	A.	Layered Network Protocols	15
	B.	TCP/IP	17
	C.	Protocol Offload and Fast-Path Processing	21
	D.	Direct Memory Access	24
5.	OVE	ERVIEW OF THE 948 PATENT	
6.	948]	PATENT PROSECUTION HISTORY	30
7.	CLA	IM CONSTRUCTION	31
	7.1.	Applicable Law	31
	7.2.	Construction of Claim Terms	32
8.	PER	SON HAVING ORDINARY SKILL IN THE ART	32
9.	DESCRIPTION OF THE PRIOR ART		32
	9.1.	Thia	33
	9.2.	Tanenbaum96: A. Tanenbaum, Computer Networks, 3rd ed. (1996)	
	9.3.	Stevens2: TCP-IP Illustrated, Vol.2	45
	9.4.	Motivations To Combine	48

	9.4.1.	Thia in combination with Tanenbaum96	48
	9.4.2.	Thia in combination with Tanenbaum96 and Stevens2	50
10.	GROUND #1:		52
		1 is obvious over Thia in combination with num96 in further combination with Stevens2	53
	10.1.1.	[1.P] A method for network communication by a host computer having a network interface that is connected to the host by an input/output bus, the method comprising.	53
	10.1.2.	[1.1] running, on the host computer, a protocol processing stack including an Internet Protocol (IP) layer and a Transmission Control Protocol (TCP) layer, with an application layer running above the TCP layer;	55
	10.1.3.	[1.2] initializing, by the host computer, a TCP connection that is defined by source and destination IP addresses and source and destination TCP ports;	60
	10.1.4.	[1.3] receiving, by the network interface, first and second packets, wherein the first packet has a first TCP header and contains first payload data for the application, and the second packet has a second TCP header and contains second payload data for the application;	63
	10.1.5.	[1.4] checking, by the network interface, whether the packets have certain exception conditions, including checking whether the packets are IP fragmented, checking whether the packets have a FIN flag set, and checking whether the packets are out of order;	66
	10.1.6.	[1.5] if the first packet has any of the exception conditions, then protocol processing the first TCP header by the protocol processing stack;	68
	10.1.7.	[1.6] if the second packet has any of the exception conditions, then protocol processing the second TCP header by the protocol processing stack;	69
	10.1.8.	[1.7] if the packets do not have any of the exception conditions, then bypassing host protocol processing of	

69	the TCP headers and storing the first payload data and the second payload data together in a buffer of the host computer, such that the payload data is stored in the buffer in order and without any TCP header stored between the first payload data and the second payload data.
74	10.2. Claim 3 is obvious over Thia in combination with Tanenbaum96 in further combination with Stevens2
74	10.2.1. [3] The method of claim 1, wherein storing the first payload data and the second payload data together in a buffer of the host computer is performed by a direct memory access (DMA) unit of the network interface
75	10.3. Claim 6 is obvious over Thia in combination with Tanenbaum96 in further combination with Stevens2
75	10.3.1. [6] The method of claim 1, including comparing, by the network interface, the IP addresses and TCP ports of the packets with the source and destination IP addresses and source and destination TCP ports that define the TCP connection
77	10.4. Claim 7 is obvious over Thia in combination with Tanenbaum96 in further combination with Stevens2
77	10.4.1. [7] The method of claim 1, wherein checking whether the packets have certain exception conditions includes checking whether the packets have a RST flag set
78	10.5. Claim 8 is obvious over Thia in combination with Tanenbaum96 in further combination with Stevens2
78	10.5.1. [8] The method of claim 1, wherein checking whether the packets have certain exception conditions includes checking whether the packets have a SYN flag set
78	10.6. Claim 9 is obvious over Thia in combination with Tanenbaum96 in further combination with Stevens2
78	10.6.1. [9.P] A method for network communication by a host computer having a network interface that is connected to the host by an input/output bus, the method comprising:

10.6.2.	[9.1] receiving, by the network interface, a first packet having a header including source and destination Internet Protocol (IP) addresses and source and destination Transmission Control Protocol (TCP) ports;	79
10.6.3.	[9.2] protocol processing, by the host computer, the first packet, thereby initializing a TCP connection that is defined by the source and destination IP addresses and source and destination TCP ports;	80
10.6.4.	[9.3] receiving, by the network interface, a second packet having a second header and payload data, wherein the second header has IP addresses and TCP ports that match the IP addresses and TCP ports of the TCP connection;	82
10.6.5.	[9.4] receiving, by the network interface, a third packet having a third header and additional payload data, wherein the third header has IP addresses and TCP ports that match the IP addresses and TCP ports of the TCP connection;	83
10.6.6.	[9.5] checking, by the network interface, whether the second and third packets have certain exception conditions, including checking whether the packets are IP fragmented, checking whether the packets have a FIN flag set, and checking whether the packets are out of order;	84
10.6.7.	[9.6] if the second packet has any of the exception conditions, then protocol processing the second packet by the host computer;	84
10.6.8.	[9.7] if the third packet has any of the exception conditions, then protocol processing the third packet by the host computer;	85
10.6.9.	[9.8] if the second and third packets do not have any of the exception conditions, then storing the payload data of the second and third packets together in a buffer of the host computer, such that the payload data is stored in the buffer in order and without any TCP

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time** alerts and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
