Neterion Licenses Alacritech's Patents

To accelerate TOE adoption in the 10Gb Ethernet market
This is a Press Release edited by StorageNewsletter.com on 2008.04.04

BOOKMARK

Neterion, Inc.
and
Alacritech, Inc.
announced today that the two companies have entered into
a licensing
agreement. The agreement enables Neterion to incorporate
Alacritech's
patented Dynamic TCP Offload Technology for Microsoft
Chimney Offload
into Neterion 10 GbE adapters.

"*As the leader in the 10 Gigabit Ethernet adapter market,
Neterion
continues to seek partnership opportunities with innovative
technology
leaders in the 10 GbE ecosystem such as Alacritech in order
to provide
advanced and complete product solutions to both OEMs and
end users*," said
Dave Zabrowski, president & CEO of Neterion. "*Adding
TOE capability that
takes advantage of Alacritech's patents is a natural complement
to our
industry leading stateless hardware acceleration, like Large
Send and
Receive Offloads (LSO/LRO). The primary beneficiaries*

of this agreement
are end users who wish to scale the performance of their servers by
deploying a TOE solution using Neterion's adapters -- the 10 GbE adapter
most broadly deployed by tier-1 server and storage OEMs for its robustness,
performance and ease-of-use."

TOE provides an offload capability that scales to meet the ever increasing
application performance demands placed on today's modern servers, while
ensuring reduced CPU utilization, without reduction in network manageability or security.

"*This licensing agreement between two market leaders has the potential to*
have a major impact on the 10 Gigabit Ethernet server and storage
networking markets by further extending the reach of Alacritech's Dynamic
TCP Offload technology," said Larry Boucher, president & CEO of Alacritech.
"*Combining Alacritech's patented Dynamic TCP Offload Technology in support*
of Microsoft's TCP Chimney Offload with Neterion's successful 10 Gigabit
technology implementation will certainly expand the market for 10 GbE by
addressing head on, the end customer's quest for performance without
compromise. Customers can have performance while maintaining a firm handle
on server sprawl," Boucher concluded.
