Disclosure of Application No.	Disclosure of US Patent No. 5,850,484
08/411,369 (Ex. 1016)	(Ex. 1014)
"These limitations significantly degrade text in color images because sharp edges are very important for reading efficiency." Ex. 1016, p. 10, lines 28- 29.	"These limitations significantly degrade text in color images because sharp edges are very important for reading efficiency." Ex. 1014, at 4:44-46.
"Accordingly, the need remains for a computationally efficient method for improving the visual quality of images, and in particular text, in scanned images." Ex. 1016, p. 11, lines 16-18.	"Accordingly, the need remains for a computationally efficient method for improving the visual quality of images, and in particular text, in scanned images." Ex. 1014, at 4:65-67.
"For edge sharpening in the frequency	"For edge sharpening in the frequency
domain, the full image is first	domain, the full image is first
transformed into the frequency domain	transformed into the frequency domain
using the Fast Fourier Transform (FFT)	using the Fast Fourier Transform (FFT)
or the Discrete Fourier Transform	or the Discrete Fourier Transform
(DFT), low frequency components are	(DFT), low frequency components are
dropped, and then the image is	dropped, and then the image is
transformed back into the time domain."	transformed back into the time domain."
Ex. 1016, p. 11, lines 9–14.	Ex. 1014, at 4:56–61.
"The scanned image, although it can be	"The scanned image, although it can be
any image, in the preferred embodiment	any image, in the preferred embodiment
is a printed version of the reference	is a printed version of the reference
image. Thus, the variance of the scanned	image. Thus, the variance of the scanned
image represents the energy or	image represents the energy or
frequency composition of the reference	frequency composition of the reference
image but which is compromised by the	image but which is compromised by the
inherent limitations of the scanner. The	inherent limitations of the scanner. The
scaling matrix, therefore, boosts the	scaling matrix, therefore, boosts the
frequency components that are	frequency components that are
compromised by the scanning process.	compromised by the scanning process.
A preferred embodiment of the	A preferred embodiment of the
invention is described herein in the	invention is described herein in the
context of a color facsimile (fax)	context of a color facsimile (fax)
machine. The color fax machine	machine. The color fax machine

08/411,369 (Ex. 1016)	(Ex. 1014)
08/411,369 (Ex. 1016) image into color source image data that represents the color image, a compression engine that compresses the color source image data to compressed image data, a means for encapsulating the compressed image data, and a means for transmitting the encapsulated data. The compression engine includes means for storing two quantization tables. The first quantization table is used to quantize the image data transformed using the discrete cosine transform (DCT). The second quantization table is encapsulated with the encoded quantized image data for use in decompressing the image. The second quantization table is related to the first quantization table in the manner described above. When used to transmit and receive color images between two locations, the machine transfers the images with higher quality than prior systems " Ex. 1016 p. 9 line 24 - p. 10	(Ex. 1014) image into color source image data that represents the color image, a compression engine that compresses the color source image data to compressed image data, a means for encapsulating the compressed image data, and a means for transmitting the encapsulated data. The compression engine includes means for storing two quantization tables. The first quantization table is used to quantize the image data transformed using the discrete cosine transform (DCT). The second quantization table is encapsulated with the encoded quantized image data for use in decompressing the image. The second quantization table is related to the first quantization table is related to the first quantization table in the manner described above. When used to transmit and receive color images between two locations, the machine transfers the images with higher quality than prior systems." Ex. 1014 at 5:39-63
"Although the compression engine according to the invention is implemented in dedicated hardware as described hereinabove, alternatively it can be implemented in software operating on a programmed computer having a microprocessor such as an Intel 80486 or Pentium or Hewlett Packard PA-RISC." Ex. 1016, p. 21, lines 18– 22.	"Although the compression engine according to the invention is implemented in dedicated hardware as described hereinabove, alternatively it can be implemented in software operating on a programmed computer having a microprocessor such as an Intel 80486 or Pentium or Hewlett Packard PA-RISC." Ex. 1014, at 10:1–6.
"Although the compression engine according to the invention is implemented in dedicated hardware as described hereinabove, alternatively it	"Although the compression engine according to the invention is implemented in dedicated hardware as described hereinabove, alternatively it
