PCT)
- 4 The problem to be solved by the present invention may be regarded as to design a shader able to simultaneously perform vertex manipulations and pixel manipulations at various degrees of completion and to freely and quickly switch between the program instructions for performing such operations.
- 4.1 The solution to this problem proposed in claims 1 and 14 of the present application is considered as involving an inventive step (Article 33(3) PCT) because the available prior art teaches away from a unified shader performing vertex operations and pixel operations (performing one of the vertex operations or pixel operations based on a selected input) as claimed in claims 1 and 14, since the prior art uses the vertex shader and the pixel shader in different phases of a graphics operation algorithms (see D4 page 2, left-hand column, paragraph 4 - right-hand column, paragraph 3) and locates them in different entities (see D4 page 2 right-hand column last paragraph - page 3, left-hand column, first paragraph).
- 5 Although claims 1 and 14 have been drafted as separate independent claims, they appear to relate effectively to the same subject-matter (unified shader) and to differ from each other only with regard to the definition of the subject-matter for which protection is sought. The aforementioned claims therefore lack conciseness and as such do not meet the requirements of Article 6 PCT.

Information:					

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Office Action Summary	Application No. 13/109,738	Applicant(s) MOREIN ET AL.	
	Examiner DANIEL WASHBURN	Art Unit 2628	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 17 May 2011.
- 2a) This action is **FINAL**.
- 2b) This action is non-final.
- 3) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) Claim(s) 1-16 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) Claim(s) _____ is/are allowed.
- 6) Claim(s) 1-16 is/are rejected.
- 7) Claim(s) _____ is/are objected to.
- 8) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) The specification is objected to by the Examiner.
- 10) The drawing(s) filed on 17 May 2011 is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) All b) Some * c) None of:
- 1. Certified copies of the priority documents have been received.
- 2. Certified copies of the priority documents have been received in Application No. _____.
- 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-16 are rejected under 35 U.S.C. 102(e) as being anticipated by Lindholm (US 7,038,685).

RE claim 1, Lindholm describes a method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data (

3:59-65: "Programmable Graphics Processing Pipeline 150 is programmed to operate on surface, primitive, vertex, fragment, pixel, sample or any other data. For simplicity, the remainder of this description will use the term 'samples' to refer to graphics data such as surfaces, primitives, vertices, pixels, fragments, or the like."

6:38-59: "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

7:6-10: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

7:36-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread."

9:33-56: "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm describes performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block (sample data, such as vertex or pixel data, is transmitted to Register File 350) and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data (the multi-threaded processing unit 400 carries out vertex operations on vertex data unless the Register File 350 doesn't have enough room to store the incoming vertex data, in which case the thread associated with the vertex data and vertex operations must wait until enough space becomes available); and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available (

Art Unit: 2628

7:6-21: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

8:15-58: "Thread Selection Unit 415 reads one or more thread entries based on thread execution priorities and outputs selected thread entries to Instruction Cache 410. Instruction cache 410 determines if the program instructions corresponding to the program counters and sample type included in the thread state data for each thread entry are available in Instruction Cache 410 ... The program instructions corresponding to the program counters from the one or more thread entries are output by Instruction Cache 410 to ... Instruction Scheduler 430 ... Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU [instruction window unit] 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350. An instruction specifies the location of source data needed to execute the instruction."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm is considered to describe an embodiment including continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available, as the Execution Unit 470 may be carrying out calculations for one or more high priority pixel threads based on instructions stored in Instruction Cache 410 and/or IWU 435 while a low priority vertex thread is waiting for the one or more pixel threads to finish such that when the pixel threads finish the system will deallocate the resources assigned to the completed pixel threads in the Register File 350 and will allocate the requested amount of resources to the queued up vertex thread).

Art Unit: 2628

RE claim 2, Lindholm describes a unified shader, comprising:

a general purpose register block for maintaining data (

7:37-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread.");

a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");

a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block (

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."); and

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (

9:39-46 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... and output the processed sample to a destination specified by the instruction. The destination may be Vertex Output Buffer 260, Pixel Output Buffer 270, or Register File 350."

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device

Art Unit: 2628

coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270."

Thus, the Execution Unit 470 is considered a processor unit that executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (also see 4:22-5:35)).

RE claim 3, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (FIG. 4 "Execution Unit 470" and "PCU 375").

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

Thus, the Execution Unit 470 and internal PCU 375 are collectively considered a processor unit operative to perform vertex calculation operations and pixel calculation operations); and

shared resources, operatively coupled to the processor unit (FIG. 4 illustrates Register File 350 coupled to Execution Unit 470, and 7:37-43 describes that the Register File 350 is shared among threads);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations (7:37-43, all types of processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when pixel threads have priority over vertex threads the processor unit will allocate the pixel data to the Register File 350 and will perform pixel calculation operations until enough shared resources become available in the Register File 350 to begin carrying out vertex threads, which may happen as a result of a completion of most of the pixel threads or a shift in priority such that the vertex threads now have the highest priority, and then use the Register File 350 to perform vertex calculation operations.

RE claim 4, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (see the corresponding section in the rejection of claim 3); and shared resources, operatively coupled to the processor unit (see the corresponding section in the rejection of claim 3);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations (7:37-43, all types of processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when vertex threads have priority over pixel threads the processor unit will allocate the vertex data to the Register File 350 and will perform vertex calculation operations until enough shared resources become available in the Register File 350 to begin carrying out pixel threads, which may happen as a result of a completion of most of the vertex threads or a shift in priority such that the pixel threads now have the highest priority, and then use the Register File 350 to perform pixel calculation operations.

Art Unit: 2628

RE claim 5, Lindholm describes a unified shader comprising:

a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");

a sequencer coupled to the processor unit, the sequencer maintaining

instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store (

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

7:6-10 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, the Scheduler 430 and Instruction Dispatcher 440 are collectively considered a sequencer coupled to the Execution Unit 470, the sequencer maintaining instructions operative to cause the Execution Unit 470 to execute vertex calculation and pixel calculation operations on selected data maintained in a Register File 350 depending upon an amount of space available in the Register File 350).

RE claim 6, Lindholm describes the shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory (

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350").

RE claim 7, Lindholm describes the shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic."

The Thread Control Unit 420 is considered a selection circuit operative to provide information to the store (Register File 350) in response to a control signal, where the control signal is the thread allocation priority associated with each thread or thread type).

RE claim 8, Lindholm describes the shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs (

5:11-35 "Pixel Input Buffer 215 outputs the samples to each Execution Pipeline 240 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270.").

RE claim 9, Lindholm describes the shader of claim 5, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress (

Art Unit: 2628

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 10, Lindholm describes the shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs (

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260").

RE claim 11, Lindholm describes the shader of claim 7, wherein the control signal is provided by an arbiter (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic ... In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on graphics primitive size".

Thus, while an arbiter isn't explicitly described, the Examiner considers it inherent that some portion of the system acts as an arbiter, and therefore can be considered an arbiter, as some portion of the system assigns priorities to thread and sample types according to the current processing circumstances, in order to more efficiently process the data).

RE claim 12, Lindholm describes a graphics processor comprising:

a unified shader comprising a processor unit that executes vertex calculations while the pixel calculations are still in progress (

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 13, Lindholm describes the graphics processor of claim 12 wherein the unified shader comprises a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store (see the corresponding section in the rejection of claim 5).

RE claim 14, Lindholm describes the graphics processor of claim 12 comprising a vertex block operative to fetch vertex information from memory (see the rejection of claim 6).

RE claim 15, Lindholm describes a unified shader comprising:

a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload (

7:6-36 "Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on graphics primitive size (number of pixels or fragments included in a primitive)".

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 16, Lindholm describes the shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store (FIG. 4 and 8:15-46 describes Instruction Cache 410, which is considered an instruction store.

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types."

Thus, the Execution Unit 470 performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store).

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DANIEL WASHBURN whose telephone number is (571)272-5551. The examiner can normally be reached on 9:30 A.M. to 6 P.M..

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Ulka Chauhan can be reached on 571-272-7782. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Publication No.US-2011-0216077-A1

Publication Date:09/08/2011

NOTICE OF PUBLICATION OF APPLICATION

The above-identified application will be electronically published as a patent application publication pursuant to 37 CFR 1.211, et seq. The patent application publication number and publication date are set forth above.

The publication may be accessed through the USPTO's publically available Searchable Databases via the Internet at www.uspto.gov. The direct link to access the publication is currently http://www.uspto.gov/patft/.

The publication process established by the Office does not provide for mailing a copy of the publication to applicant. A copy of the publication may be obtained from the Office upon payment of the appropriate fee set forth in 37 CFR 1.19(a)(1). Orders for copies of patent application publications are handled by the USPTO's Office of Public Records. The Office of Public Records can be reached by telephone at (703) 308-9726 or (800) 972-6382, by facsimile at (703) 305-8759, by mail addressed to the United States Patent and Trademark Office, Office of Public Records, Alexandria, VA 22313-1450 or via the Internet.

In addition, information on the status of the application, including the mailing date of Office actions and the dates of receipt of correspondence filed in the Office, may also be accessed via the Internet through the Patent Electronic Business Center at www.uspto.gov using the public side of the Patent Application Information and Retrieval (PAIR) system. The direct link to access this status information is currently http://pair.uspto.gov/. Prior to publication, such status information is confidential and may only be obtained by applicant using the private side of PAIR.

Further assistance in electronically accessing the publication, or about PAIR, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

RESPONSE

Dear Sir:

In response to the office action mailed July 21, 2011, Applicants petition for a three month extension of time and respond as follows:

Listing of the Claims begins on page 2 of this paper.

Remarks begin on page 6 of this paper.

Listing of the Claims:

1. (original) A method comprising:
performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. (original) A unified shader, comprising:
a general purpose register block for maintaining data;
a processor unit;
a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs.

3. (original) A unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations; and

shared resources, operatively coupled to the processor unit;

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations.

4. (original) A unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations; and

shared resources, operatively coupled to the processor unit;

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

5. (original) A unified shader comprising:

a processor unit;

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

6. (original) The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

7. (original) The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.

8. (original) The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs.

9. (original) The shader of claim 5, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress.

10. (original) The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.

11. (original) The shader of claim 7, wherein the control signal is provided by an arbiter.

12. (original) A graphics processor comprising:
a unified shader comprising a processor unit that executes vertex calculations while the pixel calculations are still in progress.

13. (original) The graphics processor of claim 12 wherein the unified shader comprises a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

14. (original) The graphics processor of claim 12 comprising a vertex block operative to fetch vertex information from memory.

15. (original) A unified shader comprising:
a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.

16. (original) The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

REMARKS

Applicants respectfully traverse and request reconsideration.

Claims 1-16 stand rejected under 35 U.S.C. § 102(e) as allegedly being anticipated by U.S. Patent No. 7,038,685 (Lindholm). Applicants respectfully submit herewith Declarations under 37 C.F.R. § 1.131 for inventors Laurent Lefebvre, Andrew E. Gruber, Stephen L. Morein and Andi P. Skende establishing conception and reduction to practice of the currently claimed subject matter prior to the June 30, 2003 priority date of Lindholm. It is believed that Lindholm does not claim the same patentable invention as defined by 37 C.F.R. § 41.203(a) and that the present rejection is not based on a statutory bar, i.e., Lindholm qualifies as prior art only under 35 U.S.C. § 102(e). Accordingly, the attached Declarations are relied on to establish prior reduction to practice of the claimed subject matter, particularly with regard to independent claims 1-5, 12 and 15.

Regarding the reduction to practice evidenced by the attached Declarations, Applicants first note that, properly presented, a Rule 131 declaration may demonstrate prior invention if it provides a “showing of facts . . . as to establish reduction to practice prior to the effective date of the reference.” 37 C.F.R. § 1.131(b). As set forth in M.P.E.P. § 715.07(I), evidence in support of asserted facts demonstrating prior invention may be provided in the form of “an accompanying model.” With regard to an apparatus and/or process implemented by an integrated circuit or the like, Applicants respectfully submit that a simulation of such an apparatus and/or circuit may effectively serve as a “model” demonstrating successful reduction to practice. Specifically, Applicants respectfully submit that evidence of (i) a successful computer-based simulation of a physical embodiment and/or (ii) a description of a physical embodiment capable of translation to implement the actual physical embodiment, coupled with

successfully testing of the resulting physical embodiment is sufficient to demonstrate an actual reduction to practice for the purposes of Rule 131 declaration. (See *McDonnell Douglas Corp. v. U.S.*, 670 F. 2d 156, 161 (Ct. Cl. 1982) (where court concludes that “physical tests proved that the computer approved device . . . failed in actual practice . . . to perform in the manner intended” and that subsequent successful physical testing was the first reduction to practice, a necessary implication is that a valid reduction to practice would result if actual physical testing demonstrates that prior computer simulation was adequate.); *Mosaid Tech. Inc. v. Samsung Elec. Co.*, 362 F.Supp.2d 526, 547 (D.N.J. 2005) (noting that the *McDonnell* case suggested “that a computer simulation may be a valid reduction to practice, but not if subsequent, actual physical testing proves that it is inadequate,” and that “there are areas of science where a successfully run simulation represents the end of the inventive process and the construction of the physical embodiment is but a matter of mere routine and mechanical application [such that] a simulation should be a valid reduction to practice.”))

With regard to the instant application, as shown in the attached Declarations, Applicants have provided evidence that both a simulation and hardware design description (expressed in a hardware design language capable of conversion to a physical embodiment) subsequently lead to a successfully tested physical embodiment of (and, therefore, actual reduction to practice of) the subject matter recited in the independent claims. More particularly, the attached Declarations demonstrate invention of the recited subject matter in claims 1-5, 12 and 15 prior to the effective filing date of the Lindholm reference.

Thus, in light of the Declarations, Applicants respectfully submit that Lindholm is not available as prior art against, and therefore obviates the sole basis for rejecting, the above claims, which claims are therefore in suitable condition for allowance. Applicants further note that

claims 6-11, 13, 14 and 16 are dependent upon, and therefore incorporate the limitations of, respective ones of claims 5, 12 and 15. As such, claims 6-11, 13, 14 and 16 are also allowable for the same reasons presented above relative to their respective independent claims.

Applicant respectfully submits that the claims are now believed to be in condition for allowance and that a timely Notice of Allowance be issued in this case. If the Examiner believes that personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at (312) 356-5094.

Respectfully submitted,

Dated: January 18, 2012

DECLARATION UNDER 37 C.F.R. § 1.131

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22314-1450

Sir:

We, Stephen L Morein a citizen of the U.S. residing at 367 Santana Heights, Unit 3027, San Jose California 95128; Laurent Lefebvre, a citizen of Canada residing at 1055 Garden Avenue, Mascouche, Quebec, CANADA, J7L-0A1; Andrew E. Gruber a citizen of the U.S. residing at 251 Pleasant Street, Arlington, Massachusetts 02476; and Andi Petrit Skende a citizen of the U.S. residing at 35 Sunrise Avenue, Worcester, Massachusetts 01606, do hereby declare that:

1. We are joint inventors of the subject matter described and claimed in U.S. Patent Application No. 13/109,738 (hereinafter "the Invention"), filed in the United States of America on May 17, 2011, entitled "Graphics Processing Architecture Employing a Unified Shader", which application is a continuation of and claims priority to U.S. Patent Application No. 12/791,597 filed June 1, 2010, which application is a continuation of and claims priority to U.S. Patent Application No. 11/842,256 filed August 21, 2007, which application is a continuation of and claims priority to U.S. Patent Application No. 11/117,863 filed April 29, 2005 (now U.S. Patent No. 7,327,369), which application is a continuation of and claims priority to U.S. Patent Application No. 10/718,318 filed November 20, 2003 (hereinafter "the '318 application"; now U.S. Patent No. 6,897,871).

2. We conceived the Invention prior to June 30, 2003 while employed by ATI Technologies Inc. and/or one of its wholly owned subsidiaries ("ATI") as indicated by attached Exhibits A and B. Exhibit A is a copy of emulation code files entitled Reg_file.cpp, Instruction_store.cpp, Arbiter.cpp, Gpr_manager.cpp, sq_alu.cpp and sq_block_model.cpp that,

based on information and belief, we invented and assisted in coding prior to June 30, 2003 the ("Model Code"). Exhibit B is a copy of hardware register transfer level (RTL) files ("the Chip Design Code") entitled sq_gpr_alloc.v, Sq_alu_instr_seq.v, sq_instruction_store_v, sp_macc_gpr.v, sp_vector.v, sq.v, sq_export_alloc.v, sq_ctl_flow_seq.v, sq_alu_instr_seq.v, sq_thread_arb.v and sq_shader_seq.v, that, based on information and belief, we assisted in creating prior to June 30, 2003. Prior to June 30, 2003 we created a graphics processing system that operated as claimed using a computer system that successfully executed the Model Code. Prior to June 30, 2003 we also created a graphics processing system as claimed in the form of a computer system that used an RTL simulator to successfully validate the operation of an integrated circuit version of the claimed graphics processing system and method. At least the following language and citations adequately support the above:

a. As shown in Exhibit A, the Model Code comprises various software instructions written in the well-known C++ language. When executed by the computer system, the Model Code caused the computer system to operate as claimed in at least claims 1-5, 12 and 15 of the Invention.

b. Using the Model Code, we successfully verified the operation of the claimed subject matter for its intended purpose through emulation thereof.

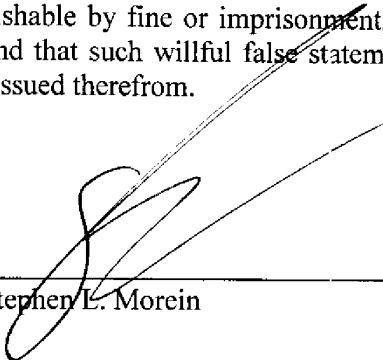

c. As shown in Exhibit B, the Chip Design Code comprises various instructions written in a well-known hardware description language. The Chip Design Code was used by an RTL simulator system to validate the operation of an integrated circuit version of the claimed graphics processing system and method as claimed in at least claims 1-5, 12 and 15. As further known by practitioners in the field of integrated circuit design, such instructions are used to generate gate level detail for silicon fabrication.

d. On information and belief, the computer system operating the Model Code and the RTL simulator system operating the Chip Design Code represents the claimed structure and operation embodied in an integrated graphics processing circuit chip referred to as the ATI XENOS chip produced by ATI on or about October, 2004 that was incorporated in the XBOX 360 product.

Accordingly, the contents of Exhibits A and B establish the possession by us of the whole Invention, falling within the scope of currently pending claims, such as but not limited to at least claims 1-5, 12 and 15.

Regarding fetching data from memory, The texture fetcher allows fetching from memory. The arbiter.cpp file picks the programs that need to fetch data in this function:

```

boolean Arbiter::chooseTexStation(int &lineNumber,Shader_Type &stype)
{
    int i;
    int vertexPick = -1;
    int pixelPick = -1;
    int lineCheck;

    // do pixels first

```

```

lineCheck = pixelHead;
for (i=0;i<pixelRsCount;i++)
{
    if (pixelStation[lineCheck].status.valid &&
pixelStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !pixelStation[lineCheck].status.event)
    {
        pixelPick=lineCheck;
    }
    // enforce restrictions based on the status
    if (pixelPick != -1)
    {
        // no texture ops while texture reads are outstanding
        if (pixelStation[pixelPick].status.texReadsOutstanding)
            pixelPick = -1;
        else
            break;
    }

    lineCheck = (lineCheck+1)%MAX_PIX_RESERVATION_SIZE;
}

lineCheck = vertexHead;
for (i=0;i<vertexRsCount;i++)
{
    if (vertexStation[lineCheck].status.valid &&
vertexStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !vertexStation[lineCheck].status.event)
    {
        vertexPick=lineCheck;
    }

    // enforce restrictions based on the status
    if (vertexPick != -1)
    {
        // no texture ops while texture reads are outstanding
        if (vertexStation[vertexPick].status.texReadsOutstanding)
            vertexPick = -1;
        else
            break;
    }

    lineCheck = (lineCheck+1)%MAX_VTX_RESERVATION_SIZE;
}

if (vertexPick != -1)
{
    lineNumber = vertexPick;
    sType = VERTEX;
    return true;
}
if (pixelPick != -1)
{
    lineNumber = pixelPick;
    sType = PIXEL;
    return true;
}

```

```

    return false;
}

```

Then fills in a request in this function:

```

  endcase
end

```

```
// - end ais state machine
```

The ais machine is the “alu instruction sequencer” it executes instructions on either vertices or pixels depending on type. The file `sq_instruction_store.v` contains the memory with all the instructions to be performed on either PS or VS:

Sq_instruction_store_v

```
// Access to the is (instruction store) is divided into 4 phases:
// 0: texture instruction read
// 1: alu instruction read
// The alu phase alternates between phases for alu0 and alu1.
// 2: CP write (or read for debug)
// 3: control flow instruction read
// The control flow phase is shared for accesses by alu0, alu1 and tex
// controlled by is_sub_phase.

// address mux
always @(*AUTONSENSE*/addr or data_cnt or i_alu0_addr
        or i_alu0_cf_addr or i_alu1_addr or i_alu1_cf_addr
        or i_is_phase or i_is_sub_phase or i_tex_addr
        or i_tex_cf_addr or q_rbi_addr_in)
begin
    // default values
    d_addr    = addr;
    d_we      = 1'b0;
    case (i_is_phase)

        TEX_PHASE :
            begin
                d_addr    = i_tex_addr;
            end

        ALU_PHASE :

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Table with 5 columns: APPLICATION NO., FILING DATE, FIRST NAMED INVENTOR, ATTORNEY DOCKET NO., CONFIRMATION NO. Includes details for application 13/109,738 filed 05/17/2011 by Stephen Morein, attorney docket no. 00100.36.0001, confirmation no. 2020. Also includes examiner WASHBURN, DANIEL C, art unit 2628, and notification date 03/15/2012 via electronic mode.

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

intear@faegrebd.com
cynthia.payson@faegrebd.com

Office Action Summary	Application No. 13/109,738	Applicant(s) MOREIN ET AL.
	Examiner DANIEL WASHBURN	Art Unit 2628

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --
Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 18 January 2012.
- 2a) This action is **FINAL**. 2b) This action is non-final.
- 3) An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.
- 4) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 5) Claim(s) 1-16 is/are pending in the application.
5a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 6) Claim(s) _____ is/are allowed.
- 7) Claim(s) 1-16 is/are rejected.
- 8) Claim(s) _____ is/are objected to.
- 9) Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 10) The specification is objected to by the Examiner.
- 11) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 12) The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 13) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) All b) Some * c) None of:
1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. _____.
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) Notice of References Cited (PTO-892)
- 2) Notice of Draftsperson's Patent Drawing Review (PTO-948)
- 3) Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____.
- 4) Interview Summary (PTO-413)
Paper No(s)/Mail Date _____.
- 5) Notice of Informal Patent Application
- 6) Other: _____.

DETAILED ACTION

Specification

Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words. It is important that the abstract not exceed 150 words in length since the space provided for the abstract on the computer tape used by the printer is limited. **The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided.** The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

Declaration filed under 37 CFR 1.131

The declaration filed 1/18/12 under 37 CFR 1.131 has been considered but is ineffective to overcome the prior art reference Lindholm (US 7,038,685, "the Lindholm reference").

The declaration does not meet the requirements of 37 CFR 1.131 section (a).

37 CFR 1.131 section (a) states (in relevant part):

“(a) When any claim of an application or a patent under reexamination is rejected, the inventor of the subject matter of the rejected claim, the owner of the patent under reexamination, or the party qualified under §§ 1.42, 1.43, or 1.47, may submit an appropriate oath or declaration to establish invention of the subject matter of the rejected claim prior to the effective date of the reference or activity on which the rejection is based. The effective date of a U.S. patent, U.S. patent application publication, or international application publication under PCT Article 21(2) is the earlier of its publication date or date that it is effective as a reference under 35 U.S.C. 102(e). **Prior invention may not be established under this section in any country other than the United States, a NAFTA country, or a WTO member country. Prior invention may not be established under this section before December 8, 1993, in**

a NAFTA country other than the United States, or before January 1, 1996, in a WTO member country other than a NAFTA country.” (emphasis added)

Section 2 of Applicants' declaration describes (in relevant part):

“2. We conceived the Invention prior to June 30, 2003 while employed by ATI Technologies Inc. and/or one of its wholly owned subsidiaries ("ATI") as indicated by attached Exhibits A and B ... Prior to June 30, 2003 we created a graphics processing system that operated as claimed using a computer system that successfully executed the Model Code. Prior to June 30, 2003 we also created a graphics processing system as claimed in the form of a computer system that used an RTL simulator to successfully validate the operation of an integrated circuit version of the claimed graphics processing system and method.”

As quoted from Applicants' declaration, section 2 describes conception and reduction to practice of the claimed invention prior to June 30, 2003. Section 2 further describes that the conception and reduction to practice of the claimed invention was carried out while the inventors were employed by ATI Technologies Inc. and/or one of its wholly owned subsidiaries.

However, section 2, and the declaration as a whole, fails to specify whether or not the conception and reduction to practice was carried out in the United States, a NAFTA country, or a WTO member country. As quoted from 37 CFR 1.131 section (a), “[p]rior invention may not be established under this section in any country other than the United States, a NAFTA country, or a WTO member country”. Thus, the declaration is ineffective to overcome the Lindholm reference due to this first deficiency.

Further, the declaration does not meet the requirements of 37 CFR 1.131 section (b).

37 CFR 1.131 section (b) states:

“(b) The showing of facts shall be such, in character and weight, as to establish reduction to practice prior to the effective date of the reference, or conception

of the invention prior to the effective date of the reference coupled with due diligence from prior to said date to a subsequent reduction to practice or to the filing of the application. Original exhibits of drawings or records, or photocopies thereof, must accompany and form part of the affidavit or declaration or their absence must be satisfactorily explained.”

MPEP 715.07 [R-3] "Facts and Documentary Evidence", section I. "General Requirements", offers further guidance regarding the requirements of 37 CFR 1.131 section (b).

MPEP 715.07, section I., describes (in relevant part):

“The essential thing to be shown under 37 CFR 1.131 is priority of invention and this may be done by any satisfactory evidence of the fact. FACTS, not conclusions, must be alleged. Evidence in the form of exhibits may accompany the affidavit or declaration. Each exhibit relied upon should be specifically referred to in the affidavit or declaration, in terms of what it is relied upon to show ... when reviewing a 37 CFR 1.131 affidavit or declaration, the examiner must consider all of the evidence presented in its entirety, including the affidavits or declarations and all accompanying exhibits, records and “notes.” An accompanying exhibit need not support all claimed limitations, provided that any missing limitation is supported by the declaration itself. Ex parte Ovshinsky, 10 USPQ2d 1075 (Bd. Pat. App. & Inter. 1989).

The affidavit or declaration and exhibits must clearly explain which facts or data applicant is relying on to show completion of his or her invention prior to the particular date. Vague and general statements in broad terms about what the exhibits describe along with a general assertion that the exhibits describe a reduction to practice “amounts essentially to mere pleading, unsupported by proof or a showing of facts” and, thus, does not satisfy the requirements of 37 CFR 1.131(b). In re Borkowski, 505 F.2d 713, 184 USPQ 29 (CCPA 1974). Applicant must give a clear explanation of the exhibits pointing out exactly what facts are established and relied on by applicant. 505 F.2d at 718-19, 184 USPQ at 33. See also In re Harry, 333 F.2d 920, 142 USPQ 164 (CCPA 1964) (Affidavit “asserts that facts exist but does not tell what they are or when they occurred.”) (emphasis added)

Section 2 of Applicants' declaration describes (in relevant part):

“Prior to June 30, 2003 we created a graphics processing system that operated as claimed using a computer system that successfully executed the Model Code. Prior to June 30, 2003 we also created a graphics processing system as claimed in the form of a computer system that used an RTL simulator to successfully validate the operation

of an integrated circuit version of the claimed graphics processing system and method
At least the following language and citations adequately support the above:

a. As shown in Exhibit A, the Model Code comprises various software instructions written in the well-known C++ language. When executed by the computer system, the Model Code caused the computer system to operate as claimed in at least claims 1-5, 12 and 15 of the Invention.

b. Using the Model Code, we successfully verified the operation of the claimed subject matter for its intended purpose through emulation thereof.

c. As shown in Exhibit B, the Chip Design Code comprises various instructions written in a well-known hardware description language. The Chip Design Code was used by an RTL simulator system to validate the operation of an integrated circuit version of the claimed graphics processing system and method as claimed in at least claims 1-5, 12 and 15. As further known by practitioners in the field of integrated circuit design, such instructions are used to generate gate level detail for silicon fabrication.

d. On information and belief, the computer system operating the Model Code and the RTL simulator system operating the Chip Design Code represents the claimed structure and operation embodied in an integrated graphics processing circuit chip referred to as the ATI XENOS chip produced by ATI on or about October, 2004 that was incorporated in the XBOX 360 product.

Accordingly, the contents of Exhibits A and B establish the possession by us of the whole Invention, failing within the scope of currently pending claims, such as but not limited to at least claims 1-5, 12 and 15.”

As quoted from Applicants' declaration, section 2 describes that Exhibit A is Model Code that, when executed by the computer system, caused the computer system to operate as claimed in at least claims 1-5, 12, and 15 of the Invention. Further, section 2 describes that Exhibit B is Chip Design Code that was used by an RTL simulator system to validate operation of an integrated circuit version of the claimed graphics processing system and method as claimed in at least claims 1-5, 12, and 15.

However, section 2, and the declaration as a whole, fails to clearly explain which facts or data applicant is relying on to show completion of his or her invention prior to

the June 30, 2003. The portions of Applicants' declaration quoted above are considered nothing more than vague and general statements in broad terms about what the exhibits describe along with general assertions that the exhibits describe a reduction to practice, which does not satisfy the requirements of 37 CFR 1.131 section (b). Thus, the declaration is ineffective to overcome the Lindholm reference due to this second deficiency.

Regarding claim 1, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed method steps of "performing vertex manipulation operations and pixel manipulation operations...and continuing pixel calculation operations that are to be or are currently being performed by the processor..."

Regarding claim 2, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed "unified shader, comprising: a general purpose register block...a processor unit; and a sequencer, coupled to the general purpose register block and the processor unit..."

Regarding claims 3 and 4, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed "unified shader comprising: a processor unit...and shared resources...the processor unit operative to use the shared resources..."

Regarding claim 5, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed "unified shader comprising: a processor unit; a sequencer coupled to the processor unit..."

Regarding claim 12, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed “graphics processor comprising: a unified shader comprising a processor unit...”

Regarding claim 15, the Examiner is unable to determine which portions of Exhibit A and/or Exhibit B describe the claimed “unified shader comprising: a processor unit flexibly controlled...”

Thus, for at least the reasons given above, the declaration filed 1/18/12 under 37 CFR 1.131 is ineffective to overcome the Lindholm reference.

As an additional note, the Examiner would like to point out that US Pat 7,015,913, to Lindholm et al., filed June 27th, 2003, appears, after brief review, to include a disclosure that is similar to US Pat 7,038,685 to Lindholm, which is used in the rejections that follow (see FIG. 2 of each patent). The Examiner has not given Lindholm et al. (US 7,015,913) a thorough review as to whether or not it teaches one or more of Applicants’ claims, but it may be worth Applicants’ time to review Lindholm et al. (US 7,015,913) and adjust the declaration such that conception and reduction to practice of the claimed invention is declared to have occurred prior to June 27th, 2003 (if such a statement is true), in order to avoid a future rejection based on the teachings of prior art reference Lindholm et al. (US 7,015,913).

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

Art Unit: 2628

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-16 are rejected under 35 U.S.C. 102(e) as being anticipated by

Lindholm (US 7,038,685).

RE claim 1, Lindholm describes a method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data (

3:59-65: "Programmable Graphics Processing Pipeline 150 is programmed to operate on surface, primitive, vertex, fragment, pixel, sample or any other data. For simplicity, the remainder of this description will use the term 'samples' to refer to graphics data such as surfaces, primitives, vertices, pixels, fragments, or the like."

6:38-59: "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

7:6-10: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

7:36-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread."

9:33-56: "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm describes performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block (sample data, such as vertex or pixel data, is transmitted to Register File 350) and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data (the multi-threaded processing unit 400 carries out vertex operations on vertex data unless the Register File 350 doesn't have enough room to store the incoming vertex data, in which case the thread associated with the vertex data and vertex operations must wait until enough space becomes available); and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available (

7:6-21: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

8:15-58: "Thread Selection Unit 415 reads one or more thread entries based on thread execution priorities and outputs selected thread entries to Instruction Cache 410. Instruction cache 410 determines if the program instructions corresponding to the program counters and sample type included in the thread state data for each thread entry are available in Instruction Cache 410 ... The program instructions corresponding to the program counters from the one or more thread entries are output by Instruction

Cache 410 to ... Instruction Scheduler 430 ... Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU [instruction window unit] 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350. An instruction specifies the location of source data needed to execute the instruction."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm is considered to describe an embodiment including continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available, as the Execution Unit 470 may be carrying out calculations for one or more high priority pixel threads based on instructions stored in Instruction Cache 410 and/or IWU 435 while a low priority vertex thread is waiting for the one or more pixel threads to finish such that when the pixel threads finish the system will deallocate the resources assigned to the completed pixel threads in the Register File 350 and will allocate the requested amount of resources to the queued up vertex thread).

RE claim 2, Lindholm describes a unified shader, comprising:

a general purpose register block for maintaining data (

7:37-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread.");

a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");

a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block (

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."); and

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (

9:39-46 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... and output the processed sample to a destination specified by the instruction. The destination may be Vertex Output Buffer 260, Pixel Output Buffer 270, or Register File 350."

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270."

Thus, the Execution Unit 470 is considered a processor unit that executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (also see 4:22-5:35)).

RE claim 3, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (FIG. 4 "Execution Unit 470" and "PCU 375").

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

Thus, the Execution Unit 470 and internal PCU 375 are collectively considered a processor unit operative to perform vertex calculation operations and pixel calculation operations); and

shared resources, operatively coupled to the processor unit (FIG. 4 illustrates Register File 350 coupled to Execution Unit 470, and 7:37-43 describes that the Register File 350 is shared among threads);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform

vertex calculation operations (7:37-43, all types of processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when pixel threads have priority over vertex threads the processor unit will allocate the pixel data to the Register File 350 and will perform pixel calculation operations until enough shared resources become available in the Register File 350 to begin carrying out vertex threads, which may happen as a result of a completion of most of the pixel threads or a shift in priority such that the vertex threads now have the highest priority, and then use the Register File 350 to perform vertex calculation operations.

RE claim 4, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (see the corresponding section in the rejection of claim 3); and shared resources, operatively coupled to the processor unit (see the corresponding section in the rejection of claim 3);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough

shared resources become available and then use the shared resources to perform pixel calculation operations (7:37-43, all types of processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when vertex threads have priority over pixel threads the processor unit will allocate the vertex data to the Register File 350 and will perform vertex calculation operations until enough shared resources become available in the Register File 350 to begin carrying out pixel threads, which may happen as a result of a completion of most of the vertex threads or a shift in priority such that the pixel threads now have the highest priority, and then use the Register File 350 to perform pixel calculation operations.

RE claim 5, Lindholm describes a unified shader comprising:
a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");
a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store (

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

7:6-10 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, the Scheduler 430 and Instruction Dispatcher 440 are collectively considered a sequencer coupled to the Execution Unit 470, the sequencer maintaining instructions operative to cause the Execution Unit 470 to execute vertex calculation and pixel calculation operations on selected data maintained in a Register File 350 depending upon an amount of space available in the Register File 350).

RE claim 6, Lindholm describes the shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory (

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350").

RE claim 7, Lindholm describes the shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic."

The Thread Control Unit 420 is considered a selection circuit operative to provide information to the store (Register File 350) in response to a control signal, where the control signal is the thread allocation priority associated with each thread or thread type).

RE claim 8, Lindholm describes the shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs (

5:11-35 "Pixel Input Buffer 215 outputs the samples to each Execution Pipeline 240 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270.").

RE claim 9, Lindholm describes the shader of claim 5, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress (

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 10, Lindholm describes the shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs (

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260").

RE claim 11, Lindholm describes the shader of claim 7, wherein the control signal is provided by an arbiter (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic ... In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on graphics primitive size".

Thus, while an arbiter isn't explicitly described, the Examiner considers it inherent that some portion of the system acts as an arbiter, and therefore can be considered an arbiter, as some portion of the system assigns priorities to thread and sample types according to the current processing circumstances, in order to more efficiently process the data).

RE claim 12, Lindholm describes a graphics processor comprising:

a unified shader comprising a processor unit that executes vertex calculations while the pixel calculations are still in progress (

6:38-59 “FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex.”

9:39-49 “Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.”).

RE claim 13, Lindholm describes the graphics processor of claim 12 wherein the unified shader comprises a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store (see the corresponding section in the rejection of claim 5).

RE claim 14, Lindholm describes the graphics processor of claim 12 comprising a vertex block operative to fetch vertex information from memory (see the rejection of claim 6).

RE claim 15, Lindholm describes a unified shader comprising:

a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload (

7:6-36 “Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations

in Register File 350 using thread allocation priorities based on graphics primitive size (number of pixels or fragments included in a primitive)".

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 16, Lindholm describes the shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store (FIG. 4 and 8:15-46 describes Instruction Cache 410, which is considered an instruction store.

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types."

Thus, the Execution Unit 470 performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store).

Conclusion

THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not

mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

<p>Request for Continued Examination (RCE) Transmittal</p> <p>Address to: Mail Stop RCE Commissioner for Patents P.O. Box 1450 Alexandria, VA 22313-1450</p>	Application Number	13/109,738
	Filing Date	May 17, 2011
	First Named Inventor	Stephen Morein
	Art Unit	2628
	Examiner Name	Daniel C. Washburn
	Attorney Docket Number	00100.36.0001

This is a Request for Continued Examination (RCE) under 37 CFR 1.114 of the above-identified application.
Request for Continued Examination (RCE) practice under 37 CFR 1.114 does not apply to any utility or plant application filed prior to June 8, 1995, or to any design application. See Instruction Sheet for RCEs (not to be submitted to the USPTO) on page 2.

1. **Submission required under 37 CFR 1.114** Note: If the RCE is proper, any previously filed unentered amendments and amendments enclosed with the RCE will be entered in the order in which they were filed unless applicant instructs otherwise. If applicant does not wish to have any previously filed unentered amendment(s) entered, applicant must request non-entry of such amendment(s).

a. Previously submitted. If a final Office action is outstanding, any amendments filed after the final Office action may be considered as a submission even if this box is not checked.

i. Consider the arguments in the Appeal Brief or Reply Brief previously filed on _____

ii. Other _____

b. Enclosed

i. Amendment/Reply

ii. Affidavit(s)/ Declaration(s)

iii. Information Disclosure Statement (IDS)

iv. Other Replacement Abstract

2. **Miscellaneous**

a. Suspension of action on the above-identified application is requested under 37 CFR 1.103(c) for a period of _____ months. (Period of suspension shall not exceed 3 months; Fee under 37 CFR 1.17(i) required)

b. Other _____

3. **Fees** The RCE fee under 37 CFR 1.17(e) is required by 37 CFR 1.114 when the RCE is filed.

a. The Director is hereby authorized to charge the following fees, any underpayment of fees, or credit any overpayments, to Deposit Account No. 02-0390.

i. RCE fee required under 37 CFR 1.17(e)

ii. Extension of time fee (37 CFR 1.136 and 1.17)

iii. Other _____

b. Check in the amount of \$ _____ enclosed

c. Payment by credit card (Form PTO-2038 enclosed)

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

PRELIMINARY AMENDMENT

Dear Sir:

In response to the final office action mailed March 15, 2012, Applicants submit a Request for Continued Examination, petition for a three month extension of time and submit the following preliminary amendment:

Amendments to the Abstract begin on page 2 of this paper and include a replacement Abstract and a clean copy showing the amended Abstract.

Amendments to the Claims begins on page 3 of this paper.

Remarks begin on page 7 of this paper.

Amendments to the Specification

Please replace the Abstract with the following amended Abstract:

GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

A graphics processing architecture in one example performs vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continues pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available. In one example, a general purpose register block maintains data. A sequencer, coupled to the general purpose register block and to a processor unit, maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs. ~~employing a single shader is disclosed. The architecture includes a circuit operative to select one of a plurality of inputs in response to a control signal; and a shader, coupled to the arbiter, operative to process the selected one of the plurality of inputs, the shader including means for performing vertex operations and pixel operations, and wherein the shader performs one of the vertex operations or pixel operations based on the selected one of the~~

plurality of inputs. The shader includes a register block which is used to store the plurality of selected inputs, a sequencer which maintains vertex manipulation and pixel manipulations instructions and a processor capable of executing both floating point arithmetic and logical operations on the selected inputs in response to the instructions maintained in the sequencer.

Amendments to the Claims:

Rewrite the claims as set forth below. This listing of claims replaces all prior versions and listings of claims in the application:

Listing of the Claims:

1. (original) A method comprising:
performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and
continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. (original) A unified shader, comprising:
a general purpose register block for maintaining data;
a processor unit;
a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and
wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs.

3. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations.

4. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

5. (original) A unified shader comprising:
a processor unit;
a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

6. (original) The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

7. (original) The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.

8. (original) The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs.

9. (canceled)

10. (original) The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.

11. (original) The shader of claim 7, wherein the control signal is provided by an arbiter.

12. – 14. (canceled)

15. (original) A unified shader comprising:
a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.

16. (original) The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

REMARKS

Applicants respectfully traverse and request reconsideration.

Applicants' attorney wishes to thank the Examiner for the courtesies extended during the telephone conference of September 17, 2012.

Applicants cancel claims 9 and 12-14 without prejudice. Applicants have also amended the Abstract.

Claims 1-16 stand rejected under 35 U.S.C. § 102(e) as allegedly being anticipated by U.S. Patent No. 7,038,685 (Lindholm). Applicants respectfully request reconsideration and respectfully submit that the declaration is proper and that the declaration is more than "vague general statements in broad terms...". To the contrary, the statements and Exhibits set forth facts sufficient to show a conception and reduction to practice sufficient to show priority of invention. To the extent additional information would be helpful, Applicants respectfully submit by way of example that:

As to claim 1 for example, Exhibit B Chip Design Code – sq_gpr_alloc.v and Sq_alu_instr_seq.v – are believed to illustrate, inter alia, loading either pixel or vertices in the GPR if there is space for them (e.g., transmission to general purpose register (gpr) blocks unless the gpr block does not have space); performing pixel and vertex manipulations; the ais machine is the "alu instruction sequencer" and it executes instructions on either vertices or pixels depending on type. the file sq_instruction_store.v contains the memory with the instructions to be performed on either pixels (PS) or vertices (VS).

As to claims 2-5 for example, Exhibit B Chip Design Code – sp_macc_gpr.v, SP_vector.v, Sq.v, Sq_export_alloc.v, sq_ctl_flow_seq.v, Sq_alu_instr_seq.v - are believed to illustrate, inter alia, the general purpose register and processor (e.g., multiply and accumulate

(MAC or MACC) logic) and a sequencer coupled to the general purpose register and processor unit and operation of the sequencer and processor unit.

Applicant respectfully submits that the claims are now believed to be in condition for allowance and that a timely Notice of Allowance be issued in this case. If the Examiner believes that personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at (312) 356-5094.

Respectfully submitted,

Dated: September 17, 2012

GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

A graphics processing architecture in one example performs vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continues pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available. In one example, a general purpose register block maintains data. A sequencer, coupled to the general purpose register block and to a processor unit, maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

This collection of information is required by 37 CFR 1.16. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

michelle.davis@faegrebd.com

Office Action Summary	Application No. 13/109,738	Applicant(s) MOREIN ET AL.	
	Examiner FRANK CHEN	Art Unit 2677	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 17 September 2012.
- 2a) This action is **FINAL**.
- 2b) This action is non-final.
- 3) An election was made by the applicant in response to a restriction requirement set forth during the interview on ____; the restriction requirement and election have been incorporated into this action.
- 4) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 5) Claim(s) 1-8,10,11,15 and 16 is/are pending in the application.
- 5a) Of the above claim(s) ____ is/are withdrawn from consideration.
- 6) Claim(s) ____ is/are allowed.
- 7) Claim(s) 1-8,10,11,15 and 16 is/are rejected.
- 8) Claim(s) ____ is/are objected to.
- 9) Claim(s) ____ are subject to restriction and/or election requirement.

* If any claims have been determined allowable, you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see http://www.uspto.gov/patents/init_events/pph/index.jsp or send an inquiry to PPHfeedback@uspto.gov.

Application Papers

- 10) The specification is objected to by the Examiner.
- 11) The drawing(s) filed on ____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
a) All b) Some * c) None of:
1. Certified copies of the priority documents have been received.
2. Certified copies of the priority documents have been received in Application No. ____.
3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).
* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) Notice of References Cited (PTO-892)
- 2) Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date ____.
- 3) Interview Summary (PTO-413)
Paper No(s)/Mail Date. ____.
- 4) Other: ____.

DETAILED ACTION

Claim Status

1. Claims 1-8,10-11, and 15-16 are currently pending in this application.
2. Claims 9 and 12-14 have been canceled.

Specification

3. Applicant is reminded of the proper language and format for an abstract of the disclosure.

The abstract should be in narrative form and **generally limited to a single paragraph on a separate sheet within the range of 50 to 150 words**. The form and legal phraseology often used in patent claims, such as "means" and "said," should be avoided. The abstract should describe the disclosure sufficiently to assist readers in deciding whether there is a need for consulting the full patent text for details.

The language should be clear and concise and should not repeat information given in the title. It should avoid using phrases which can be implied, such as, "The disclosure concerns," "The disclosure defined by this invention," "The disclosure describes," etc.

4. The abstract of the disclosure is objected to because it exceeds 150 words. Correction is required. See MPEP § 608.01(b).

Declaration filed under 37 CFR 1.131

The declaration filed 1/18/12 under 37 CFR 1.131 and the Applicants Argument/Remarks Made in an Amendment filed 9/17/2012 have been considered but is ineffective to overcome the prior art reference Lindholm (US 7,038,685, "the Lindholm reference").

The declaration does not meet the requirements of 37 CFR 1.131 section (a).

37 CFR 1.131 section (a) states (in relevant part):

Art Unit: 2677

“(a) When any claim of an application or a patent under reexamination is rejected, the inventor of the subject matter of the rejected claim, the owner of the patent under reexamination, or the party qualified under §§ 1.42, 1.43, or 1.47, may submit an appropriate oath or declaration to establish invention of the subject matter of the rejected claim prior to the effective date of the reference or activity on which the rejection is based. The effective date of a U.S. patent, U.S. patent application publication, or international application publication under PCT Article 21(2) is the earlier of its publication date or date that it is effective as a reference under 35 U.S.C. 102(e). **Prior invention may not be established under this section in any country other than the United States, a NAFTA country, or a WTO member country. Prior invention may not be established under this section before December 8, 1993, in a NAFTA country other than the United States, or before January 1, 1996, in a WTO member country other than a NAFTA country.**” (emphasis added)

Section 2 of Applicants' declaration describes (in relevant part):

“2. We conceived the Invention prior to June 30, 2003 while employed by ATI Technologies Inc. and/or one of its wholly owned subsidiaries ("ATI") as indicated by attached Exhibits A and B ... Prior to June 30, 2003 we created a graphics processing system that operated as claimed using a computer system that successfully executed the Model Code. Prior to June 30, 2003 we also created a graphics processing system as claimed in the form of a computer system that used an RTL simulator to successfully validate the operation of an integrated circuit version of the claimed graphics processing system and method.”

As quoted from Applicants' declaration, section 2 describes conception and reduction to practice of the claimed invention prior to June 30, 2003. Section 2 further describes that the conception and reduction to practice of the claimed invention was carried out while the inventors were employed by ATI Technologies Inc. and/or one of its wholly owned subsidiaries.

However, section 2, and the declaration as a whole, fails to specify whether or not the conception and reduction to practice was carried out in the United States, a NAFTA country, or a WTO member country. As quoted from 37 CFR 1.131 section (a), “[p]rior invention may not be established under this

section in any country other than the United States, a NAFTA country, or a WTO memory country". Thus, the declaration is ineffective to overcome the Lindholm reference due to this first deficiency.

Moreover, the applicants in their Remarks filed on 9/17/2012 do not appear to address this issue. In the Remarks, the applicants attempt to further correlate the claim limitations to the submitted reduction to practice evidence (Exhibit B Chip Design Code) of the Declaration Under 37 CFR 1.131 filed on 1/18/2012 but do not appear to show that reduction to practice was carried out in the United States, a NAFTA country, or a WTO member country. Therefore, the declaration continues to not meet the requirements of 37 CFR 1.131 section (a).

Further, the declaration does not meet the requirements of 37 CFR 1.131 section (b).

37 CFR 1.131 section (b) states:

"(b) The showing of facts shall be such, in character and weight, as to establish reduction to practice prior to the effective date of the reference, or conception of the invention prior to the effective date of the reference coupled with due diligence from prior to said date to a subsequent reduction to practice or to the filing of the application. Original exhibits of drawings or records, or photocopies thereof, must accompany and form part of the affidavit or declaration or their absence must be satisfactorily explained."

MPEP 715.07 [R-3] "Facts and Documentary Evidence", section I. "General Requirements", offers further guidance regarding the requirements of 37 CFR 1.131 section (b).

MPEP 715.07, section I., describes (in relevant part):

"The essential thing to be shown under 37 CFR 1.131 is priority of invention and this may be done by any satisfactory evidence of the fact. FACTS, not conclusions, must be alleged. Evidence in the form of exhibits may

Art Unit: 2677

accompany the affidavit or declaration. Each exhibit relied upon should be specifically referred to in the affidavit or declaration, in terms of what it is relied upon to show ... when reviewing a 37 CFR 1.131 affidavit or declaration, the examiner must consider all of the evidence presented in its entirety, including the affidavits or declarations and all accompanying exhibits, records and "notes." An accompanying exhibit need not support all claimed limitations, provided that any missing limitation is supported by the declaration itself. Ex parte Ovshinsky, 10 USPQ2d 1075 (Bd. Pat. App. & Inter. 1989).

The affidavit or declaration and exhibits must clearly explain which facts or data applicant is relying on to show completion of his or her invention prior to the particular date. Vague and general statements in broad terms about what the exhibits describe along with a general assertion that the exhibits describe a reduction to practice "amounts essentially to mere pleading, unsupported by proof or a showing of facts" and, thus, does not satisfy the requirements of 37 CFR 1.131(b). In re Borkowski, 505 F.2d 713, 184 USPQ 29 (CCPA 1974). **Applicant must give a clear explanation of the exhibits pointing out exactly what facts are established and relied on by applicant.** 505 F.2d at 718-19, 184 USPQ at 33. See also In re Harry, 333 F.2d 920, 142 USPQ 164 (CCPA 1964) (Affidavit "asserts that facts exist but does not tell what they are or when they occurred.") (emphasis added)

Applicants' Remarks filed on 09/17/2012 contains the following in the second to last paragraph which recites:

"As to claims 2-5 for example, Exhibit B Chip Design Code - p_macc_gpr.v, SP_vector.v, Sq.v, Sq_export_alloc.v, sq_ctl_flow_seq.v, Sq_alu_instr_seq.v - are believed to illustrate, inter alia, the general purpose register and processor (e.g., multiply and accumulate (MAC or MACC) logic) and a sequencer coupled to the general purpose register and processor unit and operation of the sequencer and processor unit."

However, this paragraph as a whole is considered nothing more than vague and general statements in broad terms about what the exhibits describe along with general assertions that the exhibits describe a reduction to practice, which does not satisfy the requirements of 37 CFR 1.131 section (b). Thus, the declaration in view of the Remark is ineffective to overcome the Lindholm reference due to this second deficiency.

Regarding claim 1, the Examiner is able to determine which sections of Exhibit B Chip Design Code corresponds to which limitations of Claim 1 after reviewing the Remarks filed on 9/17/2012 . However, the Examiner is unable to do so for Claims 2-5 as they are not satisfactorily explained in the Remarks.

Therefore, the most recent declaration filed 1/18/12 under 37 CFR 1.131 and Remarks filed on 9/17/2012 are together ineffective to overcome the Lindholm reference. As an additional note, the Examiner would like to point out that US Pat 7,015,913, to Lindholm et al., filed June 27th, 2003, appears, after brief review, to include a disclosure that is similar to US Pat 7,038,685 to Lindholm, which is used in the rejections that follow (see FIG. 2 of each patent). The Examiner has not given Lindholm et al. (US 7,015,913) a thorough review as to whether or not it teaches one or more of Applicants' claims, but it may be worth Applicants' time to review Lindholm et al. (US 7,015,913) and adjust the declaration such that conception and reduction to practice of the claimed invention is declared to have occurred prior to June 27th, 2003 (if such a statement is true), in order to avoid a future rejection based on the teachings of prior art reference Lindholm et al. (US 7,015,913).

Claim Rejections - 35 USC § 112

5. The following is a quotation of 35 U.S.C. 112(b):

(B) CONCLUSION.—The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or a joint inventor regards as the invention.

The following is a quotation of 35 U.S.C. 112 (pre-AIA), second paragraph:

Art Unit: 2677

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

6. Claim 2 recites the limitation "the selected one of the plurality of inputs" in "in response to the selected one of the plurality of inputs." There is insufficient antecedent basis for this limitation in the claim. Proper amendment is requested.

7. Claim 8 recites the limitation "the selected one of the plurality of inputs" in "in response to the selected one of the plurality of inputs." There is insufficient antecedent basis for this limitation in Claim 8 or Claim 5. Proper amendment is requested.

Claim Rejections - 35 USC § 102

8. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

Claims 1-8, 10-11, and 15-16 are rejected under 35 U.S.C. 102(e) as being anticipated by Lindholm (US 7,038,685).

RE claim 1, Lindholm describes a method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the

Art Unit: 2677

general purpose register block does not have enough available space therein to store incoming vertex data (

3:59-65: "Programmable Graphics Processing Pipeline 150 is programmed to operate on surface, primitive, vertex, fragment, pixel, sample or any other data. For simplicity, the remainder of this description will use the term 'samples' to refer to graphics data such as surfaces, primitives, vertices, pixels, fragments, or the like."

6:38-59: "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

7:6-10: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

7:36-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread."

9:33-56: "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm describes performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block (sample data, such as vertex or pixel data, is transmitted to

Art Unit: 2677

Register File 350) and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data (the multi-threaded processing unit 400 carries out vertex operations on vertex data unless the Register File 350 doesn't have enough room to store the incoming vertex data, in which case the thread associated with the vertex data and vertex operations must wait until enough space becomes available); and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available (

7:6-21: "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

8:15-58: "Thread Selection Unit 415 reads one or more thread entries based on thread execution priorities and outputs selected thread entries to Instruction Cache 410. Instruction cache 410 determines if the program instructions corresponding to the program counters and sample type included in the thread state data for each thread entry are available in Instruction Cache 410 ... The program instructions corresponding to the program counters from the one or more thread entries are output by Instruction Cache 410 to ... Instruction Scheduler 430 ... Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU [instruction window unit] 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350. An instruction specifies the location of source data needed to execute the instruction."

15:7-13: "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420

Art Unit: 2677

does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, Lindholm is considered to describe an embodiment including continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available, as the Execution Unit 470 may be carrying out calculations for one or more high priority pixel threads based on instructions stored in Instruction Cache 410 and/or IWU 435 while a low priority vertex thread is waiting for the one or more pixel threads to finish such that when the pixel threads finish the system will deallocate the resources assigned to the completed pixel threads in the Register File 350 and will allocate the requested amount of resources to the queued up vertex thread).

RE claim 2, Lindholm describes a unified shader, comprising:

a general purpose register block for maintaining data (

7:37-43: "Once a thread is assigned to a source sample, the thread is allocated storage resources such as locations in a Register File 350 to retain intermediate data generated during execution of program instructions associated with the thread.");

a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");

a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block (

Art Unit: 2677

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."); and

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (

9:39-46 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... and output the processed sample to a destination specified by the instruction. The destination may be Vertex Output Buffer 260, Pixel Output Buffer 270, or Register File 350."

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270."

Thus, the Execution Unit 470 is considered a processor unit that executes instructions that generate a pixel color in response to the selected one of the

Art Unit: 2677

plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs (also see 4:22-5:35)).

RE claim 3, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (FIG. 4 "Execution Unit 470" and "PCU 375").

6:38-59 "FIG. 4 is an illustration of an alternate embodiment of Execution Pipeline 240 containing at least one Multi-Threaded Processing Unit 400 ... In one embodiment TSR [Thread Storage Resource] 325 stores thread data for each of at least two thread types, where the at least two thread types may include pixel, primitive and vertex."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

Thus, the Execution Unit 470 and internal PCU 375 are collectively considered a processor unit operative to perform vertex calculation operations and pixel calculation operations); and

shared resources, operatively coupled to the processor unit (FIG. 4 illustrates Register File 350 coupled to Execution Unit 470, and 7:37-43 describes that the Register File 350 is shared among threads);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations (7:37-43, all types of

processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when pixel threads have priority over vertex threads the processor unit will allocate the pixel data to the Register File 350 and will perform pixel calculation operations until enough shared resources become available in the Register File 350 to begin carrying out vertex threads, which may happen as a result of a completion of most of the pixel threads or a shift in priority such that the vertex threads now have the highest priority, and then use the Register File 350 to perform vertex calculation operations.

RE claim 4, Lindholm describes a unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations (see the corresponding section in the rejection of claim 3); and

shared resources, operatively coupled to the processor unit (see the corresponding section in the rejection of claim 3);

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations (7:37-43, all types of processing threads can use the Register File 350, where thread types include vertex and pixel threads (see 6:43-44).

7:6-36 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220."

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, when vertex threads have priority over pixel threads the processor unit will allocate the vertex data to the Register File 350 and will perform vertex calculation operations until enough shared resources become available in the Register File 350 to begin carrying out pixel threads, which may happen as a result of a completion of most of the vertex threads or a shift in priority such that the pixel threads now have the highest priority, and then use the Register File 350 to perform pixel calculation operations.

RE claim 5, Lindholm describes a unified shader comprising:

a processor unit (FIG. 4 "Execution Unit 470" and "PCU 375");

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store (

8:33-9:32 "Each clock cycle, Instruction Scheduler 430 evaluates whether any instruction within the IWU 435 can be executed based on the availability of computation resources in an Execution Unit 470 and source data stored in Register File 350."

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations."

7:6-10 "In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities".

15:7-13 "In step 877 Thread Control Unit 320 or 420 determines if storage resources for storing intermediate data generated during execution of the thread are available. The storage resources may be in graphics memory. When storage resources are not available in step 877, Thread Control Unit 320 or 420 does not proceed to step 880 until a storage resources become available. In step 880 Thread Control Unit 320 dispatches the thread assigned to the sample and source data to at least one PCU 375."

Thus, the Scheduler 430 and Instruction Dispatcher 440 are collectively considered a sequencer coupled to the Execution Unit 470, the sequencer maintaining instructions operative to cause the Execution Unit 470 to execute vertex calculation and pixel calculation operations on selected data maintained in a Register File 350 depending upon an amount of space available in the Register File 350).

RE claim 6, Lindholm describes the shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory (

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350").

RE claim 7, Lindholm describes the shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic."

The Thread Control Unit 420 is considered a selection circuit operative to provide information to the store (Register File 350) in response to a control signal, where the control signal is the thread allocation priority associated with each thread or thread type).

RE claim 8, Lindholm describes the shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs (

5:11-35 "Pixel Input Buffer 215 outputs the samples to each Execution Pipeline 240 ... Each Execution Pipeline 240 signals to Pixel Input Buffer 240 when a sample can be accepted ... programmable computation units (PCUs) within an Execution Pipeline 240 ... perform operations such as tessellation, perspective correction, texture mapping, shading, blending, and the like. Processed samples are output from each Execution Pipeline 240 to a Pixel Output Buffer 270.").

RE claim 10, Lindholm describes the shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs (

4:42-5:35 "Execution Pipelines 240 may receive first samples, such as higher-order surface data, and tessellate the first samples to generate second samples, such as vertices. Execution Pipelines 240 may be configured to transform the second samples from an object-based coordinate representation (object space) to an alternatively based coordinate system such as world space or normalized device coordinates ... Execution Pipelines 240 output processed samples, such as vertices, that are stored in a Vertex Output Buffer 260").

RE claim 11, Lindholm describes the shader of claim 7, wherein the control signal is provided by an arbiter (

6:60-7:36 "Thread allocation priority, as described further herein, is used to assign a thread to a source sample. A thread allocation priority is specified for each sample type and Thread Control Unit 420 is configured to assign threads to samples or allocate locations in a Register File 350 based on the priority assigned to each sample type. The thread allocation priority may be fixed, programmable, or dynamic ... In an alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on graphics primitive size".

Thus, while an arbiter isn't explicitly described, the Examiner considers it inherent that some portion of the system acts as an arbiter, and therefore can be considered an arbiter, as some portion of the system assigns priorities to thread and sample types according to the current processing circumstances, in order to more efficiently process the data).

RE claim 15, Lindholm describes a unified shader comprising:

a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload (

7:6-36 "Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on an amount of sample data in Pixel Input Buffer 215 and another amount of sample data in Vertex Input Buffer 220 ... In a further alternate embodiment, Thread Control Unit 420 is configured to assign threads to source samples or allocate locations in Register File 350 using thread allocation priorities based on graphics primitive size (number of pixels or fragments included in a primitive)".

9:39-49 "Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations ... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types.").

RE claim 16, Lindholm describes the shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store (FIG. 4 and 8:15-46 describes Instruction Cache 410, which is considered an instruction store.

9:33-56 "Instruction Dispatcher 440 gathers the source data from Pixel Input Buffer 215, Vertex Input Buffer 220 or Register File 350 specified in an instruction and outputs the instruction and source data to Execution Unit 470 including at least one PCU 375 ... Execution Unit 470 is configured by the program instruction to simultaneously process samples using PCUs 375 to perform operations... Execution Unit 470 can simultaneously process samples of different types, and, likewise, execute threads of different types."

Thus, the Execution Unit 470 performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store).

9. Additionally, Claims 1-8, 10-11, and 15-16 are further rejected under 35 U.S.C. 103 as being unpatentable over Shen et al (U.S. Patent No. 7,646,817 B1) in view of Parikh et al. (U.S. Patent No. 6,697,074 B2).

10 Regarding Claim 1, Shen discloses **A method comprising:**
performing vertex manipulation operations and pixel manipulation operations (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.) **and performing vertex operations on the vertex data by a processor and** (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The programmable vertex shader performs graphics operations on vertex data sent to it, thus the programmable vertex shader 212 processes vertex

data and the vertex shader 212 is included within the GPU 208, which corresponds to a processor.)

continuing pixel calculation operations that are to be or are currently being performed by the processor (*Col. 6, lines 16* reciting “At block 322, video decoding application 216 directs the pixel shader component 214 of GPU 208 to perform color space conversion processing on the reconstructed image. Color space conversion processing is performed pixel-by-pixel to convert an image from a color space in which it was created (e.g., YUV) to a color space supported by display device 204 (e.g., RGB).” The color space conversion corresponds to pixel calculation operations that are to be performed by the processor because pixel shader is acting on pixel calculations that occur after vertex calculation operations and is performed by the pixel shader component of the GPU 208.) **based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.** (*Col. 4, lines 30-32* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer.” Accelerated video decoding which includes per-pixel operations is described in computer-executable instructions. These instructions which are in the form of computer-executable instructions are used for execution. The computer-readable memory medium corresponds to the instruction store that stores the computer-executable instructions.)

While Shen does not explicitly disclose **by transmitting vertex data to a general purpose register block**, and **unless the general purpose register block does not have enough available space therein to store incoming vertex data**; Parikh does disclose **by transmitting vertex data to a general purpose register block**, (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers for storing at least pixel and vertex data and additional data formats.)

unless the general purpose register block does not have enough available space therein to store incoming vertex data; (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” The number of registers available in the graphics processor will be finite and they may all be filled with only pixel format (pixel data). Therefore, if all the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data).)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are

processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

11. Regarding Claim 2, Shen discloses **a processor unit**; (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The GPU 208, which corresponds to a processor.)

a sequencer, coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of

computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The memory storage devices corresponds to the sequencer because it stores the computer-executable instructions, such as application modules, which are in a sequence. The application modules may be located in local computer storage media and such local storage medium is coupled to the processor since it is accessible by the processor.)

wherein the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs. (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects

processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to receiving a select input to perform. The special effects processing such as inverse telecine and scaling or fading corresponds to generating pixel color.)

While Shen does not explicitly disclose **A unified shader, comprising: a general purpose register block for maintaining data;** and **general purpose register block and the** Parikh does disclose **A unified shader, comprising: a general purpose register block for maintaining data;** (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers that can store at least pixel and vertex data and additional formats of data.)

general purpose register block and the (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers that can store at least pixel and vertex data and additional formats of data.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

12. Regarding Claim 3, Shen discloses **A unified shader comprising: a processor unit operative to perform vertex calculation operations and pixel calculation operations; and** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based

special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

While Shen does not disclose **shared resources, operatively coupled to the processor unit**; Parikh does disclose **shared resources, operatively coupled to the processor unit**; (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are shared resources that may be used to store at least pixel formats, vertex formats, and additional data formats.)

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations. (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to

Art Unit: 2677

registers within the graphics and audio processors.” The registers available in the graphics processor will be finite and they may all be filled with pixel format (pixel data). Therefore, if there is no empty registers left and the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

13. Regarding Claim 4, Shen discloses **A unified shader comprising: a processor unit operative to perform vertex calculation operations and pixel calculation operations; and** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

Parikh discloses **shared resources, operatively coupled to the processor unit;** (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” The registers available in the graphics processor will be finite and they may all be filled with pixel format (pixel data). Therefore, if there is no empty registers left and the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data).)

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations. (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex

values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

14. Regarding Claim 5, Shen further discloses **A unified shader comprising: a processor unit;** (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The GPU 208, which corresponds to a processor.)

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store. (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform

particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices." The memory storage devices corresponds to the sequencer because it stores the computer-executable instructions, such as application modules, which are in a sequence. The application modules may be located in local computer storage media and such local storage medium is coupled to the processor since it is accessible by the processor.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the

graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

15. Regarding Claim 6, Shen further discloses **The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.** (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The communications network based on communication protocols

corresponds to circuitry operative to fetch the instructions from the remote computer storage media.)

16. Regarding Claim 7, Shen further discloses **The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.** (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The communications networks also corresponds to selective circuit that provides information to the memory storage devices.)

17. Regarding Claim 8, Shen further discloses **The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For

example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” Fading in or out corresponds to pixel color in response to the GPU 208 receiving directions (plurality of inputs) from the video decoding application 216.)

18. Regarding Claim 10, Shen further discloses **The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” Both scaling and inverse telecine corresponds to vertex position (scaling) and appearance data (reverse telecine).)

19. Regarding Claim 11, Shen further discloses **The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” De-

interlacing, inverse telecine, and scaling all correspond to vertex position (scaling) and appearance data (reverse telecine).)

20. Regarding Claim 15, Shen discloses **A unified shader comprising: a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. The GPU corresponds to a processor unit flexibly controlled, and the reconstructed image corresponds to the workload since the reconstructed image will have varying numbers of vertex and pixel data to process.)

21. Regarding Claim 16, Shen further discloses **The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.** (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of

Art Unit: 2677

programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The local and remote computer storage media including memory storage devices corresponds to the instruction store. Computer executable instructions corresponds to the vertex and pixel manipulation operations which is completed at various degrees according to the structure of the application module (stored instructions) on the storage device (instruction store.)

CONTACT

22. Any inquiry concerning this communication or earlier communications from the examiner should be directed to FRANK CHEN whose telephone number is (571)270-7993. The examiner can normally be reached on 8 - 5, Monday - Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kee Tung can be reached on (571)272-7794. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public

Art Unit: 2677

PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

PATENT APPLICATION

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicants: Stephen Morein et al. Examiner: Frank S. Chen
Serial No.: 13/109,738 Art Unit: 2677
Filing Date: May 17, 2011 Docket No.: 00100.36.0001
Confirmation No.: 2020

Title: **GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED
SHADER**

AMENDMENT AND RESPONSE

Dear Sir:

In response to the office action mailed December 6, 2012, Applicants petition for a three month extension of time and respond as follows:

Amendments to the Abstract begin on page 2 of this paper and include a replacement Abstract and a clean copy showing the amended Abstract.

Amendments to the Claims begins on page 3 of this paper.

Remarks begin on page 7 of this paper.

Amendments to the Specification

Please replace the Abstract with the following amended Abstract:

ABSTRACT

A graphics processing architecture in one example performs vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continues pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available. ~~In one example, a general purpose register block maintains data. A sequencer, coupled to the general purpose register block and to a processor unit, maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and the processor unit executes instructions that generate a pixel color in response to the selected one of the plurality of inputs and generates vertex position and appearance data in response to a selected one of the plurality of inputs.~~

Amendments to the Claims:

Rewrite the claims as set forth below. This listing of claims replaces all prior versions and listings of claims in the application:

Listing of the Claims:

1. (original) A method comprising:
performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and
continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. (currently amended) A unified shader, comprising:
a general purpose register block for maintaining data;
a processor unit;
a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and
wherein the processor unit executes instructions that generate a pixel color in response to ~~[[the]] selected data from the general purpose register block one of the plurality of inputs and~~

generates vertex position and appearance data in response to ~~[[a]]~~ selected data from the general purpose register block. ~~one of the plurality of inputs.~~

3. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations.

4. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

5. (original) A unified shader comprising:
a processor unit;
a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation

operations on selected data maintained in a store depending upon an amount of space available in the store.

6. (original) The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

7. (original) The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.

8. (currently amended) The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected data. ~~one of the plurality of inputs.~~

9. (canceled)

10. (currently amended) The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected data. ~~one of the plurality of inputs.~~

11. (original) The shader of claim 7, wherein the control signal is provided by an arbiter.

12. – 14. (canceled)

15. (original) A unified shader comprising:
a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.

16. (original) The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

REMARKS

Applicants respectfully traverse and request reconsideration.

The Specification has been objected to. Applicants submit herewith an amended Abstract (including a clean copy of the amended Abstract and replacement sheet).

The declaration filed 1/18/12 under 37 CFR 1.131 and the Applicants Argument/Remarks Made in an Amendment filed 9/17/2012 are allegedly ineffective to overcome the prior art reference Lindholm due to certain portions in the affidavit/exhibits. Applicants respectfully traverse and submit that the Applicants' declaration and exhibits are in proper form. It is alleged that the declaration does not meet requirements of 37 CFR 1.131(a). Applicants respectfully submit that their original declaration indicates that they are citizens of the U.S. or a NAFTA country. Applicants conception reduction of practice was carried out in the United States.

As to the rejection under MPEP 715.07 section I, Applicants respectfully note that the evidence is "in the form of exhibits and may accompany the affidavit or declaration". As stated, "the Examiner must consider all of the evidence presented in its entirety, including the affidavits or declarations and all accompanying exhibits, records and notes" and respectfully submit that the exhibits clearly explain the data Applicants are relying on to show completion of the invention in combination with the explanation provided in the declaration, as understood by one of ordinary skill in the art. Applicants believe that there is a clear explanation in the exhibits as to claims 2-5 pointing out exactly what facts are established and relied upon by Applicants.

For example, on page 4 of the Exhibit B Chip Design Code the words "claim 2:" appear referencing that the following code segments refer to the reduction of practice of claim 2. Applicants also made an attempt to provide additional comments in the exhibits that clearly set forth the proof and showing of facts that are believed to satisfy the requirements of 37 CFR

1.131. Applicants respectfully request reconsideration. Applicants invite the Examiner to contact Applicants' attorney if the rejection is to be maintained since it is believed that, if necessary, an updated declaration can be provided.

Also, code segments are identified to correspond with the claim language of the general purpose register and processor and the sequencer coupled to the general purpose register and processor unit in operation of the sequencer and processor unit. For example, the code titled SQ CTL FO flow_seq.v corresponds to the sequencer control flow as understood by one of ordinary skill in the art. Given the nature of the design code and of the claimed invention, Applicants respectfully submit that the statement in combination with the contents and code in the exhibits themselves provide the detail as to the operation corresponding to the claims. Details are also provided in the declaration as to facts that existed and what facts occurred and when they occurred.

For example, the level of detail in the declaration identifies the portions of Exhibit B Chip Design Code that are believed to illustrate the reduction of practice of the claimed subject matter of these claims and is narrowed to reflect those portions believed to support Applicants' reduction to practice (Exhibit A also includes comments that explain the facts to support reduction to practice of the invention). In addition, there are statements within the code segments to assist a reader with the claim language. By way of example, in the SQ_export_alloc.v code segment, there are statements indicating for example, that the code "shows the SQ able to execute any types of export commands...an example of a shared resource is the instruction store, accesses to are controlled by: SQ_ctl_flow_seq.v identifying the code segment that performs the operation.

In an effort to advance prosecution, Applicants have attached a proposed replacement Exhibit A that illustrates claim language and corresponding code information with respect to claims including claims 2-5. Applicants respectfully request a review by the Examiner to determine whether the proposed Exhibit A provides adequate information which in combination with the second to the last paragraph of Applicants' affidavit would address the Examiner's concerns.

Claims 2 and 8 stand rejected under 35 U.S.C. § 112. Applicants respectfully traverse but have amended the claims to expedite prosecution. Claim 10 has also been amended to be consistent.

Claims 1-8, 10-11 and 15-16 stand rejected under 35 U.S.C. § 102(e) as allegedly being anticipated by Lindholm. Applicants respectfully reassert the relevant remarks made in prior responses and also request reconsideration in view of Applicants' declaration, exhibits and remarks above.

Claims 1-8, 10-11 and 15-16 stand rejected under 35 U.S.C. § 103(a) as allegedly being unpatentable over U.S. patent No. 7,646,817 (Shen et al.) in view of U.S. Patent No. 6,697,074 (Parikh et al.). As to claim 1, the office action alleges that the use of the term "or" in Shen actually means "and" (office action page 19). However, Applicants respectfully note that the cited portion, namely col. 4, lns. 8-12 and FIG. 2 (reproduced below) contradicts this interpretation. The cited portion actually teaches a similar structure as shown in Applicants' prior art diagram (FIG. 3) showing a separate vertex shader and separate pixel shader. These are shown and described in Shen as being two separate shaders, a programmable vertex shader 212 and programmable pixel shader 214. The Shen reference is directed to accelerating video decoding using a graphics processing unit and when describing the GPU 208, it specifically

states that there are two different programmable shaders, a vertex shader, one “for performing graphics operations on a per-vertex basis, and a programmable pixel shader...for performing graphics operations on a per-pixel basis” (emphasis added). There is no teaching or suggestion of any unified shader. To the contrary, the Shen reference teaches a conventional independent vertex shader and pixel shader architecture. Since the reference does not teach what is alleged, Applicants respectfully submit that the claims are in condition for allowance. Other differences will be recognized by those of ordinary skill in the art.

Figure 2

The dependent claims are believed to add additional novel and non-obvious subject matter.

As to claim 2, Applicants also respectfully note that the cited portion actually refers to “accelerated video decoding” and not to vertex calculations and pixel calculation operations facilitated by a sequencer that maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations. As noted above, the Shen reference and the cited portion thereof actually refers to the CPU executing video decoding application. There is no discussion of any sequencer that sequences instructions that cause the processor unit to execute vertex calculation and pixel calculation operations. Also, Applicants respectfully submit that the Parikh reference also fails to disclose a unified shader. The cited portion, namely col. 14, lns. 2-6 do not describe a unified shader comprising a general purpose register block for maintaining data. Also, there is no sequencer that is coupled to the general purpose register block wherein the sequencer maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block.

The cited portion of Parikh actually refers to the main processor 110 – not the graphics processor – that can start and stop the graphics and audio processors or determine a general status by reading status registers that are in the graphics and audio processors. What is described are standard status registers. In contrast, the claim recites a general purpose register block for maintaining data and a sequencer as claimed that maintains instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block. There is no teaching or suggestion of this subject matter. Accordingly, Applicants respectfully request withdrawal of the rejection. Since

the references do not teach what they allege to teach and since the combination does not teach or suggest the subject matter, Applicants respectfully request withdrawal of the rejection.

Applicant respectfully submits that the claims are now believed to be in condition for allowance and that a timely Notice of Allowance be issued in this case. If the Examiner believes that personal communication will expedite prosecution of this application, the Examiner is invited to telephone the undersigned at (312) 356-5094.

Respectfully submitted,

Dated: June 6, 2013

GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

A graphics processing architecture in one example performs vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continues pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ABSTRACT

A graphics processing architecture in one example performs vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continues pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

PROPOSED EXHIBIT A

1. A method comprising:

performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor unless the general purpose register block does not have enough available space therein to store incoming vertex data; and

continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

Model of the "GPRs" (general purpose registers):

Reg_file.cpp

```
// %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
// Project: R400
// File: reg_file.cpp
//
// Description:
// The GPRs
//
// %%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%%
/
#include "reg_file.h"

RegFile::RegFile()
{
    for (int i=0;i<128;i++)
        for (int j=0;j<16;j++)
            for (int k=0;k<4;k++)
                regValues[i].Val[j].field[k].clamp(0);
}

void RegFile::GetConstValues(const RegVect* &Values,int Addr)
{
    Values = &(regValues[Addr].Val[0]);
}

void RegFile::GetValues(RegVect* &Values,int Addr)
{
    Values = &(regValues[Addr].Val[0]);
}
```

Instruction store:

Instruction_store.cpp

4. A unified shader comprising:

a processor unit operative to perform vertex calculation operations and pixel calculation operations; and

shared resources, operatively coupled to the processor unit;

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

Same as claim 3.

5. A unified shader comprising:

a processor unit;

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

Same as claim 3.

6. The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

PROPOSED EXHIBIT A

For structure not already set forth above, the texture fetcher allows fetch from memory. The arbiter.cpp file picks the programs that need to fetch data in this function:

```
boolean Arbiter::chooseTexStation(int &lineNumber,Shader_Type &sType)
{
    int i;
    int vertexPick = -1;
    int pixelPick = -1;
    int lineCheck;

    // do pixels first
    lineCheck = pixelHead;
    for (i=0;i<pixelRsCount;i++)
    {
        if (pixelStation[lineCheck].status.valid &&
pixelStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !pixelStation[lineCheck].status.event)
        {
            pixelPick=lineCheck;
        }
        // enforce restrictions based on the status
        if (pixelPick != -1)
        {
            // no texture ops while texture reads are outstanding
            if (pixelStation[pixelPick].status.texReadsOutstanding)
                pixelPick = -1;
            else
                break;
        }

        lineCheck = (lineCheck+1)%MAX_PIX_RESERVATION_SIZE;
    }

    lineCheck = vertexHead;
    for (i=0;i<vertexRsCount;i++)
    {
        if (vertexStation[lineCheck].status.valid &&
vertexStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !vertexStation[lineCheck].status.event)
        {
            vertexPick=lineCheck;
        }

        // enforce restrictions based on the status
        if (vertexPick != -1)
        {
            // no texture ops while texture reads are outstanding
            if (vertexStation[vertexPick].status.texReadsOutstanding)
                vertexPick = -1;
            else
                break;
        }

        lineCheck = (lineCheck+1)%MAX_VTX_RESERVATION_SIZE;
    }

    if (vertexPick != -1)
```

PROPOSED EXHIBIT A

```
{
    lineNumber = vertexPick;
    sType = VERTEX;
    return true;
}
if (pixelPick != -1)
{
    lineNumber = pixelPick;
    sType = PIXEL;
    return true;
}

return false;
}
```

Then fills in a request in this function:

```
void Arbitrer::fillTextureInterface(int textureInstAddr,int texturePhase,boolean last)
{
    const RegVect* txAddr;
    TXAddr address;
    uinteger<7> registerAddress;
    uinteger<7> writeAddress;

        }
    } // end other exports
```

PROPOSED EXHIBIT A

9. The shader of claim 5, wherein the processor unit executes vertex calculations while the pixel calculations are still in progress.

Same function as claim 7, the chooseAluStation function will find another appropriate block of code (vertex or pixels) to run while some other are stuck.

10. The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.

Same as claim 9.

11. The shader of claim 7, wherein the control signal is provided by an arbiter.

Claim 7 is already done by an arbiter (arbiter.cpp).

12. A graphics processor comprising:
a unified shader comprising a processor unit that executes vertex calculations while the pixel calculations are still in progress.

The chooseAluStation function which will pick the right operations to execute next based on who is ready and what is available.

13. The graphics processor of claim 12 wherein the unified shader comprises a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

PROPOSED EXHIBIT A

Same support as for claims 1, 2 and 3, a sequencer coupled to a processor unit and the sequencer maintains instructions to cause the processor to execute pix/vtx calculations.

14. The graphics processor of claim 12 comprising a vertex block operative to fetch vertex information from memory.

Both pixels and vertices can use the texture block, as in the chooseTexStation function

```
boolean Arbiter::chooseTexStation(int &lineNumber, Shader_Type &sType)
{
    int i;
    int vertexPick = -1;
    int pixelPick = -1;
    int lineCheck;

    // do pixels first
    lineCheck = pixelHead;
    for (i=0; i<pixelRsCount; i++)
    {
        if (pixelStation[lineCheck].status.valid &&
pixelStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !pixelStation[lineCheck].status.event)
        {
            pixelPick=lineCheck;
        }
        // enforce restrictions based on the status
        if (pixelPick != -1)
        {
            // no texture ops while texture reads are outstanding
            if (pixelStation[pixelPick].status.texReadsOutstanding)
                pixelPick = -1;
            else
                break;
        }

        lineCheck = (lineCheck+1)%MAX_PIX_RESERVATION_SIZE;
    }

    lineCheck = vertexHead;
    for (i=0; i<vertexRsCount; i++)
    {
        if (vertexStation[lineCheck].status.valid &&
vertexStation[lineCheck].status.ressourceNeeded == TEXTURE
        && !vertexStation[lineCheck].status.event)
        {
            vertexPick=lineCheck;
        }
    }
}
```

PROPOSED EXHIBIT A

```
// enforce restrictions based on the status
if (vertexPick != -1)
{
    // no texture ops while texture reads are outstanding
    if (vertexStation[vertexPick].status.texReadsOutstanding)
        vertexPick = -1;
    else
        break;
}

lineCheck = (lineCheck+1)%MAX_VTX_RESERVATION_SIZE;
}

if (vertexPick != -1)
{
    lineNumber = vertexPick;
    sType = VERTEX;
    return true;
}
if (pixelPick != -1)
{
    lineNumber = pixelPick;
    sType = PIXEL;
    return true;
}

return false;
}
```

15. A unified shader comprising:

a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.

The sq_alu.cpp file executes ALU instructions on either pixels or vertices. The ChooseAluStation function picks the next block of data to execute based on the workload.

16. The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

Same as claim 15, the chooseAluFunction will pick programs at various degrees of completion...

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

Table with 5 columns: APPLICATION NO., FILING DATE, FIRST NAMED INVENTOR, ATTORNEY DOCKET NO., CONFIRMATION NO. Includes application details for 13/109,738 filed 05/17/2011 by Stephen Morein, and examination details including examiner CHEN, FRANK S and notification date 08/08/2013.

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

- inteam@faegrebd.com
michelle.davis@faegrebd.com
cynthia.payson@faegrebd.com

Office Action Summary	Application No. 13/109,738	Applicant(s) MOREIN ET AL.	
	Examiner FRANK CHEN	Art Unit 2677	AIA (First Inventor to File) Status No

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) Responsive to communication(s) filed on 6 June 2013.
 A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on _____.
- 2a) This action is **FINAL**. 2b) This action is non-final.
- 3) An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.
- 4) Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 5) Claim(s) 1-8,10,11,15 and 16 is/are pending in the application.
5a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 6) Claim(s) _____ is/are allowed.
- 7) Claim(s) 1-8,10,11,15 and 16 is/are rejected.
- 8) Claim(s) _____ is/are objected to.
- 9) Claim(s) _____ are subject to restriction and/or election requirement.

* If any claims have been determined allowable, you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see http://www.uspto.gov/patents/init_events/pph/index.jsp or send an inquiry to PPHfeedback@uspto.gov.

Application Papers

- 10) The specification is objected to by the Examiner.
- 11) The drawing(s) filed on _____ is/are: a) accepted or b) objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

Priority under 35 U.S.C. § 119

- 12) Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

Certified copies:

- a) All b) Some * c) None of the:
1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

Attachment(s)

- 1) Notice of References Cited (PTO-892)
- 2) Information Disclosure Statement(s) (PTO/SB/08)
Paper No(s)/Mail Date _____.
- 3) Interview Summary (PTO-413)
Paper No(s)/Mail Date. _____.
- 4) Other: _____.

DETAILED ACTION

Claim Status

1. Claims 1-8, 10-11, and 15-16 are currently pending in this application.
2. Claims 2, 8, and 10 have been currently amended.

Specification

3. The object of the Abstract has been withdrawn because of submission of properly amended Abstract on June 6, 2013.

Declaration filed under 37 CFR 1.131

4. The declaration filed 1/18/2012 under 37 CFR 1.131 and the Reference submitted on 6/6/2013 have been considered and are effective to overcome the prior art of reference Lindholm (U.S. Patent No. 7,038,685 B1) (hereinafter "Lindholm '685).

Claim Amendment

5. Rejection of claims 2 and 8 under 35 U.S.C. 112 has been withdrawn due to proper amendment.

Claim Rejections - 35 USC § 102

6. The following is a quotation of the appropriate paragraphs of pre-AIA 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –
(e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.

7. Additionally, Claims 1-8, 10-11, and 15-16 are further rejected under 35 U.S.C. 103 as being unpatentable over Shen et al (U.S. Patent No. 7,646,817 B1) in view of Parikh et al. (U.S. Patent No. 6,697,074 B2).

8. Regarding Claim 1 (Original), Shen discloses **A method comprising:**
performing vertex manipulation operations and pixel manipulation operations (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.) **and**
performing vertex operations on the vertex data by a processor and (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The programmable vertex shader performs graphics operations on vertex data sent to it, thus the programmable vertex shader 212 processes vertex data and the vertex shader 212 is included within the GPU 208, which corresponds to a processor.)

continuing pixel calculation operations that are to be or are currently being performed by the processor (*Col. 6, lines 16* reciting “At block 322, video decoding application 216 directs the pixel shader component 214 of GPU 208 to perform color space conversion processing on the reconstructed image. Color space conversion processing is performed pixel-by-pixel to convert an image from a color space in which it was created (e.g., YUV) to a color space supported by display device 204 (e.g., RGB).” The color space conversion corresponds to pixel calculation operations that are to be performed by the processor because pixel shader is acting on pixel calculations that occur after vertex calculation operations and is performed by the pixel shader component of the GPU 208.) **based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.** (*Col. 4, lines 30-32* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer.” Accelerated video decoding which includes per-pixel operations is described in computer-executable instructions. These instructions which are in the form of computer-executable instructions are used for execution. The computer-readable memory medium corresponds to the instruction store that stores the computer-executable instructions.)

While Shen does not explicitly disclose **by transmitting vertex data to a general purpose register block**, and **unless the general purpose register block does not have enough available space therein to store incoming vertex data**; Parikh does disclose **by transmitting vertex data to a general purpose register**

block, (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers for storing at least pixel and vertex data and additional data formats.)

unless the general purpose register block does not have enough available space therein to store incoming vertex data; (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” The number of registers available in the graphics processor will be finite and they may all be filled with only pixel format (pixel data). Therefore, if all the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data).)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further

teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

9. Regarding Claim 2 (Currently amended), Shen discloses **a processor unit;** (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The GPU 208, which corresponds to a processor.)

a sequencer, coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be

Art Unit: 2677

implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices." The memory storage devices corresponds to the sequencer because it stores the computer-executable instructions, such as application modules, which are in a sequence. The application modules may be located in local computer storage media and such local storage medium is coupled to the processor since it is accessible by the processor.)

wherein the processor unit executes instructions that generate a pixel color in response to selected data from the general purpose register block and generates vertex position and appearance data in response to selected data from the general purpose register block. (*Col. 6, lines 39-45* reciting "At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring." The GPU can perform vertex-based or pixel-based special effects processing which corresponds to receiving a select input to perform. The special effects processing such as inverse telecine and scalling or fading corresponds to generating pixel color. GPU inherently or implicitly must have general purpose register blocks to perform

calculations. One of ordinary skill would recognize such features in a GPU at and before time of the filing of this application.)

While Shen does not explicitly disclose **A unified shader, comprising: a general purpose register block for maintaining data; and general purpose register block and the** Parikh does disclose **A unified shader, comprising: a general purpose register block for maintaining data;** (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers that can store at least pixel and vertex data and additional formats of data.)

general purpose register block and the (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are general purpose registers that can store at least pixel and vertex data and additional formats of data.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics

processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

10. Regarding Claim 3 (Original), Shen discloses **A unified shader comprising: a processor unit operative to perform vertex calculation operations and pixel calculation operations; and** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation

operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

While Shen does not disclose **shared resources, operatively coupled to the processor unit**; Parikh does disclose **shared resources, operatively coupled to the processor unit**; (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” Thus, pixel and vertex data may be both written to registers that are within the graphics processor. Therefore, the registers within the graphics processors are shared resources that may be used to store at least pixel formats, vertex formats, and additional data formats.)

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations. (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” The registers available in the graphics processor will be finite and they may all be filled with pixel format (pixel data). Therefore, if there is no empty registers left and the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data).)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

11. Regarding Claim 4 (Original), Shen discloses **A unified shader comprising: a processor unit operative to perform vertex calculation operations and pixel calculation operations; and** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-

interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.”

The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

Parikh discloses **shared resources, operatively coupled to the processor unit;** (*Col. 14, lines 2-6* reciting “Main processor 110 can also load a number of graphics values (e.g., transformation matrices, pixel formats, vertex formats, etc. by writing to registers within the graphics and audio processors.” The registers available in the graphics processor will be finite and they may all be filled with pixel format (pixel data). Therefore, if there is no empty registers left and the registers are all filled with non-vertex data, the processor may not read and process vertex format (vertex data).)

the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations. (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image

sharpening or blurring.” The GPU can perform vertex-based or pixel-based special effects processing which corresponds to performing vertex manipulation operation and pixel manipulation operations. Here the “or” can be interpreted to include the meaning of “and” since “or” includes the meaning of “and.” Nothing in the specification of Shen indicates an exclusive “or” meaning. In fact the GPU of Shen is shown to perform operations on per-pixel and per-vertex.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

Art Unit: 2677

12. Regarding Claim 5 (Original), Shen further discloses **A unified shader comprising: a processor unit;** (*Col. 4, lines 8-12* reciting “Exemplary GPU 208 includes a programmable vertex shader 212 for performing graphics operations on a per-vertex basis, and a programmable pixel shader 214 for performing graphics operations on a per-pixel basis.” The GPU 208, which corresponds to a processor.)

a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store. (*Col. 4, lines 29-44* reciting

“Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer.

Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types.

Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of

communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The memory storage device corresponds to the sequencer

because it stores the computer-executable instructions, such as application modules, which are in a sequence. The application modules may be located in local computer

Art Unit: 2677

storage media and such local storage medium is coupled to the processor since it is accessible by the processor. A sequencer is implicitly coupled to the GPU since the decoding application directs the GPU to perform pixel/vertex calculations and the instructions must be sequenced in order for the proper results to be obtained.)

It would have been obvious for one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen because both are drawn to analogous art. Shen discloses accelerated decoding of video bitstreams using a graphics processing unit (GPU). The GPU generates vertex data which are processed for vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. Parikh is drawn to a unique vertex representation allowing the graphics pipeline to retain vertex state information and to mix indexed and direct vertex values and attributes. Parikh further teaches that it is possible to store vertex format and pixel format and other graphics information into registers of the graphics processor. Thus, the GPU of Shen may be modified with the registers taught in Parikh so that the generated vertex values may be stored in the GPU for later access. One of ordinary skill in the art would be motivated to combine the registers of Parikh with the GPU of Shen in order to store the vertex data generated in Shen to more efficiently construct polygons and other graphical objects. Therefore, it would be obvious to one of ordinary skill in the art to combine the teachings of Parikh with the teachings of Shen.

13. Regarding Claim 6 (Original), Shen further discloses **The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a**

memory. (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The communications network based on communication protocols corresponds to circuitry operative to fetch the instructions from the remote computer storage media.)

14. Regarding Claim 7 (Original), Shen further discloses **The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.** (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing

Art Unit: 2677

environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The communications networks also corresponds to selective circuit that provides information to the memory storage devices.)

15. Regarding Claim 8 (Currently amended), Shen further discloses **The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected data.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” Fading in or out corresponds to generating a pixel color in response to the GPU 208 receiving directions (plurality of inputs) from the video decoding application 216. The GPU 208 must inherently or implicitly have data stored in the general purpose register blocks in order to perform.)

16. Regarding Claim 10 (Currently amended), Shen further discloses **The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected data.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be

Art Unit: 2677

directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.”

Both scaling and inverse telecine corresponds to vertex position (scaling) and appearance data (reverse telecine.)

17. Regarding Claim 11 (Original), Shen further discloses **The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected one of the plurality of inputs.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.” De-interlacing, inverse telecine, and scaling all correspond to vertex position (scaling) and appearance data (reverse telecine).)

18. Regarding Claim 15 (Original), Shen discloses **A unified shader comprising: a processor unit flexibly controlled to perform vertex manipulation operations and pixel manipulation operations based on vertex or pixel workload.** (*Col. 6, lines 39-45* reciting “At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring. The GPU corresponds to a processor unit flexibly

controlled, and the reconstructed image corresponds to the workload since the reconstructed image will have varying numbers of vertex and pixel data to process.)

19. Regarding Claim 16 (Original), Shen further discloses **The shader of claim 15 comprising an instruction store and wherein the processor unit performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.** (*Col. 4, lines 29-44* reciting “Accelerated video decoding may be described in the general context of computer-executable instructions, such as application modules, being executed by a computer. Generally, application modules include routines, programs, objects, components, data structures, etc. that perform particular tasks or implement particular abstract data types. Video decoding application 216 may be implemented using any number of programming techniques and may be implemented in local computing environments or in distributed computing environments where tasks are performed by remote processing devices that are linked through various communications networks based on any number of communication protocols. In such a distributed computing environment, application modules may be located in both local and remote computer storage media including memory storage devices.” The local and remote computer storage media including memory storage devices corresponds to the instruction store. Computer executable instructions corresponds to the vertex and pixel manipulation operations which is completed at various degrees according to the structure of the application module (stored instructions) on the storage device (instruction store).)

Response to Arguments

20. Applicant's arguments filed on June 6, 2013 have been fully considered but they are not persuasive. Regarding Claim 1, applicants argue that Shen does not disclose a "unified shader." First, claim 1 makes no mention of a "unified shader." Second, claim 1 recites a method of **performing vertex manipulation operation and pixel manipulation operations**, both of which are performed by Shen as disclosed in rejection of claim 1. The GPU in Shen has both vertex shader and a pixel shader and such GPU architecture allows that GPU to perform both the vertex manipulation operation and the pixel manipulation operations. This is clearly stated in Shen, as shown in the rejection of claim 1. Claim 1 as recited is not allowable.

21. Regarding Claim 2, the applicants argue that the cited portion refers to "accelerated video decoding" and not to vertex calculations and pixel calculations. (pg. 11 of Remarks) Essentially, the applicants are arguing that accelerated video decoding does not involving any vertex calculation and pixel calculations performed by a processing unit. However, this is contrary to the evidence recited in Shen. Shen in *Abstract* recites "An accelerated video decoding system utilizes a graphics processing unit to perform motion compensation, image reconstruction, and color space conversion processes, while utilizing a central processing unit to perform other decoding processes." Moreover, Shen discloses that video decoding directly involves pixel and vertex calculations on a processor by reciting at *col. 6, lines 39-45*: "At block 326, video decoding application 216 may optionally be configured to direct GPU 208 to perform special effects processing on the reconstructed image. For example, GPU 208 may be

directed to perform vertex-based or pixel-based special effects processing such as de-interlacing, inverse telecine, scaling, fading in or out, and image sharpening or blurring.”

Therefore, Shen clearly shows that accelerated video decoding involves a processor performing vertex and/or pixel calculations. It should be noted here that the video decoding application 216 is what causes the execution of the pixel/vertex calculations on the GPU. The decoding application 216 comprises computer-executable instructions (a sequence of instructions) and decoding application 216 is shown to be configured to direct the GPU. (*col. 6, lines 39-41*) Therefore, the decoding application 216 is a sequence of instructions that directs the GPU to perform vertex/pixel calculations. The sequencer is inherently in a GPU because as the decoding application 216 directs the GPU, the instructions of the decoding application 216 will be fed into the GPU's instruction registers which will then be used to direct the GPU to perform the vertex/pixel calculations. Therefore, a sequencer is inherent or implicit in any GPU.

22. Applicants also argue that Shen does not disclose a general purpose register block, but Shen does disclose a GPU and this GPU inherently comprises general purpose registers. This is also well-known hardware architecture. Therefore, the memory contains decoding application 216 is coupled to the GPU with the general purpose registers. Furthermore, Parikh discloses that a main processor 110 can load a number of graphical values including vertex/pixel data into the registers within a graphics processor. (*col. 14, lines 2-6*) Therefore, Parikh supports the fact that a GPU can be modified to comprise general purpose registers.

23. Furthermore, Shen in view of Parikh discloses a unified shader in the form of the

Art Unit: 2677

GPU in Shen. While Shen does not explicitly recite a “unified shader,” the GPU in Shen as modified by Parikh is implicitly a unified shader as it unifies both the vertex shader and pixel shader into a single GPU and also inherently possesses the registered blocks and sequencer. Consequently claims 1-8, 10-11, and 15-16 remain rejected.

24. Examiner believes that one method of overcoming the cited prior art is to amend Claim 2 to recite a “unified shader comprising a processor which comprises a single shader capable of performing both vertex and pixel calculations.” While Shen discloses a single graphics processor capable of performing vertex and pixel calculations, neither Shen nor Parikh discloses a processor with a single shader capable of performing both vertex and pixel processing calculations. However, the Examiner further cites to

Morgan III et al. (U.S. Patent No. 7,015,909 B1) which discloses at *col. 8, lines 16-34*:

First consider each component individually. The control logic 310 generally controls the process of compiling and executing shaders, in this example according to method 400. The control logic 310 does not necessarily have sole control over the entire process. At various points, control may be shared or transferred to other components. In some embodiments, the control logic 310 may also detect and/or resolve conflicts at run time. It may also combine multiple shaders into a larger shader and then execute the larger shader (which shall be referred to as a composite shader) instead of the many constituent shaders. For example, if multiple shaders are to be applied to the same object, the control logic 310 might construct a single composite shader that has the same effect as the original multiple shaders. The fragment assembler 320 is responsible for assembling shaders to be executed from their constituent fragments. The run-time compiler 330 is responsible for compiling shaders at run time. The graphics engine 340 executes the compiled shaders. (emphasis added)

25. Shen in view of Morgan shows unequivocally states that it would have been obvious to one of ordinary skill in the art to modify the programmable pixel and vertex shaders in Shen into a single shader that can perform both pixel and vertex shading on

the same graphical object and achieve the same results that can be achieved by the pixel and vertex shaders in separation. It would have been obvious and beneficial to combine the pixel shader with the vertex shader into a single shading unit since a single shading unit will work faster.

Conclusion

26. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

CONTACT

Any inquiry concerning this communication or earlier communications from the examiner should be directed to FRANK CHEN whose telephone number is (571)270-7993. The examiner can normally be reached on 8 - 5, Monday - Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kee Tung can be reached on (571) 272-7794. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

**TERMINAL DISCLAIMER TO OBTAIN A DOUBLE PATENTING
REJECTION OVER A "PRIOR" PATENT**

Docket Number (Optional)
00100.36.0001

In re Application of: Stephen Morein et al.

Application No.: 13/109,738

Filed: May 17, 2011

For: GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

The owner*, ATI Technologies ULC, of 100 percent interest in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of **prior patent** No. 6,897,871 as the term of said **prior patent** is presently shortened by any terminal disclaimer. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and the **prior patent** are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of the term of any patent granted on the instant application that would extend to the expiration date of the full statutory term of the **prior patent**, "as the term of said **prior patent** is presently shortened by any terminal disclaimer," in the event that said **prior patent** later:

- expires for failure to pay a maintenance fee;
- is held unenforceable;
- is found invalid by a court of competent jurisdiction;
- is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321;
- has all claims canceled by a reexamination certificate;
- is reissued; or
- is in any manner terminated prior to the expiration of its full statutory term as presently shortened by any terminal disclaimer.

Check either box 1 or 2 below, if appropriate.

1. For submissions on behalf of a business/organization (e.g., corporation, partnership, university, government agency, etc.), the undersigned is empowered to act on behalf of the business/organization.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

2. The undersigned is an attorney or agent of record. Reg. No. 34,414

- Terminal disclaimer fee under 37 CFR 1.20(d) included.

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

*Statement under 37 CFR 3.73(b) is required if terminal disclaimer is signed by the assignee (owner).
Form PTO/SB/96 may be used for making this certification. See MPEP § 324.

This collection of information is required by 37 CFR 1.321. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

PETITION FOR EXTENSION OF TIME UNDER 37 CFR 1.136(a)	Docket Number (Optional) 100100.360001-04-US
---	---

Application Number 13/109,738	Filed May 17, 2011
----------------------------------	-----------------------

For **GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER**

Art Unit 2628	Examiner Frank S. Chen
------------------	---------------------------

This is a request under the provisions of 37 CFR 1.136(a) to extend the period for filing a reply in the above-identified application.

The requested extension and fee are as follows (check time period desired and enter the appropriate fee below):

	Fee	Small Entity Fee	Micro Entity Fee	
<input type="checkbox"/> One month (37 CFR 1.17(a)(1))	\$200	\$100	\$50	\$ _____
<input type="checkbox"/> Two months (37 CFR 1.17(a)(2))	\$600	\$300	\$150	\$ _____
<input checked="" type="checkbox"/> Three months (37 CFR 1.17(a)(3))	\$1,400	\$700	\$350	\$ 1400.00
<input type="checkbox"/> Four months (37 CFR 1.17(a)(4))	\$2,200	\$1,100	\$550	\$ _____
<input type="checkbox"/> Five months (37 CFR 1.17(a)(5))	\$3,000	\$1,500	\$750	\$ _____

- Applicant asserts small entity status. See 37 CFR 1.27.
- Applicant certifies micro entity status. See 37 CFR 1.29.
Form PTO/SB/15A or B or equivalent must either be enclosed or have been submitted previously.
- A check in the amount of the fee is enclosed.
- Payment by credit card. Form PTO-2038 is attached.
- The Director has already been authorized to charge fees in this application to a Deposit Account.
- The Director is hereby authorized to charge any fees which may be required, or credit any overpayment, to
Deposit Account Number 02-0390.
- Payment made via EFS-Web.

WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.

Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

PATENT APPLICATION

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

Applicants: Stephen Morein et al. Examiner: Frank S. Chen
Serial No.: 13/109,738 Art Unit: 2677
Filing Date: May 17, 2011 Docket No.: 00100.36.0001
Confirmation No.: 2020

Title: **GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED
SHADER**

AFTER FINAL RESPONSE

Dear Sir:

In response to the final office action dated August 8, 2013, and in view of discussions with the Examiner, Applicants petition for a three month extension of time and respond as follows:

Amendments to the Claims begins on page 2 of this paper.

Remarks begin on page 6 of this paper.

Amendments to the Claims:

Rewrite the claims as set forth below. This listing of claims replaces all prior versions and listings of claims in the application:

Listing of the Claims:

1. (currently amended) A method carried out by a unified shader comprising:
performing vertex manipulation operations and pixel manipulation operations by transmitting vertex data to a general purpose register block, and performing vertex operations on the vertex data by a processor within the unified shader unless the general purpose register block does not have enough available space therein to store incoming vertex data; and continuing pixel calculation operations that are to be or are currently being performed by the processor based on instructions maintained in an instruction store until enough registers within the general purpose register block become available.

2. (previously presented) A unified shader, comprising:
a general purpose register block for maintaining data;
a processor unit;
a sequencer, coupled to the general purpose register block and the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in the general purpose register block; and
wherein the processor unit executes instructions that generate a pixel color in response to selected data from the general purpose register block and generates vertex position and appearance data in response to selected data from the general purpose register block.

3. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform pixel calculation operations until enough shared resources become available and then use the shared resources to perform vertex calculation operations.

4. (original) A unified shader comprising:
a processor unit operative to perform vertex calculation operations and pixel calculation operations; and
shared resources, operatively coupled to the processor unit;
the processor unit operative to use the shared resources for either vertex data or pixel information and operative to perform vertex calculation operations until enough shared resources become available and then use the shared resources to perform pixel calculation operations.

5. (original) A unified shader comprising:
a processor unit;
a sequencer coupled to the processor unit, the sequencer maintaining instructions operative to cause the processor unit to execute vertex calculation and pixel calculation operations on selected data maintained in a store depending upon an amount of space available in the store.

6. (original) The shader of claim 5, wherein the sequencer further includes circuitry operative to fetch data from a memory.

7. (original) The shader of claim 5, further including a selection circuit operative to provide information to the store in response to a control signal.

8. (previously presented) The shader of claim 5, wherein the processor unit executes instructions that generate a pixel color in response to the selected data.

9. (canceled)

10. (previously presented) The shader of claim 5, wherein the processor unit generates vertex position and appearance data in response to a selected data.

11. (original) The shader of claim 7, wherein the control signal is provided by an arbiter.

12. – 14. (canceled)

15. (currently amended) A unified shader comprising:

a processor unit flexibly controlled to perform vertex manipulation operations and pixel

manipulation operations based on vertex or pixel workload; and

an instruction store and wherein the processor unit of the unified shader performs the vertex manipulation operations and pixel manipulation operations at various degrees of completion based on switching between instructions in the instruction store.

16. (canceled)

REMARKS

Applicants' attorney wishes to thank the Examiner for the courtesies extended during the telephone conferences of January 29 and 30, 2014. Per the conferences the following agreement was reached:

- (a) The Examiner indicated that claims 2-8, 10 and 11 would be allowed;
- (b) The Examiner indicated that claim 1 would be allowed if inherent subject matter was added indicating that the method was carried out by a unified shader and that the processor is within the unified shader;
- (c) The Examiner indicated that claim 16 would be allowable if written in independent form;
- (d) The Examiner indicated that a response to final action would be the appropriate filing in view of the above; and
- (e) The Examiner indicated that a terminal disclaimer would be required with respect to parent patent 6,897,871.

In view of the above agreement, Applicants have amended claim 1 to include what is believed to be inherent subject matter. Claim 15 has been amended to include the subject matter of claim 16 to expedite prosecution and Applicants submit a terminal disclaimer herewith.

Applicants respectfully submit that the claims are now believed to be in condition for allowance and that a timely Notice of Allowance be issued in this case. If the Examiner believes that any of the above is incorrect, the Examiner is invited to telephone the undersigned at (312) 356-5094.

Respectfully submitted,

Dated: February 4, 2014

This collection of information is required by 37 CFR 1.16. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

Applicant-Initiated Interview Summary	Application No. 13/109,738	Applicant(s) MOREIN ET AL.	
	Examiner FRANK CHEN	Art Unit 2611	

All participants (applicant, applicant's representative, PTO personnel):

(1) FRANK CHEN. (3) _____.

(2) Christopher J. Reckamp. (4) _____.

Date of Interview: 1/29/2014.

Type: Telephonic Video Conference
 Personal [copy given to: applicant applicant's representative]

Exhibit shown or demonstration conducted: Yes No.
If Yes, brief description: _____.

Issues Discussed 101 112 102 103 Others
(For each of the checked box(es) above, please describe below the issue and detailed description of the discussion)

Claim(s) discussed: 2.

Identification of prior art discussed: Shen, Morgan III.

Substance of Interview
(For each issue discussed, provide a detailed description and indicate if agreement was reached. Some topics may include: identification or clarification of a reference or a portion thereof, claim interpretation, proposed amendments, arguments of any applied references etc...)

Applicant's representative and Examiner discussed possible amendments to claim 2 such as tying the processor unit to be a part of the unified shader in the body of the claim because unified shader is only in the preamble of claim 2. The representative argues, in general, that the shader is hardware and the claim recites this shader hardware as a single processor that is capable of doing both pixel shading and vertex shading. Examiner has cited to Shen to describe a system that has a GPU that can perform both pixel and vertex shading. However, representative believes Shen is different from the Applicant's application because applicant's unified shader has a CPU within which perform the dual shading and Shen only discloses a GPU, not within a unified shader, that does pixel and vertex shading. Examiner, however, believes that a GPU can correspond to the shader while still being a processing unit or that the video decoder can be viewed upon as a unified shader. Applicant's representative believes Examiner's claim construction in such manner is faulty or too broad. No agreement is reached at the time of the interview but the Examiner will discuss this interpretation with his Supervisor.

Applicant recordation instructions: The formal written reply to the last Office action must include the substance of the interview. (See MPEP section 713.04). If a reply to the last Office action has already been filed, applicant is given a non-extendable period of the longer of one month or thirty days from this interview date, or the mailing date of this interview summary form, whichever is later, to file a statement of the substance of the interview

Examiner recordation instructions: Examiners must summarize the substance of any interview of record. A complete and proper recordation of the substance of an interview should include the items listed in MPEP 713.04 for complete and proper recordation including the identification of the general thrust of each argument or issue discussed, a general indication of any other pertinent matters discussed regarding patentability and the general results or outcome of the interview, to include an indication as to whether or not agreement was reached on the issues raised.

Attachment

/FRANK CHEN/ Examiner, Art Unit 2611	/KEE M TUNG/ Supervisory Patent Examiner, Art Unit 2611
---	--

Summary of Record of Interview Requirements

Manual of Patent Examining Procedure (MPEP), Section 713.04, Substance of Interview Must be Made of Record

A complete written statement as to the substance of any face-to-face, video conference, or telephone interview with regard to an application must be made of record in the application whether or not an agreement with the examiner was reached at the interview.

Title 37 Code of Federal Regulations (CFR) § 1.133 Interviews

Paragraph (b)

In every instance where reconsideration is requested in view of an interview with an examiner, a complete written statement of the reasons presented at the interview as warranting favorable action must be filed by the applicant. An interview does not remove the necessity for reply to Office action as specified in §§ 1.111, 1.135. (35 U.S.C. 132)

37 CFR §1.2 Business to be transacted in writing.

All business with the Patent or Trademark Office should be transacted in writing. The personal attendance of applicants or their attorneys or agents at the Patent and Trademark Office is unnecessary. The action of the Patent and Trademark Office will be based exclusively on the written record in the Office. No attention will be paid to any alleged oral promise, stipulation, or understanding in relation to which there is disagreement or doubt.

The action of the Patent and Trademark Office cannot be based exclusively on the written record in the Office if that record is itself incomplete through the failure to record the substance of interviews.

It is the responsibility of the applicant or the attorney or agent to make the substance of an interview of record in the application file, unless the examiner indicates he or she will do so. It is the examiner's responsibility to see that such a record is made and to correct material inaccuracies which bear directly on the question of patentability.

Examiners must complete an Interview Summary Form for each interview held where a matter of substance has been discussed during the interview by checking the appropriate boxes and filling in the blanks. Discussions regarding only procedural matters, directed solely to restriction requirements for which interview recordation is otherwise provided for in Section 812.01 of the Manual of Patent Examining Procedure, or pointing out typographical errors or unreadable script in Office actions or the like, are excluded from the interview recordation procedures below. Where the substance of an interview is completely recorded in an Examiners Amendment, no separate Interview Summary Record is required.

The Interview Summary Form shall be given an appropriate Paper No., placed in the right hand portion of the file, and listed on the "Contents" section of the file wrapper. In a personal interview, a duplicate of the Form is given to the applicant (or attorney or agent) at the conclusion of the interview. In the case of a telephone or video-conference interview, the copy is mailed to the applicant's correspondence address either with or prior to the next official communication. If additional correspondence from the examiner is not likely before an allowance or if other circumstances dictate, the Form should be mailed promptly after the interview rather than with the next official communication.

The Form provides for recordation of the following information:

- Application Number (Series Code and Serial Number)
- Name of applicant
- Name of examiner
- Date of interview
- Type of interview (telephonic, video-conference, or personal)
- Name of participant(s) (applicant, attorney or agent, examiner, other PTO personnel, etc.)
- An indication whether or not an exhibit was shown or a demonstration conducted
- An identification of the specific prior art discussed
- An indication whether an agreement was reached and if so, a description of the general nature of the agreement (may be by attachment of a copy of amendments or claims agreed as being allowable). Note: Agreement as to allowability is tentative and does not restrict further action by the examiner to the contrary.
- The signature of the examiner who conducted the interview (if Form is not an attachment to a signed Office action)

It is desirable that the examiner orally remind the applicant of his or her obligation to record the substance of the interview of each case. It should be noted, however, that the Interview Summary Form will not normally be considered a complete and proper recordation of the interview unless it includes, or is supplemented by the applicant or the examiner to include, all of the applicable items required below concerning the substance of the interview.

A complete and proper recordation of the substance of any interview should include at least the following applicable items:

- 1) A brief description of the nature of any exhibit shown or any demonstration conducted,
- 2) an identification of the claims discussed,
- 3) an identification of the specific prior art discussed,
- 4) an identification of the principal proposed amendments of a substantive nature discussed, unless these are already described on the Interview Summary Form completed by the Examiner,
- 5) a brief identification of the general thrust of the principal arguments presented to the examiner,
(The identification of arguments need not be lengthy or elaborate. A verbatim or highly detailed description of the arguments is not required. The identification of the arguments is sufficient if the general nature or thrust of the principal arguments made to the examiner can be understood in the context of the application file. Of course, the applicant may desire to emphasize and fully describe those arguments which he or she feels were or might be persuasive to the examiner.)
- 6) a general indication of any other pertinent matters discussed, and
- 7) if appropriate, the general results or outcome of the interview unless already described in the Interview Summary Form completed by the examiner.

Examiners are expected to carefully review the applicant's record of the substance of an interview. If the record is not complete and accurate, the examiner will give the applicant an extendable one month time period to correct the record.

Examiner to Check for Accuracy

If the claims are allowable for other reasons of record, the examiner should send a letter setting forth the examiner's version of the statement attributed to him or her. If the record is complete and accurate, the examiner should place the indication, "Interview Record OK" on the paper recording the substance of the interview along with the date and the examiner's initials.

TITLE OF INVENTION: GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

Table with 7 columns: APPLN. TYPE, ENTITY STATUS, ISSUE FEE DUE, PUBLICATION FEE DUE, PREV. PAID ISSUE FEE, TOTAL FEE(S) DUE, DATE DUE

nonprovisional UNDISCOUNTED \$960 \$0 \$0 \$960 05/14/2014

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the ENTITY STATUS shown above. If the ENTITY STATUS is shown as SMALL or MICRO, verify whether entitlement to that entity status still applies.

If the ENTITY STATUS is the same as shown above, pay the TOTAL FEE(S) DUE shown above.

If the ENTITY STATUS is changed from that shown above, on PART B - FEE(S) TRANSMITTAL, complete section number 5 titled "Change in Entity Status (from status indicated above)".

For purposes of this notice, small entity fees are 1/2 the amount of undiscounted fees, and micro entity fees are 1/2 the amount of small entity fees.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

PART B - FEE(S) TRANSMITTAL

**Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE
 Commissioner for Patents
 P.O. Box 1450
 Alexandria, Virginia 22313-1450
 or Fax (571)-273-2885**

INSTRUCTIONS: This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

29153 7590 02/14/2014
ADVANCED MICRO DEVICES, INC.
 C/O Faegre Baker Daniels LLP
 311 S. WACKER DRIVE
 CHICAGO, IL 60606

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop ISSUE FEE address above, or being facsimile transmitted to the USPTO (571) 273-2885, on the date indicated below.

DATE MAILED: 02/14/2014

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)
(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 0 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 0 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

OMB Clearance and PRA Burden Statement for PTOL-85 Part B

The Paperwork Reduction Act (PRA) of 1995 requires Federal agencies to obtain Office of Management and Budget approval before requesting most types of information from the public. When OMB approves an agency request to collect information from the public, OMB (i) provides a valid OMB Control Number and expiration date for the agency to display on the instrument that will be used to collect the information and (ii) requires the agency to inform the public about the OMB Control Number's legal significance in accordance with 5 CFR 1320.5(b).

The information collected by PTOL-85 Part B is required by 37 CFR 1.311. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, Virginia 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, Virginia 22313-1450. Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

Notice of Allowability	Application No. 13/109,738	Applicant(s) MOREIN ET AL.	
	Examiner FRANK CHEN	Art Unit 2611	AIA (First Inventor to File) Status No

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

All claims being allowable, PROSECUTION ON THE MERITS IS (OR REMAINS) CLOSED in this application. If not included herewith (or previously mailed), a Notice of Allowance (PTOL-85) or other appropriate communication will be mailed in due course. **THIS NOTICE OF ALLOWABILITY IS NOT A GRANT OF PATENT RIGHTS.** This application is subject to withdrawal from issue at the initiative of the Office or upon petition by the applicant. See 37 CFR 1.313 and MPEP 1308.

1. This communication is responsive to 02/04/2014.
 A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on _____.
2. An election was made by the applicant in response to a restriction requirement set forth during the interview on _____; the restriction requirement and election have been incorporated into this action.
3. The allowed claim(s) is/are 1-8,10,11 and 15. As a result of the allowed claim(s), you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see http://www.uspto.gov/patents/init_events/pph/index.jsp or send an inquiry to PPHfeedback@uspto.gov.
4. Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

Certified copies:

- a) All b) Some *c) None of the:
1. Certified copies of the priority documents have been received.
 2. Certified copies of the priority documents have been received in Application No. _____.
 3. Copies of the certified copies of the priority documents have been received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

* Certified copies not received: _____.

Applicant has THREE MONTHS FROM THE "MAILING DATE" of this communication to file a reply complying with the requirements noted below. Failure to timely comply will result in ABANDONMENT of this application.

THIS THREE-MONTH PERIOD IS NOT EXTENDABLE.

5. CORRECTED DRAWINGS (as "replacement sheets") must be submitted.
 including changes required by the attached Examiner's Amendment / Comment or in the Office action of Paper No./Mail Date _____.
Identifying indicia such as the application number (see 37 CFR 1.84(c)) should be written on the drawings in the front (not the back) of each sheet. Replacement sheet(s) should be labeled as such in the header according to 37 CFR 1.121(d).
6. DEPOSIT OF and/or INFORMATION about the deposit of BIOLOGICAL MATERIAL must be submitted. Note the attached Examiner's comment regarding REQUIREMENT FOR THE DEPOSIT OF BIOLOGICAL MATERIAL.

/FRANK CHEN/
Examiner, Art Unit 2611

1. The present application is being examined under the pre-AIA first to invent provisions.

DETAILED ACTION

Claim Status

2. Claims 9, 12-14, and 16 have been cancelled.
3. Claims 1-8, 10-11, and 15 are presently pending.

Terminal Disclaimer

4. The terminal disclaimer filed on 02/04/2014 disclaiming the terminal portion of any patent granted on this application which would extend beyond the expiration date of November 20, 2023 has been reviewed and is accepted. The terminal disclaimer has been recorded.

Allowable Subject Matter

5. Claims 1-8, 10-11, and 15 are allowed. The following is an examiner's statement of reasons for allowance: Claims 1 and 15, as amended, recite **an instruction store** that is not disclosed in the prior arts. Claims 2 and 5 recite **a sequencer** which is also not disclosed in the prior arts because this sequencer is within the unified shader. Claims 3 and 4 recite **shared resources** which are not disclosed in the prior arts. For these reasons claims 1-8, 10-11, and 15 are allowed.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

CONTACT

Any inquiry concerning this communication or earlier communications from the examiner should be directed to FRANK CHEN whose telephone number is (571)270-7993. The examiner can normally be reached on 8 - 5, Monday - Friday.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Kee Tung can be reached on (571) 272-7794. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

PART B - FEE(S) TRANSMITTAL

Complete and send this form, together with applicable fee(s), to: **Mail** Mail Stop **ISSUE FEE**
Commissioner for Patents
P.O. Box 1450
Alexandria, Virginia 22313-1450
 or **Fax** (571)-273-2885

INSTRUCTIONS: This form should be used for transmitting the **ISSUE FEE** and **PUBLICATION FEE** (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

291.53 7590 02/14/2014
ADVANCED MICRO DEVICES, INC.
C/O Faegre Baker Daniels LLP
311 S. WACKER DRIVE
CHICAGO, IL 60606

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Certificate of Mailing or Transmission

I hereby certify that this Fee(s) Transmittal is being deposited with the United States Postal Service with sufficient postage for first class mail in an envelope addressed to the Mail Stop **ISSUE FEE** address above, or being facsimile transmitted to the USPTO (571) 273-2885, on the date indicated below.

1. Change of correspondence address or indication of "Fee Address" (37 CFR 1.363). <input type="checkbox"/> Change of correspondence address (or Change of Correspondence Address form PTO/SB/122) attached. <input type="checkbox"/> "Fee Address" indication (or "Fee Address" Indication form PTO/SB/47; Rev 03-02 or more recent) attached. Use of a Customer Number is required.	2. For printing on the patent front page, list Faegre Baker Daniels LLP	
	(1) The names of up to 3 registered patent attorneys or agents OR, alternatively,	1
	(2) The name of a single firm (having as a member a registered attorney or agent) and the names of up to 2 registered patent attorneys or agents. If no name is listed, no name will be printed.	2

3. ASSIGNEE NAME AND RESIDENCE DATA TO BE PRINTED ON THE PATENT (print or type)
 PLEASE NOTE: Unless an assignee is identified below, no assignee data will appear on the patent. If an assignee is identified below, the document has been filed for recordation as set forth in 37 CFR 3.11. Completion of this form is NOT a substitute for filing an assignment.

(A) NAME OF ASSIGNEE: **ATI Technologies ULC** (B) RESIDENCE: (CITY and STATE OR COUNTRY) **Markham, Ontario, Canada**

Please check the appropriate assignee category or categories (will not be printed on the patent): Individual Corporation or other private group entity Government

4a. The following fee(s) are submitted:
 Issue Fee
 Publication Fee (No small entity discount permitted)
 Advance Order - # of Copies _____

4b. Payment of Fee(s): (Please first reapply any previously paid issue fee shown above)
 A check is enclosed.
 Payment by credit card. Form PTO-2038 is attached.
 The Director is hereby authorized to charge the required fee(s), any deficiency, or credits any overpayment, to Deposit Account Number **020390** (enclose an extra copy of this form).

5. **Change in Entity Status** (from status indicated above)
 Applicant certifying micro entity status. See 37 CFR 1.29
 Applicant asserting small entity status. See 37 CFR 1.27
 Applicant changing to regular undiscounted fee status.

NOTE: Absent a valid certification of Micro Entity Status (see forms PTO/SB/15A and 15B), issue fee payment in the micro entity amount will not be accepted at the risk of application abandonment.
NOTE: If the application was previously under micro entity status, checking this box will be taken to be a notification of loss of entitlement to micro entity status.
NOTE: Checking this box will be taken to be a notification of loss of entitlement to small or micro entity status, as applicable.

NOTE: This form must be signed in accordance with 37 CFR 1.31 and 1.33. See 37 CFR 1.4 for signature requirements and certifications.

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

New Applications Under 35 U.S.C. 111

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

National Stage of an International Application under 35 U.S.C. 371

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

New International Application Filed with the USPTO as a Receiving Office

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

ISSUE NOTIFICATION

The projected patent number and issue date are specified above.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)
(application filed on or after May 29, 2000)

The Patent Term Adjustment is 0 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Application Assistance Unit (AAU) of the Office of Data Management (ODM) at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site http://pair.uspto.gov for additional applicants):

- Stephen Morein, Cambridge, MA;
Laurent Lefebvre, Lachgnaic, CANADA;
Andy Gruber, Arlington, MA;
Andi Skende, Shrewsbury, MA;

The United States represents the largest, most dynamic marketplace in the world and is an unparalleled location for business investment, innovation, and commercialization of new technologies. The USA offers tremendous resources and advantages for those who invest and manufacture goods here. Through SelectUSA, our nation works to encourage and facilitate business investment. To learn more about why the USA is the best country in the world to develop technology, manufacture products, and grow your business, visit SelectUSA.gov.

POWER OF ATTORNEY FROM ASSIGNEE

ATI Technologies ULC, a corporation of Canada, having a principal place of business at 1 Commerce Valley Drive East, Markham, Ontario, Canada L3T 7X6, is assignee of the entire right, title, and interest for the United States of America (as defined in 35 U.S.C. §100), by reason of an Assignment to the Assignee executed on August 21, 2003, of an invention known as **GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER** (Attorney Docket No. 1972.3770004), that is disclosed and claimed in a patent application of the same title by the inventors Stephen MOREIN, Laurent LEFEBVRE, Andy GRUBER and Andi SKENDE (said application has a Filing Date or a 371(c) Date of May 17, 2011, at the U.S. Patent and Trademark Office, and having Application Number 13/109,738).

For the purpose of PAIR, the **Customer Number is 91505**.

The Assignee hereby appoints the practitioners associated with **CUSTOMER NUMBER 91505** as my/our attorneys or agents to prosecute the application identified above, and any continuation, divisional, continuation-in-part, or reissue application thereof, and to transact all business in the U.S. Patent and Trademark Office connected therewith. The Assignee hereby grants said practitioners associated with **CUSTOMER NUMBER 91505** the power to insert on this Power of Attorney any further identification that may be necessary or desirable in order to comply with the rules of the U.S. Patent and Trademark Office.

FOR: ATI Technologies ULC
SIGNATURE: 
BY: Sorel Bosan _____
TITLE: Senior Patent Attorney _____
DATE: 6/ Oct / 16

STATEMENT UNDER 37 CFR 3.73(b)

Atty. Docket No. 1972.3770004
ATI Reference No. 020001-US-CNT(4)

Applicant/Patent Owner: Stephen MOREIN et al.
Application No./Patent No.: 8,760,454 Filed/Issue Date: June 24, 2014
Titled: GRAPHICS PROCESSING ARCHITECTURE EMPLOYING A UNIFIED SHADER

ATI Technologies ULC, a corporation
(Name of Assignee) (Type of Assignee, e.g., corporation, partnership, university, government agency, etc.)

states that it is:

1. the assignee of the entire right, title, and interest in;
2. an assignee of less than the entire right, title, and interest in (The extent (by percentage) of its ownership interest is _____ %); or
3. the assignee of an undivided interest in the entirety of (a complete assignment from one of the joint inventors was made) the patent application/patent identified above, by virtue of either:

A. An assignment from the inventor(s) of the patent application/patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel _____, Frame _____, or for which a copy therefore is attached.

OR

B. A chain of title from the inventor(s), of the patent application/patent identified above, to the current assignee as follows:

1. From: Inventors To: ATI Technologies, Inc.

The document was recorded in the United States Patent and Trademark Office at Reel 032217, Frame 0137, or for which a copy thereof is attached.

2. From: ATI Technologies, Inc. To: ATI Technologies ULC

The document was recorded in the United States Patent and Trademark Office at Reel 032265, Frame 0101, or for which a copy thereof is attached.

3. From: _____ To: _____

The document was recorded in the United States Patent and Trademark Office at Reel _____, Frame _____, or for which a copy thereof is attached.

Additional documents in the chain of title are listed on a supplemental sheet(s).

As required by 37 CFR 3.73(b)(1)(i), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.

[NOTE: A separate copy (i.e., a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, to record the assignment in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.
