(57) **ABSTRACT**

**Reexamination Request:**

No. 90/013,252, May 22, 2014

Apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, a road speed sensor, an engine speed sensor, a manifold pressure sensor, a throttle position sensor, a radar detector for determining the distance separating the vehicle from an object in front of it, a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, a brake sensor for determining whether the brakes of the vehicle have been activated, a fuel overinjection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, a downshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an insufficient engine speed, a vehicle proximity alarm circuit for issuing an alarm that the vehicle is too close to an object in front of the vehicle and a throttle controller for automatically reducing the amount of fuel supplied to the engine if the vehicle is too close to the object in front of it. Based upon data received from the sensors and data stored in the memory subsystem, the processor determines whether to activate the fuel overinjection notification circuit, the upshift notification circuit, the downshift notification circuit, the vehicle proximity alarm circuit or the throttle controller.

**REEXAMINATION CERTIFICATE**

THE PATENT IS HEREBY AMENDED AS  
INDICATED BELOW.

**Matter enclosed in heavy brackets [ ] appeared in the patent, but has been deleted and is no longer a part of the patent; matter printed in italics indicates additions made to the patent.**

AS A RESULT OF REEXAMINATION, IT HAS BEEN DETERMINED THAT:

The patentability of claims **1, 2, 4, 5, 7, 8, 10, 12, 13, 15** and **17-30** is confirmed.

Claims **31** and **32** are now disclaimed.

New claims **33-89** are added and determined to be patentable.

Claims **3, 6, 9, 11, 14** and **16** were not reexamined.

*33. Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:*

*means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;*

*wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.*

*34. Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:*

*a throttle controller for controlling a throttle of said engine of said vehicle;*

*wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.*

*35. Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon the distance received from said means for determining.*

*36. Apparatus for optimizing operation of a vehicle according to claim 35, further comprising a mode select line for switching between said active mode and said inactive mode.*

*37. Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.*

*38. Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.*

*39. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.*

**2**

*40. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.*

*41. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.*

*42. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.*

*43. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.*

*44. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.*

*45. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.*

*46. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.*

*47. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.*

*48. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.*

*49. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.*

*50. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.*

*51. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.*

*52. Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.*

*53. Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.*

*54. Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a mode select line for switching between said active mode and said inactive mode.*

3

55. Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

57. Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

60. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

4

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

61. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said first speed/stopping distance table is a lookup table.

62. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

63. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said vehicle comprises a truck.

64. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said memory subsystem stores vehicle class information.

65. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

66. Apparatus for optimizing operation of a vehicle according to claim 60, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

67. Apparatus for optimizing operation of a vehicle according to claim 60 wherein:

said plurality of sensors further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

68. Apparatus for optimizing operation of a vehicle according to claim 60, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

69. Apparatus for optimizing operation of a vehicle, comprising:

a tachometer;

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

5

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object; said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; a throttle controller for controlling a throttle of said engine of said vehicle; wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector; further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; an upshift notification circuit coupled to said processor subsystem.

70. Apparatus for optimizing operation of a vehicle according to claim 69, further comprising a mode select line for switching between said active mode and said inactive mode.

71. Apparatus for optimizing operation of a vehicle according to claim 70, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

72. Apparatus for optimizing operation of a vehicle according to claim 71, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

73. Apparatus for optimizing operation of a vehicle according to claim 72, wherein said memory subsystem stores vehicle class information.

74. Apparatus for optimizing operation of a vehicle according to claim 72, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

75. Apparatus for optimizing operation of a vehicle according to claim 69, wherein said processor subsystem tracks the number of vehicle proximity alarms issued before corrective action eliminates a hazardous condition.

76. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

6

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

77. Apparatus for optimizing operation of a vehicle according to claim 76, further comprising a mode select line for switching between said active mode and said inactive mode.

78. Apparatus for optimizing operation of a vehicle according to claim 77, further comprising an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.

79. Apparatus for optimizing operation of a vehicle according to claim 78, further comprising a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.

80. Apparatus for optimizing operation of a vehicle according to claim 77, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

81. Apparatus for optimizing operation of a vehicle according to claim 77, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

7

82. Apparatus for optimizing operation of a vehicle according to claim 81, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

83. Apparatus for optimizing operation of a vehicle according to claim 77, further comprising a speedometer.

84. Apparatus for optimizing operation of a vehicle according to claim 77, further comprising a power source including voltage divider circuitry.

85. Apparatus for optimizing operation of a vehicle according to claim 77, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

86. Apparatus for optimizing operation of a vehicle according to claim 77, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

87. Apparatus for optimizing operation of a vehicle according to claim 77, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based

8

on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

88. Apparatus for optimizing operation of a vehicle according to claim 76, further comprising:

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; and

said processor subsystem determining, based upon whether engine speed exceeds said RPM set point, when to activate said upshift notification circuit.

89. Apparatus for optimizing operation of a vehicle according to claim 76, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

**Comments on Statement of Reasons for Patentability and/or Confirmation**

Sir:

This Response is being submitted in the above-identified Reexamination.

**Remarks** begin on page 2 of this paper.

### Remarks

Patent Owner thanks the Examiner for the Notice of Intent to Issue an Ex Parte Reexamination Certificate. The Examiner acknowledges the Patent Owner's November 3, 2014 Response, which commented on, *inter alia*, what might be perceived as ambiguities in the Examiner's statements. The Patent Owner therefore provided detailed comments in the interest of avoiding any subsequent disputes over ambiguities. In the present Notice of Intent, the Examiner states that the Examiner and the Patent Owner agree with one another. Notice of Intent, at 7 ("Examiner acknowledges the Patent Owner's response filed 11/03/2014 which agrees with the Reasons for Confirmation/Allowance made in the Non-Final Office Action date 10/21/2014.") Patent Owner therefore believes that no ambiguities remain.

For example, the Examiner notes that the overinjection notification circuit is for "alerting a driver that too much fuel is being supplied to the engine" as a consequence of the driver's operation of the vehicle. Notice of Intent, at 11. That is, the fuel overinjection notification circuit provides a driver a notification that his or her driving is fuel efficient or inefficient (*e.g.*, a light that goes on and off when driving is fuel (in)efficient manner such as driving above a speed limit, a horn that goes on and off when driving is fuel (in)efficient, a visual indication showing a deviation below a mean value the driver knows corresponds with fuel efficient driving). *See, e.g.*, U.S. Patent No. 5,954,781, at col. 13:41-44 ("By incorporating the disclosed apparatus in a vehicle, not only will certain hazardous operations of the vehicle be avoided but also the driver will be advised of certain actions which will enable the vehicle to be operated with greater fuel

efficiency.”) (emphasis added). The Examiner also has indicated he has considered Requester Volkswagen’s co-pending petition for *inter partes* review IPR2015-00276 (“the ‘276 Petition”). In that Petition, Volkswagen argued that an “indicator light” in U.S. Patent No. 4,398,174 (“Smith”) activated to alert “the driver the engine is being operated in a ‘fuel wasteful fashion’” corresponded with the claimed “fuel overinjection notification circuit.” See ‘276 Petition, at 9 & 16-17. Patent Owner assumes the Examiner considered Requester’s arguments regarding Smith before issuing the Notice of Intent and, therefore, no ambiguity exists with respect to the function of the fuel overinjection notification circuit.<sup>1</sup>

Underscoring the agreement between the Examiner and the Patent Owner is the Examiner’s thorough examination of new patent claims (*e.g.*, application claims 38, 54, 88, and 106). The Examiner presumably also thoroughly examined and approved as patentable claim 42, which provides: “Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.” The Examiner would not have allowed this claim unless the Patent Owner and Examiner agreed with one another with respect to the function of the fuel overinjection notification circuit. *See, e.g., Frank’s Casing Crews & Rental Tools, Inc. v. Weatherford Int’l, Inc.*, 389 F.3d 1370, 1377 (Fed. Cir. 2004) (“If possible, the court construes claim terms ‘in a manner that renders the patent internally consistent.’”) (quoting *Budde v. Harley-Davidson, Inc.*, 250 F.3d 1369, 1379-80 (Fed. Cir. 2001).) To

---

<sup>1</sup> Patent Owner did not dispute that Smith disclosed a fuel overinjection notification circuit, but responded to Volkswagen’s petition that Smith failed to disclose numerous elements (in addition to many other deficiencies in Volkswagen’s petition).

Control No. 90013252

the extent that Patent Owner has missed anything, Patent Owner would appreciate being so advised. To the extent that nothing has been missed, Patent Owner desires that the Reexamination Certificate issue as expeditiously as possible.

Finally, Patent Owner respectfully disagrees that application claims 86 and 87 were not patentable over U.S. Patent No. 5,905,457 ("Rashid"). Nevertheless, in the interest of expediting prosecution under the circumstances, Patent Owner has accepted the Examiner's amendments to claims 86 and 87 (and the remaining amendments).

Respectfully submitted,

### Warnings:

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

***EX PARTE* REEXAMINATION COMMUNICATION TRANSMITTAL FORM**

REEXAMINATION CONTROL NO. 90/013,252.

PATENT NO. 5,954,781.

ART UNIT 3992.

Enclosed is a copy of the latest communication from the United States Patent and Trademark Office in the above identified *ex parte* reexamination proceeding (37 CFR 1.550(f)).

Where this copy is supplied after the reply by requester, 37 CFR 1.535, or the time for filing a reply has passed, no submission on behalf of the *ex parte* reexamination requester will be acknowledged or considered (37 CFR 1.550(g)).

<b>Notice of Intent to Issue Ex Parte Reexamination Certificate</b>	<b>Control No.</b> 90/013,252	<b>Patent Under Reexamination</b> 5,954,781	
	<b>Examiner</b> DAVID ENGLAND	<b>Art Unit</b> 3992	<b>AIA (First Inventor to File) Status</b> No

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

1.  Prosecution on the merits is (or remains) closed in this *ex parte* reexamination proceeding. This proceeding is subject to reopening at the initiative of the Office or upon petition. *Cf.* 37 CFR 1.313(a). A Certificate will be issued in view of
  - (a)  Patent owner's communication(s) filed: 12 March 2015.
  - (b)  Patent owner's failure to file an appropriate timely response to the Office action mailed: \_\_\_\_\_.
  - (c)  Patent owner's failure to timely file an Appeal Brief (37 CFR 41.31).
  - (d)  The decision on appeal by the  Board of Patent Appeals and Interferences  Court dated \_\_\_\_\_
  - (e)  Other: \_\_\_\_\_.
2. The Reexamination Certificate will indicate the following:
  - (a) Change in the Specification:  Yes  No
  - (b) Change in the Drawing(s):  Yes  No
  - (c) Status of the Claim(s):
    - (1) Patent claim(s) confirmed: 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, 17 - 30.
    - (2) Patent claim(s) amended (including dependent on amended claim(s)): \_\_\_\_\_
    - (3) Patent claim(s) canceled: \_\_\_\_\_.
    - (4) Newly presented claim(s) patentable: 33 - 59, 85 - 111, and 113 - 115.
    - (5) Newly presented canceled claims: 60-84 and 112.
    - (6) Patent claim(s)  previously  currently disclaimed: 31,32
    - (7) Patent claim(s) not subject to reexamination: 3,6,9,11,14,16.
3.  A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on \_\_\_\_\_.
4.  Note the attached statement of reasons for patentability and/or confirmation. Any comments considered necessary by patent owner regarding reasons for patentability and/or confirmation must be submitted promptly to avoid processing delays. Such submission(s) should be labeled: "Comments On Statement of Reasons for Patentability and/or Confirmation."
5.  Note attached NOTICE OF REFERENCES CITED (PTO-892).
6.  Note attached LIST OF REFERENCES CITED (PTO/SB/08 or PTO/SB/08 substitute).
7.  The drawing correction request filed on \_\_\_\_\_ is:  approved  disapproved.
8.  Acknowledgment is made of the priority claim under 35 U.S.C. § 119(a)-(d) or (f).
  - a)  All b)  Some\* c)  None of the certified copies have
    - been received.
    - not been received.
    - been filed in Application No. \_\_\_\_\_.
    - been filed in reexamination Control No. \_\_\_\_\_.
    - been received by the International Bureau in PCT Application No. \_\_\_\_\_.

\* Certified copies not received: \_\_\_\_\_.
9.  Note attached Examiner's Amendment.
10.  Note attached Interview Summary (PTO-474).
11.  Other: \_\_\_\_\_.

**All correspondence** relating to this reexamination proceeding should be directed to the **Central Reexamination Unit** at the mail, FAX, or hand-carry addresses given at the end of this Office action.

U.S. Patent and Trademark Office  
PTOL-469 (Rev. 08-13)

**EXAMINER'S AMENDMENT AND STATEMENT OF REASONS FOR  
PATENTABILITY AND/OR CONFIRMATION**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Alisha Taylor Reg. No. 59332 on 04/02/2015.

Claims are to be amended as stated below and replace the PO's amendment dated 03/12/2015. Claims 38, 54, 88, and 106 deletes the claim language and typo "[means for mode selection]". Claims 86 and 87 amend in the claim limitation that was considered allowable subject matter which was indicated in the Non-Final Office Action dated 10/21/2014 of, "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle". Claim 112, a dependent claim, is canceled because it contains the claim language that was indicated as allowable and placed in the independent claim which claim 112 is connected to, independent claim 86.

**EXAMINER'S AMENDMENT**

38. (New - Amended) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a mode select line for switching between said active mode and said inactive mode.

54. (New- Amended) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a mode select line for switching between said active mode and said inactive mode.

86. (New-Amended) Apparatus for optimizing operation of a vehicle, comprising:  
a tachometer;  
a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;  
a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;  
a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;  
a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;  
a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle

proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem.

87. (New-Amended) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an

engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

88. (New - Amended) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a mode select line for switching between said active mode and said inactive mode.

106. (New - Amended) Apparatus for optimizing operation of a vehicle according to claim 86, further comprising a mode select line for switching between said active mode and said inactive mode.

112. (Canceled)

## **REASONS FOR PATENTABILITY AND/OR CONFIRMATION**

The following is an examiner's statement of reasons for allowance:

As previously stated in the Non-Final Action dated 10/21/2014, the prior art of record does not specifically disclose a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

Examiner acknowledges the PO's response filed 11/03/2014 which agrees with the Reasons for Confirmation/ Allowance made in the Non-Final Office Action dated 10/21/2014. The Examiner maintains their Reasons for Confirmation/ Allowance as restated below.

The prior art of Jurgen, Saturn '452, Toyota '599, Volkswagen '070, Davidian, and Tonkin do not disclose, alone or in combination, the limitation of "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle", as stated in claims 1, 7, 13, 17, 23, 26, and 28 of the '781 Patent.

The '781 Patent teaches the overinjection notification circuit as being activated when there is excessive fuel being supplied to the vehicle's engine. This overinjection notification circuit is activated when said processor subsystem determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, see claim 1 and similarly claimed limitations found in independent claims 7, 13, 17, 23, 26, 28, and 85 – 87 and the teachings stated in the '781 Patent 12:64 – 13:35.

As previously stated, Jurgen discloses a fuel injection shut off which utilizes a threshold. This fuel shut off is activated when a threshold is reached. "During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.", (e.g., Jurgen, page 12.22). "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.", (e.g., Jurgen, page 12.4). "Using the inputs of engine RPM and vehicle speed to the electronic control unit, **thresholds** can be established for limiting these **variables with fuel cutoff. When the maximum speed is achieved, the fuel injectors are shut off. When the speed decreases below the threshold, fuel injection resumes.**", (e.g., Jurgen, page 12.14). "During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque.", (e.g., Jurgen, page 12.17). Though, Jurgen does teach different sensor readings being used to tell the ECU when to shut off the fuel, the threshold of these values does not cause the engine to have excess fuel, i.e., their

threshold prevents overinjection of fuel whereas the '781 Patent's thresholds allow the engine to reach a state of overinjection. Jorgen does not disclose the fuel ever being **overinjected** because of the threshold that is used and does not teach the claimed limitation stated above with regards to **overinjection**. Furthermore, adding a reference in which would teach such an overinjected state would contradict Jorgen since Jorgen's threshold would stop a secondary reference from ever being realized and would not be obvious to combine. Therefore Jorgen, alone or in combination, does not disclose a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

Saturn '452 discloses, "A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear from the present gear. A method of determining the shift point is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear.", (e.g., Saturn '452, Abstract). "Shift indicators are commonly used on manual transmission vehicles to assist non-expert drivers in determining when it is appropriate to shift the transmission to a higher gear in order to maximize driving fuel economy.", (e.g., Saturn '452, 1:10 – 13). Saturn '452 further discloses a threshold value close to unity providing a shift point which achieves maximum fuel economy, but does not specifically disclose a "fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle" either alone or in combination with the References specifically discussed in this Reexam case.

Toyota '599 discloses performing shift-up and shift-down alerts based on different criteria, one of which includes fuel consumption. Each shift position corresponding to the optimum fuel consumption rate in accordance with various parameters calculated, (e.g., Toyota '599, 2:59 – 63). Toyota '599 further discloses, "The indicator 10 includes a shift-up indicating lamp 10a and a shift-down indicating lamp 10b", (e.g., Toyota '599, 2:64 – 3:3). "However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_e$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation.", (e.g., Toyota '599, 7:29 – 38). As seen, Toyota '599 does not disclose an overinjection notification based upon data received from said plurality of sensors.

Volkswagen '070 discloses, "a display of the rout-specific fuel consumption provide in a vehicle", (e.g., Volkswagen '070, p. 9 of English translation). Volkswagen '070 further discloses, "Looking initially at operating range I remote from full load, the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear, at an operating point that lies to the left of operating range I in the diagram of Figure 1. Accordingly, the device of the present invention generates a signal that asks the operator, i.e., normally the driver, to shift to a higher gear, which is indicated in Figure 1 by the upward pointing arrow within operating range I", (e.g., Volkswagen '070, pp. 6 – 7, English translation). Volkswagen '070 teachings are towards shifting the gears of an engine and not overinjection of

fuel and alerting a driver that too much fuel is being supplied to the engine. Therefore, Volkswagen '070 does not disclose the limitation discussed above.

As to Davidian and Tonkin, as was previously seen in the Order, these reference were not the basis for the SNQ for the limitation regarding overinjection, see Order. Therefore, Davidian and Tonkin, alone or in combination with the above references, disclose, "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle".

Any comments considered necessary by PATENT OWNER regarding the above statement must be submitted promptly to avoid processing delays. Such submission by the patent owner should be labeled: "Comments on Statement of Reasons for Patentability and/or Confirmation" and will be placed in the reexamination file.

Claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, 17 – 30, 33 – 59, 85 – 111, and 113 - 115 are confirmed as patentable in this reexamination proceeding.

***Conclusion***

Any comments considered necessary by PATENT OWNER regarding the above statement must be submitted promptly to avoid processing delays. Such submission by the patent owner should be labeled: "Comments on Statement of Reasons for Patentability and/or Confirmation" and will be placed in the reexamination file.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

See attached certification statement.

The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

### Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

<b>Ex Parte Reexamination Interview Summary</b>	<b>Control No.</b> 90/013,252	<b>Patent Under Reexamination</b> 5,954,781
	<b>Examiner</b> DAVID ENGLAND	<b>Art Unit</b> 3992

All participants (USPTO personnel, patent owner, patent owner's representative):

(1) DAVID ENGLAND

(3) Michael Yigdal

(2) Jennifer McNeil

(4) Alisha Taylor Reg. No. 59332

Date of Interview: 02 April 2015

Type: a)  Telephonic b)  Video Conference  
c)  Personal (copy given to: 1)  patent owner 2)  patent owner's representative)

Exhibit shown or demonstration conducted: d)  Yes e)  No.  
If Yes, brief description: \_\_\_\_\_

Agreement with respect to the claims f)  was reached. g)  was not reached. h)  N/A.  
Any other agreement(s) are set forth below under "Description of the general nature of what was agreed to..."

Claim(s) discussed: 38,54,86-88,106 and 112.

Identification of prior art discussed: Rashid 5905457.

Description of the general nature of what was agreed to if an agreement was reached, or any other comments:  
See Continuation Sheet.

(A fuller description, if necessary, and a copy of the amendments which the examiner agreed would render the claims patentable, if available, must be attached. Also, where no copy of the amendments that would render the claims patentable is available, a summary thereof must be attached.)

**A FORMAL WRITTEN RESPONSE TO THE LAST OFFICE ACTION MUST INCLUDE PATENT OWNER'S STATEMENT OF THE SUBSTANCE OF THE INTERVIEW. (See MPEP § 2281). IF A RESPONSE TO THE LAST OFFICE ACTION HAS ALREADY BEEN FILED, THEN PATENT OWNER IS GIVEN **ONE MONTH** FROM THIS INTERVIEW DATE TO PROVIDE THE MANDATORY STATEMENT OF THE SUBSTANCE OF THE INTERVIEW (37 CFR 1.560(b)). THE REQUIREMENT FOR PATENT OWNER'S STATEMENT CAN NOT BE WAIVED. **EXTENSIONS OF TIME ARE GOVERNED BY 37 CFR 1.550(c).****

/DAVID ENGLAND/  
Primary Examiner, Art Unit 3992

cc: Requester (if third party requester)

Continuation of Description of the general nature of what was agreed to if an agreement was reached, or any other comments: Examiner England discussed ways to place the case in condition for allowance. First, claims 38, 54, 88, and 106 would have to have the typo deleted from the claims, "[means for mode selection]". Second, claims 86 and 87 did not include the claim language that was deemed allowable in the Non-Final Office Action and instead had the limitations of "further wherein... (i) and active mode..., and (ii) an inactive mode...". Examiner England stated that the prior art of Rashid 5905457 disclosed similar teachings and would be used to reject this new claim language if the allowable subject matter was not placed into the claim. Attorney Taylor agreed and stated that the Examiner make the necessary Examiner's amendments to place the claims in condition for allowance. Claim 112 had the claim language that was deemed allowable and would need to be canceled or be Objected to for not further limiting independent claim 86.

	<b>Examiner</b>	<b>Art Unit</b>	
	David England	3992	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address. --

(THIRD PARTY REQUESTER'S CORRESPONDENCE ADDRESS)

Kenyon and Kenyon LLP  
One Broadway  
New York, NY 10004

Enclosed is a copy of the latest communication from the United States Patent and Trademark Office in the above-identified reexamination proceeding. 37 CFR 1.903.

Prior to the filing of a Notice of Appeal, each time the patent owner responds to this communication, the third party requester of the *inter partes* reexamination may once file written comments within a period of 30 days from the date of service of the patent owner's response. This 30-day time period is statutory (35 U.S.C. 314(b)(2)), and, as such, it cannot be extended. See also 37 CFR 1.947.

If an *ex parte* reexamination has been merged with the *inter partes* reexamination, no responsive submission by any *ex parte* third party requester is permitted.

**All correspondence** relating to this *inter partes* reexamination proceeding should be directed to the **Central Reexamination Unit** at the mail, FAX, or hand-carry addresses given at the end of the communication enclosed with this transmittal.

**Decision Expunging/Returning  
Papers in Reexamination**

Control No.: 90/013,252

1.  THIS IS A DECISION EXPUNGING THE PAPERS FILED November 21<sup>st</sup> and 24<sup>th</sup>, 2014 by Third Party Requester from the record of the reexamination proceeding(s). Since each expunged paper does not form part of the record, it is being expunged by marking it "closed" and "not public" in the Office's Image File Wrapper (IFW) system.
- THIS IS A DECISION RETURNING/DESTROYING THE PAPER(S) FILED \_\_\_\_\_ by \_\_\_\_\_.

2. The papers being  expunged  returned  destroyed are:

Third Party Requester's 11/21/2014 submission of two documents cited as exhibits with Requester's "Notice of Concurrent Proceedings" document, including: (1) a corrected petition for *inter partes* review of U.S. Patent No. 5,954,781, and (2) a petition for *inter partes* review of U.S. Patent No 5,954,781 submitted 11/21/2014; and (3) a petition for *inter partes* review of US 5,954,781, and (4) the declaration of Dr. Chris Bartone in support of the petition for *inter partes* review, submitted 11/24/2014.

This decision will be made of record in the reexamination file(s).

3. THE ABOVE-IDENTIFIED PAPERS LACK A RIGHT OF ENTRY BECAUSE:
- A.  Patent Owner may not file papers in the record prior to the order granting/denying reexamination (*ex parte*) or first action (*inter partes*). 37 CFR §§1.530(a) and 1.939(b).
- B.  Third party requester in an *ex parte* reexamination may not file papers in the reexamination file subsequent to the request, except a reply to a proper patent owner statement under 37 CFR 1.530 or a *notice of concurrent proceedings* as described in MPEP 2282. See 37 CFR §§1.535 and 1.550(g).
- C.  Third party requester in an *inter partes* reexamination may not file papers in the record, except as specified in the rules, 37 CFR §§1.947, 1.951(b) and 1.983, and 37 CFR §§ 41.61-79, other than a notice of concurrent proceedings as described in MPEP 2686. See 37 CFR 1.939.
- D.  Parties other than patent owner and a third party requester may not file documents in the record except a notice of concurrent proceedings. See 37 CFR §§1.550(h) and 1.939(a).
- E.  The notice of concurrent proceedings exceeds the permitted scope. See MPEP 2282.
- F.  Other: Third Party Requester's 11/21/2014 submission of exhibits 1-4 noted above exceed the scope of the submissions permitted by MPEP 2282 and 37 CFR 1.565(a). While MPEP 2282 permits a Third Party Requester in an *ex parte* reexamination to appraise the Office of any litigation activity, or other prior or concurrent proceeding, involving the patent undergoing reexamination, pursuant to 37 CFR 1.565(a), that notification is limited to providing "bare notice". The submissions may not include arguments or information which provides a party's arguments (See MPEP 2282). The submission by Third Party Requester of the *inter partes* review petitions and supporting declaration is not limited to "bare notice" of concurrent proceedings. Thus, this submission does not comply with MPEP 2282 and 37 CFR 1.565(a). Accordingly, all of Third Party Requester's exhibits submitted with the Notice of Concurrent Proceedings documents filed 11/21/2014 and 11/24/2014 have been expunged from the record.

4. CONCLUSION

Telephone inquiries with regard to this decision should be directed to Jennifer McNeil at 571-272-1540, in the Central Reexamination Unit.

/Jennifer McNeil/

**ENGLISH-ABST:**

Apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, a road speed sensor, an engine speed sensor, a manifold pressure sensor, a throttle position sensor, a radar detector for determining the distance separating the vehicle from an object in front of it, a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, a brake sensor for determining whether the brakes of the vehicle have been activated, a fuel overinjection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, a downshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an insufficient engine speed, a vehicle proximity alarm circuit for issuing an alarm that the vehicle is too close to an object in front of the vehicle and a throttle controller for automatically reducing the amount of fuel supplied to the engine if the vehicle is too close to the object in front of it. Based upon data received from the sensors and data stored in the memory subsystem, the processor determines whether to activate the fuel overinjection notification circuit, the upshift notification circuit, the downshift notification circuit, the vehicle proximity alarm circuit or the throttle controller.

**NO-OF-CLAIMS:** 32**NO-OF-FIGURES:** 3**NO-DRWNG-PP:** 3**SUMMARY:**

## 1. Field of the Invention

The present invention generally relates to an apparatus for optimizing vehicle operation and, more particularly, relates to a system which both notifies the driver of recommended corrections in vehicle operation and, under certain conditions, automatically initiates selected corrective action.

## 2. Description of Related Art

It has long been recognized that the improper operation of a vehicle may have many adverse effects. For example, the fuel efficiency of a vehicle may vary dramatically based upon how the vehicle is operated. More specifically, operating a vehicle at excessive speed, excessive RPM and/or excessive manifold pressure will result in both reduced fuel economy and increased operating costs. The aforementioned increased operating costs can be quite considerable, particularly for an owner or operator of a fleet of vehicles. To correct these types of improper vehicle operations are often surprisingly simple. For example, upshifting the drive gear will typically eliminate an excessive RPM condition. However, even when the solution is quite simple, oftentimes, the driver will be unaware of the need to take corrective action.

A variety of patents have disclosed systems, commonly referred to as "shift prompters", which monitor the operation of a vehicle and advises the operator of the vehicle when to take certain actions. Numerous ones of these devices include sensors which measure engine speed and vehicle speed. See, for example, U.S. Pat. No. 4,492,112 to Igarashi et al., U.S. Pat. No. 4,631,515 to Blee et al. and U.S. Pat. No. 4,701,852 to Ulveland. Certain ones, however, disclose the use of other types of sensors as well. For example, U.S. Pat. No. 4,524,460 to Weber is directed to a driving aid indicator which includes vehicle speed, manifold pressure, throttle position and engine speed sensors. U.S. Pat. No. 4,752,883 to Asakura et al. and U.S. Pat. No. 4,868,756 to Kawanabe et al. are directed to upshift notification devices which include sensors for measuring engine speed, vehicle speed, manifold pressure and cooling water temperature. Finally, U.S. Pat. No. 4,853,673 to Kido et al. discloses a shift indicator system which includes sensors for measuring engine speed and throttle position. Generally, the above-listed patents all provide displays intended to enable the driver to operate the vehicle in a manner leading to uniform performance and maximum fuel economy. However, Blee et al. discloses the use of audible warnings as well as a speed controller to prevent further increases in engine speed if the driver ignores previously issued warnings.

Improper vehicle operation has other adverse effects as well. It is well known that the faster a vehicle travels, the longer it takes to stop. Thus, what may be a safe separation distance between successive vehicles when a vehicle is traveling at 35 mph may be unsafe if that vehicle is traveling at 50 mph. Road conditions also play a role in determining the safe separation distance between vehicles. For example, greater separation distances are generally recommended when roads are wet. As a result, therefore, based on the combination of a vehicle's speed, the distance separating the vehicle from a second vehicle in front of it and road conditions, many vehicles are operated unsafely. To correct this situation, a reduction in operating speed, an increase in vehicle separation or some combination thereof, is required.

It may be readily seen from the foregoing that it would be desirable to provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely. It is, therefore, the object of the invention to provide such a system.

In one embodiment, the present invention is directed to an apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, plural sensors, including road speed, manifold pressure and throttle position sensors, for collectively monitoring operation of the vehicle and a fuel overinjection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle. The processor subsystem receives data from the sensors and, from the received data, determines when to activate the fuel overinjection circuit. In one aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure and a manifold pressure set point stored in the memory subsystem and activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point.

In further aspects thereof, the sensors may include an engine speed sensor and the processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the fuel overinjection notification circuit if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing.

In still further aspects thereof, the apparatus may also include an upshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues notifications that the engine of the vehicle is being operated at excessive engine speeds. In this aspect, the processor subsystem determines when road speed for the vehicle is increasing, when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, compares engine speed to an RPM set point stored in the memory subsystem and activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the

vehicle is at or above the RPM set point.

In still yet further aspects thereof, the apparatus may also include a downshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues a notification that the engine of the vehicle is being operated at an insufficient engine speed. The processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In still further aspects thereof, the fuel overinjection circuit, the upshift notification circuit or the downshift notification circuit may include a horn for issuing a tone for a preselected time period.

In another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle. The apparatus includes road speed, engine speed, manifold pressure and throttle position sensors, a processor subsystem coupled to each of the sensors to receive data therefrom and a memory subsystem, coupled to the processor subsystem, for storing a manifold pressure set point, an engine speed set point and present and prior levels for each one of the sensors. The apparatus further includes a fuel overinjection notification circuit, an upshift notification circuit and a downshift notification circuit, all of which are coupled to the processor subsystem. The fuel overinjection notification circuit issues notifications that excessive fuel is being supplied to the engine of the vehicle, the upshift notification circuit issues notifications that the engine of the vehicle is being operated at an excessive engine speed and the downshift notification circuit issues notifications that the engine of the vehicle is being operated at an insufficient engine speed. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit, the upshift notification circuit and the downshift notification circuit. In one aspect thereof, the fuel overinjection circuit includes a first horn for issuing a first tone for a first preselected time period, the upshift notification circuit includes a second horn for issuing a second tone for a second preselected time period and the downshift notification circuit includes a third horn for issuing a third tone for a third preselected time period.

In another aspect thereof, the processor subsystem may determine when road speed for the vehicle is increasing or decreasing, engine speed is increasing or decreasing, throttle position for the vehicle is increasing and manifold pressure is increasing; may compare manifold pressure to the manifold pressure set point and engine speed to the RPM set point; and may activate the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing, the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point and the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In another aspect, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating a vehicle having an engine and an object in front of the vehicle and at least one sensor for monitoring operation of the vehicle. The apparatus further includes a processor subsystem, a memory subsystem and a vehicle proximity alarm circuit. The processor subsystem is coupled to the radar detector and the at least one sensor to receive data therefrom while the memory subsystem, in which a first vehicle speed/stopping distance table and present levels for each one of the at least one sensor are stored, and the vehicle proximity alarm circuit are coupled to the processor subsystem. Based on data received from the radar detector, the at least one sensor and the contents of the memory subsystem, the processor determines when to instruct the vehicle proximity alarm circuit to issue an alarm that the vehicle is too close to the object.

In one aspect thereof, the at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated and a second vehicle speed/stopping distance table is stored in the memory

subsystem. In another aspect thereof, the apparatus further includes a throttle controller for controlling a throttle of the engine of the vehicle. The processor subsystem may selectively reduce the throttle based upon data received from the radar detector, the at least one sensor and the memory subsystem or may also count a total number of vehicle proximity alarms determined by the processor subsystem and selectively reduce the throttle based upon the total number of vehicle proximity alarms, as well. In yet another aspect thereof, the at least one sensor further includes a brake sensor for indicating whether a brake system of the vehicle is activated.

In other aspects thereof, the apparatus may be further provided with a fuel overinjection notification circuit for issuing a notification that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an excessive engine speed or a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. If a fuel overinjection notification circuit is provided, the apparatus includes a manifold pressure sensor and a throttle position sensor which also provide the processor subsystem with data used, together with a manifold pressure set point and prior levels for the sensors stored in the memory subsystem, to determine when to activate the fuel overinjection circuit. If an upshift notification circuit is provided, the apparatus includes an engine speed sensor which also provides the processor subsystem with data used, together with an RPM set point stored in the memory subsystem, to determine when to activate the upshift notification circuit. Finally, if a downshift notification circuit is provided, the processor subsystem determines when to activate the downshift notification circuit based upon the data received from the plurality of sensors.

In still another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating the vehicle from an object in front of it, a plurality of sensors, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor, which collectively monitor the operation of the vehicle, a processor subsystem, a memory subsystem, a fuel overinjection notification circuit for issuing notification that excessive fuel is being supplied to the engine of the vehicle and a vehicle proximity alarm circuit for issuing alarms if the vehicle is too close to the object. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit. Based upon data received from the radar detector, the sensors and the memory subsystem, the processor subsystem also determines when to activate the vehicle proximity alarm circuit.

In one aspect of this embodiment of the invention, the processor subsystem determines when road speed for the vehicle is increasing or decreasing, when throttle position for the vehicle is increasing or decreasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, determines when manifold pressure for the vehicle is increasing or decreasing and determines when engine speed for the vehicle is increasing or decreasing. In this aspect, the processor subsystem activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing.

In a further aspect thereof, the apparatus may also include an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, the processor subsystem determining when to activate the upshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem and compares engine speed to an RPM set point stored in the memory subsystem. In this aspect, the processor subsystem activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point.

In still another aspect thereof, the apparatus may also include a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. In this aspect, the processor

813270 (08) 5954781 September 21, 1999

subsystem determines when to activate the downshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is decreasing, determines when throttle position for the vehicle is increasing, determines when manifold pressure for the vehicle is increasing and determines when engine speed for the vehicle is decreasing. In this aspect, the processor subsystem activates the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

**DRWDESC:****BRIEF DESCRIPTION OF THE DRAWINGS**

The present invention may be better understood, and its numerous objects, features and advantages will become apparent to those skilled in the art by reference to the accompanying drawing, in which:

FIG. 1 is a block diagram of an apparatus for optimizing vehicle performance constructed in accordance with the teachings of the present invention; and

FIGS. 2A-B is a flow chart of a method for optimizing vehicle performance in accordance with the teachings of the present invention.

**DETDESC:****DETAILED DESCRIPTION**

Referring first to FIG. 1, a system 10 for optimizing vehicle performance constructed in accordance with the teachings of the present invention will now be described in greater detail. The system 10 includes a processor subsystem 12, for example, a microprocessor, and a memory subsystem 14, for example, the memory subsystem 14 may include a nonvolatile random access memory (or "NVRAM"), coupled together by a bus 16 for bi-directional exchanges of address, data and control signals therebetween. The system 10 is installed in a vehicle (not shown) for which optimized performance and driver assist capabilities are desired. Although it is contemplated that the system 10 is suitable for use with any type vehicle, most commonly, the system 10 shall be installed in a truck.

Also coupled to the processor subsystem 12 are a series of sensors, each of which are periodically polled by the processor subsystem 12, to determine the respective states or levels thereof. The sensors include a road speed sensor 18, an RPM sensor 20, a manifold pressure sensor 22, a throttle sensor 24, a windshield wiper sensor 30 and a brake sensor 32. The sensors are selected to be either state or level sensors, depending on whether the information to be collected thereby is a state, i.e., on/off or a level, for example, 35 mph. The road speed sensor 18 and the RPM sensor 20 are level sensors which respectively provide the processor subsystem 12 with signals which indicate the operating speed and engine speed for the vehicle. The road speed sensor 18 and the RPM sensor 20 may derive such information from any one of a variety of sources. For example, the road speed sensor 18 may be connected to receive the speed input signal transmitted to the vehicle's speedometer while the RPM sensor 20 may be connected to receive the RPM input signal to the vehicle's tachometer.

The manifold pressure sensor 22 is a level sensor which is positioned downstream of the throttle valve in the intake manifold of the vehicle to measure manifold pressure thereat. The throttle sensor 24 is a level sensor, attached to the throttle, which measures the extent to which the throttle is opened. The windshield wiper sensor 30 is a state sensor which determines whether the vehicle's windshield wipers are on or off. In alternate embodiments thereof, the windshield wiper sensor 30 may be electrically coupled to the on/off switch for the windshield wiper or to an output of

the windshield wiper motor. Finally, the brake sensor 32 is a state sensor which determines whether the brakes of the vehicle have been engaged. For example, the brake sensor 32 may be electrically coupled to the brake system to detect the activation thereof.

Preferably, the memory subsystem 14 should include first and second registers 14a and 14b, each having sufficient bits for holding the state/level of each of the sensors 18, 20, 22, 24, 30 and 32. The first register 14a is used to hold the present state or level of each of the sensors 18, 20, 22, 24, 30 and 32 while the second register 14b is used to hold the prior state or level for each of the sensors 18, 20, 22, 24, 30 and 32. Each time the processor subsystem 12 writes the present state or level of the sensors 18, 20, 22, 24, 30 and 32 to the first register 14a, the prior contents of the first register 14a is written to the second register 14b which, in turn, discards the prior content thereof. The memory subsystem 14 is also used to hold information to be utilized by the processor subsystem 12 to determining whether to take corrective actions and/or issue notifications. Typically, such information is placed in the memory subsystem 14 while the system 10 is being initialized. The information includes one or more speed/distance tables which, when used in a manner which will be more fully described below in combination with data collected by the system 10, enable the processor subsystem 12 to determine if the vehicle is being operated unsafely and if corrective action is necessary. Speed/stopping distance table. The information also includes two pre-set threshold values--a manifold psi set point and an engine RPM set point. As will also be more fully described below, the processor subsystem 12 uses these threshold values to determine when to issue notifications as to recommended changes in vehicle operation which, when executed by the driver, will optimize vehicle operation. The speed/stopping distance table(s) are based upon National Safety Council guidelines, vary according to the class of the vehicle and provide the relationship between the speed at which a vehicle is travelling and the distance which the vehicle will require to come to a complete stop if travelling at that speed. The manifold psi set point and RPM set point are selected based upon the manufacturer's guidelines for proper operation of the vehicle, vary based upon horsepower and engine size for the vehicle and represent thresholds above which the manifold pressure and engine rotation speed, respectively, for the vehicle should never exceed.

The system 10 also includes a throttle controller 26 capable of opening and/or closing the throttle, a radar detector 28 positioned to determine the distance separating the vehicle and an object in front of the vehicle, for example, a second vehicle travelling in the same direction, a series of circuits 34, 36, 38 and 40 for notifying the driver of the vehicle of recommended corrections in vehicle operation and alerting the driver to unsafe operating conditions and a power supply, for example a +12 v battery, for providing power to the energy-demanding components of the system 10. The circuits 34, 36, 38 and 40 include an upshift notification circuit 34 for notifying the driver that an upshift is recommended, a downshift notification circuit 36 for notifying the driver that a downshift is recommended, an overinjection notification circuit 38 for notifying the driver that too much fuel is being supplied to the vehicle and a vehicle proximity alarm circuit 40 for alerting the driver when an object in front of the vehicle is too close. The circuits 34, 36 and 38 may be configured to provide visual and/or audible notifications, for example, using lights and/or horns. For example, the upshift circuit 34, the downshift notification circuit 36 and the overinjection notification circuit 38 may each include a horn, or other tone generating device, from which an audible notification may be generated at a selected pitch. Preferably, each of the notification circuits 34, 36 and 38 may be configured to provide distinct audible notifications, for example, tones at distinct pitches, so that the driver may readily distinguish which of the notification circuits 34, 36 and 38 have been activated by the processor subsystem 12. The proximity alarm circuit 40 may include one or more visual and/or audible warning devices such as lights and/or horns. For example, the proximity alarm circuit 40 may include a warning light and a warning horn. If desired, the proximity alarm circuit may also include a display for displaying the speed of the object in the vehicle's path and/or the stopping distance in feet. The proximity alarm circuit 40 may be further equipped to provide audible indications of the speed of the object in the vehicle's path and/or the stopping distance in feet as well as selector circuitry for selecting both the information to be provided as well as the manner in which the information is to be conveyed.

Finally, the processor subsystem 12 is further provided with one or more mode select input lines which enable operator configuration of the operation of the system 10. For example, as described herein, the corrective operations consist of the combination of an automatic reduction of throttle and audio/visual alerts that the vehicle is being operated

unsafely. It is specifically contemplated, however, that the system 10 include a mode select line for switching the system 10 between an "active" mode where both automatic throttle reduction and audio/visual alerts are generated and an "inactive" mode where only audio/visual alerts are generated.

Referring next to FIGS. 2A-B, a method for optimizing vehicle performance in accordance with the teachings of the present invention will now be described in greater detail. The method commences by powering up the processor subsystem 12, for example, by closing switch 42, thereby coupling the processor subsystem 12 to the power source 44 via line 43. Alternately, the processor subsystem 12 may be connected to the electrical system of the vehicle such that it will automatically power up when the vehicle is started. Of course, any of the other devices which also form part of the system 10 and require power may also be coupled to the line 43. Appropriate voltage levels for the processor subsystem 12, as well as any additional power-demanding devices coupled to the power source 44, would be provided by voltage divider circuitry (not shown).

Once the system 10 is powered up, the method begins at step 50 by the processor subsystem 12 polling the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 to determine their respective levels or states and places the acquired information in the first data register 14a. Of course, it should be noted, however, that polling of the sensors by the processor subsystem 12 is but one technique by which the processor subsystem 12 may acquire the requisite information. Alternately, each sensor 20, 22, 24, 30 and 32 may periodically place its level or state in one or more bits of the first data register 14a. The processor subsystem 12 would then acquire information by checking the contents of the first data register 14a at selected time intervals.

Proceeding to step 52, the processor subsystem 12 examines the contents of the first data register 14a to determine the operating speed of the vehicle. If the processor subsystem 12 determines that the vehicle is stationary, i.e., the operating speed of the vehicle is zero, the processor subsystem 12 will return to step 50 where the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 will be repeatedly polled until an operating speed greater than zero is detected at step 52. While polling may be conducted at a variety of time intervals, a polling period of one second appears suitable for the uses contemplated herein.

Returning to step 52, once an operating speed greater than zero is detected by the processor subsystem 12, the method proceeds to step 54 where the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. In turn, the contents of the first data register 14a is placed in the second data register 14b.

Proceeding now to step 56, from the polled value of the road speed sensor 18, the processor subsystem 12 determines whether the vehicle is travelling faster than 20 mph. If the operating speed of the vehicle is less than 20 mph, the method returns to step 54 where the sensors 18, 20, 22, 24, 30 and 32 will be repeatedly polled and the value of the road speed sensor examined until the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph. If, however, the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph, the method proceeds to step 58 where the processor subsystem 12 then determines if the vehicle is travelling faster than 50 mph, again by checking the contents of the first data register 14a.

Past this juncture, the method of the present invention will proceed through a series of steps designed to optimize vehicle operation. However, prior to optimizing vehicle operation, the processor subsystem 12 will determine if the vehicle is being operated unsafely. If so, the processor subsystem 12 will initiate corrective operations before commencing vehicle operation optimization. More specifically, if the processor subsystem 12 determines at step 58 that the vehicle is travelling at a speed greater than 50 mph, the processor subsystem 12 will initiate a process by which it will determine whether the vehicle is being operated unsafely.

The processor subsystem 12 determines that the vehicle is being operated unsafely if the speed of the vehicle is such that the stopping distance for the vehicle  $d$  is greater than the distance separating the vehicle from an object, for example, a second vehicle, in its path. In order to make this determination, the processor subsystem 12 is provided access to at least one speed/distance table. For example, stored at location 14c within the memory subsystem 14 is a first speed/stopping distance table. The speed/stopping distance table contains the relationship between vehicle speed and stopping distance. Thus, for any given speed, the processor subsystem 12 may look-up the stopping distance for that speed. Preferably, the memory subsystem 14 should contain multiple speed/stopping distance tables so that differences in road conditions and/or vehicle class may be taken into account. For example, the speed/stopping distance table stored at location 14c may be a speed/stopping distance table for dry roads while a speed/stopping distance table for wet roads may be stored at location 14d. If desired, the memory subsystem 14 may also contain additional speed/stopping distance tables for other vehicle classes. If such additional tables were provided, however, the disclosed method would need to be modified to include additional steps in which the operator provides the vehicle's class and the processor subsystem 12 selects the appropriate speed/stopping distance tables for the indicated class of vehicle.

To make the aforementioned determination of unsafe vehicle operation, the method proceeds to step 60 where the processor subsystem 12 sets the value of the expression ALARM to 1. The method then proceeds to step 62 where the processor subsystem 12 examines the state of the wiper sensor 32 and selects a speed/stopping distance table based upon the state of the wiper sensor 32. If the state of the wiper sensor 32 indicates that the windshield wiper is off, the processor subsystem 12 concludes that the vehicle is being operated in dry conditions and selects the speed/stopping distance table stored at the location 14c of the memory subsystem 14. If, however, the state of the wiper sensor 32 indicates that the windshield wiper is on, the processor subsystem 12 concludes that the vehicle is being operated in wet conditions and selects the speed/stopping distance table stored at the location 14d of the memory subsystem 14. From the selected speed/stopping distance table 14c or 14d, the processor subsystem 12 then retrieves the stopping distance for the speed at which the vehicle is travelling.

Continuing on to step 64, the processor subsystem 12 determines the distance of the vehicle to an object in its path, i.e., a second vehicle travelling in front of the vehicle and in the same direction. To do so, the processor subsystem 12 instructs the radar device 28 to determine the distance between the vehicle and the second vehicle in front of it. Upon determining the distance separating the two vehicles, the radar device 28 transmits the determined separation distance to the processor subsystem 12. At step 66, the processor subsystem 12 determines if the two vehicles are separated by a safe distance. To do so, the processor subsystem 12 compares the distance separating the two vehicles to the retrieved stopping distance for the vehicle. If the determined distance separating the two vehicles is greater than the retrieved stopping distance for the vehicle, the processor subsystem 12 determines that the vehicle is being operated safely. If, however, the determined distance separating the two vehicles is less than the retrieved stopping distance, the processor subsystem 12 determines that the vehicle is being operated unsafely.

If the processor subsystem 12 determines at step 66 that the vehicle is being operated unsafely, the processor subsystem 12 initiates appropriate corrective action. At step 68, the processor subsystem 12 determines whether the vehicle brake is on by examining the state of the brake sensor 32. If the brake is on, the processor subsystem 12 concludes that the driver is taking corrective action and that further corrective action is not necessary. If, however, the processor subsystem 12 determines that the vehicle brake is off, the method proceeds to step 70 where the processor subsystem examines the level of the vehicle speed sensor to determine if the speed of the vehicle is less than 35 mph. If the speed of the vehicle is less than 30 mph, the processor subsystem 12 concludes that no further corrective action will be taken.

If, however, the processor subsystem 12 determines that the speed of the vehicle is greater than 35 mph, the method proceeds to step 72 where the processor subsystem 12 selects a throttle reduction value based upon the value of the expression ALARM. Generally, the severity of the corrective action to be initiated by the processor subsystem 12 is varied depending on the number of times that corrective action has been taken and, more specifically, the severity of the selective corrective action increases with the value of the expression ALARM. For example, in the embodiment of the invention disclosed herein, if ALARM=1, a 25% throttle reduction is selected, if ALARM=2, a 50 throttle reduction is

selected and, if  $ALARM.gtreq.3$ , a 100% throttle reduction is selected. By reducing the throttle, the transport of fuel to the engine is retarded and the vehicle will begin to decelerate.

Continuing on to step 74, the processor subsystem 12 determines the extent to which the throttle is open using the throttle level provided by the throttle sensor 24 and, using throttle control 26, reduces the throttle by the selected percentage. At step 76, the processor subsystem 12 selects an alert mode, again based upon the value of the expression  $ALARM$ . As before, the severity of the alert mode may increase with the value of  $ALARM$ . For example, when  $ALARM=1$ , a warning light may be activated in a flash mode while, when  $2.ltreq.ALARM.ltreq.3$ , an audible alert which lasts for a first selected time period, for example, two seconds, may be activated in combination with the flashing warning light and when  $ALARM.gtreq.4$ , an audible alert which lasts for a second, longer, time period, for example, six seconds, may be activated in combination with the flashing light.

Proceeding to step 78, the processor subsystem 12 issues an alert to the operator of the vehicle in accordance with the selected alert mode. To do so, the processor subsystem 12 activates vehicle proximity alarm circuit 40 in accordance with the selected alert mode. After issuing the alert at step 78, the method proceeds to step 80 where the processor subsystem 12 waits a selected period before taking any further action. The wait period is intended to provide sufficient time to see if the previously initiated corrective action eliminates the hazardous condition. As disclosed herein, a wait period of 10 seconds is suitable. However, wait periods of various lengths should be equally suitable for the uses contemplated herein.

Upon expiration of the wait period, the value of the expression  $ALARM$  is incremented by one at step 82 and, at step 84, the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. The method returns to step 64 where the distance between the vehicle and the object in its path is re-determined. The processor subsystem 12 continues to take corrective action until it determines that the vehicle is no longer being operated in a hazardous manner. More specifically, the processor subsystem 12 will conclude that the hazardous condition has been corrected when it either: determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle, determines at step 68 that the vehicle brake is on or determines at step 70 that the speed of the vehicle is less than 35 mph. Upon making such a determination, the method proceeds to step 86 where the processor subsystem 12 deactivated the vehicle proximity alarm circuit 40 to turn off the flashing light.

The method of optimizing vehicle operation in accordance with the teachings of the present invention will now be described in greater detail. Returning now to step 58, if the processor subsystem 12 determines that the vehicle is travelling slower than 50 mph, or if the processor subsystem 12 determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle or if the processor subsystem 12 determines at step 68 that the vehicle brake is on or if the processor subsystem 12 determines at step 70 that the speed of the vehicle is less than 35 mph, the method proceeds, after deactivation of the vehicle proximity alarm circuit 40, to step 88 where the processor subsystem 12 determines if the road speed of the vehicle is changing. To do so, the processor subsystem 12 compares the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b.

If the vehicle speed maintained in the first register 14a is greater than the vehicle speed maintained in the second register 14b, the vehicle is accelerating. If so, the method continues to step 90 where the processor subsystem 12 determines if the throttle position is increasing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has not increased, the processor subsystem 12 determines that, since the vehicle is accelerating but fuel consumption is not increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 90 that the throttle position has increased, the method

proceeds to step 92 where the processor subsystem 12 determines if the manifold pressure level maintained in the first register 14a has exceeded the manifold pressure set point for the vehicle. If the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is at or below the manifold pressure set point, the processor subsystem 12 proceeds to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are again polled and on to step 94 where the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the RPM set point stored in the memory subsystem 14 to determine if the engine speed has reached the RPM set point. If the engine speed has not reached the RPM set point, the method returns to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are repeatedly polled until the processor subsystem 12 determines that the engine speed has reached the RPM set point. Once the engine speed has reached the RPM set point, the processor subsystem 12 determines that the vehicle needs to be upshifted and, proceeding to step 95, the processor subsystem 12 will activate the upshift notification circuit 34 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, an upshift should be performed. The method then returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

Returning to step 92, if the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is above the manifold pressure set point, the processor subsystem 12 determines that too much fuel is being provided to the engine and proceeding to step 96, the processor subsystem 12 will activate the overinjection notification circuit 38 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. The method then returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

Returning to step 88, if the processor subsystem 12 determines, when comparing the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b, that the speed of the vehicle is decreasing, the method proceeds to step 98 where the processor subsystem 12 determines if the throttle position is changing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has either remained constant or decreased, the processor subsystem 12 determines that, since fuel consumption is either constant or reduced, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 98 that the throttle position has increased, the method proceeds to step 100 where the processor subsystem 12 determines if the manifold pressure is increasing. To do so, the processor subsystem 12 compares the manifold pressure level maintained in the first register 14a to the manifold pressure level maintained in the second register 14b. If the manifold pressure level maintained in the first register 14a is less than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that, since manifold pressure is decreasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the manifold pressure level maintained in the first register 14a is greater than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that the manifold pressure for the vehicle is increasing and the method proceeds to step 102 where the processor subsystem 12 determines if the engine speed is increasing. To do so, the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the engine speed level maintained in the second register 14b. If the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since engine speed is increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since the manifold pressure is increasing while the engine speed is decreasing, too much fuel is being supplied to the engine. Accordingly, at step 104, the processor subsystem 12 activates the overinjection notification circuit 38 to issue an audible alert for a selected time period, for

example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced.

Proceeding on to step 106, the sensors 18, 20, 22 24, 30 and 32 are again polled and, at step 108, the processor subsystem 12 determines if the engine speed is decreasing, again by comparing the engine speed level maintained in the first and second registers 14a and 14b. If the engine speed has not decreased, the method returns to step 104 where the processor subsystem 12 again activates the overinjection notification circuit 38 to issue another audible alert notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. Thus, the driver will be repeatedly notified of the overinjection condition until the processor subsystem 12 determines, at step 108, that the engine speed is decreasing. The method will then proceed to step 110 where, since the processor subsystem 12 has determined that, since the engine speed is decreasing, the vehicle should be downshifted. Accordingly, at step 110, the processor subsystem 12 activates the downshift notification circuit 36 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the vehicle should be downshifted. The method then returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32. The method will repeatedly loop through the aforementioned process to continuously determine if the vehicle is being operated unsafely, take appropriate corrective action and to provide notifications to the driver as to how operation of the vehicle may be optimized until the processor subsystem 12 is powered down or the vehicle is turned off.

Thus, there has been described and illustrated herein, an apparatus for optimizing vehicle operation which combines both operator notifications of recommended corrections in vehicle operation with automatic modification of vehicle operation under certain circumstances. By incorporating the disclosed apparatus in a vehicle, not only will certain hazardous operations of the vehicle be prevented but also the driver will be advised of certain actions which will enable the vehicle to be operated with greater fuel efficiency. However, those skilled in the art will recognize that many modifications and variations besides those specifically mentioned herein may be made without departing substantially from the concept of the present invention. Accordingly, it should be clearly understood that the form of the invention described herein is exemplary only and is not intended as a limitation on the scope of the invention.

#### **ENGLISH-CLAIMS:**

Return to Top of Patent

1. Apparatus for optimizing operation of a vehicle, comprising: a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing; means for determining when throttle position for said vehicle is increasing; and means for comparing manifold pressure to said manifold pressure set point; said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit

further comprises a horn for issuing a tone for a preselected time period.

4. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is decreasing; means for determining when throttle position for said vehicle is increasing; means for determining when manifold pressure for said vehicle is increasing; and means for determining when engine speed for said vehicle is decreasing; said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing; means for determining when throttle position for said vehicle is increasing; means for comparing manifold pressure to said manifold pressure set point; and means for comparing engine speed to said RPM set point; said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. Apparatus for optimizing operation of a vehicle, comprising: a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing; means for determining when throttle position for said vehicle is increasing; and means for comparing manifold pressure to said manifold pressure set point; said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

9. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is decreasing; means for determining when throttle position for said vehicle is increasing; means for determining when manifold pressure for said vehicle is increasing; and means for determining when engine speed for said vehicle is decreasing; said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is decreasing; means for determining when throttle

position for said vehicle is increasing; means for determining when manifold pressure for said vehicle is increasing; and means for determining when engine speed for said vehicle is decreasing; said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. Apparatus for optimizing operation of a vehicle, comprising: a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed; a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. Apparatus for optimizing operation of a vehicle according to claim 13 wherein: said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period; said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing or decreasing means for determining when throttle position for said vehicle is increasing; means for comparing manifold pressure to said manifold pressure set point; means for comparing engine speed to said RPM set point; means for determining when manifold pressure is increasing; and means for determining when engine speed is increasing or decreasing; said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing; said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. Apparatus for optimizing operation of a vehicle according to claim 15 wherein: said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period; said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. Apparatus for optimizing operation of a vehicle, comprising: a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle; at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor; a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor; a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that

said vehicle is too close to said object; a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein: said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and said memory subsystem further storing a second vehicle speed/stopping distance table.

19. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising: a throttle controller for controlling a throttle of said engine of said vehicle; and said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.

21. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises: means for counting a total number of vehicle proximity alarms determined by said processor subsystem; means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising: a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. Apparatus for optimizing operation of a vehicle, comprising: a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle; a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed; said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit; a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object; said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

24. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing or decreasing; means for determining when throttle position for said vehicle is increasing or decreasing; and means for comparing manifold pressure to said manifold pressure set point; means for determining when manifold pressure for said vehicle is increasing or decreasing; and means for determining when engine speed for said vehicle is increasing or decreasing; said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are

increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is increasing; means for determining when throttle position for said vehicle is increasing; means for comparing manifold pressure to said manifold pressure set point; and means for comparing engine speed to said RPM set point; said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. Apparatus for optimizing operation of a vehicle, comprising: a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle; a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit; a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object; said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises: means for determining when road speed for said vehicle is decreasing; means for determining when throttle position for said vehicle is increasing; means for determining when manifold pressure for said vehicle is increasing; and means for determining when engine speed for said vehicle is decreasing; said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. Apparatus for optimizing operation of a vehicle, comprising: a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor; a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom; a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle; said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. Apparatus according to claim 28 and further comprising: a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point; said processor subsystem activating said fuel overinjection notification circuit upon determining that: (1) based upon data received from said road speed sensor, road speed of said vehicle is increasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle exceeds said manifold pressure set point.

30. Apparatus according to claim 28, wherein: said plurality of sensors coupled to said vehicle further include an engine speed sensor; said processor subsystem activating said fuel overinjection notification circuit upon determining

that: (1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and (4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31. Apparatus for optimizing operation of a vehicle, comprising: a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle; at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor; a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom; a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table; a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object; said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.

32. Apparatus for optimizing operation of a vehicle according to claim 31 wherein: said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and said memory subsystem further storing a second vehicle speed/stopping distance table; if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

- 07/11/2014 90 MINUTE entry before the Honorable Michael T. Mason: For the reasons set forth in the accompanying Order, plaintiff's motion to compel LPR 2.1(b) (1) disclosures and responses to discovery 49 is granted in part and denied in part. By 08/01/14, defendant shall complete the required discovery requests. By 07/18/14 defendant shall identify any third parties who have possession, custody, or control of responsive documents or information. Plaintiff's motion to compel LPR 2.4(a) disclosures 80 is stayed. Defendant is directed to investigate and produce any additional, relevant documents by 07/25/14. If necessary, the parties are directed to meet and confer pursuant to LR 37.2 by 08/04/14 before filing any additional discovery motions. (rbf, ) (Entered: 07/11/2014)

11/22/2013	8	MAILED patent report to Patent Trademark Office, Alexandria VA (tg, ) (Entered: 11/22/2013)	
11/22/2013	9	MINUTE entry before the Honorable Edmond E. Chang: Status hearing set for February 6, 2014 at 8:30 a.m. The parties must file a joint initial status report with the content described in the attached status report requirements at least 3 business days before the initial status hearing. Plaintiff must still file the report even if not all Defendants have been served or have responded to requests to craft a joint report. Additionally, the parties must read Judge Chang's Case Management Procedures on the Court's website; those Procedures are considered standing orders in this case.Mailed notice (Attachments: # 1 Status Report Requirements) (slb, ) (Entered: 11/22/2013)	
12/02/2013	10	SUMMONS Returned Executed by Velocity Patent LLC as to Chrysler Group, LLC on 11/22/2013, answer due 12/13/2013. (Shimota, James) (Entered: 12/02/2013)	
12/02/2013	11	MINUTE entry before the Honorable Edmond E. Chang: The status hearing of 2/6/2014 is reset to 1/7/2014 at 9:30 a.m. The status report is due at least 3 business days before the initial status hearing. Mailed notice (slb, ) (Entered: 12/02/2013)	
12/03/2013	12	MINUTE entry before the Honorable Edmond E. Chang: Plaintiff's counsel called the courtroom deputy to say that Plaintiff had intended to check the box on the Civil Cover Sheet form that states there is a related case (13 C 08413) in Section IX of the form. Counsel asked whether there was a way to administratively correct the form in order to have the case reassigned as related; counsel was instructed to file a motion (where all parties may weigh in) rather than rely on some other mechanism. Mailed notice (slb, ) (Entered: 12/03/2013)

- 11/21/2013 7 Rule 3.4 Notice of Claims Involving Patents by Velocity Patent LLC (Shimota, James) (Entered: 11/21/2013)
- 11/22/2013 8 MAILED patent report to Patent Trademark Office, Alexandria VA. (tlm) (Entered: 11/22/2013)
- 11/25/2013 9 ORDER the Clerk is to arrange for this case to be transferred to the Patent Case Pilot Program, signed by the Honorable Robert W. Gettleman on 11/25/2013: Mailed notice (gds) (Entered: 11/25/2013)
- 11/26/2013 10 EXECUTIVE COMMITTEE ORDER: It appearing that 13 C 8421, Velocity Patent LLC v. Jaguar Land Rover North America LLC, pending before the Hon. Robert W. Gettleman, has been identified for transfer to the Patent Case Pilot Program in which this Court is participating, therefore It is hereby ordered that 13 C 8421, Velocity Patent LLC v. Jaguar Land Rover North America LLC,, is to be reassigned by lot to one of the district judges participating in the pilot program. Case reassigned to the Honorable Elaine E. Bucklo for all further proceedings. Signed by Executive Committee on 11/26/2013. (td, ) (Entered: 11/26/2013)
- 12/02/2013 11 SUMMONS Returned Executed by Velocity Patent LLC as to Jaguar Land Rover North America, LLC on 11/22/2013, answer due 12/13/2013. (Shimota, James) (Entered: 12/02/2013)
- 12/04/2013 12 ATTORNEY Appearance for Plaintiff Velocity Patent LLC by Aaron Charles Taggart (Taggart, Aaron) (Entered: 12/04/2013)
- 12/10/2013 13 ATTORNEY Appearance for Defendant Jaguar Land Rover North America, LLC by Kristopher R. Davis (Davis, Kristopher) (Entered: 12/10/2013)
- 12/10/2013 14 NOTIFICATION of Affiliates pursuant to Local Rule 3.2 by Jaguar Land Rover North America, LLC (Davis, Kristopher) (Entered: 12/10/2013)
- 12/10/2013 15 MOTION by Defendant Jaguar Land Rover North America, LLC for extension of time to file answer regarding complaint 1 - Defendant's Unopposed Motion for Extension of Time to Answer or Otherwise Plead (Davis, Kristopher) (Entered: 12/10/2013)
- 12/10/2013 16 NOTICE of Motion by Kristopher R. Davis for presentment of motion for extension of time to file answer, motion for relief 15 before Honorable Elaine E. Bucklo on 12/17/2013 at 09:30 AM. (Davis, Kristopher) (Entered: 12/10/2013)
- 12/11/2013 17 MOTION for Leave to Appear Pro Hac Vice Filing fee \$ 50, receipt number 0752-9012819. (Sims, Cassius) (Entered: 12/11/2013)
- 12/11/2013 18 MOTION for Leave to Appear Pro Hac Vice Filing fee \$ 50, receipt number 0752-9013079. (Naples, Clement) (Entered: 12/11/2013)
- 12/11/2013 19 MOTION for Leave to Appear Pro Hac Vice Filing fee \$ 50, receipt number 0752-9014790. (Moore, Matthew) (Entered: 12/11/2013)
- 12/16/2013 20 MINUTE entry before the Honorable Elaine E. Bucklo: Defendant's Unopposed Motion for extension of time until 1/27/2014 to answer or otherwise plead 15 is granted. Application to appear pro hac vice of Cassius Sims 17 , Clement J. Naples 18 and Matthew J. Moore 19 as counsel for defendant are granted. Scheduling Conference set for 1/31/2014 at 9:30 AM. Mailed notice (jdh) (Entered: 12/16/2013)
- 01/07/2014 21 EXECUTIVE COMMITTEE ORDER: Case reassigned to the Honorable John W. Darrah for all further proceedings. Related Case No. 13cv8413. Entered

- by Executive Committee on 1/7/14.(gcy, ) (Entered: 01/08/2014)
- 01/10/2014 22 MINUTE entry before the Honorable John W. Darrah: Status hearing set for 4/10/14 at 9:30 a.m. Mailed notice(maf) (Entered: 01/10/2014)
- 01/27/2014 23 ANSWER to Complaint with Jury Demand by Jaguar Land Rover North America, LLC(Davis, Kristopher) (Entered: 01/27/2014)
- 01/28/2014 24 MINUTE entry before the Honorable Elaine E. Bucklo: This case having been reassigned to Judge Darrah, the scheduling conference set for 1/31/2014 before Judge Bucklo is stricken. Mailed notice (jdh) (Entered: 01/28/2014)
- 02/04/2014 25 NOTICE by James A Shimota of Change of Address (Shimota, James) (Entered: 02/04/2014)
- 02/04/2014 26 NOTICE by Howard E Levin of Change of Address (Levin, Howard) (Entered: 02/04/2014)
- 02/04/2014 27 NOTICE by Aaron Charles Taggart of Change of Address (Taggart, Aaron) (Entered: 02/04/2014)
- 02/04/2014 28 NOTICE by Adam Robert Brausa of Change of Address (Brausa, Adam) (Entered: 02/04/2014)
- 04/03/2014 29 REPORT of Rule 26(f) Planning Meeting (Attachments: # 1 Exhibit 1) (Shimota, James) (Entered: 04/03/2014)
- 04/10/2014 30 ORDER: Status hearing held and continued to 4/17/14 at 9:30 a.m. Joint claim construction chart and status report to be filed by 2/15/15. Claim Construction hearing is set for 3/11/15 at 1:30 p.m. Signed by the Honorable John W. Darrah on 4/10/2014.(gcy, ) (Entered: 04/11/2014)
- 04/11/2014 31 MINUTE entry before the Honorable John W. Darrah: The Court's 4/10/14 order is amended to reflect the following: Joint claim construction chart and status report to be filed by 2/25/15. Mailed notice(maf) (Entered: 04/11/2014)
- 04/17/2014 32 MINUTE entry before the Honorable John W. Darrah: Status hearing held and continued to 4/24/14 at 9:30 a.m.Mailed notice(maf) (Entered: 04/17/2014)
- 04/24/2014 33 MINUTE entry before the Honorable John W. Darrah: Status hearing held and continued to 5/7/14 at 9:30 a.m. Mailed notice(maf) (Entered: 04/24/2014)
- 05/07/2014 34 MINUTE entry before the Honorable John W. Darrah: Status hearing held and continued to 8/19/14 at 9:30 a.m. Mailed notice(maf) (Entered: 05/07/2014)
- 05/30/2014 35 MOTION by counsel for Plaintiff Velocity Patent LLC to withdraw as attorney Adam R. Brausa (Shimota, James) (Entered: 05/30/2014)
- 05/30/2014 36 NOTICE of Motion by James A Shimota for presentment of motion to withdraw as attorney 35 before Honorable John W. Darrah on 6/5/2014 at 09:30 AM. (Shimota, James) (Entered: 05/30/2014)
- 06/02/2014 37 MINUTE entry before the Honorable John W. Darrah: Plaintiff's Motion to Withdraw Counsel Adam R. Brausa 36 is granted. No appearances necessary on June 5, 2014. All other dates remain as scheduled. Mailed notice(maf) (Entered: 06/02/2014)
- 06/18/2014 38 MOTION by counsel for Defendant Jaguar Land Rover North America, LLC to withdraw as attorney - Motion for Leave to Withdraw Cassius K. Sims as Attorney (Davis, Kristopher) (Entered: 06/18/2014)
- 06/18/2014 39 NOTICE of Motion by Kristopher R. Davis for presentment of motion to withdraw as attorney 38 before Honorable John W. Darrah on 6/26/2014 at 09:30 AM. (Davis, Kristopher) (Entered: 06/18/2014)
- 06/19/2014 40 ORDER: Defendant's Motion to Withdraw as Cassius K. Sims 38 is granted.

No appearance necessary on June 26, 2014. All other dates remain as scheduled.Signed by the Honorable John W. Darrah. (gcy, ) (Entered: 06/19/2014)

- 08/19/2014 41 MINUTE entry before the Honorable John W. Darrah: Status hearing held and continued to 9/16/14 at 9:30 a.m. Mailed notice(maf) (Entered: 08/19/2014)
- 08/25/2014 42 STIPULATION of Dismissal Joint Motion to Dismiss with Prejudice (Shimota, James) (Entered: 08/25/2014)
- 08/26/2014 43 ORDER: before the Honorable John W. Darrah: Enter agreed order of dismissal. Civil case closed. Any pending dates or motions are moot. Civil case terminated. (gcy, ) (Entered: 08/27/2014)
- 08/26/2014 44 ORDER OF DISMISSAL Entered by the Honorable John W. Darrah on 8/26/2014.(gcy, ) (Entered: 08/27/2014)
- 08/27/2014 45 MAILED certified copy of Closing Order with Patent report to Patent Trademark Office, Alexandria VA. (gcy, ) (Entered: 08/27/2014)

EXAMINER

ENGLAND, DAVID E

ART UNIT	PAPER NUMBER
3992	

MAIL DATE	DELIVERY MODE
03/17/2015	PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Examiner-Initiated Interview Summary</b>	<b>Application No.</b>	<b>Applicant(s)</b>	
	90/013,252	5,954,781	
	<b>Examiner</b>	<b>Art Unit</b>	
	DAVID ENGLAND	3992	

All participants (applicant, applicant's representative, PTO personnel):

- (1) DAVID ENGLAND. (3) JENNIFER MCNEIL (SPE).  
(2) ALISHA TAYLOR Reg. No. 59332. (4) MICHAEL YIGDALL.

Date of Interview: 11 March 2015.

Type:  Telephonic  Video Conference  
 Personal [copy given to:  applicant  applicant's representative]

Exhibit shown or demonstration conducted:  Yes  No.  
If Yes, brief description: \_\_\_\_\_.

Issues Discussed  101  112  102  103  Others  
(For each of the checked box(es) above, please describe below the issue and detailed description of the discussion)

Claim(s) discussed: 33-60 and 85-114.

Identification of prior art discussed: NA.

**Substance of Interview**

(For each issue discussed, provide a detailed description and indicate if agreement was reached. Some topics may include: identification or clarification of a reference or a portion thereof, claim interpretation, proposed amendments, arguments of any applied references etc...)

Examiner England contacted Attorney Taylor to discuss multiple amendment errors and 112 issues. All new claims need to state they are new and with those that are amended, how many times they are amended. Further, new claims need to always be underlined. Claims 38, 54, 88 and 106 claim a "means for mode selection" that invokes 112 6<sup>th</sup> paragraph. There is no structure that supports this language. As found in column 7, lines 47 - 58, what is discussed is a "mode select line" but it is not clear as to what structure is that would define the means. Examiner recommended amending the claims to state a mode select input line for switching between the active mode and inactive mode instead of a "means for" doing such. This could overcome a 112 second paragraph rejection if amended correctly .

**Applicant recordation instructions:** It is not necessary for applicant to provide a separate record of the substance of interview.

**Examiner recordation instructions:** Examiners must summarize the substance of any interview of record. A complete and proper recordation of the substance of an interview should include the items listed in MPEP 713.04 for complete and proper recordation including the identification of the general thrust of each argument or issue discussed, a general indication of any other pertinent matters discussed regarding patentability and the general results or outcome of the interview, to include an indication as to whether or not agreement was reached on the issues raised.

**RESPONSE**

Sir:

This Amendment is being submitted in the above-identified Reexamination.

Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 33 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31-32. Canceled.

33. (New) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (New) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (New) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (New - Currently amended) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a mode select line for switching [means for mode selection] between said active mode and said inactive mode.

39. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.

40. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.

41. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.

42. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.

43. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.

44. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.

45. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection

circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

53. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (New – Currently Amended) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a mode select line for switching [means for mode selection] between said active mode and said inactive mode.

55. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

57. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (New) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based

Control No. 90013252

upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (New) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

60-84. (Canceled)

85. (New - Amended Once) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said

Control No. 90013252

vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

86. (New – Amended Once) Apparatus for optimizing operation of a vehicle,

Control No. 90013252

comprising:

\_\_\_\_\_ a tachometer;

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in

Control No. 90013252

which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

an upshift notification circuit coupled to said processor subsystem.

87. (New – Amended Once) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

Control No. 90013252

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

88. (New – Currently Amended) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a mode select line for switching [means for mode selection] between said active mode and said inactive mode.

89. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of

said vehicle is being operated at an excessive speed.

90. (New) Apparatus for optimizing operation of a vehicle according to claim 89, further comprising a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.

91. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

92. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is a lookup table.

93. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

94. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

95. (New) Apparatus for optimizing operation of a vehicle according to claim 94, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

96. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a speedometer.

97. (New) Apparatus for optimizing operation of a vehicle according to

claim 85, wherein said vehicle comprises a truck.

98. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a power source including voltage divider circuitry.

99. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said memory subsystem stores vehicle class information.

100. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

101. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

102. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

103. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

104. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

105. (New) Apparatus for optimizing operation of a vehicle according to

Control No. 90013252

claim 85 wherein:

said plurality of sensors further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

106. (New - Currently Amended) Apparatus for optimizing operation of a vehicle according to claim 86, further comprising a mode select line for switching [means for mode selection] between said active mode and said inactive mode.

107. (New) Apparatus for optimizing operation of a vehicle according to claim 106, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

108. (New) Apparatus for optimizing operation of a vehicle according to claim 107, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

109. (New) Apparatus for optimizing operation of a vehicle according to claim 86, wherein said processor subsystem tracks the number of vehicle proximity alarms issued before corrective action eliminates a hazardous condition.

110. (New) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said memory subsystem stores vehicle class information.

111. (New) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

112. (New) Apparatus for optimizing operation of a vehicle according to claim 111, further comprising a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

113. (New) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising:

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; and  
said processor subsystem determining, based upon whether engine speed exceeds said RPM set point, when to activate said upshift notification circuit.

114. (New) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

115. (New) Apparatus for optimizing operation of a vehicle according to claim 85, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

**Remarks**

This Amendment is being submitted to in response to the Examiner's Interview on March 11, 2015. The interview addressed the following:

- All of the new claims must be underlined and the indicator must communicate "New - Amended Once" if the claim has been amended since it was presented;
- Claim 60 was missing from the canceled claims 61-84;
- Claims 38, 54, 88, and 106 invoke 35 U.S.C. 112(6), however, the specification does not support such language. The Examiner suggested amending the claims to remove the "means for" language and replace with the disclosed "mode select line."

In response to the interview, Applicants have re-underlined all of the new claims and corrected the indicators to indicate if the claim has been amended since it was presented. In addition, claim 60 has been indicated as canceled. Lastly, claims 38, 54, 88, and 106 have been amended to remove the "means for" language and explicitly claim the "mode select line" as supported in the specification at col. 7, lines 47-58.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Reexamination Certificate confirming the present claims be issued in this case. If for any reason the Examiner is unable to issue a Reexamination Certificate confirming the present claims the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**RESPONSE**

Sir:

This Supplemental Response is being submitted in the above-identified Reexamination. Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 34 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31-32. Canceled.

33. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor

Control No. 90013252

subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a means for mode selection between said active mode and said inactive mode.

39. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.

40. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.

41. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.

42. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.

43. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.

44. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.

45. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift

notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

53. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a means for mode selection between said active mode and said inactive mode.

55. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

Control No. 90013252

57. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

61-84. (Canceled)

85. (Previously Submitted) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor and an engine speed sensor;

Control No. 90013252

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is

Control No. 90013252

being supplied to said engine of said vehicle;

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

86. (Previously Submitted) Apparatus for optimizing operation of a vehicle, comprising:

a tachometer;

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said

Control No. 90013252

radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

an upshift notification circuit coupled to said processor subsystem.

87. (Previously Submitted) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory

Control No. 90013252

subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

[87. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, further comprising:

Control No. 90013252

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.]

88. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising means for mode selection between said active mode and said inactive mode.

89. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a a notification that said engine of said vehicle is being operated at an excessive speed.

90. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 89, further comprising a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.

91. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

92. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is a lookup table.

93. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

94. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

95. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 94, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

96. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a speedometer.

97. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said vehicle comprises a truck.

98. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a power source including voltage divider circuitry.

99. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said memory subsystem stores vehicle class information.

100. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

101. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

102. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

103. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

104. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

105. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85 wherein:

said plurality of sensors further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said

Control No. 90013252

road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

106. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 86, further comprising means for mode selection between said active mode and said inactive mode.

107. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 106, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

108. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 107, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

109. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 86, wherein said processor subsystem tracks the number of

vehicle proximity alarms issued before corrective action eliminates a hazardous condition.

110. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said memory subsystem stores vehicle class information.

111. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

112. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 111, further comprising a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

113. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising:

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; and

said processor subsystem determining, based upon whether engine speed exceeds said RPM set point, when to activate said upshift notification circuit.

Control No. 90013252

114. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

115. (New) Apparatus for optimizing operation of a vehicle according to claim 85, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

**Remarks**

This Supplemental Response is being submitted to correct duplicate claim number 87. There is a first claim 87 and a second claim 87. This Response is deleting the text of the second claim 87. The subject matter of the second claim 87 has been introduced as new claim 115. No new matter has been added.

Please note, the Supplemental Response submitted February 20, 2015, was submitted to correct a typographical error in claims 85-87. The error included the text “[at least one]”. The Supplemental Response filed February 20, 2015, deleted the text by using single brackets on each side of the text, thus, “[[at least one]]”.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Reexamination Certificate confirming the present claims be issued in this case. If for any reason the Examiner is unable to issue a Reexamination Certificate confirming the present claims the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

RICHARDS PATENT LAW PC

### Warnings:

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**RESPONSE**

Sir:

This Supplemental Response is being submitted in the above-identified Reexamination. Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 34 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31-32. Canceled.

33. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor

Control No. 90013252

subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a means for mode selection between said active mode and said inactive mode.

39. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.

40. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.

41. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.

42. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.

43. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.

44. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.

45. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift

notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

53. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a means for mode selection between said active mode and said inactive mode.

55. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

Control No. 90013252

57. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

61-84. (Canceled)

85. (Currently Amended) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [[at least one]] plurality of sensors including a road speed sensor and an engine speed sensor;

Control No. 90013252

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is

Control No. 90013252

being supplied to said engine of said vehicle;

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

86. (Currently Amended) Apparatus for optimizing operation of a vehicle, comprising:

a tachometer;

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [[at least one]] plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said

Control No. 90013252

radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

an upshift notification circuit coupled to said processor subsystem.

87. (Currently Amended) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [[at least one]] plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory

Control No. 90013252

subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

87. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, further comprising:

Control No. 90013252

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

88. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising means for mode selection between said active mode and said inactive mode.

89. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a a notification that said engine of said vehicle is being operated at an excessive speed.

90. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 89, further comprising a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.

91. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

92. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is a lookup table.

93. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

94. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

95. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 94, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

96. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a speedometer.

97. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said vehicle comprises a truck.

98. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a power source including voltage divider circuitry.

99. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said memory subsystem stores vehicle class information.

100. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

101. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

102. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

103. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

104. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

105. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 85 wherein:

said plurality of sensors further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said

Control No. 90013252

road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

106. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 86, further comprising means for mode selection between said active mode and said inactive mode.

107. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 106, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

108. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 107, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

109. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 86, wherein said processor subsystem tracks the number of

vehicle proximity alarms issued before corrective action eliminates a hazardous condition.

110. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said memory subsystem stores vehicle class information.

111. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

112. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 111, further comprising a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

113. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising:

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; and

said processor subsystem determining, based upon whether engine speed exceeds said RPM set point, when to activate said upshift notification circuit.

Control No. 90013252

114 (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

Control No. 90013252

**Remarks**

This Supplemental Response is being submitted to supplement the claim amendments submitted in the Response dated December 10, 2014.

Specifically, the present Supplemental Response is being submitted to correct a typographical error in claims 85-87.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Reexamination Certificate confirming the present claims be issued in this case. If for any reason the Examiner is unable to issue a Reexamination Certificate confirming the present claims the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

RICHARDS PATENT LAW PC

### Warnings:

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**RESPONSE**

Sir:

This Supplemental Response is being submitted in the above-identified Reexamination. Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 33 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31-32. Canceled.

33. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor

Control No. 90013252

subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a means for mode selection between said active mode and said inactive mode.

39. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.

40. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.

41. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.

42. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.

43. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.

44. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.

45. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift

notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

53. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a means for mode selection between said active mode and said inactive mode.

55. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

Control No. 90013252

57. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (Previously Presented) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

61-84. (Canceled)

85. (New) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [at least one] plurality of sensors including a road speed sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one

Control No. 90013252

sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

Control No. 90013252

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

86. (New) Apparatus for optimizing operation of a vehicle, comprising:

a tachometer;

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [at least one] plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem including random access memory, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

an upshift notification circuit coupled to said processor subsystem.

87. (New) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [at least one] plurality of sensors including a road speed sensor, an engine speed sensor and a brake sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table and an RPM set point;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said

Control No. 90013252

object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;

further wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.

87. (New) Apparatus for optimizing operation of a vehicle according to claim 85, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

88. (New) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising means for mode selection between said active mode and said inactive mode.

89. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a a notification that said engine of said vehicle is being operated at an excessive speed.

90. (New) Apparatus for optimizing operation of a vehicle according to claim 89, further comprising a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.

91. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

92. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is a lookup table.

93. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

94. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

95. (New) Apparatus for optimizing operation of a vehicle according to claim 94, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

96. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a speedometer.

97. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said vehicle comprises a truck.

98. (New) Apparatus for optimizing operation of a vehicle according to claim 88, further comprising a power source including voltage divider circuitry.

99. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said memory subsystem stores vehicle class information.

100. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

101. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

102. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

103. (New) Apparatus for optimizing operation of a vehicle according to claim 88, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle

proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

104. (New) Apparatus for optimizing operation of a vehicle according to claim 85, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

105. (New) Apparatus for optimizing operation of a vehicle according to claim 85 wherein:

said plurality of sensors further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

106. (New) Apparatus for optimizing operation of a vehicle according to claim 86, further comprising means for mode selection between said active mode

and said inactive mode.

107. (New) Apparatus for optimizing operation of a vehicle according to claim 106, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible and a visual indication; and

wherein the visual indication is displayed on the display.

108. (New) Apparatus for optimizing operation of a vehicle according to claim 107, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

109. (New) Apparatus for optimizing operation of a vehicle according to claim 86, wherein said processor subsystem tracks the number of vehicle proximity alarms issued before corrective action eliminates a hazardous condition.

110. (New) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said memory subsystem stores vehicle class information.

111. (New) Apparatus for optimizing operation of a vehicle according to claim 108, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

112. (New) Apparatus for optimizing operation of a vehicle according to claim 111, further comprising a fuel overinjection notification circuit coupled to said

Control No. 90013252

processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

113. (New) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising:

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed; and

said processor subsystem determining, based upon whether engine speed exceeds said RPM set point, when to activate said upshift notification circuit.

114 (New) Apparatus for optimizing operation of a vehicle according to claim 87, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

**Remarks**

This Supplemental Response is being submitted to supplement the claim amendments submitted in the Response dated November 10, 2014.

Specifically, the present Supplemental Response is being submitted to identify a Statutory Disclaimer of claims 31 and 32, and enter new independent claims 85-87 and dependent claims 88-114. Dependent application claims 60-84, which were previously presented and depended from claim 31, have also been cancelled for the sake of simplicity given the presentation of new claims 85-87 (and dependent claims 88-114). Patent Owner believes that dependent claims 60-84 were patentable, but, in the interest of expediting prosecution, has presented new dependent claims 88-114. In short, because claims 31 and 32 have been canceled here, the Examiner's rejections of claims 31 and 32 as anticipated by Davidian or rendered obvious by Davidian combined with Tonkin are now moot.

New independent claims 85-87 share common elements with disclaimed claim 31 (previously presented). Accordingly, the new independent claims do not enlarge the scope of the claims in the patent. To the contrary, in addition to the elements of claim 31, these new claims add several elements not found in the prior art the Examiner cited as anticipating or rendering obvious disclaimed claims 31 and 32 respectively. New independent claims 85-87 are thus narrower in scope than disclaimed claim 31. In particular, elements not found in the cited prior art are at least the following:

**Claim 85**

- “an engine speed sensor”;

- “a throttle controller for controlling a throttle of said engine of said vehicle”;
- “wherein said processor subsystem selectively reduces said throttle based upon data received from said radar detector”;
- “further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;”
- “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle”; and
- “wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.”

**Claim 86**

- “a tachometer”;
- “an engine speed sensor”;
- “a throttle controller for controlling a throttle of said engine of said vehicle”;
- “wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector”;
- “further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;” and
- “an upshift notification circuit coupled to said processor subsystem.”

**Claim 87**

- “an engine speed sensor”;
- “a brake sensor”
- “an RPM set point”;
- “a throttle controller for controlling a throttle of said engine of said vehicle”;
- “wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector”;
- “further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the

processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector;” and

- “wherein said processor subsystem determines whether a brake of the vehicle is activated based upon data received from the brake sensor.”

As previously discussed, Patent Owner believes that independent claim 31 and dependent claim 32 are patentably distinct over the prior art of record. However, Patent Owner is involved in litigations against three automobile manufacturers, each of which is currently stayed until this reexamination concludes. In an effort to expedite the reexamination so that the stay may be lifted promptly, Patent Owner has presented new independent claims 85-87 to unquestionably distinguish the prior art cited by Requester under the provisions of 35 U.S.C. § 301. New claims 88-106, which depend from independent claim 85, claims 107-112, which depend from independent claim 86, and claims 113-114, which dependent from independent claim 87, recite further limitations, making them patentably distinct from the prior art cited by Requester under the provisions of 35 U.S.C. § 301 at least for the reasons identified above.

Moreover, as discussed previously, because new claims 33-59 dependent from confirmed patentable claims 1, 17 or 28, new dependent claims 33-59 are also patentable. Again, while Patent Owner believes that the allowed claims are patentable over the prior art of record, out of an abundance of caution, Patent Owner has submitted new dependent claims 33-59 to further distinguish the prior art cited by the Requester under the provisions of 35 U.S.C. § 301. Patent Owner respectfully submits that all the claims in the application are in condition for allowance.

Control No. 90013252

No new matter has been added by the amendments and new claims presented herein. The Patent Owner respectfully requests reconsideration and reexamination of the claims in light of the present amendments and remarks contained within the Response dated November 3, 2014.

Finally, the Statutory Disclaimer pursuant to 35 U.S.C. § 253 recorded by the Patent Owner does not constitute an admission or acquiescence by the Patent Owner with regard to the Examiner's rejection or positions take by the Requester. As identified above, Patent Owner makes the Statutory Disclaimer solely in the interest of mooted the outstanding rejection and expediting this reexamination such that the litigation stay may be lifted promptly. Patent Owner disagrees with the Requester's arguments and makes the present disclaimer without prejudice to the Patent Owner's ability to rebut characterizations of, for example, prior art references in another forum.

#### **Notice of Related Litigation**

Pursuant to its ongoing duty, Patent Owner notifies the Examiner of two petitions requesting inter partes review of certain claims of U.S. Patent No. 5,954,781. The case numbers for the petitions are IPR2015-00276 and IPR2015-00290.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Reexamination Certificate confirming the present claims be issued in this case. If for any reason the Examiner is unable to issue a Reexamination Certificate confirming the present claims the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

**STATUTORY DISCLAIMER IN PATENT UNDER 37 C.F.R. 1.321(a)**

Sir:

The Applicant hereby disclaims all of Applicant's rights in entirety of Claims 31 and 32 in the above-identified patent.

The present Statutory Disclaimer does not constitute any acquiescence by the Applicant with regard to the outstanding rejections in the pending Reexamination of the above-identified patent (Control No. 90/013252). Rather, the Applicant respectfully disagrees with all of the outstanding rejections and makes the present disclaimer without prejudice to Applicant's positions regarding the cited art references cited in those rejections.

The undersigned is the attorney of record in the above-identified Reexamination and is thus authorized to sign the Statutory Disclaimer.

**EXAMINER SIGNATURE**

Examiner Signature		Date Considered	
--------------------	--	-----------------	--

\*EXAMINER: Initial if reference considered, whether or not citation is in conformance with MPEP 609. Draw line through a citation if not in conformance and not considered. Include copy of this form with next communication to applicant.

<sup>1</sup> See Kind Codes of USPTO Patent Documents at [www.USPTO.GOV](http://www.USPTO.GOV) or MPEP 901.04. <sup>2</sup> Enter office that issued the document, by the two-letter code (WIPO Standard ST.3). <sup>3</sup> For Japanese patent documents, the indication of the year of the reign of the Emperor must precede the serial number of the patent document. <sup>4</sup> Kind of document by the appropriate symbols as indicated on the document under WIPO Standard ST.16 if possible. <sup>5</sup> Applicant is to place a check mark here if English language translation is attached.

<b>INFORMATION DISCLOSURE STATEMENT BY APPLICANT</b> ( Not for submission under 37 CFR 1.99)	Application Number	90013252
	Filing Date	2014-05-22
	First Named Inventor	HARVEY SLEPIAN
	Art Unit	3992
	Examiner Name	England, David E.
	Attorney Docket Number	

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

OR

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

See attached certification statement.

The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Patrick D. Richards/	Date (YYYY-MM-DD)	2014-12-10
Name/Print	Patrick Richards	Registration Number	48905

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**NOTIFICATION OF CONCURRENT PROCEEDINGS**

Pursuant to the statement contained, for example, on pages 29 to 30 of the Order dated June 27, 2014 (“The third party requester is also reminded of the ability to similarly apprise the Office of any such activity or proceeding throughout the course of this reexamination proceeding. See MPEP §§ 2207, 2282 and 2686”), Requester, Volkswagen Group of America, Inc. (“VWGoA”), notifies the Office of the following proceedings in which the patent under reexamination, U.S. Patent No. 5,954,781, is involved:

1. *Inter Partes* Review Case No. IPR2015-00290 -- Petition, attached as Exhibit 1, filed on November 21, 2014, and Declaration of Dr. Chris G. Bartone, P.E., attached as Exhibit 2, filed on November 21, 2014 by Mercedes-Benz USA, LLC and Mercedes-Benz U.S. International, Inc.

As required pursuant to 37 C.F.R. § 1.550(f), a copy of this paper is being served on the patent owner by first class mail in the manner provided in 37 C.F.R. § 1.248 on the date stated in the Certificate of Service annexed hereto.

Respectfully submitted,

Date: November 24, 2014

**RESPONSE**

Sir:

This Supplemental Response is being submitted in the above-identified Reexamination. Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 29 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31. (Amended) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

[at least one] a plurality of sensors coupled to said vehicle for monitoring operation thereof, said [at least one] plurality of sensors including a road speed sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

Control No. 90013252

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector.

32. (Original) Apparatus for optimizing operation of a vehicle according to claim 31 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

Control No. 90013252

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

33. (New) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (New) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (New) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (New) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a means for mode selection between said active mode and said inactive mode.

39. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.
40. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.
41. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.
42. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.
43. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.
44. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.
45. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

53. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (New) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a means for mode selection between said active mode and said inactive mode.

55. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

57. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (New) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (New) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

Control No. 90013252

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

60. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising:

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

61. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible indication, and a visual indication; and

wherein the visual indication is displayed on the display.

62. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising means for mode selection between said active mode and said inactive mode.

Control No. 90013252

63. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

64. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said first speed/stopping distance table is a lookup table.

65. (New) Apparatus for optimizing operation of a vehicle according to claim 65, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

66. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising an upshift notification circuit coupled to said processor subsystem.

67. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further wherein said processor subsystem determines whether the brakes of the vehicle are activated.

68. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

69. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

70. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a tachometer.

Control No. 90013252

71. (New) Apparatus for optimizing operation of a vehicle according to claim 70, further comprising a speedometer.
72. (New) Apparatus of optimizing operation of a vehicle according to claim 31, wherein said vehicle comprises a truck.
73. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a power source including voltage divider circuitry.
74. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said memory subsystem stores vehicle class information.
75. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to automatically power on when the vehicle is started.
76. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to periodically communicate with said road speed sensor.
77. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.
78. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.
79. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity

alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

80. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

81. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

82. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising an upshift notification circuit coupled to said processor subsystem.

83. (New) Apparatus for optimizing operation of a vehicle according to claim 71, wherein said vehicle proximity alarm includes an audible indication and a visual indication.

84. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising means for mode selection between said active mode and said inactive mode.

Control No. 90013252

**Remarks**

This Supplemental Response is being submitted to correct the form of the claim amendments submitted in the Response dated November 3, 2014. No new matter has been added by the amendments and new claims presented herein. Reconsideration and reexamination of the claims in light of the following remarks contained with in the Response dated November 3, 2014.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Notice of Allowance be issued in this case. If for any reason the Examiner is unable to allow the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

### Warnings:

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**RESPONSE**

Sir:

This Response is being submitted in the above-identified Reexamination.

Please amend the above-identified application as follows:

**Amendments to the Claims** are reflected in the listing of claims, which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 29 of this paper.

### **Amendments to the Claims**

This listing of claims will replace all prior versions, and listings, of claims in the application:

#### **Listing of Claims**

1. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification

Control No. 90013252

circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. (Original) Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

7. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

Control No. 90013252

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and

Control No. 90013252

manifold pressure for said vehicle is above said manifold pressure set point.

9. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. (Original) Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. (Original) Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

Control No. 90013252

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. (Original) Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. (Original) Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

Control No. 90013252

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. (Original) Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is

Control No. 90013252

being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating

Control No. 90013252

whether a brake system of said vehicle is activated.

21. (Original) Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. (Original) Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position

Control No. 90013252

sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Control No. 90013252

24. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. (Original) Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said

Control No. 90013252

downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. (Original) Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing;

and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. (Original) Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. (Original) Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

(3) based upon data received from said manifold pressure sensor, manifold

Control No. 90013252

pressure for said vehicle exceeds said manifold pressure set point.

30. (Original) Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31. (Amended) Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

~~at least one~~ a plurality of sensors coupled to said vehicle for monitoring operation thereof, said ~~at least one~~ plurality of sensors including a road speed sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

Control No. 90013252

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem; and

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector;

further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector.

32. (Original) Apparatus for optimizing operation of a vehicle according to claim 31 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

Control No. 90013252

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

33. (New) Apparatus for optimizing operation of a vehicle according to claim 1 further comprising:

means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem, wherein the vehicle proximity alarm circuit includes at least one of a visual notification and an audible notification;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance is less than a predetermined distance, the processor subsystem activates the vehicle proximity alarm circuit.

34. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle;

wherein, upon the processor subsystem receiving the distance from said means for determining a distance and determining said distance received is less than a predetermined distance, the processor subsystem reduces said throttle.

35. (New) Apparatus for optimizing operation of a vehicle according to claim 33, further wherein the processor subsystem determines whether the brakes of the vehicle are activated.

36. (New) Apparatus for optimizing operation of a vehicle according to claim 33, wherein the vehicle proximity alarm circuit further comprises a display for displaying at least one of the speed of the object, and the distance to the object.

37. (New) Apparatus for optimizing operation of a vehicle according to claim 34, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon the distance received from said means for determining, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon the distance received from said means for determining.

38. (New) Apparatus for optimizing operation of a vehicle according to claim 37, further comprising a means for mode selection between said active mode and said inactive mode.

Control No. 90013252

39. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said plurality of sensors is the engine speed sensor and the vehicle speed sensor.

40. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated an excessive speed comprises an automatic corrective action by the vehicle.

41. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that the engine is being operated at an excessive speed notifies a driver that an upshift should be performed.

42. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said notification that excessive fuel is being supplied to said engine of said vehicle notifies a driver that the vehicle is not being operated fuel efficiently.

43. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a manifold pressure threshold value.

44. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said manifold pressure set point is a threshold value above which the manifold pressure should not exceed.

45. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem determines when to activate said fuel overinjection circuit and said upshift notification circuit based upon said manifold pressure set point and said RPM set point.

46. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the road speed sensor.

47. (New). Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the manifold pressure sensor.

48. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination to activate said fuel overinjection circuit is based on data from the throttle position sensor.

49. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

50. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said determination when to activate said fuel overinjection circuit and said determination when to activate said upshift notification circuit is based upon said present and prior levels for said plurality of sensors stored in said memory subsystem.

51. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to periodically communicate with said plurality of sensors.

52. (New) Apparatus for optimizing operation of a vehicle according to claim 1, wherein said processor subsystem is configured to retrieve data from the plurality of sensors and store the data in said memory subsystem.

Control No. 90013252

53. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the processor subsystem includes (i) an active mode wherein the processor subsystem activates an alarm and reduces the throttle based upon a distance received from said radar detector, and (ii) an inactive mode wherein the processor subsystem activates an alarm and the processor subsystem does not reduce the throttle based upon a distance received from said radar detector.

54. (New) Apparatus for optimizing operation of a vehicle according to claim 53, further comprising a means for mode selection between said active mode and said inactive mode.

55. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said processor subsystem activates said upshift notification circuit based on the manifold pressure set point and RPM set point.

56. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein said at least one sensor is the road speed sensor.

57. (New) Apparatus for optimizing operation of a vehicle according to claim 17, wherein the first speed/stopping distance table is based on National Safety Council guidelines.

58. (New) Apparatus for optimizing operation of a vehicle according to claim 17, further wherein said processor subsystem automatically applies the brakes based upon data received from said radar detector, said at least one sensor and said memory subsystem.

59. (New) Apparatus for optimizing operation of a vehicle according to claim 28 further comprising:

Control No. 90013252

a means for determining a distance separating a vehicle and an object, wherein the vehicle includes an engine; and

a vehicle proximity alarm circuit coupled to said processor subsystem;

wherein said processor subsystem activates said vehicle proximity alarm circuit based at least upon the data received from said road speed sensor, and the means for determining the distance separating the vehicle and the object.

60. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising:

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

wherein said processor subsystem determines whether to activate said fuel overinjection notification circuit based upon at least the data received from said road speed sensor.

61. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising:

a display;

wherein the vehicle proximity alarm includes at least one of an audible indication, and a visual indication; and

wherein the visual indication is displayed on the display.

62. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising means for mode selection between said active mode and said inactive mode.

Control No. 90013252

63. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a selector for selecting a type of vehicle proximity alarm, wherein the type of vehicle proximity alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

64. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said first speed/stopping distance table is a lookup table.

65. (New) Apparatus for optimizing operation of a vehicle according to claim 65, wherein said first speed/stopping distance table is based upon National Safety Council guidelines.

66. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising an upshift notification circuit coupled to said processor subsystem.

67. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further wherein said processor subsystem determines whether the brakes of the vehicle are activated.

68. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a bus for bidirectional exchanges of address, data and control signals between said processor subsystem and said memory subsystem.

69. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said memory subsystem includes at least one register for holding the level of said road speed sensor.

70. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a tachometer.

Control No. 90013252

71. (New) Apparatus for optimizing operation of a vehicle according to claim 70, further comprising a speedometer.

72. (New) Apparatus of optimizing operation of a vehicle according to claim 31, wherein said vehicle comprises a truck.

73. (New) Apparatus for optimizing operation of a vehicle according to claim 31, further comprising a power source including voltage divider circuitry.

74. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said memory subsystem stores vehicle class information.

75. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to automatically power on when the vehicle is started.

76. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to periodically communicate with said road speed sensor.

77. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to retrieve data from said road speed sensor and store the data in said memory subsystem.

78. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to wait a preselected time period after issuing the vehicle proximity alarm.

79. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said processor subsystem is configured to select a type of vehicle proximity alarm based on the determined distance, wherein the type of vehicle proximity

Control No. 90013252

alarm is selected from the group consisting of an audible indication, a visual indication, and combinations thereof.

80. (New) Apparatus for optimizing operation of a vehicle according to claim 31, wherein said first speed/stopping distance table is the relationship between vehicle speed and stopping distance.

81. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

82. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising an upshift notification circuit coupled to said processor subsystem.

83. (New) Apparatus for optimizing operation of a vehicle according to claim 71, wherein said vehicle proximity alarm includes an audible indication and a visual indication.

84. (New) Apparatus for optimizing operation of a vehicle according to claim 71, further comprising means for mode selection between said active mode and said inactive mode.

**Remarks**

New claims 33-84 have been added. No new matter has been added by the amendments and new claims presented herein. Reconsideration and reexamination of the claims in light of the following remarks is requested.

**Patentable Claims**

Patent Owner thanks the Examiner for identifying and confirming claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17-30 as patentable in the present reexamination proceeding.

Patent Owner agrees that none of the prior art submitted by the Requester anticipates or renders obvious the patent claims. The Patent Owner comments here on certain ambiguities in the Examiner's Statement of Reasons for Patentability and/or Confirmation.

The Examiner notes that none of the prior art of record discloses "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle." The Patent Owner agrees.

When discussing "Jurgen," the Examiner states: "The '781 Patent's thresholds allow the engine to reach a state of overinjection." The Examiner's statement is true. But the statement is ambiguous such that it could be misconstrued to imply that "overinjection" is a consequence of the claimed invention. Any such implication is manifestly inconsistent with the invention and wrong. Rather, every vehicle with an engine can operate in a "state of overinjection" as a result of inefficient driver operation.

Control No. 90013252

In the claimed invention, certain sensor data is used by a processor subsystem to trigger driver notifications regarding driver fuel inefficient operation and/or driver unsafe operation, not affect how fuel is injected into the vehicle's engine.

The Patent describes an inventive system that “notifies a driver of recommended corrections in vehicle operation and, under certain conditions, automatically initiates corrective action.” (*See* ‘781 Patent, at col. 1:7-9.) For example, in the Background of the Invention, the Patent describes how “fuel efficiency of a vehicle may vary dramatically based upon how the vehicle is operated. More specifically, operating a vehicle at excessive speed, excessive RPM and/or excessive manifold pressure will result in both reduced fuel economy and increased operating costs.” (*See id.* at col. 1:11-16.) The Patent continues: “To correct these type of *improper vehicle operations* are often surprisingly simple ... However, even when the solution is quite simple, oftentimes, the driver will be unaware of the need to take corrective action.” (*See id.* at col. 1:19-26 (emphasis added).) Accordingly, the system of the Patent aims to issue notifications that suggest a driver change how he or she is operating a vehicle in order to improve fuel economy/efficiency and safety.

One embodiment of a notification in the Patent is an “overinjection notification.” In the preferred embodiment, the system analyzes inputs from one or more sensors to make determinations regarding the vehicle’s “fuel consumption.” (*See id.* at col. 11:41 & col. 12:28-29.) Based on these determinations, when appropriate, the system provides “overinjection notifications” and/or “upshift/downshift notifications” that advise a driver

if his or her driving is fuel inefficient.<sup>1</sup> The system in the preferred embodiment therefore recommends actions (*e.g.*, easing off the throttle or slowing down when speeding) that, if taken by the driver, will result in “greater fuel efficiency.” (*See id.* at col. 13:44.)<sup>2</sup>

Stated another way, the invention of the Patent is not directed at a particular internal combustion engine programmed to inject fuel according to one scheme versus another internal combustion engine programmed to inject fuel according to another scheme. The claims in the Patent discussed by the Examiner are broadly directed at all fuel-consuming engines in vehicles.<sup>3</sup> Accordingly, the Patent describes that all engines in vehicles will inject as much fuel as driver demands by his or her operation of the vehicle. If the driver operates the vehicle in a fuel inefficient manner (*e.g.*, excessively speeding, abruptly accelerating, etc.), the engine will overinject more fuel than the engine would if the vehicle were being operated efficiently. In that circumstance, the inventive system of the Patent will provide the driver with a “overinjection notification” as an alert that his or her driving is fuel inefficient.

Moreover, again in the interest of a clear record, the Patent Owner addresses certain prior art identified by the Requester and discussed by the Examiner. The Patent Owner agrees that none of the prior art anticipates or renders obvious the examined patent claims.

---

<sup>1</sup> The upshift and downshift notifications are also related to fuel efficiency and protecting the engine from overrevving (excessive engine speed) or lugging (insufficient engine speed).

<sup>2</sup> The preferred embodiment also provides additional notifications regarding safe operation of the vehicle. It also describes situations where the system automatically alters operation of the vehicle in certain situations (*e.g.*, controlling the throttle).

<sup>3</sup> To be clear, Claim 31 is not limited to fuel-consuming engines.

First, the Examiner properly notes that what the Requester calls “Jurgen” does not render the claims invalid. At the threshold, however, the Requester has improperly presented “Jurgen” as a single prior art reference. Jurgen is actually a collection of chapters or articles written by different authors describing different vehicles (or, more accurately, particular implementations of components in different vehicles) entitled by “Automotive Electronics Handbook,” and edited by Mr. Jurgen. The sections of the chapter discussed by the Examiner are actually written by Gary Hirschlieb, Gottfried Schiller & Shari Stottler. The chapters Requester calls “Jurgen” therefore are at best a number of discrete prior art references properly analyzed under section 103. *See Kyocera Wireless Corp. v. International Trade Comm’n*, 545 F.3d 1340, 1351-52 (Fed. Cir. 2008) (holding that specifications collected in the GSM standard which had different authors were a section 103 prior art combination, not a single section 102 prior art reference).

Moreover, “unless a reference discloses within the four corners of the document not only all of the limitations claimed but also all of the limitations **arranged or combined in the same way as recited in the claim**, it cannot be said to prove prior invention of the thing claimed and thus cannot anticipate[.]”) *NetMoneyIN, Inc. v. Verisign, Inc.*, 545 F.3d 1359, 1371 (Fed. Cir. 2008) (emphasis added); *see also Therasense, Inc. v. Becton, Dickinson & Co.*, 593 F.3d 1325, 1332 (Fed. Cir. 2010) (“The way in which elements are arranged or combined in the claim must itself be disclosed ... in an anticipatory reference.”) Because anticipation requires that prior art elements must themselves be “arranged as in the claim,” the claims must not be “treated ... as mere catalogs of separate parts, in disregard of the part-to-part relationships set forth in the claims and that give the claims their meaning.” *Lindemann Maschinen-fabrik*

*GMBH v. Am. Hoist & Derrick Co.*, 730 F.2d 1452, 1459 (Fed. Cir. 1984). Beyond mislabeling “Jurgen” as a single prior art reference, Requester made the legal error of treating the patent claims as a mere catalogue of parts from which it may pick and choose from various chapters to construct **some** of the elements of the claims. *See In re Arkley*, 455 F.2d 586, 587 (CCPA 1971) (holding that “picking, choosing and combining various disclosures not directed related to each other” is legal error). Of course, Requester does not even allege that what it calls “Jurgen” anticipates any claims. Therefore, Requester made the next step of combining the various unrelated, cobbled-together parts of what it called “Jurgen” with other prior art references. Such hindsight cherry picking (particularly without anything other than conclusory lip service to motivation to combine) is the classic example of what is strictly forbidden for an obviousness inquiry. The Examiner correctly rejected Requester’s position. Nevertheless, in the interest of a clear prosecution record, Patent Owner has explained why there is no “Jurgen” reference.

In all events, the sections of the chapter in “Jurgen” referenced by the Examiner do not disclose any notification to a driver. Rather, the sections discuss a fuel shutoff scheme that is invisible to the driver. Under certain circumstances, depending on throttle position, engine speed and vehicle speed, the fuel shutoff scheme will result in turning off fuel injection during braking or coasting. That is, if appropriate, the engine will automatically execute a fuel saving strategy when the vehicle is slowing down to a stop. The sections of the chapter in “Jurgen” referenced by the Examiner, however, say nothing at all about driver contributions to fuel inefficiency that can be corrected. Accordingly, not only does the chapter sections relied upon by the Examiner fail to disclose the notification(s) required by the claim(s), it also does not discuss fuel

inefficient operation by a driver. The Patent Owner respectfully submits that the sections of the chapter of “Jurgen” discussed by the Examiner are marginally relevant at best.

Second, the Patent Owner agrees with the Examiner that “the Volkswagen ‘070’s teachings are directed towards shifting the gears of an engine.” The Examiner states that the Volkswagen ‘070 notes, according to the English translation, “a display of the route-specific fuel consumption provide in a vehicle.” But, as the Examiner correctly concludes, the Volkswagen ‘070 fails to disclose issuance of notifications (*e.g.*, a light that goes on or off when appropriate, a horn or chime that sounds when appropriate, a visual indication showing a deviation below a mean value when appropriate, etc.) when a driver is operating a vehicle in a fuel inefficient manner.<sup>4</sup>

#### **Litigation Activity**

According to 37 C.F.R. 1.565(a), Applicants notify the Office that the following cases have been stayed until resolution of the present reexamination proceeding: *Velocity Patent LLC v. Mercedes-Benz USA, LLC*, Civil Action No. 1:13-cv-08413 (N.D. Ill.); *Velocity Patent LLC v. Audi of America, Inc.*, Civil Action No. 1:13-cv-08418 (N.D. Ill.); *Velocity Patent LLC v. Chrysler Group, LLC*, Civil Action No. 1:13-cv-08419 (N.D. Ill). Under the circumstances, Patent Owner has responded to the Office Action in less than a month so that present reexamination might continue to proceed with special dispatch. Patent Owner thanks the Examiner in advance for the Examiner’s diligent attention to this matter so that the litigation stays identified above may be lifted shortly.

---

<sup>4</sup> Patent Owner believes that many additional claim elements are not disclosed by the Volkswagen ‘070, and has identified them in the related litigation(s). Requester of course concedes that the Volkswagen ‘070 does not anticipate any patent claims.

Control No. 90013252

Patent Owner also notes for the Examiner's attention the pending petition for inter partes review filed by Mercedes-Benz USA, LLC and Mercedes-Benz U.S. International, Inc. concerning claims 31 and 32. The petition can be located at *Mercedes-Benz USA, LLC et. al. v. Velocity Patent, LLC*, Case IPR 2014-0127. Patent Owner believes that, in light of Patent Owner's amendment to Claim 31 here, the petition must be denied as a matter of law.

### **Claim Rejections**

Claim 31 is rejected under 35 U.S.C. 102(b) as being unpatentable over Davidian (U.S. Patent No. 5,357,438).

Without conceding that the Examiner's stated reasons in support of the rejection are correct, the Patent Owner has amended Claim 31, thereby mooting the Examiner's rejection. The Patent Owner respectfully submits that the elements added to Claim 31 are not disclosed in either Davidian or Tonkin. Specifically, both Davidian and Tonkin fail to disclose (1) an engine speed sensor, (2) a throttle controller for controlling a throttle of said engine of said vehicle, (3) wherein said processor subsystem selectively reduces said throttle based upon the data received from said radar detector and (4) further wherein the processor subsystem includes (i) an active mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the vehicle proximity alarm and reduces the throttle based upon the data received from said radar detector, and (ii) an inactive mode in which the processor subsystem activates the vehicle proximity alarm circuit to issue the alarm and the throttle is not selectively reduced based upon the data received from said radar detector. Patent Owner respectfully submits that Claim 31 is now

Control No. 90013252

significantly and patentably distinct from Davidian, Tonkin or any combination of the two (which Patent Owner does not concede there would be any motivation to do).

Claim 32 is rejected under 35 U.S.C. 103(a) as being unpatentable over Davidian in view of Tonkin (PCT Pub. No. WO/02853). Claim 32 depends from Claim 31, which is patentable for reasons discussed above. Accordingly, the Examiner's rejection is moot.

#### **New Claims**

Because new claims 33-59 depend from confirmed patentable claims 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17-30, the new claims are also patentable. New claims 60-84 depend from amended claim 31, which is patentable for reasons discussed above. While Patent Owner believes that all of the examined claims are patentable over the prior art of record, out of an abundance of caution, Patent Owner has submitted the new dependent claims to further distinguish all of the prior art cited by Requester under the provisions of 35 U.S.C. § 301.

**Conclusion**

In view of the foregoing remarks, Patent Owner submits that all of the currently pending claims are in allowable form and that the application is in condition for allowance. Therefore, Patent Owner respectfully requests that a timely Notice of Allowance be issued in this case. If for any reason the Examiner is unable to allow the application and feels that an interview would be helpful to resolve any remaining issues, the Examiner is requested to contact the undersigned attorney at (312) 283-8555.

Respectfully submitted,

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**Part II SUMMARY OF ACTION**

- 1a.  Claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17-32 are subject to reexamination.
- 1b.  Claims 3, 6, 9, 11, 14 and 16 are not subject to reexamination.
2.  Claims \_\_\_\_\_ have been canceled in the present reexamination proceeding.
3.  Claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17-30 are patentable and/or confirmed.
4.  Claims 31, 32 are rejected.
5.  Claims \_\_\_\_\_ are objected to.
6.  The drawings, filed on \_\_\_\_\_ are acceptable.
7.  The proposed drawing correction, filed on \_\_\_\_\_ has been (7a)  approved (7b)  disapproved.
8.  Acknowledgment is made of the priority claim under 35 U.S.C. § 119(a)-(d) or (f).  
a)  All b)  Some\* c)  None of the certified copies have  
1  been received.  
2  not been received.  
3  been filed in Application No. \_\_\_\_\_ .  
4  been filed in reexamination Control No. \_\_\_\_\_ .  
5  been received by the International Bureau in PCT application No. \_\_\_\_\_ .
- \* See the attached detailed Office action for a list of the certified copies not received.
9.  Since the proceeding appears to be in condition for issuance of an *ex parte* reexamination certificate except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte* Quayle, 1935 C.D. 11, 453 O.G. 213.
10.  Other: \_\_\_\_\_

cc: Requester (if third party requester)

## DETAILED EX PARTE REEXAMINATION NON-FINAL OFFICE ACTION

### I. INTRODUCTION

This is a first Non-Final Office Action on the merits in the *Ex Parte* Reexamination of claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 32 of US Patent No. US 5,954,781 to Slepian et al., hereinafter “the ‘781 Patent”.

The present application is being examined under the pre-AIA first to invent provisions.

#### *A. References Cited in this Office Action*

1. The prior art patents and/or printed publications, hereinafter “the references”, which have been submitted 08/22/2014, have been considered and are relied upon in this Office Action are relisted as follows.

- a. Automotive Electronics Handbook, by Ronald Jurgen (“Jurgen”).
- b. U.S. Patent No. 5,477,452 to Milunas et al. (“Saturn ‘452”).
- c. U.S. Patent No. 4,559,599 to Habu et al. (“Toyota ‘599”).
- d. German Patent Application Publication No. 29 26 070 (“Volkswagen ‘070”).
- e. U.S. Patent No. 5,357,438 to Davidian (“Davidian”).
- f. PCT Publication No. WO 96/02853 (“Tonkin”).

## II. REJECTIONS

### A. Relevant Statutes – Claim Rejections

#### 1. *Claim Rejections - 35 USC § 102*

The following is a quotation of the appropriate paragraphs of pre-AIA 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

#### 2. *Claim Rejections - 35 USC § 103*

The following is a quotation of pre-AIA 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

### B. Detailed Analysis of the Rejection

The Examiner will use the shorthand notation of “1:1-5” for Column 1, lines 1-5.

1. Claim **31** is rejected under **pre-AIA 35 U.S.C. 102(b)** as being unpatentable over U.S. Patent No. 5,357,438 to Davidian, hereinafter “**Davidian**”.

RE: Claim 31

**Apparatus for optimizing operation of a vehicle, comprising:**

Davidian discloses an invention relating to an anti-collision system for vehicles. Therefore, preventing a vehicle from colliding with an object could result in the vehicle operating optimally.

**a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;**

It is seen in the '781 Patent the "radar detector" or as also stated in the specification, "radar device", is not specifically defined. It only states what its function. Davidian discloses such a device, "Vehicle 2 further includes a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle, a corresponding rear space sensor 10, and a pair of side sensors 11. All the space sensors are in the form of pulse (e.g., ultrasonic) transmitters and receivers, for determining the distance of the vehicle from an object, e.g., another vehicle, at front or rear. Space sensors may also be provided at the sides of the vehicle. Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc.", (e.g., Davidian, 4:52-66).

Davidian further discloses, "FIG. 7 is a circuit diagram of the microcomputer 4 and the other components of the electrical system. The microprocessor is indicated by block 100, its power supply by block 102, and its watchdog circuit by block 104. It includes a **transmitter 106** and a **receiver 108** for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 and the rear space sensor 10 for measuring the distance of the vehicle

Art Unit: 3992

from objects in front of and to the rear, of the vehicle, respectively.", (e.g., Davidian, 10:17 – 26).

Davidian further discloses, "As indicated earlier, the distance of the vehicle from an object is determined by the front space sensor 8 with respect to objects in front of the vehicle, and by the rear space sensor 10 with respect to objects at the rear of the vehicle. Each of these space sensors may be of known construction, including a transmitter as indicated at 106 in FIG. 7, and a receiver as indicated at 108. Thus, pulses are continuously transmitted by each transmitter, and the echoes from the objects in front of or to the rear of the vehicle are received by the respective receiver. The computer then measures the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.", (e.g., Davidian, 10:38 – 50).

**at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor;**

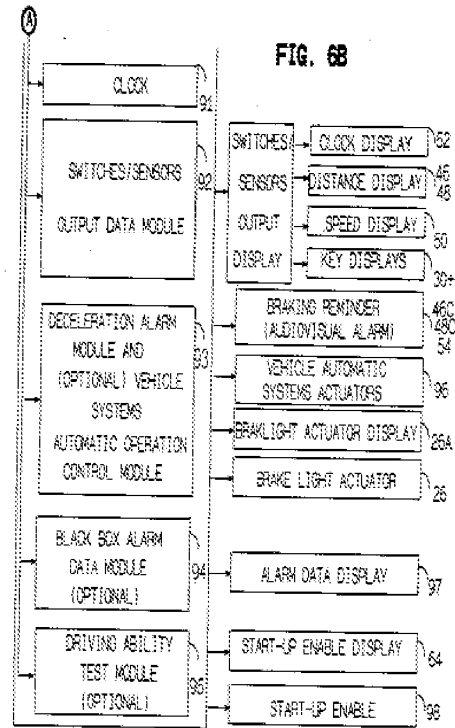

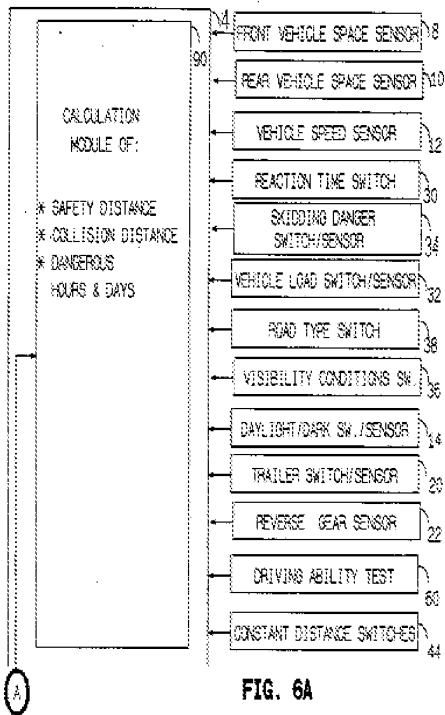

Davidian discloses "Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc," (e.g. Davidian, 4:60 – 66).

**a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;**

Davidian discloses, "FIGS. 6a, 6b, are a block diagram illustrating the microcomputer 4 and its inputs and outputs described earlier which enable it to continuously monitor the operation of the vehicle and to actuate first a Safety alarm, and then a Collision alarm whenever the vehicle may enter a danger-of-collision situation according to the various preset parameters and automatic parameters introduced into the computer. The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm.", (e.g., Davidian, 8:29 – 43). "Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12.", (e.g., Davidian 8:58 – 60).

E.g., Davidian, Figure 6A:

E.g., Davidian, Figure 6B:

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

Davidian discloses "Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.", (e.g., Davidian, 9:20 – 27).

"The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and **speed**; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger. A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated. The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162. Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.", (e.g., Davidian, 12:59 – 13:22).

**a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;**

Jurgen discloses an, "anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another, which is equal to or less than a danger-of-collision distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision.", (e.g., Davidian, 3:59 – 66).

"In the system described below, there are two alarms: a Collision alarm, which is actuated when the vehicle is determined to be within the danger-of- collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor, e.g., 1.25.", (e.g., Davidian, 4:14 – 16).

"Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and whether or not there is a collision danger (region 46c).", (e.g., Davidian, 6:25 – 29).

"Control panel 6 further includes a speaker 54 for producing an audio alarm in the event of a collision danger, in addition to the visually-indicated alarms of sections 46c and 48c of the displays 46 and 48.", (e.g., Davidian, 6:41 – 46).

"The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: ... a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...", (e.g., Davidian, 8:37 – 48, and Figs. 3, (ref. no. 46 & 48) and 6B, (ref. no. 46C & 48C).

**said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.**

Jurgen discloses a, "microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...", (e.g., Davidian, 8:37 – 43).

"Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.", (e.g., Davidian, 9:20 – 27).

"The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and **speed**; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be

Art Unit: 3992

actuated to first alert the driver of an approaching collision danger. A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated”, (e.g., Davidian, 12:59 – 13:11).

"Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.", (e.g., Davidian, 13:17 – 22).

2. Claim **32** is rejected under **pre-AIA 35 U.S.C. 103(a)** as being unpatentable over **Davidian** in view of PCT Publication No. WO 96/02853 to Tonkin, hereinafter “**Tonkin**”.

RE: Claim 32

**Apparatus for optimizing operation of a vehicle according to claim 31 wherein:**

Davidian discloses such as explained above in independent claim 31.

**said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and**

The Requester points out in the request, page that:

During prosecution of the '781 Patent, the Applicants stated that "the windshield wiper sensor [of claim 32] is **not** used to inform the operator as to whether the windshield wipers are on or off." Rather, according to the Applicants, "the sensor is used by the processor subsystem to classify road conditions as either 'dry' or 'wet'.", (e.g., Application 08/813,270, Response to Non-Final Office Action, dated 02/19/1999, page 12). When finding the specific teachings in the '781 Patent's specification, 9:35—47, it is seen that if the windshield wiper is off it is concluded that the vehicle is operated in "dry conditions" and selects a first speed/stopping distance table, if the windshield wiper are on it is concluded that the vehicle is operated in "wet conditions" and selects a second speed/stopping distance table. Therefore, 'off = dry' and 'on = wet'.

If the state of the wiper sensor 32 indicates that the windshield wiper is off, the processor subsystem 12 concludes that the vehicle is being operated in dry conditions and selects the speed/stopping distance table stored at the location 14c of the memory subsystem 14. If, however, the state of the wiper sensor 32 indicates that the windshield wiper is on, the processor subsystem 12 concludes that the vehicle is being operated in wet conditions and selects the speed/stopping distance table stored at the location 14d of the memory subsystem 14. From the selected speed/stopping distance table 14c or 14d, the processor subsystem 12 then retrieves the stopping distance for the speed at which the vehicle is travelling.

Therefore, under this interpretation, Davidian describes that the automatic sensors of the vehicle include a rain sensor 16, "The automatic sensors on vehicle 2 further include a daylight sensor 14, a rain sensor 16, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22.", (e.g., Davidian, 4:67 – 5:2), and, "Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.", (e.g., Davidian, 8:58 – 63). (col. 4, line 67 to col. 5, line 2). Furthermore, Davidian discloses keys that if depressed would

Art Unit: 3992

take into consideration road conditions and alter parameters in determining braking distance, i.e.,

“slippery conditions of the road”, (e.g., Davidian, 5:54 – 66),

Control panel 6 includes two keys 34 indicating the condition of the road with respect to the danger of 55 skidding thereon by the vehicle. Thus, key 34a would be depressed to indicate a slippery condition of the road and therefore a high danger of skidding, whereas key 34b would be depressed to indicate an unslippery condition of the road (e.g., dry) and therefore a low danger of 60 skidding.

Two keys 36 on the control panel 6 indicate the visibility condition of the road. Thus, key 36a would be depressed where the visibility condition is high, whereas key 36b would be depressed where it is low, 65 e.g., because of fog, sandstorm, snow, etc.

and (e.g., Davidian, 9:20 – 27).

Computer module 90 also includes information about 66 the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skid- 25 ding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.

It can be interpreted that the activation of the key is much the same as activating a windshield wiper.

Tonkin describes that safe stopping distances can be adjusted for prevailing weather conditions, and that information regarding the weather may be obtained by the warning system controller ascertaining if the windscreen wipers are in use or have been in use recently due to rain (col. 18, lines 9 to 16). Thus, the combination of Davidian and Tonkin discloses a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, as described in claim 32. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Tonkin with Davidian because adjusting what has been

predetermined determined as a safe stopping distance for a vehicle, based on road conditions, would aid in operating the vehicle in a safe manner and avoid potential dangerous instances.

**said memory subsystem further storing a second vehicle speed/ stopping distance table;**

Davidian discloses a look-up table for predetermined defined conditions, i.e., skidding danger as previously discussed. "Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.", (e.g., Davidian, 9:20 – 27). As previously stated, the skidding danger condition of Davidian is part of determining if the road conditions are wet or dry. Although not specifically stated, one may interpret the different "predetermined defined conditions" as other tables to be used when the determination is made that the road conditions fall under one of those categories.

Tonkin describes that "safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to weather and possibly for different severities of poor weather.", (e.g., Tonkin, 18:16 - 19). "The size of the enhanced safe distance and enlarged safety envelope will generally be predetermined so as to correspond to typical parameters appropriate for driving under adverse road conditions. These parameters may for example be stored in a look up table allowing the parameters to be determined from the signals received by the controller together with the parameters defining the normal safety envelope.",

Art Unit: 3992

(e.g., Tonkin, 3:25 – 32). Tonkin further discloses a “two level warning system can be provided wherein, a first warning, e.g. turn on all lamps 13, when a trailing vehicle 18 encroaches within the safe stopping distance of the subject vehicle 16 for poor weather, and a second warning e.g. flash all or some lamps 13, if the trailing vehicle encroaches within the safe stopping distance for good conditions, (e.g., Tonkin, 18:19 - 26).

Thus, the combination of Davidian and Tonkin discloses a memory subsystem storing a second vehicle speed/stopping distance table, as described in claim 32. It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Tonkin with Davidian because storing a second type of “look up table”, or multiple tables, would allow the system to operate in multiple types of driving conditions, i.e., road type, skidding danger, vehicle load and tires pressure, (e.g., Davidian, 9:20 – 27), prevailing weather conditions for different severities of poor weather., (e.g., Tonkin, 18:16 - 19).

**if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;**

**AND**

**if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor**

**and said second vehicle speed/stopping distance table stored in said memory subsystem.**

As previously stated, in the rejection of claim 31, Davidian discloses said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem, see the above rejection of claim 31. The noticeable difference in these limitations is the determination of whether or not the road conditions are wet or dry and utilizing the specific vehicle speed/stopping distance table accordantly.

As previously stated, Davidian describes that the automatic sensors of the vehicle include a rain sensor 16, "The automatic sensors on vehicle 2 further include a daylight sensor 14, a rain sensor 16, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22.", (e.g., Davidian, 4:67 – 5:2), and, "Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.", (e.g., Davidian, 8:58 – 63). (col. 4, line 67 to col. 5, line 2). Furthermore, Davidian discloses keys that if depressed would take into consideration road conditions and alter parameters in determining braking distance, i.e., "slippery conditions of the road", (e.g., Davidian, 5:54 – 66). It can be interpreted that the activation of the key is much the same as activating a windshield wiper.

Tonkin describes that safe stopping distances can be adjusted for prevailing weather conditions, and that information regarding the weather may be obtained by the warning system

controller ascertaining if the windscreen wipers are in use or have been in use recently due to rain (col. 18, lines 9 to 16).

Tonkin further discloses a “two level warning system can be provided wherein, a first warning, e.g. turn on all lamps 13, when a trailing vehicle 18 encroaches within the safe stopping distance of the subject vehicle 16 for poor weather, and a second warning e.g. flash all or some lamps 13, if the trailing vehicle encroaches within the safe stopping distance for good conditions, (e.g., Tonkin, 18:19 - 26).

Thus, the combination of Davidian and Tonkin discloses a determination as to the road conditions and selecting a specific set of parameters, i.e., two or more “look up table”, based on the road condition, to utilize for sending an alert to the operator of the vehicle.

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Tonkin with Davidian because selecting a specific set of parameters, “look up table”, or multiple tables, based on specific driving conditions would allow the system to adjusting what has been predetermined determined as a safe stopping distance for a vehicle being operating and avoid potential dangerous instances by warning the vehicle’s operator of a potential collision based on those specific set of parameters based on the road conditions, i.e., road type, skidding danger, vehicle load and tires pressure, (e.g., Davidian, 9:20 – 27), prevailing weather conditions for different severities of poor weather., (e.g., Tonkin, 18:16 - 19).

### III. STATEMENT OF REASONS FOR PATENTABILITY AND/OR CONFIRMATION

The following is an Examiner's statement of reasons for patentability and/or confirmation of the claims found patentable in this reexamination proceeding: The prior art of Jurgen, Saturn '452, Toyota '599, Volkswagen '070, Davidian, and Tonkin do not disclose, alone or in combination, the limitation of "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle", as stated in claims 1, 7, 13, 17, 23, 26, and 28 of the '781 Patent.

The '781 Patent teaches the overinjection notification circuit as being activated when there is excessive fuel being supplied to the vehicle's engine. This overinjection notification circuit is activated when said processor subsystem determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, see claim 1 and similarly claimed limitations found in independent claims 7, 13, 17, 23, 26, and 28, and the teachings stated in the '781 Patent 12:64 – 13:35.

Jurgen discloses a fuel injection shut off which utilizes a threshold. This fuel shut off is activated when a threshold is reached. "During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.", (e.g., Jurgen, page 12.22). "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.", (e.g., Jurgen, page 12.4). "Using the inputs of

Art Unit: 3992

engine RPM and vehicle speed to the electronic control unit, **thresholds** can be established for limiting these **variables with fuel cutoff. When the maximum speed is achieved, the fuel injectors are shut off. When the speed decreases below the threshold, fuel injection resumes.**", (e.g., Jurgen, page 12.14). "During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque.", (e.g., Jurgen, page 12.17). Though, Jurgen does teach different sensor readings being used to tell the ECU when to shut off the fuel, the threshold of these values does not cause the engine to have excess fuel, i.e., their threshold prevents overinjection of fuel whereas the '781 Patent's thresholds allow the engine to reach a state of overinjection. Therefore, Jurgen does not disclose the fuel ever being **overinjected** because of the threshold that is used and does not teach the claimed limitation stated above with regards to **overinjection**.

Saturn '452 discloses, "A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear from the present gear. A method of determining the shift point is provided based upon actual operating

parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear.", (e.g., Saturn '452, Abstract). "Shift indicators are commonly used on manual transmission vehicles to assist non-expert drivers in determining when it is appropriate to shift the transmission to a higher gear in order to maximize driving fuel economy.", (e.g., Saturn '452, 1:10 – 13). Saturn '452 further discloses a threshold value close to unity providing a shift point which achieves maximum fuel economy, but does not specifically disclose a "fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle" either alone or in combination with the References specifically discussed in this Reexam case.

Toyota '599 discloses performing shift-up and shift-down alerts based on different criteria, one of which includes fuel consumption. Each shift position corresponding to the optimum fuel consumption rate in accordance with various parameters calculated, (e.g., Toyota '599, 2:59 – 63). Toyota '599 further discloses, "The indicator 10 includes a shift-up indicating lamp 10a and a shift-down indicating lamp 10b", (e.g., Toyota '599, 2:64 – 3:3). "However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_e$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation.", (e.g., Toyota '599, 7:29 – 38). As seen, Toyota '599 does not disclose an overinjection notification based upon data received from said plurality of sensors.

Volkswagen '070 discloses, "a display of the rout-specific fuel consumption provide in a vehicle", (e.g., Volkswagen '070, p. 9 of English translation). Volkswagen '070 further discloses, "Looking initially at operating range I remote from full load, the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear, at an operating point that lies to the left of operating range I in the diagram of Figure 1. Accordingly, the device of the present invention generates a signal that asks the operator, i.e., normally the driver, to shift to a higher gear, which is indicated in Figure 1 by the upward pointing arrow within operating range I", (e.g., Volkswagen '070, pp. 6 – 7, English translation). Volkswagen '070 teachings are towards shifting the gears of an engine and not overinjection of fuel and alerting a driver that too much fuel is being supplied to the engine. Therefore, Volkswagen '070 does not disclose the limitation discussed above.

As to Davidian and Tonkin, as was previously seen in the Order, these reference were not the basis for the SNQ for the limitation regarding overinjection, see Order. Therefore, Davidian and Tonkin, alone or in combination with the above references, disclose, "a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle".

Any comments considered necessary by PATENT OWNER regarding the above statement must be submitted promptly to avoid processing delays. Such submission by the patent owner should be labeled: "Comments on Statement of Reasons for Patentability and/or Confirmation" and will be placed in the reexamination file.

Claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 30 are confirmed as patentable in this reexamination proceeding.

#### **IV. CONCLUSION**

##### **A. Submissions**

1. Information Disclosure Statement (IDS)

The IDS submission on 08/22/2014 has been considered. It is to be noted, however, that where patents, publications, and other such items of information are submitted by a party (patent owner or requester) in compliance with the requirements of the rules, the requisite degree of consideration to be given to such information will be limited by the degree to which the party filing the information citation has explained the content and relevance of the information. In instances, where no explanation of citations (items of information) is required and none is provided for an information citation, only a cursory review of that information is required. The examiner need only perform a cursory evaluation of each unexplained item of information, to the extent that he/she needs in order to determine whether he/she will evaluate the item further. If the cursory evaluation reveals the item not to be useful, the examiner may simply stop looking at it. This review may often take the form of considering the documents in the same manner as other

documents in Office search files are considered by the Examiner while conducting a search of the prior art in a proper field of search. The initials of the Examiner, in this proceeding, placed adjacent to the citations on the PTO/SB/08A or its equivalent, without an indication in the record to the contrary in the record, do not signify that the information has been considered by the Examiner any further than to the extent noted above. The same degree of consideration was provided for the references merely cited with the request but for which no explanation regarding the content and relevance of the information was provided. See MPEP 609, Chapter 0600, pages 192-193 of pages 1-197 - MPEP Eighth Edition, Revision 8 (July 2010). The examiner notes that due to the unusually large number of references cited, and the absence of any description of the relevance of the references, it should be assumed that only the most cursory review of the cited documents consistent with these guidelines has been performed. If applicant is aware of any information that might be of particular relevance, it should be pointed out in order to insure a higher degree consideration.

2. In order to ensure full consideration of any amendments, affidavits or declarations, or other documents as evidence of patentability, such documents must be submitted in response to this Office action. Submissions after the next Office action, which is intended to be a final action, will be governed by the requirements of 37 CFR 1.116, after final rejection and 37 CFR 41.33 after appeal, which will be strictly enforced.

**B. Extension of time**

Extensions of time under 37 CFR 1.136(a) will not be permitted in these proceedings because the provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Additionally, 35 U.S.C. 305 requires that reexamination proceedings "will be conducted with special dispatch" (37 CFR 1.550(a)). Extensions of time in ex parte reexamination proceedings are provided for in 37 CFR 1.550(c). See MPEP § 2265.

### **C. Litigation Reminder**

The patent owner is reminded of the continuing responsibility under 37 CFR 1.565(a) to apprise the Office of any litigation activity, or other prior or concurrent proceeding, involving in the '781 Patent throughout the course of this reexamination proceeding. See MPEP §§ 2207, 2282 and 2286.

### **D. Amendment in Reexamination Proceedings**

Patent owner is notified that any proposed amendment to the specification and/or claims in this reexamination proceeding must comply with 37 CFR 1.530(d)-(j), must be formally presented pursuant to 37 CFR 1.530(d) - (j), and must contain any fees required by 37 CFR 1.20(c). See MPEP § 2234 and 2250(IV) for examples to assist in the preparation of proper proposed amendments in reexamination proceedings.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

- See attached certification statement.
- The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.
- A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Patrick D. Richards/	Date (YYYY-MM-DD)	2014-08-22

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

See attached certification statement.

The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Patrick D. Richards/	Date (YYYY-MM-DD)	08/22/14
Name/Print	Patrick Richards	Registration Number	48905

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

### Warnings:

### Information:

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

See attached certification statement.

The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Patrick D. Richards/	Date (YYYY-MM-DD)	2014-08-22
Name/Print	Patrick Richards	Registration Number	48905

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

See attached certification statement.

The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.

A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Patrick D. Richards/	Date (YYYY-MM-DD)	08/22/14
Name/Print	Patrick Richards	Registration Number	48905

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

**All participants (USPTO official and patent owner):**

- (1) Sudhanshu C. Pathak, SPRS 3992 (3)  
(2) Alisha bull (4)

Date of Telephonic Interview: 07/17/2014.

**A. The USPTO official requested waiver of the patent owner's statement pursuant to the pilot program for waiver of patent owner's statement in ex parte reexamination proceedings.\***

- The patent owner **agreed** to waive its right to file a patent owner's statement under 35 U.S.C. 304 in the event reexamination is ordered for the above-identified patent.
- The patent owner **did not agree** to waive its right to file a patent owner's statement under 35 U.S.C. 304 at this time.
- USPTO personnel were unable to reach the patent owner.\*\*

**B. The Patent Owner of record telephoned the Office and indicated they would like to participate in the pilot program for waiver of patent owner's statement in ex parte reexamination proceedings.\***

- The Patent owner of record telephoned the Office and **agreed** to waive its right to file a patent owner's statement under 35 U.S.C. 304 in the event reexamination is ordered for the above-identified patent.

The patent owner is not required to file a written statement of this telephone communication under 37 CFR 1.560(b) or otherwise. However, any disagreement as to this interview summary must be brought to the immediate attention of the USPTO, and no later than one month from the mailing date of this interview summary. Extensions of time are governed by 37 CFR 1.550(c).

\*For more information regarding this pilot program, see *Pilot Program for Waiver of Patent Owner's Statement in Ex Parte Reexamination Proceedings*, 75 Fed. Reg. 47269 (August 5, 2010), available on the USPTO Web site at <http://www.uspto.gov/patents/law/notices/2010.jsp>.

\*\*The patent owner may contact the USPTO personnel at (571) 272-7705 or at the telephone number provided below if the patent owner decides to waive the right to file a patent owner's statement under 35 U.S.C. 304.

--The MAILING DATE of this communication appears on the cover sheet with the correspondence address--

The request for *ex parte* reexamination filed **22 May 2014** has been considered and a determination has been made. An identification of the claims, the references relied upon, and the rationale supporting the determination are attached.

Attachments: a)  PTO-892, b)  PTO/SB/08, c)  Other: IDS List

1.  The request for *ex parte* reexamination is GRANTED.

**RESPONSE TIMES ARE SET AS FOLLOWS:**

For Patent Owner's Statement (Optional): **TWO MONTHS** from the mailing date of this communication (37 CFR 1.530 (b)). **EXTENSIONS OF TIME ARE GOVERNED BY 37 CFR 1.550(c).**

For Requester's Reply (optional): **TWO MONTHS** from the **date of service** of any timely filed Patent Owner's Statement (37 CFR 1.535). **NO EXTENSION OF THIS TIME PERIOD IS PERMITTED.** If Patent Owner does not file a timely statement under 37 CFR 1.530(b), then no reply by requester is permitted.

2.  The request for *ex parte* reexamination is DENIED.

This decision is not appealable (35 U.S.C. 303(c)). Requester may seek review by petition to the Commissioner under 37 CFR 1.181 within **ONE MONTH** from the mailing date of this communication (37 CFR 1.515(c)). **EXTENSION OF TIME TO FILE SUCH A PETITION UNDER 37 CFR 1.181 ARE AVAILABLE ONLY BY PETITION TO SUSPEND OR WAIVE THE REGULATIONS UNDER 37 CFR 1.183.**

In due course, a refund under 37 CFR 1.26 ( c ) will be made to requester:

- a)  by Treasury check or,
- b)  by credit to Deposit Account No. \_\_\_\_\_, or
- c)  by credit to a credit card account, unless otherwise notified (35 U.S.C. 303(c)).

/DAVID ENGLAND/  
Primary Examiner, Art Unit 3992

cc:Requester ( if third party requester )

Art Unit: 3992

1. The present application is being examined under the pre-AIA first to invent provisions.

### **DECISION GRANTING EX PARTE REEXAMINATION**

A Request for *ex parte* reexamination affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15 and 17 – 32 of United States Patent Number 5,954,781 (hereafter “the ‘781 Patent”) has been submitted on 05/22/2014.

Extensions of time under 37 CFR 1.136(a) will not be permitted in these proceedings because the provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Additionally, 35 U.S.C. 305 requires that *ex parte* reexamination proceedings "will be conducted with special dispatch" (37 CFR 1.550(a)). Extensions of time in *ex parte* reexamination proceedings are provided for in 37 CFR 1.550(c).

### **Prosecution History**

The ‘781 Patent was issued on September 21 1999 from U.S. Application Serial No. 08/813,270, hereinafter “the ‘270 Application”, filed on March 10, 1997.

The prosecution history of the ‘781 Patent includes:

The '270 application was filed on March 10, 1997 with 32 claims, of which application claims 1, 14, 18, and 27 were the only independent claims. Among these independent claims, application claim 1 included a fuel overinjection circuit, application claim 14 included a fuel overinjection circuit, an upshift notification circuit, and a downshift notification circuit,

Art Unit: 3992

application claim 18 included a vehicle proximity alarm, and application claim 27 included a fuel overinjection circuit and a vehicle proximity alarm.

In the only Office Action, dated August 6, 1998, application claims 1, 2 and 4 to 6 were rejected as obvious in view of U.S. Patent No. 4,901,701 to Chasteen (copy attached as Exhibit 3), application claim 3 was rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 4,631,515 to Blee et al. (copy attached as Exhibit 4), and application claims 7, 18 to 24, 27, and 28 were rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 5,708,584 to Doi et al. (copy attached as Exhibit 5).

In the Office Action, the Examiner stated that application claims 8 to 13, 25, 26, and 29 to 32 included allowable subject matter. Specifically, the Examiner stated that application claims 8, 25, and 29 included allowable subject matter on the basis that "the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit." Similarly, the Examiner stated that application claims 11, 26, and 31 included allowable subject matter on the basis that "the prior art fails to disclose a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit." In addition, application claims 14 - 17, which included both an upshift notification circuit and a downshift notification circuit, were allowed on the basis that:

the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

In response to this Office Action, the applicant submitted an Amendment on February 8, 1999 with numerous amendments, see the response to Office Action and the Request pages 6 – 13 for further explanation. The '270 Application was subsequently allowed, see Notice of Allowance dated 04/21/1999 or the Request pages 13 and 14 for further details. The Examiner stated in their reasons for allowance that:

The prior art fails to disclose an apparatus for optimizing operation of a vehicle and comprising an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive speed and the processor determines when to activate the upshift notification circuit; and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing

a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

The Notice of Allowance further states that:

Nor does the prior art disclose [sic] a fuel overinjection notification circuit coupled to the processor subsystem, wherein the fuel overinjection notification circuit issuing a notification that excess fuel is being supplied to the engine of the vehicle and the processor subsystem determining whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor.

Additionally, the Notice of Allowance states:

Nor does the prior art disclose [sic] that the processor subsystem determines whether to activate the vehicle proximity alarm circuit based upon separation distance data received from the radar detector, vehicle speed, stopping distance table stored in the memory subsystem.

### Proposed Substantial New Question of Patentability

Third Party Requester ("Requester") identifies the following printed publications as evidence that a substantial new question should be raised in the Request, see pp. 15-16.

1. Automotive Electronics Handbook, by Ronald Jurgen ("Jurgen"), attached as exhibit 11.
2. U.S. Patent No. 5,477,452 to Milunas et al. ("Saturn '452"), attached as exhibit 12.
3. U.S. Patent No. 4,559,599 to Habu et al. ("Toyota '599"), attached as exhibit 13.
4. German Patent Application Publication No. 29 26 070 ("Volkswagen '070"), attached as exhibit 14.
5. U.S. Patent No. 5,357,438 to Davidian ("Davidian"), attached as exhibit 15.

6. U.S. Patent No. 4,061,055 to Iizuka et al. ("Nissan '055"), attached as exhibit 16.
7. U.S. Patent No. 5,121,324 to Rini et al. ("Mack '324"), attached as exhibit 17.
8. U.S. Patent No. 3,925,753 to Auman et al. ("GM '452"), attached as exhibit 18.
9. PCT Publication No. WO 96/02853 ("Tonkin"), attached as exhibit 19.

Requester has alleged a substantial new question, "SNQ", of patentability in light of proposed rejections which are stated below:

- The 1<sup>st</sup> Proposed Rejection: Claim 1 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Saturn '452.
- The 2<sup>nd</sup> Proposed Rejection: Claims 1, 7, and 13 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Toyota '599.
- The 3<sup>rd</sup> Proposed Rejection: Claims 1, 7, and 13 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Volkswagen '070.
- The 4<sup>th</sup> Proposed Rejection: Claims 17-23 and 26 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Davidian.
- The 5<sup>th</sup> Proposed Rejection: Claims 17-23 and 26 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Davidian.
- The 6<sup>th</sup> Proposed Rejection: Claims 17-21 and 23 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Davidian.

Art Unit: 3992

- The 7<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Nissan '055.
- The 8<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Mack '324.
- The 9<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and GM '753.
- The 10<sup>th</sup> Proposed Rejection: Claim 31 is alleged as Anticipated Under 35 U.S.C. § 102(b) by Davidian.
- The 11<sup>th</sup> Proposed Rejection: Claims 31 and 32 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Tonkin and Doi et al.

Requester has proposed rejections for dependent claims that are not the basis for the SNQ, which are stated below:

- The 12<sup>th</sup> Proposed Rejection: Claims 2, 4, and 5 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Chasteen.
- The 13<sup>th</sup> Proposed Rejection: Claims 2, 4, 5, 8, 10, 12, and 15 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Chasteen.
- The 14<sup>th</sup> Proposed Rejection: Claims 2, 4, 5, 8, 10, 12, and 15 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Chasteen.

- The 15<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Toyota '599, Davidian, and Tonkin.
- The 16<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, Davidian, and Tonkin.
- The 17<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Saturn '452, Davidian, and Tonkin.
- The 18<sup>th</sup> Proposed Rejection: Claims 24 and 25 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Saturn '452, Davidian and Chasteen.
- The 19<sup>th</sup> Proposed Rejection: Claims 24, 25, and 27 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Toyota '599, Davidian and Chasteen.
- The 20<sup>th</sup> Proposed Rejection: Claims 24, 25, and 27 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, Davidian and Chasteen.
- The 21<sup>st</sup> Proposed Rejection: Claim 32 is alleged as Obvious Under 35 U.S.C. § 103(a) in in View of the combination of Davidian and Tonkin.

**Analysis of Substantial New Question of Patentability**

A SNQ of patentability is raised by a cited patent or printed publication when there is a substantial likelihood that a reasonable examiner would consider the prior art patent or printed publication important in deciding whether or not the claim is patentable. A SNQ of patentability is not raised by prior art presented in a reexamination request if the Office has previously considered (in an earlier examination of the patent) the same question of patentability as to a patent claim favorable to the patent owner based on the same prior art patents or printed publications. In re Recreative Technologies, 83 F.3d 1394, 38 USPQ2d 1776 (Fed. Cir. 1996). The substantial new question of patentability may be based on art previously considered by the Office if the reference is presented in a new light or a different way that escaped review during earlier examination. MPEP §2216.

It is not sufficient that a request for reexamination merely proposes one or more rejections of a patent claim or claims as a basis for reexamination. It must first be demonstrated that a patent or printed publication that is relied upon in a proposed rejection presents a new, non-cumulative technological teaching that was not previously considered and discussed on the record during the prosecution of the application that resulted in the patent for which reexamination is requested, and during the prosecution of any other prior proceeding involving the patent for which reexamination is requested. MPEP §2216.

**Basis of SNQ**

The '781 Patent was issued on September 21, 1999 from the '270 Application, filed on March 10, 1997. The previous Examiner of the '270 Application concluded the reasons for allowance for claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 27 was the prior art failed to teach

or suggest upshift or downshift notification circuits. Therefore the limitations that are the basis of the SNQ of patentability affecting independent claims 1, 7, 13, 17, 23, 26, and their dependent claims 2, 4, 5, 8, 10, 12, 15, 18 – 22, 24, 25 and 27, teaches the upshift or downshift and reads as follows:

“an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.”

OR

“a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.”

With respect to claims 28 - 30, the applicant in the original prosecution emphasized that the prior art failed to teach a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Therefore the limitation disclosed in independent claim 28 which is the basis of the SNQ of patentability, and also affecting dependent claims 29 and 30, reads as follows:

“said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.;said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.”

With respect to claims 31 and 32, the applicant in the original prosecution emphasized that the prior art failed to teach a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. The prosecution history focused on a vehicle proximity alarm that is activated based on these three parameters and was the basis for the reasons for allowance on these claims. Therefore the limitation disclosed in independent claim 31 which is the basis of the SNQ of patentability, also affecting dependent claim 32, reads as follows:

“said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

**Alleged SNQ based upon Jurgen**

Jurgen is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, 26, 28 of the '781 Patent is raised as stated in the First to Ninth proposed rejections, see above. Jurgen was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal drivability.

(Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also discloses that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Jurgen illustrates these hardware parts:

FIGURE 13.1 Overview of hardware parts.

Jurgen also discloses that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. "In the event that the particular shift characteristic is crossed (excessive/insufficient) by one of either of the two input valves, the electronic ECU releases the shift by

activating the related actuator. This can be a direct shift into the target gear or by a serial activation of specific actuators in a fixed sequence to the target gear, depending on the transmission hardware design." (Page 13.9). "The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application." *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jorgen, therefore, discloses "an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed" as taught in Independent claims 1, 7, 13, 17, 23, and 26.

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Jorgen teachings are new and non-cumulative. Accordingly, Jorgen raises a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4, 5, 8, 10, 12, 15, 18 – 22, 24, 25, and 27 are brought in at least due to their dependency on Independent claims 1, 7, 13, 17, 23, and 26.

Jorgen discloses fuel injection notification circuit, which issues a notification to shut off fuel in certain situations. For Example, the ECU disclosed in Jorgen can shut of fuel in certain situation by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides a notification to the fuel injectors when a fuel cutoff state is reached.

Jurgen discloses based upon data received from said plurality of sensors, when to activate said fuel injection circuit and when to activate said upshift/downshift notification circuit. For example, the combination of the ECU, which monitors all of the vehicle's sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Accordingly, Jurgen teachings, either alone or in combination with a secondary reference, would be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Further, Jurgen teachings are new and non-cumulative.

Accordingly, Jurgen raises a substantial new question of patentability as to at least independent claim 28 of the '781 Patent that have not been decided in a previous examination. Dependent claims 29 and 30 are brought in at least due to their dependency on Independent claim 28.

#### **Alleged SNQ based upon Saturn '452**

Saturn '452 Patent is presented to determine if a SNQ of patentability regarding Independent claims 1, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the First and Sixth proposed rejection, see above. Saturn '452 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Saturn '452 discloses an upshift notification circuit connected to the control unit, which indicates "via line 60 the state of an upshift indicator light or equivalent visual display." Col. 2, lines 42 to 55. Therefore, it is seen that Saturn '452 discloses "an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed" and "said processor

subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift notification circuit." as taught in Independent claims 1, 17, and 23.

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 17, and 23 of the '781 Patent. Further, Saturn '452 teachings are new and non-cumulative. Accordingly, Saturn '452 raises a substantial new question of patentability as to at least independent claims 1, 17, and 23 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4, 5, 18 – 22, 24, and 25 are brought in at least due to their dependency on Independent claims 1, 17, and 23.

**Alleged SNQ based upon Toyota '599**

Toyota '599 is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the Second and Forth proposed rejections, see above. Toyota '599 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Toyota '599 discloses a "shift indication apparatus coupled to a plurality of sensors. An overview of this system is illustrated in Figure 1:

Toyota '599 discloses that indicator lamps that tell the driver to shift up or shift down are lit by the microcomputer in order to tell the driver when to shift to improve fuel economy "Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the drive that the speed change from current shift position to the one step shifting up position  $SP_{+1}$  is preferable." Col. 5, line 63 to col. 6, line 2. "However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_c$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation." E.g. col. 7, lines 29 to 38. Therefore, Toyota '599 discloses "an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed" and "said processor subsystem determining, based upon data received from said plurality of sensors,.. when to activate said upshift[/downshift] notification circuit."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Toyota '599 teachings are new and non-cumulative. Accordingly, Toyota '599 raises a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4,

5, 8, 10, 12, 15, 18 – 22, 24, 25, and 27 are brought in at least due to their dependency on Independent claims 1, 7, 13, 17, 23, and 26.

### Alleged SNQ based upon Volkswagen '070

Volkswagen '070 is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the Third and Fifth proposed rejections, see above. Volkswagen '070 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Volkswagen '070 discloses:

Volkswagen '070 discloses a device "that assists the operator of [an] internal combustion engine equipped with a conventional transmission." Page 5. The device receives an engine speed signal "with the aid of known sensor systems" and uses it to activate an "engine-speed dependent change-over switch 6." Page 7. Volkswagen '070 describes two operating ranges, I and II, and the change-over switch 6 indicates that an upshift or downshift is necessary when the limits of those ranges (e.g., the RPM set point) is reached. Pages 6–8. For example, Figure 2 of Volkswagen '070 illustrates the change-over switch, which receives the engine speed signal and determines when to activate the upshift and downshift notification lamps 4 and 6:

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Volkswagen '070 teachings are new and non-cumulative. Accordingly, Volkswagen '070 raises

a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination.

**Alleged SNQ based upon Davidian**

Davidian is presented to determine if a SNQ of patentability regarding claims 17, 23, 26, and 31 of the '781 Patent is raised as stated in the Fourth, Fifth, Sixth and Tenth proposed rejection, see above. Davidian was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Davidian discloses a memory subsystem that stores a vehicle speed/stopping distance table. *"Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary."* Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Therefore, Davidian discloses "a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table." Davidian discloses a vehicle proximity alarm circuit, which activates a collision alarm when a calculated "Collision Distance" is close to a calculated "Stopping Distance." "A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then

actuated." Col. 12, line 59 to col. 13, line 11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 ("Operation of the Calculation Module 90"). Therefore, Davidian discloses "a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object." Davidian also discloses that the processor subsystem determines when to activate the proximity alarm based on (1) separation distance data (received from the front vehicle space sensor 8); (2) vehicle speed data (received from vehicle speed sensor 12); and (3) the vehicle speed/stopping distance table stored in memory. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Therefore, Davidian discloses "said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Further, Davidian teachings are new and non-cumulative. Accordingly, Davidian raises a substantial new question of patentability as to at least independent claim 31 of the '781 Patent that have not been decided in a previous examination. Dependent claim 32 is brought in at least due to their dependency on Independent claim 31.

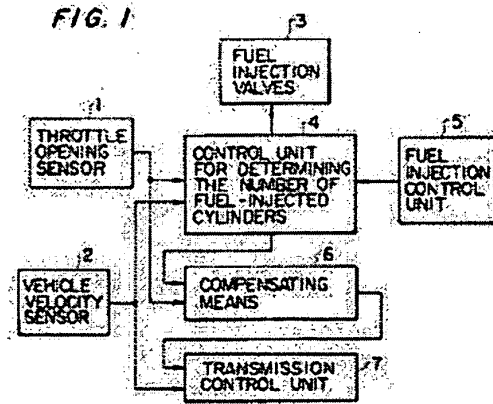

Davidian does not disclose “an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed,” OR “a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.” Davidian teachings alone would not be pertinent to a reasonable examiner in deciding patentability as to at least Independent claims 1, 17, 23, and 26 of the ‘781 Patent. Accordingly, Davidian does not raises a substantial new question of patentability as to independent claims 1, 17, 23, and 26 of the ‘781 Patent.

**Alleged SNQ based upon Nissan ‘055**

Nissan ‘055 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the ‘781 Patent is raised as stated in the Seventh proposed rejection, see above. Nissan ‘055 was not present as prior art in prior prosecutions of the application which became the ‘781 Patent.

Nissan ‘055 discloses a control system that "controls the number of fuel injected cylinders" in order to increase fuel economy. Abstract. Figure 1 of Nissan '055 discloses that a throttle opening sensor and vehicle velocity sensor are inputs to the system:

Nissan '055 discloses that "when the signal from the vehicle velocity sensor 2 exceeds a predetermined level and at the same time the signal from the throttle opening sensor 1 falls below another predetermined level, the control unit 4 determines the number of cylinders to which fuel is actually injected based on the two signals applied and stops injection of fuel to specified one or more cylinders." Col. 2, lines 59 to 66. Nissan '055 does not refer to the use of a manifold pressure sensor.

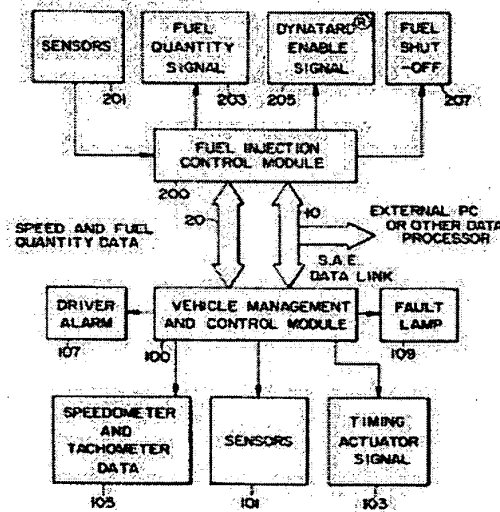

Nissan '055 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor" since Nissan '055 does not take into consideration the manifold pressure in their determination.

Nissan '055 teachings alone would not be pertinent to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Accordingly, Nissan '055 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

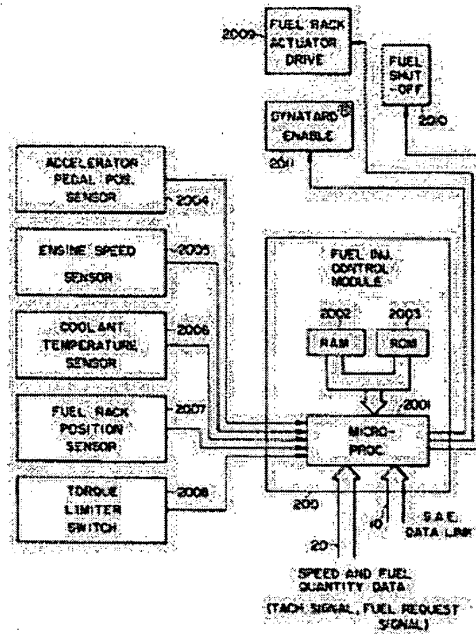

**Alleged SNQ based upon Mack '324**

Mack '324 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the '781 Patent is raised as stated in the Eighth proposed rejection, see above. Mack '324 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Mack '324 discloses an engine and vehicle management and control system. Figure 1 of Mack '324 illustrates an overview of the system:

The fuel injection control module 200 in Mack '324 contains a microprocessor 2001, and receives inputs from sensors 201 and outputs a fuel quantity signal 203 and a fuel shut-off enable signal 207. Col. 2, lines 33 to 27. Figure 3 illustrates the details of the fuel injection control module:

Inputs to the fuel injection control module include sensor inputs from "an accelerator pedal position sensor 2005, an engine speed sensor 2005, a coolant temperature sensor 2006, a fuel rack position sensor 2007, and a torque limiter switch 2008." Col. 3, lines 57 to 61. Mack '324 discloses a fuel injection signal that stops fuel being injected to the engine when certain overspeed conditions are met. Col. 6, lines 24 to 53. The fuel request signal is sent by the fuel injection control module, to which the sensors are input. However, Mack '324 does not refer to the use of a manifold pressure sensor. Therefore, Mack '324 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor," since Mack '324 does not need a manifold pressure sensor in their

determination as to how much fuel is sent to the engine and said system prevents too much fuel from being injected into the system.

Accordingly, Mack '324 teachings alone would not be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Mack '324 teachings are new and non-cumulative. Accordingly, Mack '324 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

**Alleged SNQ based upon GM '753**

GM '753 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the '781 Patent is raised as stated in the Ninth proposed rejection, see above. GM '753 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

GM '753 discloses a "warning system for providing an indication when the fuel consumption of a throttle controlled vehicle having an internal combustion engine with an intake manifold exceeds pre-established levels." The vacuum transducer 12 of GM '753 "is effective to generate a voltage having a magnitude which progressively changes with a progressively increased manifold intake level." Col. 1, lines 38 to 55. The speed transducer "generates a series of voltage pulses having a frequency progressively increasing with increasing vehicle speed." Col. 2, lines 34 to 51. These inputs are fed to an analog circuit, which is used to send current to a lamp when a level "determined to represent excessive fuel consumption" is reached. Col. 2, lines 52 to 58. "When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, *the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide*

*an indication of fuel consumption in excess of the predetermined amount at that speed."* Col. 3, lines 20 to 27. GM '753 does not refer to the use of a throttle position sensor, nor any other specific sensor in their system. There is also no processor in which the information is determined as to whether or not to activate said fuel overinjection notification sensor. Therefore, GM '753 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor."

Accordingly, these teachings alone would not be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. GM '753 teachings are new and non-cumulative. Accordingly, GM '753 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

#### **Alleged SNQ based upon Tonkin**

Tonkin is presented to determine if a SNQ of patentability regarding Independent claim 31 of the '781 Patent is raised as stated in the Eleventh proposed rejection, see above. Tonkin was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Tonkin discloses a system that calculates a safety envelope and displays a visible warning when a rear-facing vehicle is getting too near. Abstract. Tonkin discloses the use of a radar sensor in order to determine "distance of separation and/or a relative velocity of a trailing vehicle." Page 1, lines 23 - 29. *See also* page 5, lines 4 - 9, "The sensor means for sensing the distance and velocity of the trailing vehicle may comprise a radar system." Tonkin also discloses

Art Unit: 3992

the use of sensors, including a velocity sensing means comprising "a conventional speed sensing device fitted to the vehicle's transmission train." Page 5, lines 17 - 19. Tonkin discloses the use of a memory subsystem that stores parameters in a lookup table, including a vehicle speed/stopping distance table. For example, Tonkin discloses that predetermined driving parameters "may for example be stored in a look up table." Page 3, lines 25 - 32. Additionally, the control system that activates the vehicle proximity alarm relies in part on "known safe stopping distances such as those published by the Minister of Transport, in which a vehicle will stop when the brakes are applied." Page 16, lines 2 - 21. Finally, Tonkin discloses that a look-up table or database could be provided for unsafe closing speeds, which could be varied according to the velocity of the subject vehicle." Page 17, lines 7 - 25. Tonkin discloses that the processor subsystem determines when to activate the proximity alarm circuit based upon (1) separation distance data received from said radar detector; (2) vehicle speed data received from said road speed sensor; and (3) the vehicle speed/stopping distance table. For example, the radar system is "operable to sense a distance of separation and/or a relative velocity of a trailing vehicle." Page 1, lines 32 - 34. The processor subsystem "is operable to process the received velocity signal and data signals to determine the existence of an unsafe condition." The velocity signal used by the processing means is the vehicle velocity signal determined from the vehicle speed sensor. Page 5, lines 17 - 19. The data signals include the separation data (determined from the radar), and the determination regarding whether to activate the alarm is made, in part, using the safe stopping distances provided in the look-up table. Page 17, lines 7 to 25. Therefore, Tonkin discloses "said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from

Art Unit: 3992

said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Further, Tonkin teachings are new and non-cumulative. Accordingly, Tonkin raises a substantial new question of patentability as to at least independent claim 31 of the '781 Patent that have not been decided in a previous examination. Dependent claim 32 is brought in at least due to their dependency on Independent claim 31.

#### **Alleged SNQ based upon Doi**

Doi is presented to determine if a SNQ of patentability regarding Independent claim 31 of the '781 Patent is raised as stated in the Eleventh proposed rejection, see above. Doi was present as prior art in prior prosecutions of the application which became the '781 Patent.

In an amendment from the Applicant, dated February 8, 1999, the Applicant asserted that claim 31, previously claim 37 in the '270 Application:

The Applicants respectfully submit that new Claims 37-38, as presented herein, are neither taught nor suggested by the proposed combination of Chasteen and Doi et al. The Examiner properly cited Doi et al. as disclosing a vehicle running mode detection system equipped with a radar detector and an alarm circuit. The Applicants respectfully note, however, that the system disclosed in Doi et al. determines alert conditions relative to the proximity between a vehicle and a forward object based upon changes in the distance separating the vehicle and the forward object. In contrast, Applicants' apparatus for optimizing vehicle operation set forth in Claim 37 includes a processor subsystem configured to activate a vehicle proximity alarm circuit based upon road speed (as determined by a road speed sensor), separation (as determined by a radar detector) and a vehicle speed/stopping distance table stored in a memory subsystem.

Also see, The Request pp. 11-14 for more details.

The Examiner of the '270 Application subsequently issued a Notice of Allowance stating that the prior art did not teach the limitation in question, which is the basis for the SNQ of claim 31. It is further seen in the Request, pages 80 – 83, that the Requester utilizes Doi in the same way as what was already discussed by the Applicant and agreed to by the Examiner of the '270 Application in their reasons for allowance, i.e., Doi does not disclose the limitation that is the basis for SNQ for claim 31. Doi is not new prior art and also not used or presented in a new light that would raise a SNQ for claim 31. Therefore, it is seen that Doi alone does not disclose a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem.

Accordingly, these teachings would **not** be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Accordingly, Doi alone does not raise a substantial new question of patentability as to independent claim 31 of the '781 Patent.

### ***Conclusion***

A Request for *ex parte* reexamination of United States Patent Number 5,954,781 is Ordered.

A substantial new question of patentability affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 30 of United States Patent Number 5,954,781 is raised by the Request for *ex parte*

reexamination based on the Jurgen, Saturn '452, Toyota '599, and Volkswagen '070 cited areas supplied by the Requester.

A substantial new question of patentability affecting claims 31 and 32 of United States Patent Number 5,954,781 is raised by the Request for *ex parte* reexamination based on the Davidian, and Tonkin cited areas supplied by the Requester.

Therefore, claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 32 will be reexamined.

Nissan '055, Mack '324, and GM '753 alone do **Not** raise a SNQ affecting claims 28 – 30.

Davidian alone does **Not** raise a SNQ affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 27.

Doi alone does **Not** raise a SNQ affecting claims 31 and 32.

Extensions of time under 37 CFR 1.136(a) will not be permitted in these proceedings because the provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Additionally, 35 U.S.C. 305 requires that *ex parte* reexamination proceedings "will be conducted with special dispatch" (37 CFR 1.550(a)). Extensions of time in *ex parte* reexamination proceedings are provided for in 37 CFR 1.550(c).

#### **Notification of Concurrent Proceedings**

The patent owner is reminded of the continuing responsibility under 37 CFR 1.985 to apprise the Office of any litigation activity, or other prior or concurrent proceeding, involving the '469 Patent throughout the course of this reexamination proceeding. The third party requester is

also reminded of the ability to similarly apprise the Office of any such activity or proceeding throughout the course of this reexamination proceeding. See MPEP §§ 2207, 2282 and 2286.

### CORRESPONDENCE

All correspondence relating to this ex parte reexamination proceeding should be directed:

By EFS: Registered users may submit via the electronic filing system EFS-Web, at <https://sportal.uspto.gov/authenticate/authenticateuserlocalepf.html>.

***EX PARTE* REEXAMINATION COMMUNICATION TRANSMITTAL FORM**

REEXAMINATION CONTROL NO. 90/013,252.

PATENT NO. 5,954,781.

ART UNIT 3992.

Enclosed is a copy of the latest communication from the United States Patent and Trademark Office in the above identified *ex parte* reexamination proceeding (37 CFR 1.550(f)).

Where this copy is supplied after the reply by requester, 37 CFR 1.535, or the time for filing a reply has passed, no submission on behalf of the *ex parte* reexamination requester will be acknowledged or considered (37 CFR 1.550(g)).

1. The present application is being examined under the pre-AIA first to invent provisions.

### **DECISION GRANTING EX PARTE REEXAMINATION**

A Request for *ex parte* reexamination affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15 and 17 – 32 of United States Patent Number 5,954,781 (hereafter “the ‘781 Patent”) has been submitted on 05/22/2014.

Extensions of time under 37 CFR 1.136(a) will not be permitted in these proceedings because the provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Additionally, 35 U.S.C. 305 requires that *ex parte* reexamination proceedings "will be conducted with special dispatch" (37 CFR 1.550(a)). Extensions of time in *ex parte* reexamination proceedings are provided for in 37 CFR 1.550(c).

### **Prosecution History**

The ‘781 Patent was issued on September 21 1999 from U.S. Application Serial No. 08/813,270, hereinafter “the ‘270 Application”, filed on March 10, 1997.

The prosecution history of the ‘781 Patent includes:

The '270 application was filed on March 10, 1997 with 32 claims, of which application claims 1, 14, 18, and 27 were the only independent claims. Among these independent claims, application claim 1 included a fuel overinjection circuit, application claim 14 included a fuel overinjection circuit, an upshift notification circuit, and a downshift notification circuit,

application claim 18 included a vehicle proximity alarm, and application claim 27 included a fuel overinjection circuit and a vehicle proximity alarm.

In the only Office Action, dated August 6, 1998, application claims 1, 2 and 4 to 6 were rejected as obvious in view of U.S. Patent No. 4,901,701 to Chasteen (copy attached as Exhibit 3), application claim 3 was rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 4,631,515 to Blee et al. (copy attached as Exhibit 4), and application claims 7, 18 to 24, 27, and 28 were rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 5,708,584 to Doi et al. (copy attached as Exhibit 5).

In the Office Action, the Examiner stated that application claims 8 to 13, 25, 26, and 29 to 32 included allowable subject matter. Specifically, the Examiner stated that application claims 8, 25, and 29 included allowable subject matter on the basis that "the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit." Similarly, the Examiner stated that application claims 11, 26, and 31 included allowable subject matter on the basis that "the prior art fails to disclose a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit." In addition, application claims 14 - 17, which included both an upshift notification circuit and a downshift notification circuit, were allowed on the basis that:

the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

In response to this Office Action, the applicant submitted an Amendment on February 8, 1999 with numerous amendments, see the response to Office Action and the Request pages 6 – 13 for further explanation. The '270 Application was subsequently allowed, see Notice of Allowance dated 04/21/1999 or the Request pages 13 and 14 for further details. The Examiner stated in their reasons for allowance that:

*The prior art fails to disclose an apparatus for optimizing operation of a vehicle and comprising an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive speed and the processor determines when to activate the upshift notification circuit; and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing*

a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

The Notice of Allowance further states that:

Nor does the prior art disclose [sic] a fuel overinjection notification circuit coupled to the processor subsystem, wherein the fuel overinjection notification circuit issuing a notification that excess fuel is being supplied to the engine of the vehicle and the processor subsystem determining whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor.

Additionally, the Notice of Allowance states:

Nor does the prior art disclose [sic] that the processor subsystem determines whether to activate the vehicle proximity alarm circuit based upon separation distance data received from the radar detector, vehicle speed/stopping distance table stored in the memory subsystem.

### **Proposed Substantial New Question of Patentability**

Third Party Requester (“Requester”) identifies the following printed publications as evidence that a substantial new question should be raised in the Request, see pp. 15-16.

1. Automotive Electronics Handbook, by Ronald Jurgen (“Jurgen”), attached as exhibit 11.
2. U.S. Patent No. 5,477,452 to Milunas et al. (“Saturn ‘452”), attached as exhibit 12.
3. U.S. Patent No. 4,559,599 to Habu et al. (“Toyota ‘599”), attached as exhibit 13.
4. German Patent Application Publication No. 29 26 070 (“Volkswagen ‘070”), attached as exhibit 14.
5. U.S. Patent No. 5,357,438 to Davidian (“Davidian”), attached as exhibit 15.

6. U.S. Patent No. 4,061,055 to Iizuka et al. ("Nissan '055"), attached as exhibit 16.
7. U.S. Patent No. 5,121,324 to Rini et al. ("Mack '324"), attached as exhibit 17.
8. U.S. Patent No. 3,925,753 to Auman et al. ("GM '452"), attached as exhibit 18.
9. PCT Publication No. WO 96/02853 ("Tonkin"), attached as exhibit 19.

Requester has alleged a substantial new question, "SNQ", of patentability in light of proposed rejections which are stated below:

- The 1<sup>st</sup> Proposed Rejection: Claim 1 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Saturn '452.
- The 2<sup>nd</sup> Proposed Rejection: Claims 1, 7, and 13 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Toyota '599.
- The 3<sup>rd</sup> Proposed Rejection: Claims 1, 7, and 13 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Volkswagen '070.
- The 4<sup>th</sup> Proposed Rejection: Claims 17-23 and 26 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Toyota '599, and Davidian.
- The 5<sup>th</sup> Proposed Rejection: Claims 17-23 and 26 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Volkswagen '070, and Davidian.
- The 6<sup>th</sup> Proposed Rejection: Claims 17-21 and 23 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Saturn '452, and Davidian.

- The 7<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Nissan '055.
- The 8<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Mack '324.
- The 9<sup>th</sup> Proposed Rejection: Claims 28-30 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and GM '753.
- The 10<sup>th</sup> Proposed Rejection: Claim 31 is alleged as Anticipated Under 35 U.S.C. § 102(b) by Davidian.
- The 11<sup>th</sup> Proposed Rejection: Claims 31 and 32 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Tonkin and Doi et al.

Requester has proposed rejections for dependent claims that are not the basis for the SNQ, which are stated below:

- The 12<sup>th</sup> Proposed Rejection: Claims 2, 4, and 5 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Chasteen.
- The 13<sup>th</sup> Proposed Rejection: Claims 2, 4, 5, 8, 10, 12, and 15 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Chasteen.
- The 14<sup>th</sup> Proposed Rejection: Claims 2, 4, 5, 8, 10, 12, and 15 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Chasteen.

- The 15<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Toyota '599, Davidian, and Tonkin.
- The 16<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, Davidian, and Tonkin.
- The 17<sup>th</sup> Proposed Rejection: Claim 18 is alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Saturn '452, Davidian, and Tonkin.
- The 18<sup>th</sup> Proposed Rejection: Claims 24 and 25 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Saturn '452, Davidian and Chasteen.
- The 19<sup>th</sup> Proposed Rejection: Claims 24, 25, and 27 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Toyota '599, Davidian and Chasteen.
- The 20<sup>th</sup> Proposed Rejection: Claims 24, 25, and 27 are alleged as Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, Davidian and Chasteen.
- The 21<sup>st</sup> Proposed Rejection: Claim 32 is alleged as Obvious Under 35 U.S.C. § 103(a) in in View of the combination of Davidian and Tonkin.

### **Analysis of Substantial New Question of Patentability**

A SNQ of patentability is raised by a cited patent or printed publication when there is a substantial likelihood that a reasonable examiner would consider the prior art patent or printed publication important in deciding whether or not the claim is patentable. A SNQ of patentability is not raised by prior art presented in a reexamination request if the Office has previously considered (in an earlier examination of the patent) the same question of patentability as to a patent claim favorable to the patent owner based on the same prior art patents or printed publications. In re Recreative Technologies, 83 F.3d 1394, 38 USPQ2d 1776 (Fed. Cir. 1996). The substantial new question of patentability may be based on art previously considered by the Office if the reference is presented in a new light or a different way that escaped review during earlier examination. MPEP §2216.

It is not sufficient that a request for reexamination merely proposes one or more rejections of a patent claim or claims as a basis for reexamination. It must first be demonstrated that a patent or printed publication that is relied upon in a proposed rejection presents a new, non-cumulative technological teaching that was not previously considered and discussed on the record during the prosecution of the application that resulted in the patent for which reexamination is requested, and during the prosecution of any other prior proceeding involving the patent for which reexamination is requested. MPEP §2216.

### **Basis of SNQ**

The '781 Patent was issued on September 21, 1999 from the '270 Application, filed on March 10, 1997. The previous Examiner of the '270 Application concluded the reasons for allowance for claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 27 was the prior art failed to teach

or suggest upshift or downshift notification circuits. Therefore the limitations that are the basis of the SNQ of patentability affecting independent claims 1, 7, 13, 17, 23, 26, and their dependent claims 2, 4, 5, 8, 10, 12, 15, 18 – 22, 24, 25 and 27, teaches the upshift or downshift and reads as follows:

“an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.”

OR

“a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.”

With respect to claims 28 - 30, the applicant in the original prosecution emphasized that the prior art failed to teach a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Therefore the limitation disclosed in independent claim 28 which is the basis of the SNQ of patentability, and also affecting dependent claims 29 and 30, reads as follows:

“said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.;said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.”

With respect to claims 31 and 32, the applicant in the original prosecution emphasized that the prior art failed to teach a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. The prosecution history focused on a vehicle proximity alarm that is activated based on these three parameters and was the basis for the reasons for allowance on these claims. Therefore the limitation disclosed in independent claim 31 which is the basis of the SNQ of patentability, also affecting dependent claim 32, reads as follows:

“said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

#### **Alleged SNQ based upon Jurgen**

Jurgen is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, 26, 28 of the '781 Patent is raised as stated in the First to Ninth proposed rejections, see above. Jurgen was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal drivability.

(Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also discloses that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Jurgen illustrates these hardware parts:

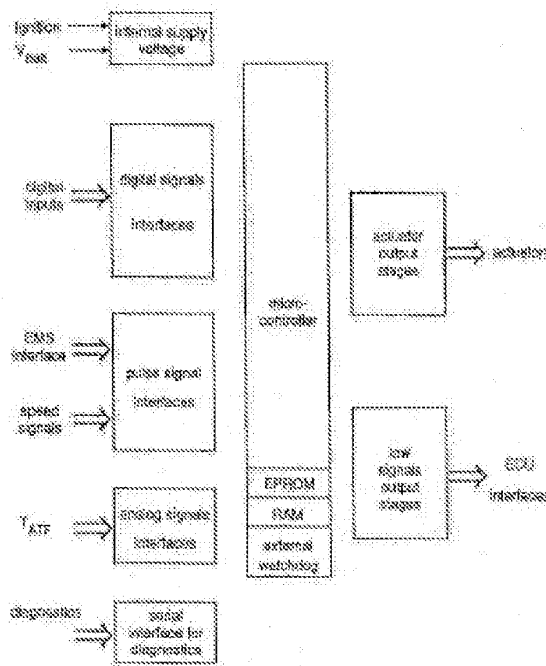

FIGURE 13.1 Overview of hardware parts.

Jurgen also discloses that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. "In the event that the particular shift characteristic is crossed (excessive/insufficient) by one of either of the two input valves, the electronic ECU releases the shift by

activating the related actuator. This can be a direct shift into the target gear or by a serial activation of specific actuators in a fixed sequence to the target gear, depending on the transmission hardware design." (Page 13.9). "The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application." *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, discloses "an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed" as taught in Independent claims 1, 7, 13, 17, 23, and 26.

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Jurgen teachings are new and non-cumulative. Accordingly, Jurgen raises a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4, 5, 8, 10, 12, 15, 18 – 22, 24, 25, and 27 are brought in at least due to their dependency on Independent claims 1, 7, 13, 17, 23, and 26.

Jurgen discloses fuel injection notification circuit, which issues a notification to shut off fuel in certain situations. For Example, the ECU disclosed in Jurgen can shut of fuel in certain situation by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides a notification to the fuel injectors when a fuel cutoff state is reached.

Jurgen discloses based upon data received from said plurality of sensors, when to activate said fuel injection circuit and when to activate said upshift/downshift notification circuit. For example, the combination of the ECU, which monitors all of the vehicle's sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Accordingly, Jurgen teachings, either alone or in combination with a secondary reference, would be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Further, Jurgen teachings are new and non-cumulative.

Accordingly, Jurgen raises a substantial new question of patentability as to at least independent claim 28 of the '781 Patent that have not been decided in a previous examination. Dependent claims 29 and 30 are brought in at least due to their dependency on Independent claim 28.

#### **Alleged SNQ based upon Saturn '452**

Saturn '452 Patent is presented to determine if a SNQ of patentability regarding Independent claims 1, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the First and Sixth proposed rejection, see above. Saturn '452 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Saturn '452 discloses an upshift notification circuit connected to the control unit, which indicates "via line 60 the state of an upshift indicator light or equivalent visual display." Col. 2, lines 42 to 55. Therefore, it is seen that Saturn '452 discloses "an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed" and "said processor

subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift notification circuit." as taught in Independent claims 1, 17, and 23.

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 17, and 23 of the '781 Patent. Further, Saturn '452 teachings are new and non-cumulative. Accordingly, Saturn '452 raises a substantial new question of patentability as to at least independent claims 1, 17, and 23 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4, 5, 18 – 22, 24, and 25 are brought in at least due to their dependency on Independent claims 1, 17, and 23.

#### **Alleged SNQ based upon Toyota '599**

Toyota '599 is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the Second and Forth proposed rejections, see above. Toyota '599 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Toyota '599 discloses a "shift indication apparatus coupled to a plurality of sensors. An overview of this system is illustrated in Figure 1:

Toyota '599 discloses that indicator lamps that tell the driver to shift up or shift down are lit by the microcomputer in order to tell the driver when to shift to improve fuel economy "Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the drive that the speed change from current shift position to the one step shifting up position  $SP_{+1}$  is preferable." Col. 5, line 63 to col. 6, line 2. "However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_c$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation." E.g. col. 7, lines 29 to 38. Therefore, Toyota '599 discloses "an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed" and "said processor subsystem determining, based upon data received from said plurality of sensors,.. when to activate said upshift[/downshift] notification circuit."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Toyota '599 teachings are new and non-cumulative. Accordingly, Toyota '599 raises a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination. Dependent claims 2, 4,

5, 8, 10, 12, 15, 18 – 22, 24, 25, and 27 are brought in at least due to their dependency on Independent claims 1, 7, 13, 17, 23, and 26.

### **Alleged SNQ based upon Volkswagen '070**

Volkswagen '070 is presented to determine if a SNQ of patentability regarding Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent is raised as stated in the Third and Fifth proposed rejections, see above. Volkswagen '070 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Volkswagen '070 discloses:

Volkswagen '070 discloses a device "that assists the operator of [an] internal combustion engine equipped with a conventional transmission." Page 5. The device receives an engine speed signal "with the aid of known sensor systems" and uses it to activate an "engine-speed dependent change-over switch 6." Page 7. Volkswagen '070 describes two operating ranges, I and II, and the change-over switch 6 indicates that an upshift or downshift is necessary when the limits of those ranges (e.g., the RPM set point) is reached. Pages 6-8. For example, Figure 2 of Volkswagen '070 illustrates the change-over switch, which receives the engine speed signal and determines when to activate the upshift and downshift notification lamps 4 and 6:

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent. Further, Volkswagen '070 teachings are new and non-cumulative. Accordingly, Volkswagen '070 raises

a substantial new question of patentability as to at least independent claims 1, 7, 13, 17, 23, and 26 of the '781 Patent that have not been decided in a previous examination.

#### **Alleged SNQ based upon Davidian**

Davidian is presented to determine if a SNQ of patentability regarding claims 17, 23, 26, and 31 of the '781 Patent is raised as stated in the Fourth, Fifth, Sixth and Tenth proposed rejection, see above. Davidian was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Davidian discloses a memory subsystem that stores a vehicle speed/stopping distance table. *"Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary."* Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Therefore, Davidian discloses "a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table." Davidian discloses a vehicle proximity alarm circuit, which activates a collision alarm when a calculated "Collision Distance" is close to a calculated "Stopping Distance." "A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then

actuated." Col. 12, line 59 to col. 13, line 11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 ("Operation of the Calculation Module 90"). Therefore, Davidian discloses "a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object." Davidian also discloses that the processor subsystem determines when to activate the proximity alarm based on (1) separation distance data (received from the front vehicle space sensor 8); (2) vehicle speed data (received from vehicle speed sensor 12); and (3) the vehicle speed/stopping distance table stored in memory. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Therefore, Davidian discloses "said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Further, Davidian teachings are new and non-cumulative. Accordingly, Davidian raises a substantial new question of patentability as to at least independent claim 31 of the '781 Patent that have not been decided in a previous examination. Dependent claim 32 is brought in at least due to their dependency on Independent claim 31.

Davidian does not disclose “an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed,” OR “a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.” Davidian teachings alone would not be pertinent to a reasonable examiner in deciding patentability as to at least Independent claims 1, 17, 23, and 26 of the ‘781 Patent. Accordingly, Davidian does not raises a substantial new question of patentability as to independent claims 1, 17, 23, and 26 of the ‘781 Patent.

**Alleged SNQ based upon Nissan ‘055**

Nissan ‘055 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the ‘781 Patent is raised as stated in the Seventh proposed rejection, see above. Nissan ‘055 was not present as prior art in prior prosecutions of the application which became the ‘781 Patent.

Nissan ‘055 discloses a control system that "controls the number of fuel injected cylinders" in order to increase fuel economy. Abstract. Figure 1 of Nissan '055 discloses that a throttle opening sensor and vehicle velocity sensor are inputs to the system:

Nissan '055 discloses that "when the signal from the vehicle velocity sensor 2 exceeds a predetermined level and at the same time the signal from the throttle opening sensor 1 falls below another predetermined level, the control unit 4 determines the number of cylinders to which fuel is actually injected based on the two signals applied and stops injection of fuel to specified one or more cylinders." Col. 2, lines 59 to 66. Nissan '055 does not refer to the use of a manifold pressure sensor.

Nissan '055 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor" since Nissan '055 does not take into consideration the manifold pressure in their determination.

Nissan '055 teachings alone would not be pertinent to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Accordingly, Nissan '055 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

### Alleged SNQ based upon Mack '324

Mack '324 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the '781 Patent is raised as stated in the Eighth proposed rejection, see above. Mack '324 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Mack '324 discloses an engine and vehicle management and control system. Figure 1 of Mack '324 illustrates an overview of the system:

The fuel injection control module 200 in Mack '324 contains a microprocessor 2001, and receives inputs from sensors 201 and outputs a fuel quantity signal 203 and a fuel shut-off enable signal 207. Col. 2, lines 33 to 27. Figure 3 illustrates the details of the fuel injection control module:

Inputs to the fuel injection control module include sensor inputs from "an accelerator pedal position sensor 2005, an engine speed sensor 2005, a coolant temperature sensor 2006, a fuel rack position sensor 2007, and a torque limiter switch 2008." Col. 3, lines 57 to 61. Mack '324 discloses a fuel injection signal that stops fuel being injected to the engine when certain overspeed conditions are met. Col. 6, lines 24 to 53. The fuel request signal is sent by the fuel injection control module, to which the sensors are input. However, Mack '324 does not refer to the use of a manifold pressure sensor. Therefore, Mack '324 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor," since Mack '324 does not need a manifold pressure sensor in their

determination as to how much fuel is sent to the engine and said system prevents too much fuel from being injected into the system.

Accordingly, Mack '324 teachings alone would not be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. Mack '324 teachings are new and non-cumulative. Accordingly, Mack '324 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

#### **Alleged SNQ based upon GM '753**

GM '753 is presented to determine if a SNQ of patentability regarding Independent claim 28 of the '781 Patent is raised as stated in the Ninth proposed rejection, see above. GM '753 was not present as prior art in prior prosecutions of the application which became the '781 Patent.

GM '753 discloses a "warning system for providing an indication when the fuel consumption of a throttle controlled vehicle having an internal combustion engine with an intake manifold exceeds pre-established levels." The vacuum transducer 12 of GM '753 "is effective to generate a voltage having a magnitude which progressively changes with a progressively increased manifold intake level." Col. 1, lines 38 to 55. The speed transducer "generates a series of voltage pulses having a frequency progressively increasing with increasing vehicle speed." Col. 2, lines 34 to 51. These inputs are fed to an analog circuit, which is used to send current to a lamp when a level "determined to represent excessive fuel consumption" is reached. Col. 2, lines 52 to 58. "When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, *the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide*

*an indication of fuel consumption in excess of the predetermined amount at that speed."* Col. 3, lines 20 to 27. GM '753 does not refer to the use of a throttle position sensor, nor any other specific sensor in their system. There is also no processor in which the information is determined as to whether or not to activate said fuel overinjection notification sensor. Therefore, GM '753 does not disclose "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor."

Accordingly, these teachings alone would not be important to a reasonable examiner in deciding patentability as to at least Independent claim 28 of the '781 Patent. GM '753 teachings are new and non-cumulative. Accordingly, GM '753 alone does not raise a substantial new question of patentability as to independent claim 28 of the '781 Patent.

#### **Alleged SNQ based upon Tonkin**

Tonkin is presented to determine if a SNQ of patentability regarding Independent claim 31 of the '781 Patent is raised as stated in the Eleventh proposed rejection, see above. Tonkin was not present as prior art in prior prosecutions of the application which became the '781 Patent.

Tonkin discloses a system that calculates a safety envelope and displays a visible warning when a rear-facing vehicle is getting too near. Abstract. Tonkin discloses the use of a radar sensor in order to determine "distance of separation and/or a relative velocity of a trailing vehicle." Page 1, lines 23 - 29. *See also* page 5, lines 4 - 9, "The sensor means for sensing the distance and velocity of the trailing vehicle may comprise a radar system." Tonkin also discloses

the use of sensors, including a velocity sensing means comprising "a conventional speed sensing device fitted to the vehicle's transmission train." Page 5, lines 17 - 19. Tonkin discloses the use of a memory subsystem that stores parameters in a lookup table, including a vehicle speed/stopping distance table. For example, Tonkin discloses that predetermined driving parameters "may for example be stored in a look up table." Page 3, lines 25 - 32. Additionally, the control system that activates the vehicle proximity alarm relies in part on "known safe stopping distances such as those published by the Minister of Transport, in which a vehicle will stop when the brakes are applied." Page 16, lines 2 - 21. Finally, Tonkin discloses that a look-up table or database could be provided for unsafe closing speeds, which could be varied according to the velocity of the subject vehicle." Page 17, lines 7 - 25. Tonkin discloses that the processor subsystem determines when to activate the proximity alarm circuit based upon (1) separation distance data received from said radar detector; (2) vehicle speed data received from said road speed sensor; and (3) the vehicle speed/stopping distance table. For example, the radar system is "operable to sense a distance of separation and/or a relative velocity of a trailing vehicle." Page 1, lines 32 - 34. The processor subsystem "is operable to process the received velocity signal and data signals to determine the existence of an unsafe condition." The velocity signal used by the processing means is the vehicle velocity signal determined from the vehicle speed sensor. Page 5, lines 17 - 19. The data signals include the separation data (determined from the radar), and the determination regarding whether to activate the alarm is made, in part, using the safe stopping distances provided in the look-up table. Page 17, lines 7 to 25. Therefore, Tonkin discloses "said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from

said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem."

Accordingly, these teachings would be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Further, Tonkin teachings are new and non-cumulative. Accordingly, Tonkin raises a substantial new question of patentability as to at least independent claim 31 of the '781 Patent that have not been decided in a previous examination. Dependent claim 32 is brought in at least due to their dependency on Independent claim 31.

#### **Alleged SNQ based upon Doi**

Doi is presented to determine if a SNQ of patentability regarding Independent claim 31 of the '781 Patent is raised as stated in the Eleventh proposed rejection, see above. Doi was present as prior art in prior prosecutions of the application which became the '781 Patent.

In an amendment from the Applicant, dated February 8, 1999, the Applicant asserted that claim 31, previously claim 37 in the '270 Application:

The Applicants respectfully submit that new Claims 37-38, as presented herein, are neither taught nor suggested by the proposed combination of Chastoon and Doi et al. The Examiner properly cited Doi et al. as disclosing a vehicle running mode detection system equipped with a radar detector and an alarm circuit. The Applicants respectfully note, however, that the system disclosed in Doi et al. determines alert conditions relative to the proximity between a vehicle and a forward object based upon changes in the distance separating the vehicle and the forward object. In contrast, Applicants' apparatus for optimizing vehicle operation set forth in Claim 37 includes a processor subsystem configured to activate a vehicle proximity alarm circuit based upon road speed (as determined by a road speed sensor), separation (as determined by a radar detector) and a vehicle speed/stopping distance table stored in a memory subsystem.

Also see, The Request pp. 11-14 for more details.

The Examiner of the '270 Application subsequently issued a Notice of Allowance stating that the prior art did not teach the limitation in question, which is the basis for the SNQ of claim 31. It is further seen in the Request, pages 80 – 83, that the Requester utilizes Doi in the same way as what was already discussed by the Applicant and agreed to by the Examiner of the '270 Application in their reasons for allowance, i.e., Doi does not disclose the limitation that is the basis for SNQ for claim 31. Doi is not new prior art and also not used or presented in a new light that would raise a SNQ for claim 31. Therefore, it is seen that Doi alone does not disclose a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem.

Accordingly, these teachings would **not** be important to a reasonable examiner in deciding patentability as to at least Independent claim 31 of the '781 Patent. Accordingly, Doi alone does not raise a substantial new question of patentability as to independent claim 31 of the '781 Patent.

### ***Conclusion***

A Request for *ex parte* reexamination of United States Patent Number 5,954,781 is Ordered.

A substantial new question of patentability affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 30 of United States Patent Number 5,954,781 is raised by the Request for *ex parte*

Art Unit: 3992

reexamination based on the Jorgen, Saturn '452, Toyota '599, and Volkswagen '070 cited areas supplied by the Requester.

A substantial new question of patentability affecting claims 31 and 32 of United States Patent Number 5,954,781 is raised by the Request for *ex parte* reexamination based on the Davidian, and Tonkin cited areas supplied by the Requester.

Therefore, claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 32 will be reexamined.

Nissan '055, Mack '324, and GM '753 alone do **Not** raise a SNQ affecting claims 28 – 30.

Davidian alone does **Not** raise a SNQ affecting claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 – 27.

Doi alone does **Not** raise a SNQ affecting claims 31 and 32.

Extensions of time under 37 CFR 1.136(a) will not be permitted in these proceedings because the provisions of 37 CFR 1.136 apply only to "an applicant" and not to parties in a reexamination proceeding. Additionally, 35 U.S.C. 305 requires that *ex parte* reexamination proceedings "will be conducted with special dispatch" (37 CFR 1.550(a)). Extensions of time in *ex parte* reexamination proceedings are provided for in 37 CFR 1.550(c).

### **Notification of Concurrent Proceedings**

The patent owner is reminded of the continuing responsibility under 37 CFR 1.985 to apprise the Office of any litigation activity, or other prior or concurrent proceeding, involving the '469 Patent throughout the course of this reexamination proceeding. The third party requester is

also reminded of the ability to similarly apprise the Office of any such activity or proceeding throughout the course of this reexamination proceeding. See MPEP §§ 2207, 2282 and 2286.

## CORRESPONDENCE

**All** correspondence relating to this ex parte reexamination proceeding should be directed:

By EFS: Registered users may submit via the electronic filing system EFS-Web, at <https://sportal.uspto.gov/authenticate/authenticateuserlocalepf.html>.

By Mail to: Mail Stop *Ex Parte* Reexam  
Central Reexamination Unit  
Commissioner for Patents  
United States Patent & Trademark Office  
P.O. Box 1450  
Alexandria, VA 22313-1450

By FAX to: (571) 273-9900  
Central Reexamination Unit

By hand: Customer Service Window  
Randolph Building  
401 Dulany Street  
Alexandria, VA 22314

For EFS-Web transmissions, 37 CFR 1.8(a)(1)(i) (C) and (ii) states that correspondence (except for a request for reexamination and a corrected or replacement request for reexamination) will be considered timely filed if (a) it is transmitted via the Office's electronic filing system in accordance with 37 CFR 1.6(a)(4), and (b) includes a certificate of transmission for each piece of correspondence stating the date of transmission, which is prior to the expiration of the set period of time in the Office action.

Art Unit: 3992

Any inquiry concerning this communication or earlier communications from the Examiner, or as to the status of this proceeding, should be directed to the Central Reexamination Unit at telephone number (571) 272-7705.

Signed:

/David E. England/

<b>Order Granting / Denying Request For Ex Parte Reexamination</b>	<b>Control No.</b> 90/013,252	<b>Patent Under Reexamination</b> 5,954,781
	<b>Examiner</b> DAVID ENGLAND	<b>Art Unit</b> 3992

**--The MAILING DATE of this communication appears on the cover sheet with the correspondence address--**

The request for *ex parte* reexamination filed 22 May 2014 has been considered and a determination has been made. An identification of the claims, the references relied upon, and the rationale supporting the determination are attached.

Attachments: a)  PTO-892,      b)  PTO/SB/08,      c)  Other: IDS List

1.  The request for *ex parte* reexamination is GRANTED.

RESPONSE TIMES ARE SET AS FOLLOWS:

For Patent Owner's Statement (Optional): TWO MONTHS from the mailing date of this communication (37 CFR 1.530 (b)). **EXTENSIONS OF TIME ARE GOVERNED BY 37 CFR 1.550(c).**

For Requester's Reply (optional): TWO MONTHS from the **date of service** of any timely filed Patent Owner's Statement (37 CFR 1.535). **NO EXTENSION OF THIS TIME PERIOD IS PERMITTED.** If Patent Owner does not file a timely statement under 37 CFR 1.530(b), then no reply by requester is permitted.

2.  The request for *ex parte* reexamination is DENIED.

This decision is not appealable (35 U.S.C. 303(c)). Requester may seek review by petition to the Commissioner under 37 CFR 1.181 within ONE MONTH from the mailing date of this communication (37 CFR 1.515(c)). **EXTENSION OF TIME TO FILE SUCH A PETITION UNDER 37 CFR 1.181 ARE AVAILABLE ONLY BY PETITION TO SUSPEND OR WAIVE THE REGULATIONS UNDER 37 CFR 1.183.**

In due course, a refund under 37 CFR 1.26 ( c ) will be made to requester:

- a)  by Treasury check or,  
b)  by credit to Deposit Account No. \_\_\_\_\_, or  
c)  by credit to a credit card account, unless otherwise notified (35 U.S.C. 303(c)).

**I. Power of Attorney.** This form may be used to change the Power of Attorney in a reexamination or supplemental examination proceeding (or multiple proceedings where merged). This form may also be used to change the Power of Attorney in the patent file; in such a case, a copy of this form will be placed in both the patent file and the reexamination or supplemental examination proceeding.

**A. Revocation of Previous Power of Attorney.** I hereby revoke all previous patent owner powers of attorney, if any, given:

in the above-identified reexamination or supplemental examination proceeding control number(s) (more than one may be changed only if the proceedings are merged).

in the file of the above-identified patent.

(check BOTH boxes if change in BOTH the patent file and the reexamination or supplemental examination proceeding is requested).

**B. Designation of Power of Attorney.**

A Power of Attorney is submitted herewith.

OR

I hereby appoint Practitioner(s) associated with the Customer Number identified in the box at right as my/our attorney(s) or agent(s) to prosecute the proceeding(s)/patent identified above and selected in section I(A), and to transact all business in the United States Patent and Trademark Office connected therewith:

88360

OR

I hereby appoint Practitioner(s) named below as my/our attorney(s) or agent(s) to prosecute the proceeding(s) identified above, and to transact all business in the United States Patent and Trademark Office connected therewith:

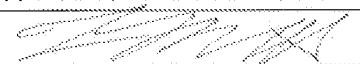

Practitioner(s) Name	Registration Number

Authorization for the Power of Attorney is provided by the signature on page 2 of this form.

This collection of information is required by 37 CFR 1.31, 1.32, and 1.33. The information is required to obtain or retain a benefit by the public, which is to update (and by the USPTO to process) the file of a patent or reexamination proceeding. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 3 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.

If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.

Under the Paperwork Reduction Act of 1995 no persons are required to respond to a collection of information unless it displays a valid OMB control number

II. Change of Correspondence Address

## Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**STATEMENT UNDER 37 CFR 3.73(c)**Applicant/Patent Owner: Velocity Patent LLCApplication No./Patent No.: 5,954,781 Filed/Issue Date: September 21, 1999Titled: Method and Apparatus for Optimizing Vehicle OperationVelocity Patent LLC, a limited liability company

(Name of Assignee)

(Type of Assignee, e.g., corporation, partnership, university, government agency, etc.)

states that, for the patent application/patent identified above, it is (choose **one** of options 1, 2, 3 or 4 below):

1.  The assignee of the entire right, title, and interest.
2.  An assignee of less than the entire right, title, and interest (check applicable box):
- The extent (by percentage) of its ownership interest is \_\_\_\_\_%. Additional Statement(s) by the owners holding the balance of the interest must be submitted to account for 100% of the ownership interest.
- There are unspecified percentages of ownership. The other parties, including inventors, who together own the entire right, title and interest are:

Additional Statement(s) by the owner(s) holding the balance of the interest must be submitted to account for the entire right, title, and interest.

3.  The assignee of an undivided interest in the entirety (a complete assignment from one of the joint inventors was made). The other parties, including inventors, who together own the entire right, title, and interest are:

Additional Statement(s) by the owner(s) holding the balance of the interest must be submitted to account for the entire right, title, and interest.

4.  The recipient, via a court proceeding or the like (e.g., bankruptcy, probate), of an undivided interest in the entirety (a complete transfer of ownership interest was made). The certified document(s) showing the transfer is attached.

The interest identified in option 1, 2 or 3 above (not option 4) is evidenced by either (choose **one** of options A or B below):

- A.  An assignment from the inventor(s) of the patent application/patent identified above. The assignment was recorded in the United States Patent and Trademark Office at Reel \_\_\_\_\_, Frame \_\_\_\_\_, or for which a copy thereof is attached.
- B.  A chain of title from the inventor(s), of the patent application/patent identified above, to the current assignee as follows:

1. From: Harvey Slepian and Loran Sutton To: TAS Distributing Co., Inc.The document was recorded in the United States Patent and Trademark Office at Reel 008435, Frame 0064, or for which a copy thereof is attached.2. From: TAS Distributing Co., Inc. To: Velocity Patents LLCThe document was recorded in the United States Patent and Trademark Office at Reel 031635, Frame 0364, or for which a copy thereof is attached.

This collection of information is required by 37 CFR 3.73(b). The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450**

*If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.*

**STATEMENT UNDER 37 CFR 3.73(c)**

3. From: Velocity Patents LLC To: Velocity Patent LLC

The document was recorded in the United States Patent and Trademark Office at  
Reel 031635, Frame 0376, or for which a copy thereof is attached.

4. From: \_\_\_\_\_ To: \_\_\_\_\_

The document was recorded in the United States Patent and Trademark Office at  
Reel \_\_\_\_\_, Frame \_\_\_\_\_, or for which a copy thereof is attached.

5. From: \_\_\_\_\_ To: \_\_\_\_\_

The document was recorded in the United States Patent and Trademark Office at  
Reel \_\_\_\_\_, Frame \_\_\_\_\_, or for which a copy thereof is attached.

6. From: \_\_\_\_\_ To: \_\_\_\_\_

The document was recorded in the United States Patent and Trademark Office at  
Reel \_\_\_\_\_, Frame \_\_\_\_\_, or for which a copy thereof is attached.

Additional documents in the chain of title are listed on a supplemental sheet(s).

As required by 37 CFR 3.73(c)(1)(i), the documentary evidence of the chain of title from the original owner to the assignee was, or concurrently is being, submitted for recordation pursuant to 37 CFR 3.11.

[NOTE: A separate copy (i.e., a true copy of the original assignment document(s)) must be submitted to Assignment Division in accordance with 37 CFR Part 3, to record the assignment in the records of the USPTO. See MPEP 302.08]

The undersigned (whose title is supplied below) is authorized to act on behalf of the assignee.

## Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

CONFIRMATION NO. 9999  
REEEXAM ASSIGNMENT NOTICE

Date Mailed: 05/23/2014

**NOTICE OF ASSIGNMENT OF REEXAMINATION REQUEST**

The above-identified request for reexamination has been assigned to Art Unit 3993. All future correspondence to the proceeding should be identified by the control number listed above and directed to the assigned Art Unit.

A copy of this Notice is being sent to the latest attorney or agent of record in the patent file or to all owners of record. (See 37 CFR 1.33(c)). If the addressee is not, or does not represent, the current owner, he or she is required to forward all communications regarding this proceeding to the current owner(s). An attorney or agent receiving this communication who does not represent the current owner(s) may wish to seek to withdraw pursuant to 37 CFR 1.36 in order to avoid receiving future communications. If the address of the current owner(s) is unknown, this communication should be returned within the request to withdraw pursuant to Section 1.36.

**NOTICE OF USPTO EX PARTE REEXAMINATION PATENT OWNER STATEMENT WAIVER PROGRAM**

The USPTO has implemented a pilot program where, after a reexamination proceeding has been granted a filing date and before the examiner begins his or her review, the patent owner may orally waive the right to file a patent owner's statement. See "Pilot Program for Waiver of Patent Owner's Statement in Ex Parte Reexamination Proceedings," 75 FR 47269 (August 5, 2010). One goal of the pilot program is to reduce the pendency of reexamination proceedings and improve the efficiency of the reexamination process.

Ordinarily when ex parte reexamination is ordered, the USPTO must wait until after the receipt of the patent owner's statement and the third party requester's reply, or after the expiration of the time period for filing the statement and reply (a period that can be as long as 5 to 6 months), before mailing a first determination of patentability. The USPTO's first determination of patentability is usually a first Office action on the merits or a Notice of Intent to Issue Reexamination Certificate (NIRC).

**Under the pilot program, the patent owner's oral waiver allows the USPTO to act on the first determination of patentability immediately after determining that reexamination will be ordered, and in a suitable case issue the reexamination order and the first determination of patentability (which could be a NIRC if the claims under reexamination are confirmed) at the same time.**

**Benefits to the Patent Owner for participating in this pilot program include reduction in pendency.**

To participate in this pilot program, Patent Owners may contact the USPTO's Central Reexamination Unit (CRU) at 571-272-7705. The USPTO will make the oral waiver of record in the reexamination file in an interview summary and a copy will be mailed to the patent owner and any third party requester.

NOTICE OF USPTO EX PARTE REEXAMINATION PATENT OWNER STATEMENT WAIVER PROGRAM

The USPTO has implemented a pilot program where, after a reexamination proceeding has been granted a filing date and before the examiner begins his or her review, the patent owner may orally waive the right to file a patent owner's statement. See "Pilot Program for Waiver of Patent Owner's Statement in Ex Parte Reexamination Proceedings," 75 FR 47269 (August 5, 2010). One goal of the pilot program is to reduce the pendency of reexamination proceedings and improve the efficiency of the reexamination process.

Ordinarily when ex parte reexamination is ordered, the USPTO must wait until after the receipt of the patent owner's statement and the third party requester's reply, or after the expiration of the time period for filing the statement and reply (a period that can be as long as 5 to 6 months), before mailing a first determination of patentability. The USPTO's first determination of patentability is usually a first Office action on the merits or a Notice of Intent to Issue Reexamination Certificate (NIRC).

Under the pilot program, the patent owner's oral waiver allows the USPTO to act on the first determination of patentability immediately after determining that reexamination will be ordered, and in a suitable case issue the reexamination order and the first determination of patentability (which could be a NIRC if the claims under reexamination are confirmed) at the same time.

Benefits to the Patent Owner for participating in this pilot program include reduction in pendency.

To participate in this pilot program, Patent Owners may contact the USPTO's Central Reexamination Unit (CRU) at 571-272-7705. The USPTO will make the oral waiver of record in the reexamination file in an interview summary and a copy will be mailed to the patent owner and any third party requester.

*(Third Party Requester)*

Requester is hereby notified that the filing date of the request for reexamination is 05/22/2014, the date that the filing requirements of 37 CFR § 1.510 were received.

A decision on the request for reexamination will be mailed within three months from the filing date of the request for reexamination. (See 37 CFR 1.515(a)).

A copy of the Notice is being sent to the person identified by the requester as the patent owner. Further patent owner correspondence will be the latest attorney or agent of record in the patent file. (See 37 CFR 1.33). Any paper filed should include a reference to the present request for reexamination (by Reexamination Control Number).

**REQUEST FOR EX PARTE REEXAMINATION TRANSMITTAL FORM**

Address to:

**Mail Stop Ex Parte Reexam**  
**Commissioner for Patents**  
**P.O. Box 1450**  
**Alexandria, VA 22313-1450**

Attorney Docket No.: Date: 

1.  This is a request for *ex parte* reexamination pursuant to 37 CFR 1.510 of patent number 5,954,781 issued September 21, 1999. The request is made by:
  - patent owner.
  - third party requester.
2.  The name and address of the person requesting reexamination is:
 

Volkswagen Group of America, Inc.

2200 Ferdinand Porsche Drive

Herndon, VA 20171
3. Requester claims  small entity (37 CFR 1.27) or  micro entity status (37 CFR 1.29) -- only a patent owner requester can claim micro entity status.
4.  a. A check in the amount of \$ \_\_\_\_\_ is enclosed to cover the reexamination fee, 37 CFR 1.20(c)(1);
- b. The Director is hereby authorized to charge the fee as set forth in 37 CFR 1.20(c)(1) to Deposit Account No. \_\_\_\_\_;
- c. Payment by credit card. Form PTO-2038 is attached; or
- d. Payment made via EFS-Web.
5.  Any refund should be made by  check or  credit to Deposit Account No. 11-0600. 37 CFR 1.26(c). If payment is made by credit card, refund must be to credit card account.
6.  A copy of the patent to be reexamined having a double column format on one side of a separate paper is enclosed. 37 CFR 1.510(b)(4).
7.  CD-ROM or CD-R in duplicate, Computer Program (Appendix) or large table
  - Landscape Table on CD
8.  Nucleotide and/or Amino Acid Sequence Submission  
*If applicable, items a. -- c. are required.*
  - a.  Computer Readable Form (CRF)
  - b. Specification Sequence Listing on:
    - i.  CD-ROM (2 copies) or CD-R (2 copies); or
    - ii.  paper
  - c.  Statements verifying identity of above copies
9.  A copy of any disclaimer, certificate of correction or reexamination certificate issued in the patent is included.
10.  Reexamination of claim(s) 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17-32 is requested.
11.  A copy of every patent or printed publication relied upon is submitted herewith including a listing thereof on Form PTO/SB/08, PTO-1449, or equivalent.
12.  An English language translation of all necessary and pertinent non-English language patents and/or printed publications is included.

(Page 1 of 2)

This collection of information is required by 37 CFR 1.510. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 18 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Mail Stop Ex Parte Reexam, Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

*If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.*

13.  The attached detailed request includes at least the following items:
- a. A statement identifying each substantial new question of patentability based on prior patents and printed publications. 37 CFR 1.510(b)(1).
  - b. An identification of every claim for which reexamination is requested, and a detailed explanation of the pertinency and manner of applying the cited art to every claim for which reexamination is requested. 37 CFR 1.510(b)(2).
14.  A proposed amendment is included (only where the patent owner is the requester). 37 CFR 1.510(e).
15.  a. It is certified that a copy of this request (if filed by other than the patent owner) has been served in its entirety on the patent owner as provided in 37 CFR 1.33(c).  
 The name and address of the party served and the date of service are:  
Michael S. Bush, Haynes & Boone LLP  
3100 Nationsbank Plaza, 901 Main Street, Dallas, TX 75202-3789  
 Date of Service: May 22, 2014; or
- b. A duplicate copy is enclosed since service on patent owner was not possible. An explanation of the efforts made to serve patent owner is attached. See MPEP § 2220.

16. Correspondence Address: Direct all communication about the reexamination to:

The address associated with Customer Number: 26646

OR

Firm or Individual Name \_\_\_\_\_

Address \_\_\_\_\_

City	State	Zip
Country		
Telephone	Email	

17.  The patent is currently the subject of the following concurrent proceeding(s):
- a. Copending reissue Application No. \_\_\_\_\_
  - b. Copending reexamination Control No. \_\_\_\_\_
  - c. Copending Interference No. \_\_\_\_\_
  - d. Copending litigation styled: Please see attached continuation sheet.

**WARNING: Information on this form may become public. Credit card information should not be included on this form. Provide credit card information and authorization on PTO-2038.**

## Privacy Act Statement

The **Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (*i.e.*, GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

## EXHIBITS

- Exhibit 1 U.S. Patent No. 5,954,781, entitled “Method and Apparatus for Optimizing Vehicle Operation,” issued Sept. 21, 1999, to Harvey Slepian, et al.
- Exhibit 2 “First Amended Complaint for Patent Infringement” filed on January 30, 2014 in *VELOCITY PATENT LLC v. AUDI OF AMERICA, INC.*, Case No. 1:13-cv-08418-JBG (N.D. Ill.)
- Exhibit 3 U.S. Patent No. 4,901,701, issued on February 20, 1990 to Chasteen
- Exhibit 4 U.S. Patent No. 4,631,515, issued on December 23, 1986 to Blee et al.
- Exhibit 5 U.S. Patent No. 5,708,584, filed on September 8, 1995, issued on January 13, 1998 to Doi et al.
- Exhibit 6 Velocity Patent LLC’s Initial Infringement Contentions Pursuant to Local Patent Rule 2.2 to Audi
- Exhibit 7 Velocity Patent LLC’s Initial Infringement Contentions Pursuant to Local Patent Rule 2.2 to Mercedes-Benz
- Exhibit 8 Velocity Patent LLC’s Initial Infringement Contentions Pursuant to Local Patent Rule 2.2 to Chrysler
- Exhibit 9 Velocity Patent LLC’s Initial Infringement Contentions Pursuant to Local Patent Rule 2.2 to Jaguar Land Rover
- Exhibit 10 Listing of Prior Art Patents and Printed Publications that Raise Substantial New Questions of Patentability Affecting the Claims of U.S. Patent No. 5,954,781
- Exhibit 11 “Automotive Electronics Handbook,” published in 1995, by Ronald Jurgen
- Exhibit 12 U.S. Patent No. 5,477,452, issued on December 19, 1995 to Milunas et al.
- Exhibit 13 U.S. Patent No. 4,559,599, issued on December 17, 1985 to Habu et al.
- Exhibit 14 German Patent Application Publication No. 29 26 070, and its corresponding English Translation, published on January 15, 1981
- Exhibit 15 U.S. Patent No. 5,357,438, issued on October 18, 1994 to Davidian
- Exhibit 16 U.S. Patent No. 4,061,055, issued on December 6, 1977 to Iizuka et al.
- Exhibit 17 U.S. Patent No. 5,121,324, issued on June 9, 1992 to Rini et al.
- Exhibit 18 U.S. Patent No. 3,925,753, issued on December 9, 1975 to Auman et al.

Exhibit 19 International Patent Application No. WO 96/02853, published on  
February 1, 1996 to Tonkin

Exhibit 20 Certificate of Service

**I. IDENTIFICATION PURSUANT TO 37 C.F.R. § 1.510(b)(2)**

*Ex parte* reexamination of claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17–32 of U.S. Patent No. 5,954,781 (“the ’781 patent”) is requested.

**II. COPY OF ’781 PATENT PURSUANT TO 37 C.F.R. § 1.510(b)(4)**

Pursuant to 37 C.F.R. § 1.510(b)(4), annexed hereto as Exhibit 1 is a copy of the entire ’781 patent including the front face, drawings, specification and claims (in double column format) for which *ex parte* reexamination is requested.

To the best of Requester’s knowledge, as of the date of this request, no disclaimer, certificate of correction, or reexamination certificate has been issued in connection with the ’781 patent.

**III. PROCEEDINGS RELATED TO ’781 PATENT**

Although Requester is not obligated to inform the Office of proceedings related to the ’781 patent, the Office is hereby informed of the following proceedings, which are pending as of the date of this Request, that relate to the ’781 patent:

*VELOCITY PATENT LLC v. AUDI OF AMERICA, INC.*, Case No. 1:13-cv-08418-JBG (N.D. Ill.) – First Amended Complaint Filed on January 30, 2014 (“the *VELOCITY-AUDI* case,” copy annexed hereto as Exhibit 2) naming as defendants Audi of America, Inc. and Audi of America, LLC. Audi of America, Inc. is a d/b/a of Volkswagen Group of America, Inc., which is a wholly owned subsidiary of Volkswagen AG, a publicly-held German corporation.

*VELOCITY PATENT LLC v. MERCEDES-BENZ USA, LLC, et al.*, Case No. 1:13-cv-08413-JWD (N.D. Ill.) – Complaint Filed on November 21, 2013 (“the *VELOCITY-MERCEDES-BENZ* case”).

*VELOCITY PATENT LLC v. BMW OF NORTH AMERICA, LLC, et al.*, Case No. 1:13-cv-08416-JWD (N.D. Ill.) – Complaint Filed on November 21, 2013 (“the *VELOCITY-BMW* case”).

*VELOCITY PATENT LLC v. CHRYSLER GROUP LLC*, Case No. 1:13-cv-08419-JWD (N.D. Ill.) – Complaint Filed on November 21, 2013 (“the *VELOCITY-CHRYSLER* case”).

#### **IV. THE '781 PATENT AND ITS PROSECUTION**

##### **A. The '781 Patent**

The '781 patent is titled “Method and Apparatus for Optimizing Vehicle Operation” and was issued on September 21, 1999 from U.S. Application Serial No. 08/873,270 (“the '270 application”), filed on March 10, 1997.

The '781 patent is generally related to an “[a]pparatus for optimizing operation of an engine-driven vehicle.” Abstract. In describing the background and prior art, the '781 patent states that “[i]t has long been recognized that the improper operation of a vehicle may have many adverse effects.” Col. 1, lines 12–13. For example, according to the '781 patent, “the fuel efficiency of a vehicle may vary dramatically based upon how the vehicle is operated.” Col. 1, lines 13–15. The '781 patent refers specifically to, for example, operating a vehicle at excessive speeds, excessive RPMs, and excessive manifold pressures as leading to reduced fuel economy and increased operating costs. Col. 1, lines 15–18. The increased operating costs may be considerable, especially for the owner or operator of a fleet of vehicles. Against this background, the '781 patent describes a processor subsystem to determine when to issue notifications as to recommended changes in vehicle operation that, when executed by the driver, will optimize vehicle operation.

According to the specification, the system “both notifies the driver of recommended corrections in vehicle operation and, under certain conditions, automatically initiates selected corrective action.” Col. 1, lines 7–10. The '781 patent states that “it would be desirable to provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66–col. 2, line 6.

The '781 patent describes three types of circuits for issuing notifications that indicate operating inefficiencies: a shift notification circuit; a fuel overinjection notification circuit; and a vehicle proximity alarm circuit. The shift notification circuit issues a notification that the engine of the vehicle is being operated at an excessive speed, i.e., the shift notification circuit operates as an upshift notification circuit, and/or issues a notification that the engine of the vehicle is being operated at an insufficient speed, i.e., the shift notification circuit operates as a downshift notification circuit. The fuel overinjection notification circuit issues a notification that excessive fuel is being supplied to the engine of the vehicle, and the vehicle proximity alarm circuit issues an alarm when the vehicle is too close to an object.

According to the '781 patent, a series of sensors, including a road speed sensor 18, an RPM sensor 20, a manifold pressure sensor 22, a throttle sensor 24, a windshield wiper sensor 30, and a brake sensor 32, are coupled to a processor subsystem 12 and are periodically polled by the processor subsystem to determine their respective states or levels. Col. 5, line 65–col. 6, line 4. The system 10 includes a memory subsystem 14, which is used to hold information to be utilized by the processor subsystem 12 to determine whether to take corrective actions and/or issue notifications. Col. 6, lines 43–46. Figure 1 of the '781 patent is reproduced below:

Fig. 1

For example, the processor subsystem 12 determines that the vehicle is being operated unsafely if the speed of the vehicle is such that the stopping distance for the vehicle is greater than the distance separating the vehicle from an object, e.g., a second vehicle, in its path. Col. 9, lines 4–8. As another example, the processor subsystem 12 will notify the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced if the processor subsystem 12 determines that too much fuel is being provided to the engine, which is determined based on the vehicle's road speed, throttle position, and manifold pressure. Col. 12, lines 5–14. As a further example, the processor subsystem 12 will issue an audible alert to notify the driver that, in order to optimize vehicle operation, an upshift should be performed, based on the vehicle's engine speed reaching a particular RPM set point. Col. 11, line 45–col. 12, line 4.

Thus, according to the '781 patent, a system is provided for optimizing vehicle operation that combines operator notifications of recommended corrections in vehicle operation with automatic modification of vehicle operation under certain circumstances. Col.

13, lines 36–40. In addition, the driver is advised of certain actions that will enable the vehicle to be operated with greater fuel efficiency. Col. 13, lines 40–44.

**B. Prosecution of the '781 Patent**

As described in more detail below, during prosecution of the '781 patent, the Examiner concluded that upshift notification circuits, downshift notification circuits, and processors that determine when to activation upshift and downshift notification circuits were not taught by the cited prior art.

Claims 1 to 6 and 17 to 25 were allowed because they were amended to include, for example, an upshift notification circuit and a processor that determines when to activate the upshift notification circuit. Therefore, the questions whether substantial new questions of patentability are raised and whether claims 1 to 6 and 17 to 25 are obvious in view of the prior art are reduced to these limitations relating to the upshift notification circuit.<sup>1</sup>

Claims 7 to 12, 26, and 27 were allowed because they were, in effect,<sup>2</sup> amended to include, for example, a downshift notification circuit and a processor that determines when to activate the downshift notification circuit. Therefore, the questions whether substantial new questions of patentability are raised and whether claims 7 to 12, 26, and 27 are obvious in view of the prior art are reduced to these limitations relating to the downshift notification circuit.

Claims 13 to 16 were allowed based on the fact that they include an upshift notification circuit, a downshift notification circuit, and a processor that determines when to activate the upshift and downshift notification circuits. Therefore, the questions whether substantial new questions of patentability are raised and whether claims 13 to 16 are obvious in view of the prior art are reduced to these limitations relating to the upshift and downshift notification circuits.

Regarding claims 28 to 30, which were added during prosecution, the applicant argued that these claims were allowable over the cited prior art based on the fact that they

---

<sup>1</sup> *Graham v. John Deere Co.* 383 U.S. 1 (1966) (“Here, the patentee obtained his patent only by accepting the limitations imposed by the Examiner. The claims were carefully drafted to reflect these limitations and Cook Chemical is not now free to assert a broader view of Scoggin’s invention. The subject matter as a whole reduces, then, to the distinguishing features clearly incorporated into the claims. We now turn to those features.”).

<sup>2</sup> *See, e.g., Honeywell Int’l v. Hamilton Sundstrand Corp.*, 370 F.3d 1131, 1144 (Fed. Cir. 2004) (“[D]ependent c]laims 4, 8, and 19 were rewritten into independent form, and the original independent claims were cancelled, effectively adding the inlet guide vane limitations [of dependent claims 4, 8 and 19] to the claimed invention.”).

claim a fuel overinjection notification circuit and a processor subsystem that determines whether to activate the fuel overinjection notification circuit based on data received from a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Therefore, the questions whether substantial new questions of patentability are raised and whether claims 28 to 30 are obvious in view of the prior art are reduced to these limitations relating to the fuel overinjection notification circuit.

Regarding claims 31 and 32, which were added during prosecution, the applicants argued that these claims were allowable over the prior art based on the fact that they claim a processor subsystem that determines whether to activate a vehicle proximity alarm circuit based on separation distance data received from a radar detector, vehicle speed data received from a road speed sensor, and a vehicle stopping distance table stored in a memory subsystem. Therefore, the questions whether substantial new questions of patentability are raised and whether claims 31 and 32 are obvious in view of the prior art are reduced to these limitations relating to the vehicle proximity alarm circuit.

The '270 application was filed on March 10, 1997 with 32 claims, of which application claims 1, 14, 18, and 27 were the only independent claims. Among these independent claims, application claim 1 included a fuel overinjection circuit, application claim 14 included a fuel overinjection circuit, an upshift notification circuit, and a downshift notification circuit, application claim 18 included a vehicle proximity alarm, and application claim 27 included a fuel overinjection circuit and a vehicle proximity alarm.

In the only Office Action, dated August 6, 1998, application claims 1, 2 and 4 to 6 were rejected as obvious in view of U.S. Patent No. 4,901,701 to Chasteen (copy attached as Exhibit 3), application claim 3 was rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 4,631,515 to Blee et al. (copy attached as Exhibit 4), and application claims 7, 18 to 24, 27, and 28 were rejected as obvious in view of the combination of Chasteen and U.S. Patent No. 5,708,584 to Doi et al. (copy attached as Exhibit 5).

In the Office Action, the Examiner stated that application claims 8 to 13, 25, 26, and 29 to 32 included allowable subject matter. Specifically, the Examiner stated that application claims 8, 25, and 29 included allowable subject matter on the basis that "the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit." Similarly, the Examiner stated that application claims 11, 26, and 31 included

allowable subject matter on the basis that “the prior art fails to disclose a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.” In addition, application claims 14 to 17, which included both an upshift notification circuit and a downshift notification circuit, were allowed on the basis that:

the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

In response to this Office Action, the applicant submitted an Amendment on February 8, 1999. Application claim 1 was amended as follows, to add the limitations of claims 4 and 8, including the upshift notification circuit of claim 8:

1. Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification

that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

Dependent application claim 11, which included a downshift notification circuit, was rewritten into independent form as follows:

11. Apparatus for optimizing operation of a vehicle, [according to claim 4 and further] comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

Application claim 18 was amended as follows, to add the limitations of dependent claims 23 to 25, including the upshift notification circuit of claim 25:

18. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed stopping distance table, a manifold pressure set point, an RPM set point, a [and] present level[s] for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

Application claim 27 was amended as follows, to add the limitations of dependent claim 29, including the upshift notification circuit of claim 29:

27. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation

of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

Dependent application claim 31, which included a downshift notification circuit, was rewritten into independent form as follows:

31. Apparatus for optimizing operation of a vehicle, [according to claim 27 and further] comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed

sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

In addition to the foregoing claim amendments, the applicants added new application claims 33 to 38, which are discussed in further detail below.

Regarding the claim amendments, the applicant did not present any substantive arguments against the rejection of claims 1-2, 5, 6, 18 to 24, 27, and 28. Rather, the applicant acknowledged that the claims were merely reformulated to place into allowable form the claims that were indicated to include allowable subject matter.

Regarding the newly presented claims, application claims 34 and 37 were the only independent claims, and these claims as presented in the February 8, 1999 Amendment are reproduced below:

34. Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

37. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.

In the accompanying Remarks, the applicant asserted that application claim 34 is patentable over the prior art by stating:

With respect to Chasteen, the Applicants first note the [sic] Chasteen discloses a system where, in response to certain detected conditions, a CPU issues control commands which modify the operation of an engine. In contrast, Applicants' system merely issues notifications of the determination of a fuel overinjection condition. No corrective action is taken by the system. Applicants' system is superior in that it enables the vehicle to be operated outside of the preferred operating conditions when the vehicle operator deems it necessary. For example, it may be necessary to operate the vehicle in a fuel overinjection mode when performing emergency actions such as rapid accelerations to avoid collisions.

The Applicants further note that, in rejection prior Claim 1 as unpatentable over Chasteen, the Examiner acknowledged that Chasteen "fails to specifically disclose a road speed sensor" and asserted that "it would have been obvious . . . to have a road speed sensor in the system since the speed sensor would help to monitor the operation of the vehicle." Again, the Applicants respectfully disagree. Specifically, as presented in new Claims 34-36, Applicants' claimed apparatus for optimizing operation of a vehicle includes a fuel overinjection notification circuit and a processor subsystem which determines when to activate the fuel overinjection notification circuit. The processor makes that determination based upon data received from specifically recited sensors, including the road speed sensor. Thus, not only does Chasteen fail to teach an apparatus for optimizing vehicle operation which includes a road speed sensor, Chasteen is equally deficient in teaching a processor configured to determine a fuel overinjection condition by analyzing, in combination, road speed, throttle position and manifold pressure level. As Chasteen lacks both a specific sensor and a processor configured to determine a fuel overinjection condition from data collected from that specific sensor in combination with other sensors, the Applicants respectfully submit that Chasteen cannot teach or suggest the apparatus defined by new Claims 34-36.

February 8, 1999 Amendment, at 10-11 (emphasis in original).

In other words, according to the applicant, application claim 34 is allowable because the prior art does not disclose a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor.

Additionally, the applicant asserted that application claim 37 is patentable over the prior art by stating:

The Applicants respectfully submit that new Claims 37-38, as presented herein, are neither taught nor suggested by the proposed combination of Chasteen and Doi et al. The Examiner properly cited Doi et al. as disclosing a vehicle running mode detection system equipped with a radar detector and an alarm circuit. The Applicants respectfully note, however, that the system disclosed in Doi et al. determines alert conditions relative to the proximity between a vehicle and a forward object based upon changes in the distance separating the vehicle and the forward object. In contrast, Applicants' apparatus for optimizing vehicle operation set forth in Claim 37 includes a processor subsystem configured to activate a vehicle proximity alarm circuit based upon road speed (as determined by a road speed sensor), separation (as determined by a radar detector) and a vehicle speed/stopping distance table stored in a memory subsystem.

Id. at 11-12.

In other words, according to the applicant, application claim 37 is allowable because the prior art does not disclose a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. The applicant did acknowledge, however, that a vehicle proximity alarm that is activated based on separation is disclosed in the prior art: "The Applicants respectfully note, however, that the system disclosed in Doi et al. determines alert conditions relative to the proximity between a vehicle and a forward object based upon changes in the distance separating the vehicle and the forward object."

Thereafter, the Examiner issued a Notice of Allowance, which includes a lengthy statement by the Examiner of the reasons for allowance. Although no specific claims are discussed in the Examiner's statement of reasons for allowance, particular claim language is discussed such the reason that each independent was allowed is apparent.

For example, the Notice of Allowance states that

The prior art fails to disclose an apparatus for optimizing operation of a vehicle and comprising an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive speed and the processor determines when to activate the upshift notification circuit; and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing

a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.

The Notice of Allowance further states that:

Nor does the prior art disclose [sic] a fuel overinjection notification circuit coupled to the processor subsystem, wherein the fuel overinjection notification circuit issues a notification that excess fuel is being supplied to the engine of the vehicle and the processor subsystem determines whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor.

Additionally, the Notice of Allowance states:

Nor does the prior art disclose [sic] that the processor subsystem determines whether to activate the vehicle proximity alarm circuit based upon separation distance data received from the radar detector, vehicle speed/stopping distance table stored in the memory subsystem.

**V. PATENT OWNER'S INFRINGEMENT CONTENTIONS IN LITIGATIONS INVOLVING THE '781 PATENT**

As stated above, the '781 patent is the subject of related litigations, including the *VELOCITY-AUDI* case, the *VELOCITY-MERCEDES-BENZ* case, the *VELOCITY-BMW* case, the *VELOCITY-CHRYSLER* case, and the *VELOCITY-JAGUAR* case. Attached as Exhibits 6 to 9 are copies of "Velocity Patent LLC's Initial Infringement Contentions Pursuant to Local Patent Rule 2.2," served by the Patent Owner in the *VELOCITY-AUDI* case, the *VELOCITY-MERCEDES-BENZ* case, the *VELOCITY-CHRYSLER* case, and the *VELOCITY-JAGUAR* case, respectively. In these Initial Infringement Contentions, the Patent Owner has asserted (1) that cylinder-on-demand systems, fuel economy messages, and speed warning systems, for example, are functionalities that infringe fuel overinjection notification circuits, (2) that efficiency programs, gearshift indicators that show current and recommended gears, dynamic steering systems, transmission overheating indicators, and gear selection levers in automatic transmissions, for example, are functionalities that infringe upshift and downshift notification

circuits; and (3) that adaptive cruise control systems, braking guard systems, and side assist systems, for example, are functionalities that infringe vehicle proximity alarm circuits.<sup>3</sup>

**VI. CITATIONS OF PRIOR ART PATENTS AND PRINTED PUBLICATIONS THAT RAISE SUBSTANTIAL NEW QUESTIONS OF PATENTABILITY**

Substantial new questions of patentability of claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 to 32 of the '781 patent are raised by the following prior art patents and printed publications. Annexed hereto as Exhibit 10 is a listing of, *inter alia*, the prior art patents and printed publications that raise substantial questions of patentability. Each of the prior art patent and printed publications cited herein constitutes prior art against the '781 patent under 35 U.S.C. § 102(b).

- A. Automotive Electronics Handbook, by Ronald Jurgen ("Jurgen"), published in 1995.
- B. U.S. Patent No. 5,477,452 ("Saturn '452"), issued on December 19, 1995.
- C. U.S. Patent No. 4,559,599 ("Toyota '599"), issued on December 17, 1985.
- D. German Patent Application Publication No. 29 26 070 ("Volkswagen '070"), published on January 15, 1981.
- E. U.S. Patent No. 5,357,438 ("Davidian"), issued on October 18, 1994.
- F. U.S. Patent No. 4,061,055 ("Nissan '055"), issued on December 6, 1977.
- G. U.S. Patent No. 5,121,324 ("Mack '324"), issued on June 9, 1992.
- H. U.S. Patent No. 3,925,753 ("GM '753"), issued on December 9, 1975.
- I. PCT Publication No. WO 96/02853 ("Tonkin"), published on February 1, 1996.

A copy of every prior art patent and printed publication relied upon or referred to herein is submitted herewith as required by 37 C.F.R. § 1.510(b)(3), as follows:

---

<sup>3</sup> Nothing in the present Request should be considered to constitute an agreement, admission, or concession by VWGoA that the claims of the '781 patent cover the systems or vehicles described in the Patent Owner's Initial Infringement Contentions.

- A. A copy of Jurgan is annexed hereto as Exhibit 11.
- B. A copy of Saturn '452 is annexed hereto as Exhibit 12.
- C. A copy of Toyota '599 is annexed hereto as Exhibit 13.
- D. A copy of Volkswagen '070 is annexed hereto as Exhibit 14.
- E. A copy of Davidian is annexed hereto as Exhibit 15.
- F. A copy of Nissan '055 is annexed hereto as Exhibit 16.
- G. A copy of Mack '324 is annexed hereto as Exhibit 17.
- H. A copy of GM '753 is annexed hereto as Exhibit 18.
- I. A copy of Tonkin is annexed hereto as Exhibit 19.

**VII. STATEMENTS IDENTIFYING EACH SUBSTANTIAL NEW  
QUESTION OF PATENTABILITY PURSUANT TO 37 C.F.R. § 1.510(b)(1)**

1. Claim 1 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Saturn '452
2. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Toyota '599
3. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Volkswagen '070
4. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Toyota '599, and Davidian
5. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Volkswagen '070, and Davidian
6. Claims 17–21 and 23 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan, Saturn '452, and Davidian
7. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Nissan '055
8. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and Mack '324
9. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgan and GM '753
10. Claim 31 is Anticipated Under 35 U.S.C. § 102(b) by Davidian

11. Claims 31 and 32 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Tonkin and Doi et al.
12. Claims 2, 4, and 5 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Chasteen
13. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Chasteen
14. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Chasteen
15. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, Davidian, and Tonkin
16. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, Davidian, and Tonkin
17. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, Davidian, and Tonkin
18. Claims 24 and 25 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, Davidian and Chasteen
19. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, Davidian and Chasteen
20. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, Davidian and Chasteen
21. Claim 32 is Obvious Under 35 U.S.C. § 103(a) in in View of the combination of Davidian and Tonkin

**DETAILED EXPLANATIONS PURSUANT TO 37 C.F.R. § 1.510(b)(2)**

The following statements are made, pursuant to 37 C.F.R. § 1.510(b)(2), pointing out each substantial new question of patentability based on the prior art patents and printed publications cited above, in accordance with the “broadest reasonable interpretation” standard as set forth in M.P.E.P. § 2258(I)(G).<sup>4</sup>

As set forth in detail below, the foregoing prior art patents and printed publications would have been considered important by a reasonable Examiner in deciding whether to allow claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 to 32 of the '781 patent. Therefore, these prior art patents and printed publications raise substantial new questions of patentability.

---

<sup>4</sup> “During reexamination, claims are given their broadest reasonable interpretation consistent with the specification and limitations in the specification are not read into the claims.”

Pursuant to 37 C.F.R. § 1.510(b)(2), a detailed explanation of the pertinence and manner of applying the cited prior art patents and printed publications to every claim for which reexamination is requested is set forth below with reference to the appended charts.

The following detailed explanation is informed by the prosecution history, as set forth above. To briefly summarize, the Examiner in the original prosecution concluded that the prior art failed to teach or suggest upshift or downshift notification circuits for claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17 to 27. Because the prosecution history focused on the upshift and/or downshift notification circuits, and because the prior art discussed herein discloses these circuits, substantial new questions of patentability affecting claims 1, 7, 13, 17, 23, 26 are raised by the prior art discussed herein.

With respect to claims 28 to 30, the applicant in the original prosecution emphasized that the prior art failed to teach a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Because the prosecution history focused on a fuel overinjection notification circuit activated based on these three sensors, and because the prior art disclosed herein discloses a fuel overinjection notification circuit activated based on these three sensors, substantial new questions of patentability affecting claims 28 to 30 are raised by the prior art discussed herein.

With respect to claims 31 and 32, the applicant in the original prosecution emphasized that the prior art failed to teach a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. Because the prosecution history focused on a vehicle proximity alarm that is activated based on these three parameters, and because the prior art disclosed herein discloses a vehicle proximity alarm activated based on these three parameters, substantial new questions of patentability affecting claims 31 and 32 are raised by the prior art discussed herein.

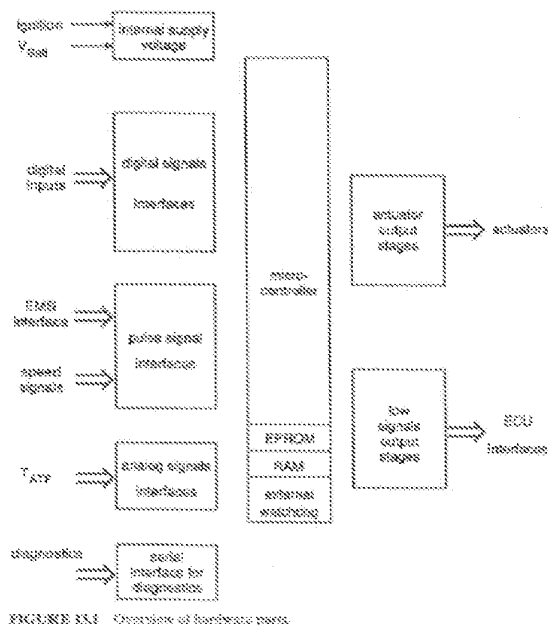

**1. Claim 1 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Saturn '452**

Claim 1 is obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and Saturn '452. Neither Jurgen nor Saturn '452 was cited by the Examiner or the applicants during prosecution of the '781 patent. Therefore, the question of whether claim 1 is obvious in view of the combination of Jurgen and Saturn '452 was not previously considered. The combination of Jurgen and Saturn '452 is closer to the subject matter of claim 1 of the '781

patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen and Saturn '452 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claim 1 was allowable over the prior art cited during prosecution on the basis that the prior art does not teach an upshift notification circuit, wherein the processor determines, based upon data received from sensors, when to activate said upshift notification circuit.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates these hardware parts:

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a

throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”)). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen also teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps,

can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Saturn '452 teaches a "means for indicating to the operator a point in operation for upshifting to the next higher gear." Abstract. The processor subsystem taught by Saturn '452 receives sensor inputs that sense manifold pressure, engine speed, and throttle position. Col. 2, lines 42 to 44; col. 7, lines 13 to 21. Therefore, Saturn '452 teaches "a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor," except for the claimed road speed sensor, which is taught by Jurgen.

Figure 1 of Saturn '452 is illustrative:

Figure 1 of Saturn '452 illustrates that the control unit 42 is connected to the sensor inputs, and outputs a signal on line 60 that may drive a lamp "for indicating the state of the upshift indicator light." Col. 2, lines 42 to 55; col. 3, lines 60 to 65. Additionally, Saturn '452 teaches that the control unit includes a memory (col. 2, lines 52 to 55), and that a "predetermined maximum allowable engine speed threshold K1" is used by the system. Col. 6, lines 55 to 60. Therefore, Saturn '452 discloses "a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point,

an RPM set point, and present and prior levels for each one of said plurality of sensors,” except for the claimed manifold pressure set point and present and prior levels for each one of the sensors, which are taught by Jorgen (*see* Jorgen at 12.9, 13.5).

Saturn '452 teaches an upshift notification circuit connected to the control unit, which indicates “via line 60 the state of an upshift indicator light or equivalent visual display.” Col. 2, lines 42 to 55. Therefore, Saturn '452 teaches “an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed” and “said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift notification circuit.”

A person of ordinary skill in the art, at the time the alleged invention of claim 1 of the '781 patent was made, would have found it obvious to combine the teachings of Jorgen and Saturn '452, and, in addition, would have been motivated to do so. Indeed, Jorgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jorgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged invention of claim 1 of the '781 patent was made would have been further motivated to combine the teachings of Jorgen and Saturn '452 to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jorgen, Page 12.4), to provide a “means for indicating to the operator a point in operation for upshifting to the next higher gear” (Saturn '452, Abstract), and to provide “an improved method of determining shift points and indicating the same to a vehicle operator in order to maximize real driving fuel economy” (Saturn '452, col. 1, lines 44 to 47). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jorgen and Saturn '452 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jorgen and the teachings of Saturn '452, Jorgen describes at page xviii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to

them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and Saturn '452 teaches the limitations that the Examiner concluded were absent from the prior art cited during prosecution of the '781 patent, *i.e.*, an upshift notification circuit activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claim 1 is raised by the combination of Jurgen and Saturn '452.

As set forth in the appended charts, the combination of Jurgen and Saturn '452 teaches all of the limitations of claim 1 of the '781 patent and therefore renders obvious claim 1 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claim 1 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and Saturn '452.

## **2. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Toyota '599**

Claims 1, 7, and 13 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and Toyota '599. Neither Jurgen nor Toyota '599 was cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 1, 7, and 13 are obvious in view of the combination of Jurgen and Toyota '599 was not previously considered. The combination of Jurgen and Toyota '599 is closer to the subject matter of

claims 1, 7, and 13 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen and Toyota '599 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 1, 7, and 13 were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrated a diagram of these hardware parts:

FIGURE 13.1 Overview of hardware parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a

throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen also teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which

monitors all of the vehicle's sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Toyota '599 discloses a "shift indication apparatus" coupled to a plurality of sensors. An overview of this system is illustrated in Figure 1:

The sensor inputs to the microcomputer include an engine speed sensor 1 and a throttle sensor 3, which are both "connected to the input of the I/O port 6 so as to transmit the output pulses to the microcomputer 5." Col. 2, lines 43 to 48; col. 2, lines 52 to 59. Therefore, Toyota '599 teaches "a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor," except for the claimed manifold pressure sensor and road speed sensor, which is taught by Jurgen. *See, e.g.*, Jurgen, pages 2.5, 2.7, and 7.6. Toyota '599 also teaches "a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom."

Additionally, Toyota '599 teaches that a memory can be used to store a torque data map and an RPM set point. Col. 3, lines 7 to 20 and lines 44 to 61. For example, the engine speed "is read from the RAM 9 and it is compared with a predetermined number N (=1000 rpm) to determine whether or not the  $N_e$  exceeds the value 1000 at the step 21." Col. 3, lines 44 to 61. The actual RPM exceeding this RPM set point is necessary to begin the main routine. Therefore, Toyota '599 teaches "a memory subsystem, coupled to said processor subsystem" and that said memory subsystem stores an "RPM set point."

Toyota '599 teaches that indicator lamps that tell the driver to shift up or shift down are lit by the microcomputer in order to tell the driver when to shift to improve fuel economy. "Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the drive that the speed change from current shift position to the one step shifting up position  $SP_{+1}$  is preferable." Col. 5, line 63 to col. 6, line 2. "However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_e$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation." E.g. col. 7, lines 29 to 38. Therefore, Toyota '599 teaches "an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed" and "said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift[/downshift] notification circuit."

A person of ordinary skill in the art, at the time the alleged inventions of claims 1, 7, and 13 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen and Toyota '599, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 1, 7, and 13 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen and Toyota '599 to "provide optimal driveability for all operating conditions" (Jurgen, Page 12.1), to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), and to "obtain preferable shift positions relating to optimum fuel consumption rate in accordance with . . . data detected" (Toyota '599, Abstract). The '781 patent states that its object is to "provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely." Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen and Toyota '599 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen and the teachings of Toyota '599, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and Toyota '599 teaches the limitations that the Examiner concluded were absent from the prior art cited during prosecution of the '781 patent, *i.e.*, upshift and downshift notification circuits activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claims 1, 7, and 13 is raised by the combination of Jurgen and Toyota '599.

As set forth in the appended charts, the combination of Jurgen and Toyota '599 teaches all of the limitations of claims 1, 7, and 13 of the '781 patent and therefore renders obvious claims 1, 7, and 13 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 1, 7, and 13 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and Toyota '599.

**3. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Volkswagen '070**

Claims 1, 7, and 13 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and Volkswagen '070. Neither Jurgen nor Volkswagen '070 was cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 1, 7, and 13 are obvious in view of the combination of Jurgen and Volkswagen '070 was not previously considered. The combination of Jurgen and Volkswagen '070 is closer to the subject matter of claims 1, 7, and 13 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen and Volkswagen '070 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 1, 7, and 13 were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Indeed, Jurgen illustrates a diagram of these hardware parts:

FIGURE 12.3 Overview of motor system parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a

maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Volkswagen '070 acknowledges that automobile instrument panels that display fuel economy are in the prior art. For example, Volkswagen '070 describes at page 9:

It is useful in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the *induction manifold vacuum* as a measure of the fuel consumption. . . . In this case it is useful to integrate the signal transmitters denoted by 4 and 5 in Figure 2 into the instrument of the fuel consumption display, as sketched in Figure 3. During standard driving operation, pointer 30 of the fuel consumption display sweeps scale 31, while it is hidden behind cover 32 during an idling operation or at full-load accelerations. Incorporated in the scale is arrow 33, which constitutes part of a signal transmitter requesting upshifting, which therefore corresponds to signal transmitter 4 in Figure 2.

(emphasis added)

Thus, by describing a fuel consumption display that indicates full-load acceleration, Volkswagen '070 teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps,

can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Volkswagen '070 discloses a device “that assists the operator of [an] internal combustion engine equipped with a conventional transmission.” Page 5. The device receives an engine speed signal “with the aid of known sensor systems” and uses it to activate an “engine-speed dependent change-over switch 6.” Page 7. Volkswagen '070 describes two operating ranges, I and II, and the change-over switch 6 indicates that an upshift or downshift is necessary when the limits of those ranges (*e.g.*, the RPM set point) is reached. Pages 6–8. For example, Figure 2 of Volkswagen '070 illustrates the change-over switch, which receives the engine speed signal and determines when to activate the upshift and downshift notification lamps 4 and 5:

Volkswagen '070 also teaches that engine operating efficiency is based on throttle valve angle, induction manifold vacuum, and engine speed. For example, at page 6, Volkswagen '070 describes:

As can be seen when viewing Figure 1 to begin with, output  $N$  of the engine has been plotted across engine speed  $n$ .  $a$  is the curve of the output at full load,  $b$  is a line that represents a constant setting of the output control element, *i.e.*, a line that represents a constant **throttle valve angle** in a carburetor engine. As a measure thereof, in addition to the **throttle valve angle** itself, it is also possible to use the **induction manifold vacuum**. . . . The operating ranges I and II are further delimited by **engine speed values**  $n_1$  or  $n_2$ , the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between 40 to 70% of the maximum engine speed.

Volkswagen '070 also describes at page 8 that the “engine speed signal is obtained with the aid of known sensor systems.”

Therefore, Volkswagen '070 teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor,” except for the claimed road speed sensor, which is taught by Jurgen. *See, e.g.*, Jurgen, pages 2.5, 2.7, 7.6, and 12.8. Volkswagen '070 also teaches “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Although Volkswagen '070 does not explicitly refer to the use of memory, it does disclose operating ranges I and II which are bounded by RPM set points, which trigger the shift notifications. For example, Figure 1 discloses these operating ranges, and includes limits N1 and N2 which are engine speeds at which the shifts are indicated (Pages 6–8):

It would have been obvious to one having ordinary skill in the art to use a known memory device, such as the memory devices described by Jurgen at pages 11.24 to 11.31,<sup>5</sup> to store these set points. Therefore, the combination of Jurgen and Volkswagen '070 renders obvious an “RPM set point.”

<sup>5</sup> *See, e.g.*, pages 11.25 (“On-chip microcontroller memory consists of some mix of five basic types: random access memory (RAM), read-only memory (ROM), erasable ROM (EPROM), electrically erasable ROM (EEPROM), and flash memory. RAM is typically utilized for run-time variable storage and SFRs. The various types of ROM are generally used for code storage and fixed data tables.”) and 11.29 (“Off-chip memory offers the most flexibility to the system designer. . . . Off-chip memory is flexible because the user can implement various memory devices in the configuration of his choice. Most microcontrollers on the market today offer a wide variety of control pins and timing modes to allow the system designer flexibility when interfacing to a wide range of external memory systems.”).

Volkswagen '070 also teaches both upshift and downshift notification circuits, as upward and downward pointing arrows. When the engine is being operated at an excessive speed, an upshift notification circuit is activated. When the engine is being operated at an insufficient speed, the downshift notification circuit is activated. “Looking initially at operating range I remote from full load, *the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear*, at an operating point that lies to the left of operating range I in the diagram of Figure 1. *Accordingly, the device of the present invention generates a signal that asks the operator, i.e., normally the driver, to shift to a higher gear, which is indicated in Figure 1 by the upward pointing arrow within operating range I.*” Pages 6–7; “When the operating point lies in operating range II, *the device according to the present invention generates a signal that asks the driver to downshift, which is indicated by the downward pointing arrow at operating range II in Figure 1.*” Page 7. Volkswagen '070 also teaches that the change-over switch 6 pivots either upwardly or downwardly based upon the engine speed in order to drive the upshift or downshift indicator lights. Pages 7–8. Therefore, Volkswagen '070 teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed” and “said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift[/downshift] notification circuit.”

A person of ordinary skill in the art, at the time the alleged inventions of claims 1, 7, and 13 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen and Volkswagen '070, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 1, 7, and 13 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen and Volkswagen '070, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), and to “provid[e] a device that assists the operator of the internal combustion engine equipped with a conventional transmission . . . for example, in setting an operating point of

the engine that is advantageous in terms of fuel consumption” (Volkswagen ’070, Page 5). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jurgen and Volkswagen ’070 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen and the teachings of Volkswagen ’070, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and Volkswagen ’070 teaches the limitations that the Examiner concluded were absent from the prior art cited during prosecution of the ’781 patent, *i.e.*, upshift and downshift notification circuits activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claims 1, 7, and 13 is raised by the combination of Jurgen and Volkswagen ’070.

As set forth in the appended charts, the combination of Jurgen and Volkswagen '070 teaches all of the limitations of claims 1, 7, and 13 of the '781 patent and therefore renders obvious claims 1, 7, and 13 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 1, 7, and 13 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and Volkswagen '070.

**4. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Davidian**

Claims 17–23 and 26 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Toyota '599, and Davidian. Jurgen, Toyota '599, and Davidian were not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 17–23 and 26 are obvious in view of the combination of Jurgen, Toyota '599, and Davidian was not previously considered. The combination of Jurgen, Toyota '599, and Davidian is closer to the subject matter of claims 17–23 and 26 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen, Toyota '599, and Davidian provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner determined that claims 17–23 and 26 were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates a diagram of these hardware parts:

FIGURE 22.2 Overview of motor system parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a

maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen also teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Toyota ’599 discloses a “shift indication apparatus” coupled to a plurality of sensors. An overview of this system is illustrated in Figure 1:

The sensor inputs to the microcomputer include an engine speed sensor 1 and a throttle sensor 3, which are both “connected to the input of the I/O port 6 so as to transmit the output pulses to the microcomputer 5.” Col. 2, lines 43 to 48; col. 2, lines 52 to 59. Therefore, Toyota ’599 discloses “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor,” except for the claimed manifold pressure sensor and road speed sensor, which is taught by Jurgen. *See, e.g.*, Jurgen, pages 2.5, 2.7, and 7.6. Toyota ’599 also teaches “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Additionally, Toyota ’599 teaches that a memory can be used to store a torque data map and an RPM set point. Col. 3, lines 7 to 20 and lines 44 to 61. For example, the engine speed “is read from the RAM 9 and it is compared with a predetermined number N (=1000 rpm) to determine whether or not the  $N_e$  exceeds the value 1000 at the step 21.” Col. 3, lines 44 to 61. The actual RPM exceeding this RPM set point is necessary to begin the main routine. Therefore, Toyota ’599 teaches “a memory subsystem, coupled to said processor subsystem” and that said memory subsystem stores an “RPM set point.”

Toyota ’599 teaches that indicator lamps that tell the driver to shift up or shift down are lit by the microcomputer in order to tell the driver when to shift to improve fuel economy. “Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the driver that the speed change from current shift position to the one step shifting up position  $SP_{+1}$  is preferable.” Col. 5, line 63 to col. 6, line 2. “However, only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate  $B_e$ , the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated, thus indicating the necessity of the speed change operation.” E.g. col. 7, lines 29 to 38. Therefore, Toyota ’599 teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed” and “said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift[/downshift] notification circuit.”

Davidian discloses an anti-collision system that includes “a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle.” Col. 4,

lines 52 to 66. This front space sensor includes “a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 . . . for measuring the distance of the vehicle from objects in front of . . . the vehicle.” Col. 10, lines 17 to 26. The front space sensor in Davidian continuously transmits pulses (including, in one example, RF pulses) and measures “the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.” Col. 10, lines 38 to 50. Therefore, Davidian teaches “a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle.”

Davidian also teaches a processor subsystem, disclosed as microcomputer 4, which is illustrated in FIGS. 6a and 6b. It is coupled to the radar detector (front vehicle space sensor 8) and the vehicle speed sensor 12:

“The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above.” Col. 8, lines 29 to 43. Therefore, Davidian teaches “a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom.”

Davidian teaches a memory subsystem that stores a vehicle speed/stopping distance table. “*Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table,* for example,

provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is *stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.*” Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Davidian also teaches the storing of present and prior levels of each sensor in memory. For example, Davidian’s “Black Box Module” 94 stores the “time, *speed*, and *relative distance* between the vehicle and object” each time a collision alarm is activated. Col. 15, lines 22 to 26. Therefore, Davidian teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table” and the memory subsystem storing “a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor.”

Davidian teaches a vehicle proximity alarm circuit, which activates a collision alarm when a calculated “Collision Distance” is close to a calculated “Stopping Distance.” “A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.” Col. 12, line 59 to col. 13, line 11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 (“Operation of the Calculation Module 90”). Therefore, Davidian teaches “a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.”

Davidian also teaches that the processor subsystem determines when to activate the proximity alarm. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Col. 12, line 59 to col. 13, line 11. Therefore, Davidian teaches “said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

Davidian also teaches the use of a rain sensor connected to module 90 to detect the presence of rain. Claim 18 requires the use of a windshield wiper sensor in order to detect if rain is present. In rejecting claim 18, the Examiner stated that “Chasteen discloses a plurality

of sensors for controlling the operation of the fuel injection wherein it would have been obvious to use a windshield wiper sensor in order to provide a complete performance operation of the vehicle.” August 6, 1998 Office Action, at 5. This rejection was not challenged by the applicant, and the claim was allowed due to the addition of the upshift notification circuit to claim 17. The Examiner’s statement that a windshield wiper sensor would be an obvious modification to Chasteen carries equal weight in view of the rain sensor taught in Davidian.

Davidian also teaches that it would be beneficial in certain situations to take automatic control of the vehicle. Col. 2, lines 67 to col. 3, line 2. While Claim 19 requires a throttle controller that selectively reduces the throttle based upon inputs from various sensors, the disclosure in Davidian regarding the automatic application of the brakes achieves the same result — slowing the vehicle down.<sup>6</sup>

Jurgen teaches the use of a brake sensor as claimed in Claim 20. For example, Jurgen teaches that “[p]ressure sensors are used to monitor brake fluid pressure” and that “[b]rake pedal position and brake fluid pressure information are also required for control.” Jurgen, pages 7.21 to 22. Therefore, the combination of Jurgen, Toyota ’599, and Davidian teaches “at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.”

Davidian also teaches the use of a “black box” to record vehicle events. Claim 21 requires a “means for counting a total number of vehicle proximity alarms determined by said processor subsystem.” Davidian teaches the use of four different counters, which are stored in the black box each time a front or rear proximity alarm is activated. Col. 11, lines 60 to 68; col. 14, lines 8 to 12. Davidian does not teach “means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.” However, Davidian does teach that automated activation of a brake system is used to slow the vehicle down. Indeed, the Examiner stated that “it has been discussed that Doi et al. disclose an alarm therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to count a total number of alarms associated with the system.” August 6, 1998 Office Action, at 6. Davidian teaches counting the number of vehicle proximity alarms, and also teaches the automatic control of a vehicle. Therefore, Davidian renders obvious claim 21.

A person of ordinary skill in the art, at the time the alleged inventions of claims 17–23 and 26 of the ’781 patent were made, would have found it obvious to combine the teachings

---

<sup>6</sup> Additionally, Jurgen teaches that an electronic throttle controller was known in the art.

of Jurgen, Toyota '599, and Davidian, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 17–23 and 26 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen, Toyota '599, and Davidian, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “obtain preferable shift positions relating to optimum fuel consumption rate in accordance with . . . data detected” (Toyota '599, Abstract), and to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Toyota '599, and Davidian are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Toyota '599, and Davidian, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple

substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgén, Toyota '599, and Davidian teaches the limitations that the Examiner concluded were absent from the prior art cited during prosecution of the '781 patent, *i.e.*, upshift and downshift notification circuits activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claims 17–23 and 26 is raised by the combination of Jurgén, Toyota '599, and Davidian.

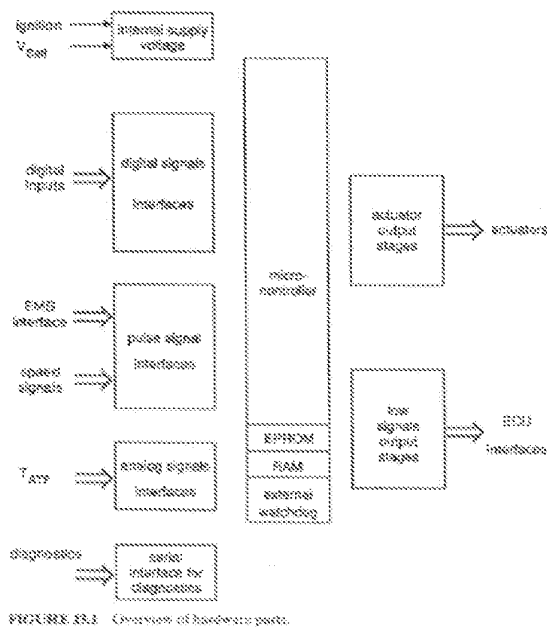

As set forth in the appended charts, the combination of Jurgén, Toyota '599, and Davidian teaches all of the limitations of claims 17–23 and 26 of the '781 patent and therefore renders obvious claims 17–23 and 26 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 17–23 and 26 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgén, Toyota '599, and Davidian.

#### **5. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, and Davidian**

Claims 17–23 and 26 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgén, Volkswagen '070, and Davidian. Jurgén, Volkswagen '070, and Davidian were not cited by the Examiner or the applicants during prosecution of the '781 patent. Therefore, the question of whether claims 17–23 and 26 are obvious in view of the combination of Jurgén, Volkswagen '070, and Davidian was not previously considered. The combination of Jurgén, Volkswagen '070, and Davidian is closer to the subject matter of claims 17–23 and 26 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgén, Volkswagen '070, and Davidian provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 17–23 and 26 were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates a diagram of these hardware parts:

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic

use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen also teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Volkswagen ’070 discloses a device “that assists the operator of [an] internal combustion engine equipped with a conventional transmission.” Page 5. The device receives an engine speed signal “with the aid of known sensor systems” and uses it to activate an “engine-speed dependent change-over switch 6.” Page 7. Volkswagen ’070 describes two operating ranges, I and II, and the change-over switch 6 indicates that an upshift or downshift is necessary when the limits of those ranges (e.g., the RPM set point) is reached. Pages 6–8.

For example, Figure 2 of Volkswagen '070 illustrates the change-over switch, which receives the engine speed signal and determines when to activate the upshift and downshift notification lamps 4 and 6:

Volkswagen '070 also teaches that engine operating efficiency is based on throttle valve angle, induction manifold vacuum, and engine speed. For example, at page 6, Volkswagen '070 describes:

As can be seen when viewing Figure 1 to begin with, output  $N$  of the engine has been plotted across engine speed  $n$ .  $a$  is the curve of the output at full load,  $b$  is a line that represents a constant setting of the output control element, i.e., a line that represents a constant *throttle valve angle* in a carburetor engine. As a measure thereof, in addition to the *throttle valve angle* itself, it is also possible to use the *induction manifold vacuum*. . . . The operating ranges I and II are further delimited by *engine speed values*  $n_1$  or  $n_2$ , the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between 40 to 70% of the maximum engine speed.

Volkswagen '070 also describes at page 8 that the “engine speed signal is obtained with the aid of known sensor systems.”

Therefore, Volkswagen '070 teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor,” except for the claimed road speed sensor, which is taught by Jurgen. See, e.g., Jurgen, pages 2.5, 2.7, 7.6, and 12.8. Volkswagen '070 also teaches “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Although Volkswagen '070 does not explicitly refer the use of memory, it does disclose operating ranges I and II which are bounded by RPM set points, which trigger the shift notifications. For example, Figure 1 illustrates these operating ranges, and includes limits N1 and N2 which are engine speeds at which the shifts are indicated (Pages 6–8):

It would have been obvious to one having ordinary skill in the art to use a known memory device, such as the memory devices described by Jurgen at pages 11.24 to 11.31,<sup>7</sup> to store these set points. Therefore, the combination of Jurgen, Volkswagen '070, and Davidian renders obvious an “RPM set point.”

Volkswagen '070 also teaches both upshift and downshift notification circuits, as upward and downward pointing arrows. When the engine is being operated at an excessive speed, an upshift notification circuit is activated. When the engine is being operated at an insufficient speed, the downshift notification circuit is activated. “Looking initially at operating range I remote from full load, *the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear*, at an operating point that lies to the left of operating range I in the diagram of Figure 1. *Accordingly, the device of the present invention generates a signal that asks the operator, i.e., normally the driver, to shift to a higher gear, which is indicated in Figure 1 by the*

<sup>7</sup> See, e.g., pages 11.25 (“On-chip microcontroller memory consists of some mix of five basic types: random access memory (RAM), read-only memory (ROM), erasable ROM (EPROM), electrically erasable ROM (EEPROM), and flash memory. RAM is typically utilized for run-time variable storage and SFRs. The various types of ROM are generally used for code storage and fixed data tables.”) and 11.29 (“Off-chip memory offers the most flexibility to the system designer. . . . Off-chip memory is flexible because the user can implement various memory devices in the configuration of his choice. Most microcontrollers on the market today offer a wide variety of control pins and timing modes to allow the system designer flexibility when interfacing to a wide range of external memory systems.”).

*upward pointing arrow within operating range I.*” Pages 6–7; “When the operating point lies in operating range II, *the device according to the present invention generates a signal that asks the driver to downshift, which is indicated by the downward pointing arrow at operating range II in Figure 1.*” Page 7. Volkswagen ’070 also teaches that the change-over switch 6 pivots either upwardly or downwardly based upon the engine speed in order to drive the upshift or downshift indicator lights. Pages 7-8. Therefore, Volkswagen ’070 teaches “an upshift[/downshift] notification circuit coupled to said processor subsystem, said upshift[/downshift] notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive[/insufficient] speed” and “said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift[/downshift] notification circuit.”

Davidian discloses an anti-collision system that includes “a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle.” Col. 4, lines 52 to 66. This front space sensor includes “a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 . . . for measuring the distance of the vehicle from objects in front of . . . the vehicle.” Col. 10, lines 17 to 26. The front space sensor taught by Davidian continuously transmits pulses (including, in one example, RF pulses) and measures “the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.” Col. 10, lines 38 to 50. Therefore, Davidian teaches “a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle.”

Davidian also teaches a processor subsystem, disclosed as microcomputer 4, which is illustrated in FIGS. 6a and 6b. It is coupled to the radar detector (front vehicle space sensor 8) and the vehicle speed sensor 12:

“The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above.” Col. 8, lines 29 to 43. Therefore, Davidian teaches “a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom.”

Davidian teaches a memory subsystem that stores a vehicle speed/stopping distance table. “*Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table*, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is *stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.*” Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Davidian also teaches the storing of present and prior levels of each sensor in memory. For example, Davidian’s “Black Box Module” 94 stores the “time, *speed*, and *relative distance* between the vehicle and object” each time a collision alarm is activated. Col. 15, lines 22 to 26. Therefore, Davidian teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table” and the memory subsystem storing “a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor.”

Davidian teaches a vehicle proximity alarm circuit, which activates a collision alarm when a calculated "Collision Distance" is close to a calculated "Stopping Distance." "A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated." Col. 12, line 59 to col. 13, line 11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 ("Operation of the Calculation Module 90"). Therefore, Davidian teaches "a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object."

Davidian also teaches that the processor subsystem determines when to activate the proximity alarm. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Col. 12, line 59 to col. 13, line 11. Therefore, Davidian teaches "said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem."

Davidian also teaches the use of a rain sensor connected to module 90 to detect the presence of rain. Claim 18 requires the use of a windshield wiper sensor in order to detect if rain is present. In rejecting claim 18, the Examiner stated that "Chasteen discloses a plurality of sensors for controlling the operation of the fuel injection wherein it would have been obvious to use a windshield wiper sensor in order to provide a complete performance operation of the vehicle." August 6, 1998 Office Action, at 5. This rejection was not challenged by the applicant, and the claim was allowed due to the addition of the upshift notification circuit to claim 17. The Examiner's statement that a windshield wiper sensor would be an obvious modification to Chasteen carries equal weight in view of the rain sensor taught in Davidian.

Davidian also teaches that it would be beneficial in certain situations to take automatic control of the vehicle. Col. 2, lines 67 to col. 3, line 2. While Claim 19 requires a throttle controller that selectively reduces the throttle based upon inputs from various sensors,

the disclosure in Davidian regarding the automatic application of the brakes achieves the same result – slowing the vehicle down.<sup>8</sup>

Jurgen teaches the use of a brake sensor as claimed in Claim 20. For example, Jurgen teaches that “[p]ressure sensors are used to monitor brake fluid pressure” and that “[b]rake pedal position and brake fluid pressure information are also required for control.” Jurgen, pages 7.21 to 22. Therefore, the combination of Jurgen, Volkswagen ’070, and Davidian teaches “at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.”

Davidian also teaches the use of a “black box” to record vehicle events. Claim 21 requires a “means for counting a total number of vehicle proximity alarms determined by said processor subsystem.” Davidian teaches the use of four different counters, which are stored in the black box each time a front or rear proximity alarm is activated. Col. 11, lines 60 to 68; col. 14, lines 8 to 12. Davidian does not teach “means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.” However, Davidian does teach that automated activation of a brake system is used to slow the vehicle down. Indeed, the Examiner stated that “it has been discussed that Doi et al. disclose an alarm therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to count a total number of alarms associated with the system.” August 6, 1998 Office Action, at 6. Davidian teaches counting the number of vehicle proximity alarms, and also teaches the automatic control of a vehicle. Therefore, Davidian renders obvious claim 21.

A person of ordinary skill in the art, at the time the alleged inventions of claims 17–23 and 26 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen, Volkswagen ’070, and Davidian, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 17–23 and 26 of the ’781 patent were made would have been further motivated to combine the teachings of Jurgen, Volkswagen ’070, and Davidian, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel

---

<sup>8</sup> Additionally, Jurgen teaches that an electronic throttle controller was known in the art.

consumption (Jurgen, Page 12.4), to “provid[e] a device that assists the operator of the internal combustion engine equipped with a conventional transmission . . . for example, in setting an operating point of the engine that is advantageous in terms of fuel consumption” (Volkswagen ’070, Page 5), and to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jurgen, Volkswagen ’070, and Davidian are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Volkswagen ’070, and Davidian, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen, Volkswagen ’070, and Davidian teaches the limitations that the Examiner concluded were absent from the prior art cited during

prosecution of the '781 patent, *i.e.*, upshift and downshift notification circuits activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claims 17–23 and 26 is raised by the combination of Jurgen, Volkswagen '070, and Davidian.

As set forth in the appended charts, the combination of Jurgen, Volkswagen '070, and Davidian teaches all of the limitations of claims 17–23 and 26 of the '781 patent and therefore renders obvious claims 17–23 and 26 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 17–23 and 26 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Volkswagen '070, and Davidian.

**6. Claims 17–21 and 23 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Davidian**

Claims 17–21 and 23 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Saturn '452, and Davidian. Jurgen, Saturn '452, and Davidian were not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 17–21 and 23 are obvious in view of the combination of Jurgen, Saturn '452, and Davidian was not previously considered. The combination of Jurgen, Saturn '452, and Davidian is closer to the subject matter of claims 17–21 and 23 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen, Saturn '452, and Davidian provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 17 and 23 were allowable over the prior art cited during prosecution on the basis that the prior art does not teach an upshift notification circuit, wherein the processor determines, based upon data received from sensors, when to activate said upshift notification circuit.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates these hardware parts:

FIGURE 22.2 Overview of motor system parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen also discloses that a memory subsystem can be used in connection with the processor subsystem in order to store programs and data. (Page 13.5). It is disclosed that the memory can store data tables including a manifold pressure set point and an RPM set point for use by the system. (Pages 13.5 (“The memory devices for program and data are usually EPROMs”), 12.9 (“The engine load information is provided by the manifold pressure sensor . . . . The engine control unit contains data tables for combinations of load and RPM”). Additionally, present and prior levels of each sensor are stored in the memory for diagnostic use, which preserves sensor outputs for later use. (Pages 14.2, 22.2 to 22.3). Jurgen, therefore, teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a

maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen also teaches that the transmission can be controlled by calculating the necessary shift points based upon throttle position, the accelerator pedal position (e.g., throttle position), and the vehicle speed. (Page 13.9). “The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application.” *Id.* The TCU (transmission control unit) stores shift maps that provide notifications to the transmission regarding whether and when to shift. (Page 13.14). Jurgen, therefore, teaches “an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Saturn ’452 teaches a “means for indicating to the operator a point in operation for upshifting to the next higher gear.” Abstract. The processor subsystem taught by Saturn ’452 receives sensor inputs that sense manifold pressure, engine speed, and throttle position. Col. 2, lines 42 to 44; col. 7, lines 13 to 21. Therefore, Saturn ’452 teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor,” except for the claimed road speed sensor, which is taught by Jurgen.

Figure 1 of Saturn ’452 is illustrative:

Figure 1 of Saturn '452 teaches that the control unit 42 is connected to the sensor inputs, and outputs a signal on line 60 that may drive a lamp "for indicating the state of the upshift indicator light." Col. 2, lines 42 to 55; col. 3, lines 60 to 65. Additionally, Saturn '452 teaches that the control unit includes a memory (col. 2, lines 52 to 55), and that a "predetermined maximum allowable engine speed threshold K1" is used by the system. Col. 6, lines 55 to 60. Therefore, Saturn '452 discloses "a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors," except for the claimed manifold pressure set point and present and prior levels for each one of the sensors, which are taught in Jurgan (*see* Jurgan at 12.9, 13.5).

Saturn '452 teaches an upshift notification circuit connected to the control unit, which indicates "via line 60 the state of an upshift indicator light or equivalent visual display." Col. 2, lines 42 to 55. Therefore, Saturn '452 teaches "an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed" and "said processor subsystem determining, based upon data received from said plurality of sensors, . . . when to activate said upshift notification circuit."

Davidian discloses an anti-collision system that includes “a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle.” Col. 4, lines 52 to 66. This front space sensor includes “a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 . . . for measuring the distance of the vehicle from objects in front of . . . the vehicle.” Col. 10, lines 17 to 26. The front space sensor in Davidian continuously transmits pulses (including, in one example, RF pulses) and measures “the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.” Col. 10, lines 38 to 50. Therefore, Davidian teaches “a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle.”

Davidian also teaches a processor subsystem, disclosed as microcomputer 4, which is illustrated in FIGS. 6a and 6b. It is coupled to the radar detector (front vehicle space sensor 8) and the vehicle speed sensor 12:

FIG. 6A

“The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above.” Col. 8, lines 29 to 43. Therefore, Davidian teaches “a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom.”

Davidian teaches a memory subsystem that stores a vehicle speed/stopping distance table. “*Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table*, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is *stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.*” Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Davidian also teaches the storing of present and prior levels of each sensor in memory. For example, Davidian’s “Black Box Module” 94 stores the “time, *speed*, and *relative distance* between the vehicle and object” each time a collision alarm is activated. Col. 15, lines 22 to 26. Therefore, Davidian teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table” and the memory subsystem storing “a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor.”

Davidian teaches a vehicle proximity alarm circuit, which activates a collision alarm when a calculated “Collision Distance” is close to a calculated “Stopping Distance.” “A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.” Col. 12, line 59 to col. 13, line 11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 (“Operation of the Calculation Module 90”). Therefore, Davidian teaches “a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.”

Davidian also teaches that the processor subsystem determines when to activate the proximity alarm. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Col. 12, line 59 to col. 13, line 11. Therefore, Davidian teaches “said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

Davidian also teaches the use of a rain sensor connected to module 90 to detect the presence of rain. Claim 18 requires the use of a windshield wiper sensor in order to detect if rain is present. In rejecting claim 18, the Examiner stated that “Chasteen discloses a plurality of sensors for controlling the operation of the fuel injection wherein it would have been obvious to use a windshield wiper sensor in order to provide a complete performance operation of the vehicle.” August 6, 1998 Office Action, at 5. This rejection was not challenged by the applicant, and the claim was allowed due to the addition of the upshift notification circuit to claim 17. The Examiner’s statement that a windshield wiper sensor would be an obvious modification to Chasteen carries equal weight in view of the rain sensor taught in Davidian.

Davidian also teaches that it would be beneficial in certain situations to take automatic control of the vehicle. Col. 2, lines 67 to col. 3, line 2. While Claim 19 requires a throttle controller that selectively reduces the throttle based upon inputs from various sensors, the disclosure in Davidian regarding the automatic application of the brakes achieves the same result – slowing the vehicle down.<sup>9</sup>

Jurgen teaches the use of a brake sensor as claimed in Claim 20. For example, Jurgen teaches that “[p]ressure sensors are used to monitor brake fluid pressure” and that “[b]rake pedal position and brake fluid pressure information are also required for control.” Jurgen, pages 7.21 to 22. Therefore, the combination of Jurgen, Saturn ’452, and Davidian teaches “at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.”

Davidian also teaches the use of a “black box” to record vehicle events. Claim 21 requires a “means for counting a total number of vehicle proximity alarms determined by said processor subsystem.” Davidian teaches the use of four different counters, which are stored in the black box each time a front or rear proximity alarm is activated. Col. 11, lines 60 to 68; col. 14, lines 8 to 12. Davidian does not teach “means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.” However, Davidian does teach that automated activation of a brake system is used to slow the vehicle down. Indeed, the Examiner stated that “it has been discussed that Doi et al. disclose an alarm therefore it would have been obvious to one of ordinary skill in the art at the time of the invention to count a total number of alarms associated with the system.” August 6, 1998 Office Action, at

---

<sup>9</sup> Additionally, Jurgen teaches that an electronic throttle controller was known in the art.

6. Davidian teaches counting the number of vehicle proximity alarms, and also teaches the automatic control of a vehicle. Therefore, Davidian renders obvious claim 21.

A person of ordinary skill in the art, at the time the alleged inventions of claims 17–21 and 23 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen, Saturn '452, and Davidian, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 17–21 and 23 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen, Saturn '452, and Davidian, to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to provide a “means for indicating to the operator a point in operation for upshifting to the next higher gear” (Saturn '452, Abstract), to provide “an improved method of determining shift points and indicating the same to a vehicle operator in order to maximize real driving fuel economy” (Saturn '452, col. 1, lines 44 to 47), and to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Saturn '452, and Davidian are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Saturn '452, and Davidian, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen, Saturn '452, and Davidian teaches the limitations that the Examiner concluded were absent from the prior art cited during prosecution of the '781 patent, *i.e.*, an upshift notification circuit activated by a processor in response to sensor inputs. Accordingly, a substantial new question of patentability affecting claims 17–21 and 23 is raised by the combination of Jurgen, Saturn '452, and Davidian.

As set forth in the appended charts, the combination of Jurgen, Saturn '452, and Davidian teaches all of the limitations of claims 17–21 and 23 of the '781 patent and therefore renders obvious claims 17–21 and 23 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 17–21 and 23 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Saturn '452, and Davidian.

#### **7. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Nissan '055**

Claims 28–30 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and Nissan '055. Neither Jurgen nor Nissan '055 was cited by the Examiner or the applicants during prosecution of the '781 patent. Therefore, the question of whether claims 28–30 are obvious in view of the combination of Jurgen and Nissan '055 was not previously considered. The combination of Jurgen and Nissan '055 is closer to the subject matter of claims 28–30 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen and Nissan '055 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the applicants asserted that claim 28 was allowable over the prior art because the prior art does not disclose a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates these hardware parts:

FIGURE 33.1 Composition of hardware parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU disclosed in Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine

RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Nissan ’055 discloses a control system that “controls the number of fuel injected cylinders” in order to increase fuel economy. Abstract. Figure 1 of Nissan ’055 discloses that a throttle opening sensor and vehicle velocity sensor are inputs to the system:

Nissan ’055 teaches that “when the signal from the vehicle velocity sensor 2 exceeds a predetermined level and at the same time the signal from the throttle opening sensor 1 falls below another predetermined level, the control unit 4 determines the number of cylinders to which fuel is actually injected based on the two signals applied and stops injection of fuel to specified one or more cylinders.” Col. 2, lines 59 to 66. Therefore, Nissan ’055 teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to

said engine of said vehicle.” Although Nissan ’055 does not refer to the use of a manifold pressure sensor, manifold pressure sensors are taught by Jurgen. Therefore, the combination of Jurgen and Nissan ’055 teaches “said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.”

Claims 29 and 30 require the fuel overinjection notification circuit to be activated when certain conditions measured by the claimed sensors are either increasing or decreasing. For example, claim 29 requires the fuel overinjection notification circuit to be activated when it is determined that (1) road speed is increasing; (2) throttle position is increasing; and (3) the manifold pressure exceeds a manifold pressure set point. In the remarks that were presented with these claims, the Applicant stated as follows:

Specifically, as presented in new Claims 34-36, Applicants’ claimed apparatus for optimizing operation of a vehicle includes a fuel overinjection notification circuit and a processor subsystem which determines when to activate the fuel overinjection notification circuit. The processor makes that determination based upon data received from specifically recited sensors, including the road speed sensor.

February 16, 1999 Amendment, page 11 (emphasis in original).

In allowing these claims, the Examiner stated that the prior art does not disclose that the processor subsystem determines “whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor.” April 22, 1999 Notice of Allowability, at 3. The combination of Jurgen and Nissan ’055 teaches the use of road speed, throttle position, and manifold pressure sensors, and also teaches that a fuel overinjection notification circuit can be activated based upon input from these sensors. *See* Jurgen, page 12.22; Nissan ’055, col. 2, lines 59 to 66.

A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen and Nissan ’055, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the ’781 patent were made would have been further motivated to combine the teachings of Jurgen and Nissan ’055, to “provide optimal

driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), and to “increas[e] fuel economy” (Nissan ’055, Abstract). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jurgen and Nissan ’055 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen and Nissan ’055, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and Nissan ’055 teaches the limitations that the applicants asserted were absent from the prior art cited during prosecution of the ’781 patent, *i.e.*, a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Accordingly, a substantial new question of patentability affecting claim 28 is raised by the combination of Jurgen and Nissan ’055.

As set forth in the appended charts, the combination of Jurgen and Nissan '055 teaches all of the limitations of claims 28–30 of the '781 patent and therefore renders obvious claims 28–30 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 28–30 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and Nissan '055.

**8. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Mack '324**

Claims 28–30 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and Mack '324. Neither Jurgen nor Mack '324 was cited by the Examiner or the applicants during prosecution of the '781 patent. Therefore, the question of whether claims 28–30 are obvious in view of the combination of Jurgen and Mack '324 was not previously considered. The combination of Jurgen and Mack '324 is closer to the subject matter of claims 28–30 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen and Mack '324 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Applicant asserted that claim 28 was allowable over the prior art on the basis that the prior art does not disclose a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates these hardware parts:

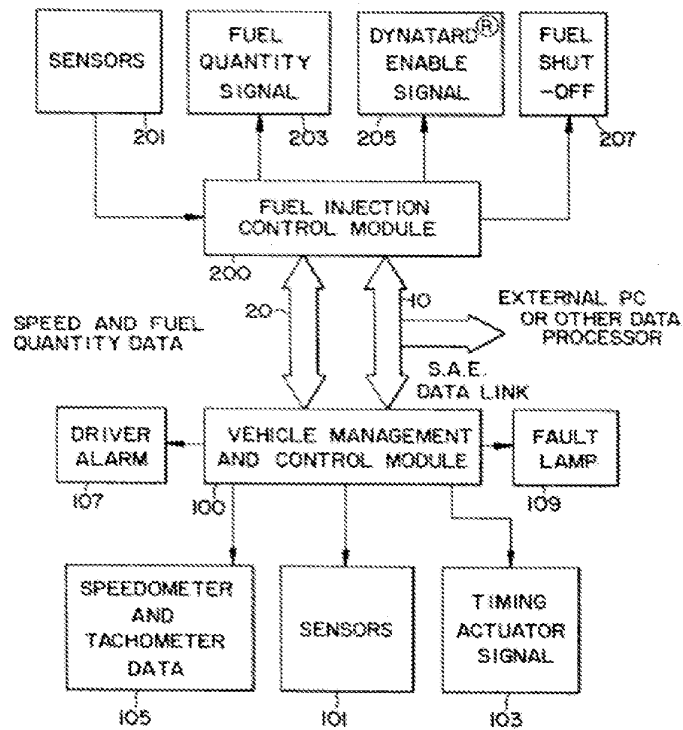

FIGURE 22.2 Overview of bus system parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

Mack '324 discloses an engine and vehicle management and control system. Abstract. Figure 1 of Mack '324 illustrates an overview of the system:

The fuel injection control module 200 in Mack '324 contains a microprocessor 2001, and receives inputs from sensors 201 and outputs a fuel quantity signal 203 and a fuel shut-off enable signal 207. Col. 2, lines 33 to 27. Figure 3 illustrates the details of the fuel injection control module:

Inputs to the fuel injection control module include sensor inputs from “an accelerator pedal position sensor 2005, an engine speed sensor 2005, a coolant temperature sensor 2006, a fuel rack position sensor 2007, and a torque limiter switch 2008.” Col. 3, lines 57 to 61. Mack '324 teaches a fuel overinjection notification signal that stops fuel being injected to the engine when certain overspeed conditions are met. Col. 6, lines 24 to 53. The fuel request signal is sent by the fuel injection control module, to which the sensors are input. Therefore, Mack '324 teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.” Although Mack '324 does not refer to the use of a manifold pressure sensor, manifold pressure sensors are taught by Jurgen. Therefore, the combination of Jurgen and Mack '324 teaches “said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.”

Claims 29 and 30 require the fuel overinjection notification circuit to be activated when certain conditions measured by the claimed sensors are either increasing or decreasing. For example, claim 29 requires the fuel overinjection notification circuit to be activated when

it is determined that (1) road speed is increasing; (2) throttle position is increasing; and (3) the manifold pressure exceeds a manifold pressure set point. In the remarks that were presented with these claims, the Applicant stated as follows:

Specifically, as presented in new Claims 34-36, Applicants' claimed apparatus for optimizing operation of a vehicle includes a fuel overinjection notification circuit and a processor subsystem which determines when to activate the fuel overinjection notification circuit. The processor makes that determination based upon data received from specifically recited sensors, including the road speed sensor.

February 16, 1999 Amendment, page 11 (emphasis in original).

In allowing these claims, the Examiner stated that the prior art does not disclose that the processor subsystem determines "whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor." April 22, 1999 Notice of Allowability, at 3. The combination of Jurgen and Mack '324 teaches the use of road speed, throttle position, and manifold pressure sensors, and also teaches that a fuel overinjection notification circuit can be activated based upon input from these sensors. *See* Jurgen, page 12.22; Mack '324, col. 6, lines 24 to 53.

A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen and Mack '324, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen and Mack '324, to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), and to provide for "optimization in terms of fuel economy" (Mack '324, col. 1, line 24). The '781 patent states that its object is to "provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely." Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen and Mack '324 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen and Mack '324, Jurgen describes at page xvii

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and Mack '324 teaches the limitations that the applicants asserted were absent from the prior art cited during prosecution of the '781 patent, *i.e.*, a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Accordingly, a substantial new question of patentability affecting claims 28–30 is raised by the combination of Jurgen and Mack '324.

As set forth in the appended charts, the combination of Jurgen and Mack '324 teaches all of the limitations of claims 28–30 of the '781 patent and therefore renders obvious claims 28–30 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 28–30 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and Mack '324.

**9. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and GM '753**

Claims 28–30 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen and GM '753. Neither Jurgen nor GM '753 was cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 28–30 are obvious in view of the combination of Jurgen and GM '753 was not previously considered. The combination of Jurgen and GM '753 is closer to the subject matter of claims 28–30 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen and GM '753 provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the applicants asserted that claim 28 was allowable over the prior art on the basis that the prior art does not disclose a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), and throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen illustrates these hardware parts:

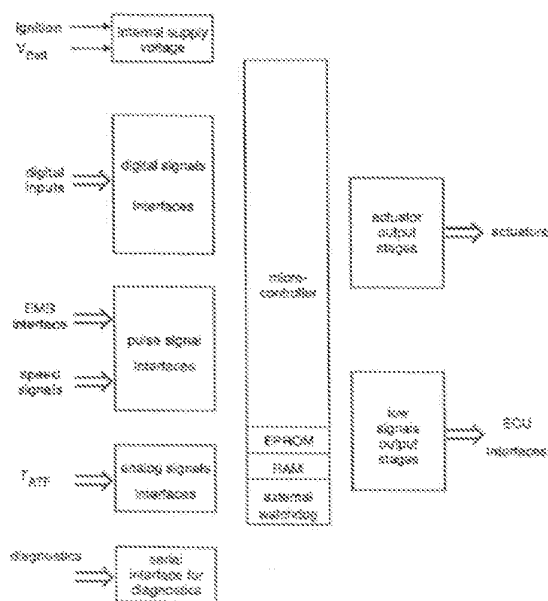

FIGURE 12.3 Overview of bus system parts.

Jurgen, therefore, teaches “a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor” and “a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.”

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Jurgen, therefore, teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.”

Jurgen teaches “said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift/downshift notification circuit.” For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition or shift the engine.

GM '753 discloses “a warning system for providing an indication when the fuel consumption of a throttle controlled vehicle having an internal combustion engine with an intake manifold exceeds pre-established levels.” Abstract. Figure 1 of GM '753 provides an overview of the system, which includes a manifold pressure sensor and a vehicle speed sensor:

The vacuum transducer 12 of GM '753 “is effective to generate a voltage having a magnitude which progressively changes with a progressively increased manifold intake level.” Col. 1, lines 38 to 55. The speed transducer “generates a series of voltage pulses having a frequency progressively increasing with increasing vehicle speed.” Col. 2, lines 34 to 51. These inputs are fed to an analog circuit acting as a processor, which is used to send current to a lamp when a level “determined to represent excessive fuel consumption” is reached. Col. 2, lines 52 to 58. “When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, *the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide an indication of fuel consumption in excess of the predetermined amount at that speed.*” Col. 3, lines 20 to 27. Therefore, GM '753 teaches “a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.” Although GM '753 does not refer to the use of a throttle position sensor, throttle position sensors are taught by Jurgen. Therefore, the combination of

Jurgen and GM '753 teaches "said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor."

Claims 29 and 30 require the fuel overinjection notification circuit to be activated when certain conditions measured by the claimed sensors are either increasing or decreasing. For example, claim 29 requires the fuel overinjection notification circuit to be activated when it is determined that (1) road speed is increasing; (2) throttle position is increasing; and (3) the manifold pressure exceeds a manifold pressure set point. In the remarks that were presented with these claims, the Applicant stated as follows:

Specifically, as presented in new Claims 34-36, Applicants' claimed apparatus for optimizing operation of a vehicle includes a fuel overinjection notification circuit and a processor subsystem which determines when to activate the fuel overinjection notification circuit. The processor makes that determination based upon data received from specifically recited sensors, including the road speed sensor.

February 16, 1999 Amendment, page 11 (emphasis in original).

In allowing these claims, the Examiner stated that the prior art does not disclose that the processor subsystem determines "whether to activate the fuel overinjection notification circuit based upon data received from the road speed sensor, the throttle position sensor and the manifold sensor." April 22, 1999 Notice of Allowability, at 3. The combination of Jurgen and GM '753 teaches the use of road speed, throttle position, and manifold pressure sensors, and also teaches that a fuel overinjection notification circuit can be activated based upon input from these sensors. *See* Jurgen, page 12.22; GM '753, col. 3, lines 20 to 27.

A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen and GM '753, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 28–30 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen and GM '753, to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), and to "provide[e] an indication when the fuel consumption of a . . . vehicle . . . exceeds pre-

established levels” (GM ’753, Abstract). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jurgen and GM ’753 are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen and GM ’753, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Jurgen and GM ’753 teaches the limitations that the applicants asserted were absent from the prior art during prosecution of the ’781 patent, *i.e.*, a fuel overinjection notification circuit that is activated based on three sensors: a road speed sensor, a throttle position sensor, and a manifold pressure sensor. Accordingly, a substantial new question of patentability affecting claims 28–30 is raised by the combination of Jurgen and GM ’753.

As set forth in the appended charts, the combination of Jurgen and GM ’753 teaches all of the limitations of claims 28–30 of the ’781 patent and therefore renders obvious claims

28–30 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 28–30 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen and GM '753.

**10. Claim 31 is Anticipated Under 35 U.S.C. § 102(b) by Davidian**

Claim 31 is anticipated under 35 U.S.C. § 102(b) by Davidian. Davidian was not cited by the Examiner or the applicants during prosecution of the '781 patent, and Davidian is closer to the subject matter of claim 31 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. Davidian provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

Davidian discloses an anti-collision system that includes “a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle.” Col. 4, lines 52 to 66. This front space sensor includes “a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 . . . for measuring the distance of the vehicle from objects in front of . . . the vehicle.” Col. 10, lines 17 to 26. The front space sensor in Davidian continuously transmits pulses (including, in one example, RF pulses) and measures “the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.” Col. 10, lines 38 to 50. Therefore, Davidian teaches “a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle.”

Davidian also teaches the use of sensors, including “a speed sensor 12 which may sense the speed of the vehicle in any known manner.” Col. 4, lines 60 to 66. Therefore, Davidian teaches “at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor.”

Davidian also teaches a processor subsystem, disclosed as microcomputer 4, which is illustrated in FIGS. 6a and 6b. It is coupled to the radar detector (front vehicle space sensor 8) and the vehicle speed sensor 12:

“The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above.” Col. 8, lines 29 to 43. Therefore, Davidian teaches “a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom.”

Davidian teaches a memory subsystem that stores a vehicle speed/stopping distance table. “*Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table*, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is *stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.*” Col. 9, lines 20 to 27. This memory subsystem is a part of the microcomputer 4, as illustrated in FIG. 6A. Therefore, Davidian teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table.”

Davidian teaches a vehicle proximity alarm circuit, which activates a collision alarm when a calculated “Collision Distance” is close to a calculated “Stopping Distance.” “A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.” Col. 12, line 59 to col. 13, line

11. The collision alarm, may be an audio alarm or a visual alarm. Col. 9, lines 52 to 56. The determination whether to activate the collision alarm is made by the calculation module 90, which is part of the microcomputer 4. *See* col. 12, line 27 (“Operation of the Calculation Module 90”). Therefore, Davidian teaches “a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.”

Davidian also teaches that the processor subsystem determines when to activate the proximity alarm based on (1) separation distance data (received from the front vehicle space sensor 8); (2) vehicle speed data (received from vehicle speed sensor 12); and (3) the vehicle speed/stopping distance table stored in memory. The radar input, the vehicle speed input, and the vehicle speed/stopping distance tables are all located in the calculation module 90, which it uses to calculate stopping distance and collision distance. Therefore, Davidian teaches “said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

Thus, Davidian teaches the limitations that the applicants asserted were absent from the prior art during prosecution of the '781 patent, *i.e.*, a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. Accordingly, a substantial new question of patentability affecting claim 31 is raised by Davidian.

As set forth in the appended charts, Davidian teaches all of the limitations of claim 31 of the '781 patent and therefore anticipates claim 31 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claim 31 of the '781 patent under 35 U.S.C. § 102(b) as anticipated by Davidian.

**11. Claims 31 and 32 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Tonkin and Doi et al.**

Claims 31 and 32 are obvious under 35 U.S.C. § 103(a) in view of the combination of Tonkin and Doi et al. Although Doi et al. was cited by the Examiner during prosecution of the '781 patent, Tonkin was not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 31 and 32 are obvious in view of the combination of Tonkin and Doi et al. was not previously considered. The combination of Tonkin and Doi et al. is closer to the subject matter of claims 31 and 32 of the '781 patent than any prior art

that was relied upon during prosecution of the '781 patent, and the combination of Tonkin and Doi et al. provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the applicants asserted that claim 31 was allowable over the prior art on the basis that the prior art does not disclose a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem. The applicants admitted, however, that a vehicle proximity alarm that is activated based on separation is disclosed in the prior art: "The Applicants respectfully note, however, that the system disclosed in Doi et al. determines alert conditions relative to the proximity between a vehicle and a forward object based upon changes in the distance separating the vehicle and the forward object."

Tonkin discloses a system that calculates a safety envelope and displays a visible warning when a rear-facing vehicle is getting too near. Abstract. Tonkin discloses the use of a radar sensor in order to determine "distance of separation and/or a relative velocity of a trailing vehicle." Page 1, lines 23 to 29. *See also* page 5, lines 4 to 9, "The sensor means for sensing the distance and velocity of the trailing vehicle may comprise a radar system." Therefore, Tonkin discloses "a radar detector."

Tonkin also teaches the use of sensors, including a velocity sensing means comprising "a conventional speed sensing device fitted to the vehicle's transmission train." Page 5, lines 17 to 19. Therefore, Tonkin teaches "at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor."

Tonkin also teaches the use of a processor coupled to the sensor. Page 1, lines 32 to 34 ("wherein the controller is operable to process the received velocity signal and data signals to determine the existence of an unsafe condition"). Therefore, Tonkin discloses "a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom."

Tonkin teaches the use of a memory subsystem that stores parameters in a lookup table, including a vehicle speed/stopping distance table. For example, Tonkin teaches that predetermined driving parameters "may for example be stored in a look up table." Page 3, lines 25 to 32. Additionally, the control system that activates the vehicle proximity alarm relies in part on "known safe stopping distances such as those published by the Minister of Transport, in which a vehicle will stop when the brakes are applied." Page 16, lines 2 to 21. Finally, Tonkin teaches that a look-up table or database could be provided for unsafe closing

speeds, which could be varied according to the velocity of the subject vehicle.” Page 17, lines 7 to 25. Therefore, Tonkin teaches “a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table.”

Tonkin also teaches a vehicle proximity alarm circuit. “***The system may comprise means for warning*** that the subject vehicle is stationary. ***The system can further comprise means for providing warning*** of different levels of deceleration of the subject vehicle. ***The warning means can comprise an orange light display for the relative speed and/or relative separation conditions and a red light display for the vehicle stationary and/or levels of deceleration conditions.*** The relative separation and/or relative speed warning may be overridden by the level of deceleration warning.” Page 2, line 29 to page 3, line 3. The control system in Tonkin warns the driver behind the vehicle equipped with the device that the driver is getting too close. Therefore, Tonkin teaches “a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.”

Tonkin teaches that the processor subsystem determines when to activate the proximity alarm circuit based upon (1) separation distance data received from said radar detector; (2) vehicle speed data received from said road speed sensor; and (3) the vehicle speed/stopping distance table. For example, the radar system is “operable to sense a distance of separation and/or a relative velocity of a trailing vehicle.” Page 1, lines 32 to 34. The processor subsystem “is operable to process the received velocity signal and data signals to determine the existence of an unsafe condition.” The velocity signal used by the processing means is the vehicle velocity signal determined from the vehicle speed sensor. Page 5, lines 17 to 19. The data signals include the separation data (determined from the radar), and the determination regarding whether to activate the alarm is made, in part, using the safe stopping distances provided in the look-up table. Page 17, lines 7 to 25. Therefore, Tonkin teaches “said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.”

Although Tonkin does not refer to the radar detector determining a distance separating a vehicle having an engine and an object *in front* of the vehicle, Doi et al., which was cited by the Examiner during prosecution of the '781 patent, discloses a radar detector that “emits a pulse laser beam (as a radar wave) forward of the vehicle 1 from the source and receives reflected light beam reflected by a forward object in the way such as a vehicle, thereby

measuring the distance from the vehicle 1 to the forward object.” Col. 2, lines 59 to 62. Therefore, Doi et al. teaches “a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle.”

Tonkin teaches that “information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windscreen wipers are in use or have been in use recently due to rain.” Page 18, lines 9 to 13. Additionally, Tonkin teaches that “safe stopping distances can be adjusted for prevailing weather conditions.” Page 18, lines 16 to 19. Therefore, Tonkin discloses the adjustment of the vehicle speed/stopping distance tables based upon weather information determined from a windshield wiper sensor as claimed in claim 32.

A person of ordinary skill in the art, at the time the alleged invention of claims 31 and 32 of the '781 patent was made, would have found it obvious to combine the teachings of Tonkin and Doi et al., and, in addition, would have been motivated to do so, for example, to “provide safety information for example to drivers of following vehicles” (Tonkin, page 1, lines 4-5) and to “detect the relative speed of a vehicle to a forward object (e.g., a forward vehicle) at high efficiency” (Doi et al., col. 1, lines 34 to 36). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Tonkin and Doi et al. are concerned with, for example, vehicle safety.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Thus, the combination of Tonkin and Doi et al. teaches the limitations that the applicants asserted were absent from the prior art during prosecution of the '781 patent, *i.e.*, disclose a vehicle proximity alarm that is activated based upon three parameters: (1) road speed, as determined by a road speed sensor; (2) separation, as determined by a radar detector; and (3) a vehicle speed/stopping distance table stored in a memory subsystem.

Accordingly, a substantial new question of patentability affecting claims 31 and 32 is raised by the combination of Tonkin and Doi et al.

As set forth in the appended charts, the combination of Tonkin and Doi et al. teaches all of the limitations of claims 31 and 32 of the '781 patent and therefore renders obvious claims 31 and 32 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 31 and 32 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Tonkin and Doi et al.

**12. Claims 2, 4, and 5 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Chasteen**

Claims 2, 4, and 5 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Saturn '452, and Chasteen. Although Chasteen was cited by the Examiner during prosecution of the '781 patent, neither Jurgen nor Saturn '452 was cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claims 2, 4, and 5 are obvious in view of the combination of Jurgen, Saturn '452, and Chasteen was not previously considered. The combination of Jurgen, Saturn '452, and Chasteen is closer to the subject matter of claims 2, 4, and 5 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen, Saturn '452, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claim 1, from which claims 2, 4, and 5 depend, was allowable over the prior art cited during prosecution on the basis that the prior art does not teach an upshift notification circuit, wherein the processor determines, based upon data received from sensors, when to activate said upshift notification circuit, and there is no indication in the prosecution history that any of dependent claims 2, 4, and 5 were allowable over the cited prior art for any reason other than their dependency from claim 1. As also more fully explained above, the combination of Jurgen and Saturn '452 raises a substantial new question of patentability affecting claim 1 and renders obvious claim 1 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 2, 4, and

5 obvious in view of the teachings of Chasteen.<sup>10</sup> For example, in rejecting claims 2 and 4 as obvious in view of Chasteen, the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provide s control command to the engine to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

In the amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claims 2 and 4 and did not present any arguments against the Examiner's findings. Instead, and as indicated above, the applicants amended claim 1, from which claims 2, 4 , and 5 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

---

<sup>10</sup> To render a claim obvious, "[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations." M.P.E.P. § 2141

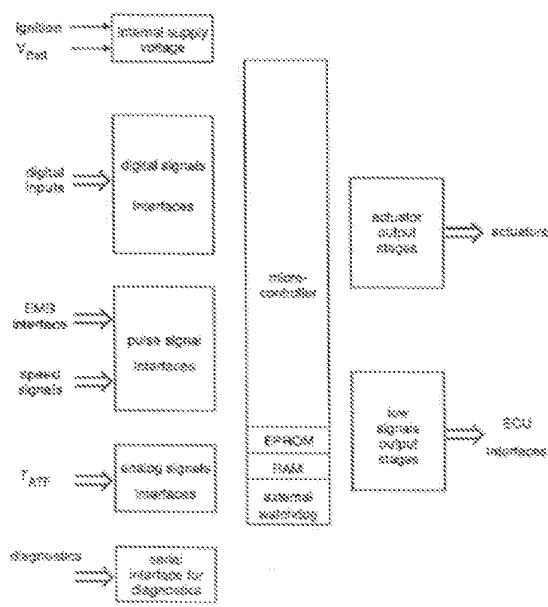

FIGURE 22.2 Overview of hardware parts.

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is increasing[/decreasing],” and “means for determining when throttle position for said vehicle is increasing[/decreasing]” as claimed in claims 2, 4, and 5.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Because Saturn ’452 discloses an upshift notification circuit triggered by a processor in response to sensors (*see* col. 2, lines 42 to 55), the Examiner’s statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift notification circuit in view of Saturn ’452.

A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, and 5 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen, Saturn ’452, and Chasteen, and, in addition, would have been motivated to do so.

Indeed, Jorgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jorgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, and 5 of the ’781 patent were made would have been further motivated to combine the teachings of Jorgen, Saturn ’452, and Chasteen, to “provide optimal driveability for all operating conditions” (Jorgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jorgen, Page 12.4), to provide a “means for indicating to the operator a point in operation for upshifting to the next higher gear” (Saturn ’452, Abstract), to provide “an improved method of determining shift points and indicating the same to a vehicle operator in order to maximize real driving fuel economy” (Saturn ’452, col. 1, lines 44 to 47), and to indicate the “optimum fuel requirements for the engine” (Chasteen, col. 2, lines 48 to 54). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jorgen, Saturn ’452, and Chasteen are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jorgen, Saturn ’452, and Chasteen, Jorgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jurgén, Saturn '452, and Chasteen teaches all of the limitations of claims 2, 4, and 5 of the '781 patent and therefore renders obvious claims 2, 4, and 5 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 2, 4, and 5 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgén, Saturn '452, and Chasteen.

**13. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Toyota '599, and Chasteen**

Claims 2, 4, 5, 8, 10, 12, and 15 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgén, Toyota '599, and Chasteen. While Chasteen was cited by the Examiner during prosecution, neither Jurgén nor Toyota '599 was cited by the Examiner or the applicants during prosecution. Thus, the question of whether claims 2, 4, 5, 8, 10, 12, and 15 are obvious in view of the combination of Jurgén, Toyota '599, and Chasteen was not previously considered. The combination of Jurgén, Toyota '599, and Chasteen is closer to the subject matter of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgén, Toyota '599, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 1, 7, and 13, from which claims 2, 4, 5, 8, 10, 12, and 15 depend, were allowable over the prior art cited during prosecution solely on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits, and there is no indication in the prosecution history that any of dependent claims 2, 4, 5, 8, 10, 12, and 15 were considered allowable over the cited prior art for any reason other than their dependency from claim 1, 7, or 13.

As set forth in more detail above, the combination of Jurgen and Toyota '599 raises a substantial new question of patentability affecting claims 1, 7, and 13 and renders unpatentable claims 1, 7, and 13 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 2, 4, 5, 8, 10, 12, and 15 obvious in view of the teachings of Chasteen.<sup>11</sup> For example, in rejecting claims 2, 4, and 8 as obvious in view of Chasteen, the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provides a control command to the engine fuel injector to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

In the Amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claims 2, 4, or 8 and did not present any arguments against the Examiner's findings. Instead, and as indicate above, the applicants amended claim 1, from which claims 2, 4, and 5 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art. Similarly, the applicants rewrote claim 7, from which claims 8, 10, 12 depend, into independent form, in effect adding the downshift notification circuit limitations that the Examiner found missing from the prior art.<sup>12</sup> As for claim 15, which depends from claim 13, the Examiner allowed claim 13, and dependent claim 15, because claim 13 include the upshift and downshift notification circuit limitations that the Examiner found missing from the prior art.

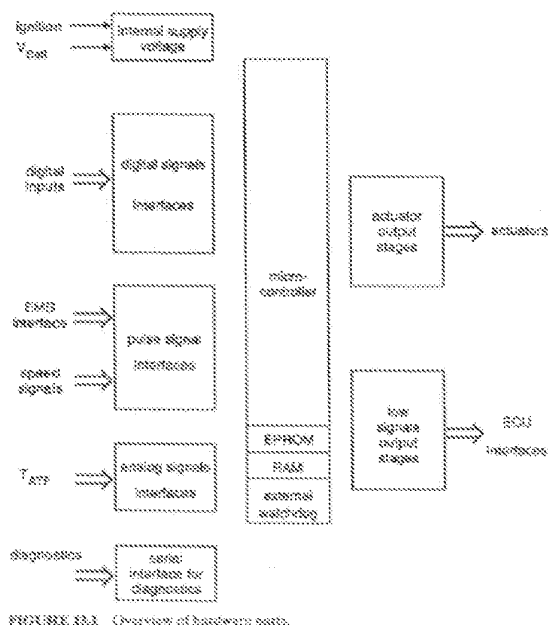

Jurgen teaches an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also teaches that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21), and acceleration, *i.e.*, change in speed, (pages 7.8 to 7.18), and that the use of

---

<sup>11</sup> To render a claim obvious, “[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations.” M.P.E.P. § 2141.

<sup>12</sup> See, e.g., *Honeywell Int'l v. Hamilton Sundstrand Corp.*, 370 F.3d 1131, 1144 (Fed. Cir. 2004) (“[D]ependent c]laims 4, 8, and 19 were rewritten into independent form, and the original independent claims were cancelled, effectively adding the inlet guide vane limitations [of dependent claims 4, 8 and 19] to the claimed invention.”).

processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6) “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is increasing[/decreasing],” and “means for determining when throttle position for said vehicle is increasing[/decreasing]” as claimed in claims 2, 4, 5, 8, 10, 12, and 15.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Based upon the Examiner’s findings during the original prosecution, it would have been obvious to one of ordinary skill in the art to enable the fuel overinjection notification circuit based upon sensor inputs. For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Claims 5, 10, and 15 require that the upshift and/or downshift notification circuits are activated based upon the same types of sensor inputs. For example, claim 5 requires that “said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.” These claims were indicated as allowable because “the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.”<sup>13</sup> Because Toyota ’599 discloses both upshift and downshift notification circuits triggered by a processor in response to sensors (*see* col. 5, line 63 to col. 6, line 2), the Examiner’s statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift/downshift notification circuits in view of Toyota ’599.

A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, 5, 8, 10, 12, and 15 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen, Toyota ’599, and Chasteen, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, 5, 8, 10, 12, and 15 of the ’781 patent were made would have been further motivated to combine the teachings of Jurgen, Toyota ’599, and Chasteen, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “obtain preferable shift positions relating to optimum fuel consumption rate in accordance with . . . data detected” (Toyota

---

<sup>13</sup> Claim 15 was explicitly allowed for the quoted reason. Claims 5 and 10 were objected to as being dependent on a rejected base claim, and were allowed when the upshift/downshift notification circuit limitations were added to the independent claims.

'599, Abstract), and to indicate the “optimum fuel requirements for the engine” (Chasteen, col. 2, lines 48 to 54). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgén, Toyota '599, and Chasteen are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgén, Toyota '599, and Chasteen, Jurgén describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jurgén, Toyota '599, and Chasteen teaches all of the limitations of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent and therefore renders obvious claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgén, Toyota '599, and Chasteen.

**14. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Chasteen**

Claims 2, 4, 5, 8, 10, 12, and 15 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Volkswagen '070, and Chasteen. Although Chasteen was cited during prosecution of the '781 patent, neither Jurgen nor Volkswagen '070 was cited by the Examiner or the applicants during prosecution. Thus, the question of whether claims 2, 4, 5, 8, 10, 12, and 15 are obvious in view of the combination of Jurgen, Volkswagen '070, and Chasteen was not previously considered. The combination of Jurgen, Volkswagen '070, and Chasteen is closer to the subject matter of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen, Volkswagen '070, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 1, 7, and 13, from which claims 2, 4, 5, 8, 10, 12, and 15 depend, were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits, and there is no indication in the prosecution history that any of dependent claims 2, 4, 5, 8, 10, 12, and 15 were considered allowable over the prior art for any reason other than their dependency from claim 1, 7, or 13.

As set forth in more detail above, the combination of Jurgen and Volkswagen '070 raises a substantial new question of patentability affecting claims 1, 7, and 13 and renders obvious claims 1, 7, and 13 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 2, 4, 5, 8, 10, 12, and 15 obvious in view of the teachings of Chasteen.<sup>14</sup> For example, in rejecting claims 2, 4, and 8 as obvious in view of Chasteen, the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provides a control command to the

---

<sup>14</sup> To render a claim obvious, “[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations.” M.P.E.P. § 2141.

engine fuel injector to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

In the Amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claims 2, 4, or 8 and did not present any arguments against the Examiner's findings. Instead, and as indicate above, the applicants amended claim 1, from which claims 2, 4, and 5 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art. Similarly, the applicants rewrote claim 7, from which claims 8, 10, 12 depend, into independent form, in effect adding the downshift notification circuit limitations that the Examiner found missing from the prior art.<sup>15</sup> As for claim 15, which depends from claim 13, the Examiner allowed claim 13, and dependent claim 15, because claim 13 include the upshift and downshift notification circuit limitations that the Examiner found missing from the prior art.

Jurgen teaches an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also teaches that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21), and acceleration, *i.e.*, change in speed, (pages 7.8 to 7.18), and that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

---

<sup>15</sup> See, e.g., *Honeywell Int'l v. Hamilton Sundstrand Corp.*, 370 F.3d 1131, 1144 (Fed. Cir. 2004) ("[D]ependent c]laims 4, 8, and 19 were rewritten into independent form, and the original independent claims were cancelled, effectively adding the inlet guide vane limitations [of dependent claims 4, 8 and 19] to the claimed invention.").

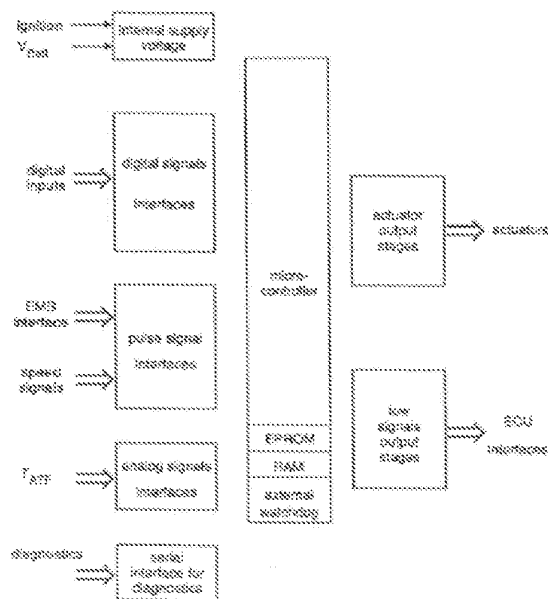

FIGURE 23.3 Overview of hardware parts.

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is increasing[/decreasing],” and “means for determining when throttle position for said vehicle is increasing[/decreasing]” as claimed in claims 2, 4, 5, 8, 10, 12, and 15.

Volkswagen '070 acknowledges that automobile instrument panels that display fuel economy are in the prior art. For example, Volkswagen '070 describes at page 9:

It is useful in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the *induction manifold vacuum* as a measure of the fuel consumption. . . . In this case it is useful to integrate the signal transmitters denoted by 4 and 5 in Figure 2 into the instrument of the fuel consumption display, as sketched in Figure 3. During standard driving operation, pointer 30 of the fuel consumption display sweeps scale 31, while it is hidden behind cover 32 during an idling operation or at full-load accelerations. Incorporated in the scale is arrow 33, which constitutes part of a signal transmitter requesting upshifting, which therefore corresponds to signal transmitter 4 in Figure 2.

(emphasis added)

Thus, by describing a fuel consumption display that indicates full-load acceleration, Volkswagen '070 teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is

increasing[/decreasing],” “means for determining when throttle position for said vehicle is increasing[/decreasing],” and the processor activating the fuel overinjection circuit based upon measurements from these sensors as claimed in claims 2, 4, 5, 8, 10, 12, and 15.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Based upon the Examiner’s findings during the original prosecution, it would have been obvious to one of ordinary skill in the art to enable the fuel overinjection notification circuit based upon sensor inputs. For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Claims 5, 10, and 15 require that the upshift and/or downshift notification circuits are activated based upon the same types of sensor inputs. For example, claim 5 requires that “said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.” These claims were indicated as allowable because “the prior art fails to disclose an upshift notification circuit coupled to the processor subsystem, the upshift notification circuit issuing a notification that the engine of the vehicle is being operated at an excessive engine speed and the processor determines when to activate the upshift notification circuit and a downshift notification circuit coupled to the processor subsystem, the downshift notification circuit issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed and the processor determines when to activate the downshift notification circuit.”<sup>16</sup> Because Volkswagen ’070 discloses both upshift and downshift notification circuits triggered by a processor in response to sensors (*see* pages 6–8), the Examiner’s statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift/downshift notification circuits in view of Volkswagen ’070.

---

<sup>16</sup> Claim 15 was explicitly allowed for the quoted reason. Claims 5 and 10 were objected to as being dependent on a rejected base claim, and were allowed when the upshift/downshift notification circuit limitations were added to the independent claims.

A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent were made, would have found it obvious to combine the teachings of Jurgen, Volkswagen '070, and Chasteen, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent were made would have been further motivated to combine the teachings of Jurgen, Volkswagen '070, and Chasteen, to "provide optimal driveability for all operating conditions" (Jurgen, Page 12.1), , to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to "provid[e] a device that assists the operator of the internal combustion engine equipped with a conventional transmission . . . for example, in setting an operating point of the engine that is advantageous in terms of fuel consumption" (Volkswagen '070, page 5)and to indicate the "optimum fuel requirements for the engine" (Chasteen, col. 2, lines 48 to 54). The '781 patent states that its object is to "provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely." Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Volkswagen '070, and Chasteen are concerned with, for example, improving fuel efficiency.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Volkswagen '070, and Chasteen, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-

cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jurgen, Volkswagen '070, and Chasteen teaches all of the limitations of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent and therefore renders obvious claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 2, 4, 5, 8, 10, 12, and 15 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Volkswagen '070, and Chasteen.

**15. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, Davidian, and Tonkin**

Claim 18 is obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Toyota '599, Davidian, and Tonkin. Jurgen, Toyota '599, Davidian, and Tonkin were not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claim 18 is obvious in view of the combination of Jurgen, Toyota '599, Davidian, and Tonkin was not previously considered. The combination of Jurgen, Toyota '599, Davidian, and Tonkin is closer to the subject matter of claim 18 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen, Toyota '599, Davidian, and Tonkin provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

Claim 18 depends from claim 17, and adds the limitations of a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated and that the memory subsystem stores a second vehicle speed/stopping distance table.

As set forth in more detail above, the combination of Jurgen, Toyota '599, and Davidian raises a substantial new question of patentability affecting claim 17 and renders obvious claim 17.

Tonkin teaches that “information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windshield wipers are in use or have been in use recently due to rain.” Page 18, lines 9 to 13. Additionally, Tonkin teaches that “safe stopping distances can be adjusted for prevailing weather conditions.” Page 18, lines 16 to 19. Therefore, Tonkin discloses the adjustment of the vehicle speed/stopping distance tables based upon weather information determined from a windshield wiper sensor.

A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made, would have found it obvious to combine the teachings of Jurgen, Toyota '599, Davidian, and Tonkin, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made would have been further motivated to combine the teachings of Jurgen, Toyota '599, Davidian, and Tonkin, to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “obtain preferable shift positions relating to optimum fuel consumption rate in accordance with . . . data detected” (Toyota '599, Abstract), to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to “provide safety information for example to drivers of following vehicles” (Tonkin, page 1, lines 4-5). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Toyota '599, Davidian, and Tonkin are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Toyota '599, Davidian, and Tonkin, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Regarding the second vehicle speed/stopping distance table, claim 18 merely recites that the memory subsystem stores a second vehicle speed/stopping distance table, and neither claim 18 nor claim 17, from which claim 18 depends, otherwise mentions the second vehicle speed/stopping distance table. Therefore, the second vehicle speed/stopping distance table is a mere duplication of parts, which has not patentable significance since no new or unexpected result is produced thereby. *See*, M.P.E.P. § 2144.04(VI)(B).

As set forth in the appended charts, the combination of Jurgen, Toyota '599, Davidian, and Tonkin teaches all of the limitations of claim 18 of the '781 patent and therefore renders obvious claim 18 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claim 18 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Toyota '599, Davidian, and Tonkin.

**16. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, Davidian, and Tonkin**

Claim 18 is obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Volkswagen '070, Davidian, and Tonkin. Jurgen, Volkswagen '070, Davidian, and Tonkin were not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claim 18 is obvious in view of the combination of Jurgen, Volkswagen '070, Davidian, and Tonkin was not previously considered. The combination of Jurgen, Volkswagen '070, Davidian, and Tonkin is closer to the subject matter of claim 18 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgen, Volkswagen '070, Davidian, and Tonkin provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

Claim 18 depends from claim 17, and adds the limitations of a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated and that the memory subsystem stores a second vehicle speed/stopping distance table.

As set forth in more detail above, the combination of Jurgen, Volkswagen '070, and Davidian raises a substantial new question of patentability affecting claim 17 and renders obvious claim 17.

Tonkin teaches that “information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windscreen wipers are in use or have been in use recently due to rain.” Page 18, lines 9 to 13. Additionally, Tonkin teaches that “safe stopping distances can be adjusted for prevailing weather conditions.” Page 18, lines 16 to 19. Therefore, Tonkin discloses the adjustment of the vehicle speed/stopping distance tables based upon weather information determined from a windshield wiper sensor.

A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made, would have found it obvious to combine the teachings of Jurgen, Volkswagen '070, Davidian, and Tonkin, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made would have been further motivated to combine the teachings of Jurgen, Volkswagen '070, Davidian, and Tonkin, to

“provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “provid[e] a device that assists the operator of the internal combustion engine equipped with a conventional transmission . . . for example, in setting an operating point of the engine that is advantageous in terms of fuel consumption” (Volkswagen ’070, Page 5), to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to “provide safety information for example to drivers of following vehicles” (Tonkin, page 1, lines 4-5). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jurgen, Volkswagen ’070, Davidian, and Tonkin are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Volkswagen ’070, Davidian, and Tonkin, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either

the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Regarding the second vehicle speed/stopping distance table, claim 18 merely recites that the memory subsystem stores a second vehicle speed/stopping distance table, and neither claim 18 nor claim 17, from which claim 18 depends, otherwise mentions the second vehicle speed/stopping distance table. Therefore, the second vehicle speed/stopping distance table is a mere duplication of parts, which has not patentable significance since no new or unexpected result is produced thereby. *See*, M.P.E.P. § 2144.04(VI)(B).

As set forth in the appended charts, the combination of Jurgén, Volkswagen '070, Davidian, and Tonkin teaches all of the limitations of claim 18 of the '781 patent and therefore renders obvious claim 18 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claim 18 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgén, Volkswagen '070, Davidian, and Tonkin.

**17. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Saturn '452, Davidian, and Tonkin**

Claim 18 is obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgén, Saturn '452, Davidian, and Tonkin. Jurgén, Saturn '452, Davidian, and Tonkin were not cited by the Examiner or the applicants during prosecution. Therefore, the question of whether claim 18 is obvious in view of the combination of Jurgén, Saturn '452, Davidian, and Tonkin was not previously considered. The combination of Jurgén, Saturn '452, Davidian, and Tonkin is closer to the subject matter of claim 18 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Jurgén, Saturn '452, Davidian, and Tonkin provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

Claim 18 depends from claim 17, and adds the limitations of a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated and that the memory subsystem stores a second vehicle speed/stopping distance table.

As set forth in more detail above, the combination of Jurgén, Saturn '452, and Davidian raises a substantial new question of patentability affecting claim 17 and renders obvious claim 17.

Tonkin teaches that “information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windshield wipers are in use or have been in use recently due to rain.” Page 18, lines 9 to 13. Additionally, Tonkin teaches that “safe stopping distances can be adjusted for prevailing weather conditions.”

Page 18, lines 16 to 19. Therefore, Tonkin discloses the adjustment of the vehicle speed/stopping distance tables based upon weather information determined from a windshield wiper sensor.

A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made, would have found it obvious to combine the teachings of Jurgen, Saturn '452, Davidian, and Tonkin, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged invention of claim 18 of the '781 patent was made would have been further motivated to combine the teachings of Jurgen, Saturn '452, Davidian, and Tonkin, to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to provide a "means for indicating to the operator a point in operation for upshifting to the next higher gear" (Saturn '452, Abstract), to provide "an improved method of determining shift points and indicating the same to a vehicle operator in order to maximize real driving fuel economy" (Saturn '452, col. 1, lines 44 to 47). to provide an "anti-collision system for vehicles" that "computes[] the danger-of-collision distance to the object" (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to "provide safety information for example to drivers of following vehicles" (Tonkin, page 1, lines 4-5). The '781 patent states that its object is to "provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*" Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Saturn '452, Davidian, and Tonkin are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Saturn '452, Davidian, and Tonkin, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately

in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

Regarding the second vehicle speed/stopping distance table, claim 18 merely recites that the memory subsystem stores a second vehicle speed/stopping distance table, and neither claim 18 nor claim 17, from which claim 18 depends, otherwise mentions the second vehicle speed/stopping distance table. Therefore, the second vehicle speed/stopping distance table is a mere duplication of parts, which has not patentable significance since no new or unexpected result is produced thereby. *See*, M.P.E.P. § 2144.04(VI)(B).

As set forth in the appended charts, the combination of Jurgen, Saturn '452, Davidian, and Tonkin teaches all of the limitations of claim 18 of the '781 patent and therefore renders obvious claim 18 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claim 18 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Saturn '452, Davidian, and Tonkin.

**18. Claims 24 and 25 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, Davidian and Chasteen**

Claims 24 and 25 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgen, Saturn '452, Davidian, and Chasteen. Although Chasteen was cited by the Examiner during prosecution of the '781 patent, Jurgen, Saturn '452, and Davidian were not cited by the Examiner or the applicants during prosecution. Thus, the question of whether claims 24 and 25 are obvious in view of the combination of Jurgen, Saturn '452, Davidian and Chasteen was not previously considered. The combination of Jurgen, Saturn '452, Davidian, and

Chasteen is closer to the subject matter of claims 24 and 25 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgen, Saturn '452, Davidian, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claim 23, from which claims 24 and 25 depend, was allowable over the prior art cited during prosecution on the basis that the prior art does not teach an upshift notification circuit, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits, and there is no indication in the prosecution history that either claim 24 or claim 25 was considered allowable over the cited prior art for any reason other than their dependency from claim 23.

As set forth in more detail above, the combination of Jurgen, Saturn '452, and Davidian raises a substantial new question of patentability affecting claim 23 and renders obvious claim 23 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 24 and 25 obvious in view of the teachings of Chasteen.<sup>17</sup> For example, in rejecting claim 24 as obvious in view of the combination of Chasteen and Doi et al., the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provides a control command to the engine fuel injector to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

In the Amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claim 24 or 25 and did not present any arguments against the Examiner's findings. Instead, and as indicate above, the applicants amended claim 23, from which claims 24 and 25 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art.

---

<sup>17</sup> To render a claim obvious, "[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations." M.P.E.P. § 2141.

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/~~decreasing~~],” means for determining when throttle position for said vehicle is increasing[/~~decreasing~~],” and “means for determining when throttle position for said vehicle is increasing[/~~decreasing~~],” as claimed in claims 24, 25, and 27.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Based upon the Examiner’s statements during the original prosecution, it would have been obvious to one of ordinary skill in the art to enable the fuel overinjection notification circuit based upon sensor

inputs. For example, the combination of the ECU, which monitors all of the vehicle's sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Claim 25 describes that the upshift notification circuit is activated based upon the same types of sensor inputs. For example, claim 25 requires that "said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point." Because Saturn '452 discloses an upshift notification circuit triggered by a processor in response to sensors (*see* col. 2, lines 42 to 55) the Examiner's statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift notification circuit in view of Saturn '452.

A person of ordinary skill in the art, at the time the alleged inventions of claims 24 and 25 of the '781 patent were made, would have found it obvious to combine the teachings of Jorgen, Saturn '452, Davidian, and Chasteen, and, in addition, would have been motivated to do so. Indeed, Jorgen, for example, expressly describes one such motivation: "The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur." (Jorgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 24 and 25 of the '781 patent were made would have been further motivated to combine the teachings of Jorgen, Saturn '452, Davidian, and Chasteen, to "provide optimal driveability for all operating conditions" (Jorgen, Page 12.1), to "provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jorgen, Page 12.4), to provide a "means for indicating to the operator a point in operation for upshifting to the next higher gear" (Saturn '452, Abstract), to provide "an improved method of determining shift points and indicating the same to a vehicle operator in order to maximize real driving fuel economy" (Saturn '452, col. 1, lines 44 to 47), to provide an "anti-collision system for vehicles" that "computes[] the danger-of-collision distance to the object" (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to indicate the "optimum fuel requirements for the engine" (Chasteen, col. 2, lines 48 to 54). The '781 patent states that its object is to "provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective

action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Jorgen, Saturn ’452, Davidian, and Chasteen are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jorgen, Saturn ’452, Davidian, and Chasteen, Jorgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jorgen, Saturn ’452, Davidian, and Chasteen teaches all of the limitations of claims 24 and 25 of the ’781 patent and therefore renders obvious claims 24 and 25 of the ’781 patent. Therefore, VWGoA proposes a ground of rejection of claims 24 and 25 of the ’781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jorgen, Saturn ’452, Davidian, and Chasteen.

**19. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jorgen, Toyota ’599, Davidian and Chasteen**

Claims 24, 25, and 27 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jorgen, Toyota ’599, Davidian and Chasteen. Although Chasteen was cited

by the Examiner during prosecution of the '781 patent, Jurgén, Toyota '599, and Davidian were not cited by the Examiner or the applicants during prosecution. Thus, the question of whether claims 24, 25, and 27 are obvious in view of the combination of Jurgén, Toyota '599, Davidian and Chasteen was not previously considered. The combination of Jurgén, Toyota '599, Davidian, and Chasteen is closer to the subject matter of claims 24, 25, and 27 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgén, Toyota '599, Davidian, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 23 and 26, from which claims 24, 25, and 27 depend, were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits, and there is no indication in the prosecution history that any of dependent claims 24, 25, and 27 were considered allowable over the cited prior art for any reason other than their dependency from claim 23 or 26.

As set forth in more detail above, the combination of Jurgén, Toyota '599, and Davidian raises a substantial new question of patentability affecting claims 23 and 26 and renders obvious claims 23 and 26 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 24, 25, and 27 obvious in view of the teachings of Chasteen.<sup>18</sup> For example, in rejecting claim 24 as obvious in view of the combination of Chasteen and Doi et al., the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provides a control command to the engine fuel injector to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

---

<sup>18</sup> To render a claim obvious, “[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations.” M.P.E.P. § 2141.

In the Amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claim 24, 25, or 27 and did not present any arguments against the Examiner’s findings. Instead, and as indicate above, the applicants amended claim 23, from which claims 24 and 25 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art, and rewrote claim 26, from which, claim 27 depends, in effect adding the downshift notification circuit limitations that the Examiner found missing from the prior art.<sup>19</sup>

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). “During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to.” (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

FIGURE 11.3 Overview of hardware parts.

<sup>19</sup> See, e.g., *Honeywell Int'l v. Hamilton Sundstrand Corp.*, 370 F.3d 1131, 1144 (Fed. Cir. 2004) (“[D]ependent claims 4, 8, and 19 were rewritten into independent form, and the original independent claims were cancelled, effectively adding the inlet guide vane limitations [of dependent claims 4, 8 and 19] to the claimed invention.”).

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is increasing[/decreasing],” and “means for determining when throttle position for said vehicle is increasing[/decreasing]” as claimed in claims 24, 25, and 27.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Based upon the Examiner’s statements during the original prosecution, it would have been obvious to one of ordinary skill in the art to enable the fuel overinjection notification circuit based upon sensor inputs. For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Claims 25 and 27 require that the upshift and/or downshift notification circuits are activated based upon the same types of sensor inputs. For example, claim 25 requires that “said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.” Because Toyota ’599 discloses both upshift and downshift notification circuits triggered by a processor in response to sensors (*see* col. 5, line 63 to col. 6, line 2), the Examiner’s statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift/downshift notification circuits in view of Toyota ’599.

A person of ordinary skill in the art, at the time the alleged inventions of claims 24, 25, and 27 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen, Toyota ’599, Davidian, and Chasteen, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 24, 25, and 27 of the ’781

patent were made would have been further motivated to combine the teachings of Jurgen, Toyota '599, Davidian, and Chasteen, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “obtain preferable shift positions relating to optimum fuel consumption rate in accordance with [] data detected” (Toyota '599, Abstract), to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to indicate the “optimum fuel requirements for the engine” (Chasteen, col. 2, lines 48 to 54). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Toyota '599, Davidian, and Chasteen are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Toyota '599, Davidian, and Chasteen, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either

the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jurgén, Toyota '599, Davidian, and Chasteen teaches all of the limitations of claims 24, 25, and 27 of the '781 patent and therefore renders obvious claims 24, 25, and 27 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 24, 25, and 27 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgén, Toyota '599, Davidian, and Chasteen.

**20. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgén, Volkswagen '070, Davidian and Chasteen**

Claims 24, 25, and 27 are obvious under 35 U.S.C. § 103(a) in view of the combination of Jurgén, Volkswagen '070, Davidian and Chasteen. Although Chasteen was cited by the Examiner during prosecution of the '781 patent, Jurgén, Volkswagen '070, and Davidian were not cited by the Examiner or the applicants during prosecution. Thus, the question of whether claims 24, 25, and 27 are obvious in view of the combination of Jurgén, Volkswagen '070, Davidian and Chasteen was not previously considered. The combination of Jurgén, Volkswagen '070, Davidian, and Chasteen is closer to the subject matter of claims 24, 25, and 27 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent. The combination of Jurgén, Volkswagen '070, Davidian, and Chasteen provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

As more fully explained above, the Examiner concluded that claims 23 and 26, from which claims 24, 25, and 27 depend, were allowable over the prior art cited during prosecution on the basis that the prior art does not teach upshift and/or downshift notification circuits, wherein the processor determines, based upon data received from sensors, when to activate said upshift and/or downshift notification circuits, and there is no indication in the prosecution history that any of dependent claims 24, 25, and 27 were considered allowable over the cited prior art for any reason other than their dependency from claim 23 or 26.

As set forth in more detail above, the combination of Jurgén, Volkswagen '070, and Davidian raises a substantial new question of patentability affecting claims 23 and 26 and renders obvious claims 23 and 26 under 35 U.S.C. § 103(a).

During prosecution of the '781 patent, the Examiner determined that a person of ordinary skill in the art would have found the added limitations of dependent claims 24, 25,

and 27 obvious in view of the teachings of Chasteen.<sup>20</sup> For example, in rejecting claim 24 as obvious in view of the combination of Chasteen and Doi et al., the Examiner found that:

Chasteen discloses the sensors as discussed for sensing the signals and a processor and compare [sic] manifold pressure for activating the fuel injection. Chasteen discloses the speed (RPM) and throttle position are determined to be greater than 0 (increasing) and the CPU provides a control command to the engine fuel injector to prime the engine (See column 11, lines 22-33) therefore on [sic] would consider increasing and decreasing the speed and throttle for adjusting the fuel injector for supplying fuel to the engine.

In the Amendment filed by the applicants in response to the Office Action containing the foregoing findings, the applicants did not amend claim 24, 25, or 27 and did not present any arguments against the Examiner's findings. Instead, and as indicate above, the applicants amended claim 23, from which claims 24 and 25 depend, to include the upshift notification circuit limitations that the Examiner found missing from the prior art, and rewrote claim 26, from which, claim 27 depends, in effect adding the downshift notification circuit limitations that the Examiner found missing from the prior art.<sup>21</sup>

Jurgen discloses an electronic engine control system that receives sensor inputs, evaluates them, and determines the necessary outputs to provide for optimal driveability. (Jurgen, page 12.1). Jurgen also discloses that these sensors monitor engine speed (page 7.6), road speed (pages 7.8, 14.3), manifold pressure (pages 2.5, 2.7), throttle position (page 12.21). Jurgen also teaches that the use of processor subsystems to receive inputs from these sensors was known. (Pages 12.1, 13.6, 22.6). "During the entire operating time of the vehicle, the ECUs are constantly supervising the sensors they are connected to." (Page 22.6). Indeed, Jurgen discloses a diagram of these hardware parts:

---

<sup>20</sup> To render a claim obvious, "[t]he prior art reference (or references when combined) need not teach or suggest all of the claim limitations." M.P.E.P. § 2141.

<sup>21</sup> See, e.g., *Honeywell Int'l v. Hamilton Sundstrand Corp.*, 370 F.3d 1131, 1144 (Fed. Cir. 2004) ("[D]ependent c]laims 4, 8, and 19 were rewritten into independent form, and the original independent claims were cancelled, effectively adding the inlet guide vane limitations [of dependent claims 4, 8 and 19] to the claimed invention.").

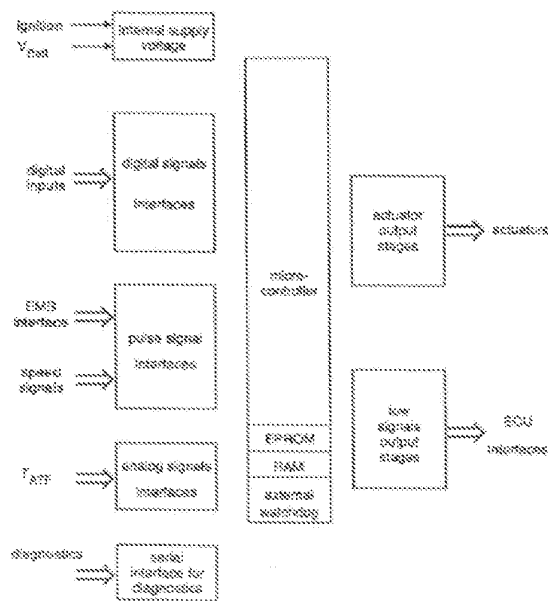

FIGURE 23.3 Overview of hardware parts.

Jurgen, therefore, teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is increasing[/decreasing],” and “means for determining when throttle position for said vehicle is increasing[/decreasing]” as claimed in claims 24, 25, and 27.

Volkswagen '070 acknowledges that automobile instrument panels that display fuel economy are in the prior art. For example, Volkswagen '070 describes at page 9:

It is useful in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the *induction manifold vacuum* as a measure of the fuel consumption. . . . In this case it is useful to integrate the signal transmitters denoted by 4 and 5 in Figure 2 into the instrument of the fuel consumption display, as sketched in Figure 3. During standard driving operation, pointer 30 of the fuel consumption display sweeps scale 31, while it is hidden behind cover 32 during an idling operation or at full-load accelerations. Incorporated in the scale is arrow 33, which constitutes part of a signal transmitter requesting upshifting, which therefore corresponds to signal transmitter 4 in Figure 2.

(emphasis added)

Thus, by describing a fuel consumption display that indicates full-load acceleration, Volkswagen '070 teaches “means for determining when road speed for said vehicle is increasing[/decreasing],” means for determining when throttle position for said vehicle is

increasing[/decreasing],” “means for determining when throttle position for said vehicle is increasing[/decreasing],” and the processor activating the fuel overinjection circuit based upon measurements from these sensors as claimed in claims 2, 4, 5, 8, 10, 12, and 15.

Jurgen teaches a fuel overinjection notification circuit, which issues a notification that excessive fuel is being supplied to the engine of the vehicle. For example, the ECU taught by Jurgen can shut off fuel in certain situations by evaluating the throttle position, engine RPM, and vehicle speed. (Page 12.4). Additionally, the ECU can shut off fuel injectors when a maximum speed is achieved (page 12.14). The ECU provides the fuel overinjection notification to the fuel injectors when a fuel cutoff state is reached. Based upon the Examiner’s statements during the original prosecution, it would have been obvious to one of ordinary skill in the art to enable the fuel overinjection notification circuit based upon sensor inputs. For example, the combination of the ECU, which monitors all of the vehicle’s sensors (see above) and the TCU, which stores the shift maps, can send notification circuits to the fuel injectors and/or the transmission in order to alleviate a fuel overinjection condition.

Claims 25 and 27 require that the upshift and/or downshift notification circuits are activated based upon the same types of sensor inputs. For example, claim 25 requires that “said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.” Because Volkswagen ’070 discloses both upshift and downshift notification circuits triggered by a processor in response to sensors (*see* pages 6–8), the Examiner’s statements that the fuel overinjection circuit triggered based upon sensor inputs would have been obvious in view of Chasteen also apply to the upshift/downshift notification circuits in view of Volkswagen ’070.

A person of ordinary skill in the art, at the time the alleged inventions of claims 24, 25, and 27 of the ’781 patent were made, would have found it obvious to combine the teachings of Jurgen, Volkswagen ’070, Davidian, and Chasteen, and, in addition, would have been motivated to do so. Indeed, Jurgen, for example, expressly describes one such motivation: “The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, provide optimal driveability for all operating conditions, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.” (Jurgen, Page 12.1). A person of ordinary skill in the art, at the time the alleged inventions of claims 24, 25, and 27 of the ’781 patent were made would have been further motivated to combine the teachings of

Jurgen, Volkswagen '070, Davidian, and Chasteen, to “provide optimal driveability for all operating conditions” (Jurgen, Page 12.1), to “provide[] the fuel metering and ignition timing precision to minimize fuel consumption (Jurgen, Page 12.4), to “provid[e] a device that assists the operator of the internal combustion engine equipped with a conventional transmission . . . for example, in setting an operating point of the engine that is advantageous in terms of fuel consumption” (Volkswagen '070, Page 5), to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3 to 4), and to indicate the “optimum fuel requirements for the engine” (Chasteen, col. 2, lines 48 to 54). The '781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will *enhance the efficient operation* thereof with the ability to automatically take corrective action *if the vehicle is being operated unsafely.*” Col. 1, line 66 to col. 2, line 5. Thus, like the '781 patent, Jurgen, Volkswagen '070, Davidian, and Chasteen are concerned with, for example, improving fuel efficiency and safety.

Furthermore, as additional evidence that a person of ordinary skill in the art would be motivated to combine the teachings of Jurgen, Volkswagen '070, Davidian, and Chasteen, Jurgen describes at page xvii:

Automotive electronics as we know it today encompasses a wide variety of devices and systems. Key to them all, and those yet to come, is the ability to sense and measure accurately automotive parameters. Equally important at the output is the ability to initiate control actions accurately in response to commands. In other words, sensors and actuators are the heart of any automotive electronics application. . . .

The importance of sensors and actuators cannot be overemphasized. The future growth of automotive electronics is arguably more dependent on sufficiently accurate and low-cost sensors and actuators than on computers, controls, displays, and other technologies.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either

the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Jurgen, Volkswagen '070, Davidian, and Chasteen teaches all of the limitations of claims 24, 25, and 27 of the '781 patent and therefore renders obvious claims 24, 25, and 27 of the '781 patent. Therefore, VWGoA proposes a ground of rejection of claims 24, 25, and 27 of the '781 patent under 35 U.S.C. § 103(a) as obvious in view of the combination of Jurgen, Volkswagen '070, Davidian, and Chasteen.

**21. Claim 32 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Davidian and Tonkin**

Claim 32 is obvious under 35 U.S.C. § 103(a) in view of the combination of Davidian, Chasteen, and Tonkin. Neither Davidian nor Tonkin was cited by the Examiner or the applicants during prosecution of the '781 patent. Therefore, the question of whether claim 32 is obvious in view of the combination of Davidian and Tonkin was not previously considered. The combination of Davidian and Tonkin is closer to the subject matter of claim 32 of the '781 patent than any prior art that was relied upon during prosecution of the '781 patent, and the combination of Davidian and Tonkin provides new, non-cumulative technical teachings that were not otherwise provided in any prior art that was relied upon during prosecution of the '781 patent.

Claim 32 depends from claim 31. As set forth in more detail above, Davidian raises a substantial new question of patentability affecting claim 31 and anticipates claim 31 under 35 U.S.C. § 102(b).

Claim 32 adds the limitations of a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated and that the memory subsystem further stores a second vehicle speed/stopping distance table. During prosecution of the '781 patent, the applicants stated that “the windshield wiper sensor [of claim 32] is not used to inform the operator as to whether the windshield wipers are on or off.” Rather, according to the applicants, “the sensor is used by the processor subsystem to classify road conditions as either ‘dry’ or ‘wet’.” Davidian describes that the automatic sensors of the vehicle include a rain sensor 16 (col. 4, line 67 to col. 5, line 2), and Tonkin describes that safe stopping distances can be adjusted for prevailing weather conditions, and that information regarding the weather may be obtained by the warning system controller ascertaining if the windscreen wipers are in use or have been in use recently due to rain (col. 18, lines 9 to 16). Thus, the

combination of Davidian and Tonkin teaches a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, as described in claim 32.

Regarding the memory subsystem storing a second vehicle speed/stopping distance table, Tonkin describes that “safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to weather and possibly for different severities of poor weather.” Page 18, lines 16 to 19. Thus, Tonkin teaches a memory subsystem storing a second vehicle speed/stopping distance table, as described in claim 32.

Claim 32 additionally recites that:

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based on data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

and

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based on data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

According to the applicants, “[i]f the road is dry, the processor subsystem uses a first vehicle speed/stopping distance table to determine if an object is too closed to the vehicle” and “[i] the road is wet, however, the processor subsystem uses a second vehicle speed/stopping distance table to determine if the object is too close to the vehicle.” Referring, for example, to page 18, lines 19 to 26, Tonkin teaches the same control strategy:

[A] two level warning system can be provided wherein, a first warning, e.g. turn on all lamps 13, when a trailing vehicle 18 encroaches within the safe stopping distance of the subject vehicle 16 for poor weather conditions, and a second warning e.g. flash all or some lamps 13, if the trailing vehicle encroaches within the safe stopping distance for good conditions.

A person of ordinary skill in the art, at the time the alleged inventions of claim 18 of the '781 patent was made, would have found it obvious to combine the teachings of Davidian Chasteen, and Tonkin and, in addition, would have been motivated to do so, for example, to provide an “anti-collision system for vehicles” that “computes[] the danger-of-collision distance to the object” (Davidian, Col. 1, line 7 and col. 2, lines 3-4) and to “provide safety

information for example to drivers of following vehicles” (Tonkin, page 1, lines 4-5). The ’781 patent states that its object is to “provide a system which integrates the ability to issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely.” Col. 1, line 66 to col. 2, line 5. Thus, like the ’781 patent, Tonkin and Doi et al. are concerned with, for example, vehicle safety.

Moreover, the combination of these teachings is merely (a) the combination of prior art elements according to known methods to yield predictable results; (b) the simple substitution of known elements for one another to obtain predictable results; (c) the use of known techniques to improve similar devices in the same way; (d) the application of known techniques to known devices ready for improvement to yield predictable results; (e) obvious to try; and (f) known to work in one field of endeavor prompting variations for use in either the same field or a different one based on design incentives or other market forces since the variations are predictable to one of ordinary skill in the art.

As set forth in the appended charts, the combination of Davidian and Tonkin teaches all of the limitations of claim 32 of the ’781 patent and therefore renders obvious claim 32 of the ’781 patent. Therefore, VWGoA proposes a ground of rejection of claim 32 of the ’781 patent under 35 U.S.C. § 103(a) as obvious by the combination of Davidian and Tonkin.

### **VIII. VWGoA’s PROPOSED GROUNDS OF REJECTION**

In view of all of the foregoing, and the annexed claim charts, VWGoA respectfully proposes the following grounds of rejection:

1. Claim 1 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Saturn ’452
2. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Toyota ’599
3. Claims 1, 7, and 13 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Volkswagen ’070
4. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota ’599, and Davidian
5. Claims 17–23 and 26 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen ’070, and Davidian
6. Claims 17–21 and 23 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn ’452, and Davidian

7. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Nissan '055
8. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and Mack '324
9. Claims 28–30 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen and GM '753
10. Claim 31 is Anticipated Under 35 U.S.C. § 102(b) by Davidian
11. Claims 31 and 32 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Tonkin and Doi et al.
12. Claims 2, 4, and 5 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, and Chasteen
13. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, and Chasteen
14. Claims 2, 4, 5, 8, 10, 12, and 15 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, and Chasteen
15. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, Davidian, and Tonkin
16. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, Davidian, and Tonkin
17. Claim 18 is Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, Davidian, and Tonkin
18. Claims 24 and 25 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Saturn '452, Davidian and Chasteen
19. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Toyota '599, Davidian and Chasteen
20. Claims 24, 25, and 27 are Obvious Under 35 U.S.C. § 103(a) in View of the Combination of Jurgen, Volkswagen '070, Davidian and Chasteen
21. Claim 32 is Obvious Under 35 U.S.C. § 103(a) in in View of the combination of Davidian and Tonkin

**IX. FEE PURSUANT TO 37 C.F.R. § 1.510(a)**

The fee under 37 C.F.R. § 1.510(a) for requesting *ex parte* reexamination is being paid by credit card. The Director is authorized to charge any additional fees that may be required in connection with this paper or these proceedings on behalf of Requester,

Volkswagen Group of America, Inc., to the deposit account of Kenyon & Kenyon LLP, Deposit Account 11-0600.

**X. CERTIFICATION PURSUANT TO 37 C.F.R. § 1.510(b)(5)**

According to 37 C.F.R. § 1.510(b)(5), a request for *ex parte* reexamination must include a certification that a copy of the request filed by a person other than the patent owner has been served in its entirety on the patent owner at the address as provided for in 37 C.F.R. § 1.33(c).

According to the Office's PAIR system, the correspondence address for the '781 patent is: Michael S. Bush, Haynes & Boone LLP, 3100 Nationsbank Plaza, 901 Main Street, Dallas, TX 75202-3789. Accordingly, a copy of this Request is being served in its entirety at the foregoing correspondence address as provided for in 37 C.F.R. § 1.33(c), in accordance with 37 C.F.R. § 1.510(b)(5). A certificate of service is annexed hereto as Exhibit 10, which sets forth that, pursuant to 37 C.F.R. § 1.510(b)(5), a copy of this Request is being served in its entirety on "the patent owner at the address as provided for in [37 C.F.R.] § 1.33(c)" at the following address: 3100 Nationsbank Plaza, 901 Main Street, Dallas, TX 75202-3789.

**XI. CERTIFICATION PURSUANT TO 37 C.F.R. § 1.510(b)(6)**

Requester Volkswagen Group of America, Inc. hereby certifies that the statutory estoppel provisions of 35 U.S.C. § 315(e)(1) or 35 U.S.C. § 325(e)(1) do not prohibit the filing of the *ex parte* reexamination request.

**XII. CONCLUSION**

For all of the reasons set forth above, reexamination of claims 1, 2, 4, 5, 7, 8, 10, 12, 13, 15, and 17–32 of the '781 patent is requested.

Respectfully submitted,

Date: May 22, 2014

1. Claim 1 is Obvious in View of the Combination of Jurgen and Saturn '452

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)
<p>1. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, "The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur."</p>	<p>E.g., Abstract, "<i>A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear from the present gear. A method of determining the shift point</i> is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear."</p>
<p>a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>E.g., page 7.6, "There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed</i>. This information is used for transmission control, engine control, cruise control, and possibly for a tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications."</p> <p>E.g., page 7.8, "In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio."</p> <p>E.g., page 2.5, "Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors</i>."</p>	<p>E.g., col. 1, lines 31 to 33, "Conventional shift indicator calibration typically involves setting <i>manifold pressure (MAP)</i> thresholds at a variety of speeds."</p> <p>E.g., col. 2, lines 13 to 18, "Referring to FIG. 1, the reference numeral 10 generally designates a motor vehicle drivetrain comprising a spark ignition <i>internal combustion engine (engine)</i> 12, engine output shaft 10 and the combination of conventional manual clutch, gearbox and final drive assembly (manual drivetrain) 16."</p> <p>E.g., col. 2, lines 42 to 44, "Control unit 42 receives inputs required by the present embodiment including <i>manifold absolute pressure (MAP)</i>, on line 46, <i>engine speed (Ne)</i> on line 50 and output speed (No) on line 54."</p> <p>E.g., col. 7, lines 13 to 21, "Throttle position "%T" is checked at block 515 against a closed position threshold K3. Closed throttle is indicative of vehicle coast, a state of operation wherein the engine is not imparting torque to the drive wheels and thus does not necessitate an upshift. Closed throttle may also be indicative of the operator purposefully using the drivetrain to decelerate the vehicle."</p>

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)
	 <p>FIGURE 3.1 Overview of hardware parts.</p> <p>E.g., page 14.3, “The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor’s signal</i> to within 1/32 m/h.”</p>	 <p>FIG. 1</p>
<p>a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;</p>	<p>E.g., page 13.5, “The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs.”</p> <p>E.g., page 12.9, “A subsystem of the fuel control system is lambda</p>	<p>E.g., col. 2, lines 52 to 55, “Control unit 42 may be mechanized with a conventional state of the art microcomputer controller including a central processing unit, <i>memory</i> and input-output devices.”</p> <p>E.g., col. 6, lines 55 to 60, “First, <i>engine speed Ne is checked at block 511 to determine if it exceeds a predetermined maximum allowable engine speed threshold K1.</i> If the threshold is exceeded then an upshift is required regardless of the value of UTR and control is therefore passed via line 560 to block 542 where the shift</p>

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)
	<p>closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory).”</p>	<p>light flag is set to one (SL FLAG=1). If the threshold at block 511 is not exceeded, decision block 512 is encountered.”</p> <p>E.g., FIG. 5:</p>  <pre> graph TD     A([SHIFT LIGHT LOGIC]) --&gt; B{511 Ne &gt; K1}     B -- YES --&gt; C[ ]     B -- NO --&gt; D[ ]     style C fill:none,stroke:none     style D fill:none,stroke:none   </pre>
<p>a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, “During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>”</p> <p>E.g., page 12.4, “During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle</i></p>	

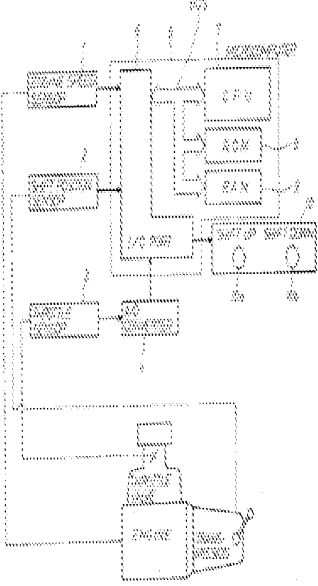

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)
<p>an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;</p>	<p><i>position, engine RPM, and vehicle speed.”</i></p> <p>E.g., page 13.7 to 13.9, “<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>”</p> <p>E.g., page 13.9, “The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed</i> (determined by the transmission output speed).”</p> <p>E.g., page 13.14, “In addition to these functions, <i>different shift maps can be implemented into the data field of the TCU [Transmission Control Unit].</i> For example, it is possible to have one shift map for low fuel consumption, which has shift points in the range of the best efficiency of the engine, and additionally to have another map for power operation, where the shift points are placed at points of highest engine output power.”</p>	<p>E.g., Abstract, “<i>A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear from the present gear. A method of determining the shift point</i> is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear.”</p> <p>E.g., col. 1, lines 10 to 13, “Shift indicators are commonly used on manual transmission vehicles <i>to assist non-expert drivers in determining when it is appropriate to shift the transmission to a higher gear</i> in order to maximize driving fuel economy.”</p> <p>E.g., col. 2, lines 42 to 55, “Control unit 42 receives inputs required by the present embodiment including manifold absolute pressure (MAP), on line 46, engine speed (Ne) on line 50 and output speed (No) on line 54. Knock sensing means Kn are also shown providing signal input via line 56 to control unit 42. <i>Control unit 42 indicates via line 60 the state of an upshift indicator light or equivalent visual display such as is found in conventional instrumentation in a motor vehicle. Line 60 may provide a logic signal to an instrument cluster for further processing or may drive a lamp directly via a power driver in control unit 42.</i> Control unit 42 may be mechanized with a conventional state of the art microcomputer controller including a central processing unit, memory and input-output devices.”</p> <p>E.g., col. 3, lines 60 to 65, “Finally, <i>control unit 42 outputs a signal online [sic] 60 as shown in FIG. 1 for indicating the state of the upshift indicator light</i> as well as various other output signals for instrument cluster displays such as vehicle speedometer, oil pressure and coolant temperature for example.”</p>
<p>said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to</p>	<p>E.g., page 12.4, “During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>”</p>	<p>E.g., col. 2, lines 42 to 55, “Control unit 42 receives inputs required by the present embodiment including manifold absolute pressure (MAP), on line 46, engine speed (Ne) on line 50 and output speed (No) on line 54. Knock sensing means Kn are also shown providing signal input via line 56 to control unit 42. <i>Control unit</i></p>

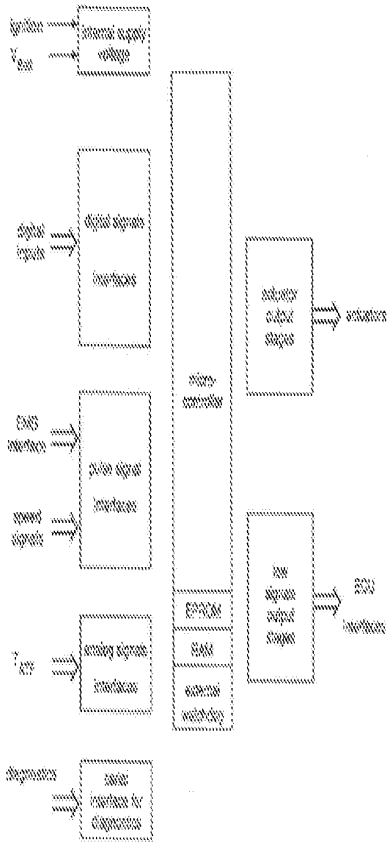

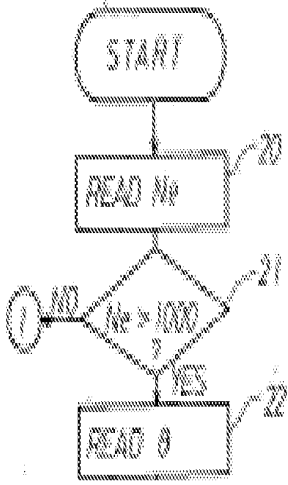

**2. Claims 1, 7, and 13 are Obvious in View of the Combination of Jurgen and Toyota '599**

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
<p>1. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, "The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur."</p>	<p>E.g., Abstract, "<i>A shift indication apparatus</i> having an engine rotation sensor, a throttle valve sensor, and a shift position sensor, a microcomputer having a ROM and RAM for storing data corresponding to the engine speed, throttle valve openings, and the shift positions therein, and an indicator for indicating preferable shift positions to be performed by a driver in which a torque data map and a fuel consumption rate data map have stored in the ROM for calculating various torque and fuel consumption rates <i>so as to obtain preferable shift positions relating to optimum fuel consumption rate in accordance with said data detected. With this construction, it becomes possible for a driver to run his car in accordance with the indications of the shift operation on the indicator so as to enable the economical running of the car to be realized.</i>"</p>
<p>a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>E.g., page 7.6, "There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed.</i> This information is used for transmission control, engine control, cruise control, and possibly for a tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications."</p> <p>E.g., page 7.8, "In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio."</p> <p>E.g., page 2.5, "Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors.</i>"</p>	<p>E.g., col. 2, lines 23 to 36, "Referring to FIG. 1, the shift indication apparatus with a manual transmission according to the present invention comprises <i>an engine speed sensor 1 for detecting the engine speed and for producing pulse signals of a frequency proportional to the engine speed</i>, a shift position sensor 2 for detecting the shift positions of the transmission, <i>a throttle sensor 3 for detecting the opening degree of the throttle valve by means of, for instance, a potentiometer</i>, an A/D converter 4 for converting analog signals from the throttle valve sensor 3 into digital signals, a microcomputer 5 for performing various calculations in accordance with the different signals from the sensors, and an indicator 10 for indicating the result of the calculations."</p> <p>E.g., col. 2, lines 43 to 48, "<i>The engine speed sensor 1</i> is mounted in a distributor (not shown) and the output of the sensor is connected to the input of the I/O port 6 so as to transmit the output pulses to the microcomputer 5 through the I/O port 6 and to store the data corresponding to the engine speed into the RAM 9."</p> <p>E.g., col. 2, lines 52 to 59, "Similarly, the output of <i>the throttle sensor 3</i> is connected through the A/D converter 4 to the input of the I/O port 6 so as to transmit the output signals thereof to the</p>

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
	<p>E.g., page 2.7, "Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models."</p> <p>E.g., page 12.18, "To control the idle speed, the ECU uses inputs from the <i>throttle position sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed."</p> <p>E.g., page 12.21, "The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU."</p>	<p>microcomputer 5 through the A/D converter 4 and to store the data corresponding to the throttle value opening into the RAM 9 after converting from the analog signals into the digital signals."</p> <p>E.g., FIG. 1:</p> 
<p>a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, "The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs."</p> <p>E.g., page 22.6, "During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>"</p> <p>E.g., page 13.4, "On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1)."</p>	<p>E.g., col. 2, lines 23 to 36, "Referring to FIG. 1, the shift indication apparatus with a manual transmission according to the present invention comprises an engine speed sensor 1 for detecting the engine speed and for producing pulse signals of a frequency proportional to the engine speed, a shift position sensor 2 for detecting the shift positions of the transmission, a throttle sensor 3 for detecting the opening degree of the throttle valve by means of, for instance, a potentiometer, an A/D converter 4 for converting analog signals from the throttle valve sensor 3 into digital signals, <i>a microcomputer 5 for performing various calculations in accordance with the different signals from the sensors</i>, and an indicator 10 for indicating the result of the calculations."</p> <p>E.g., col. 2, lines 37 to 42, "<i>The microcomputer 5</i> further comprises an input/output port (I/O port) 6, <i>a central processing unit (CPU) 7</i>, a read only memory (ROM) 8, and a random access</p>

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
	<p>E.g., Figure 13.1:</p>  <p>FIGURE 13.1 Overview of hardware parts.</p> <p>E.g., page 14.3, “The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor’s signal</i> to within 1/32 m/h.”</p>	<p>memory (RAM) 9. In the microcomputer 5, there is provided a bus BUS which communicates the I/O port 6 and the CPU 7, ROM 8, and RAM 9.”</p> <p>E.g., col. 2, lines 43 to 48, “The engine speed sensor 1 is mounted in a distributor (not shown) and <i>the output of the sensor is connected to the input of the I/O port 6 so as to transmit the output pulses to the microcomputer 5</i> through the I/O port 6 and to store the data corresponding to the engine speed into the RAM 9.”</p> <p>E.g., col. 2, lines 52 to 59, “Similarly, <i>the output of the throttle sensor 3 is connected through the A/D converter 4 to the input of the I/O port 6 so as to transmit the output signals thereof to the microcomputer 5</i> through the A/D converter 4 and to store the data corresponding to the throttle value opening into the RAM 9 after converting from the analog signals into the digital signals.”</p>
<p>a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;</p>	<p>E.g., page 13.5, “The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being</p>	<p>E.g., col. 2, lines 37 to 42, “The microcomputer 5 further comprises an input/output port (I/O port) 6, a central processing unit (CPU) 7, <i>a read only memory (ROM) 8, and a random access memory (RAM) 9.</i> In the microcomputer 5, there is provided a bus BUS which communicates the I/O port 6 and the CPU 7, <i>ROM 8, and RAM 9.</i>”</p>

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
	<p>replaced by EEPROMs.”</p> <p>E.g., page 12.9, “A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory).”</p> <p>E.g., page 14.2, “Other safety-related items include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals.”</p> <p>E.g., pages 22.2 to 22.3, “The most important test points of control units and sensors are tied to a diagnostic connector which is</p>	<p>E.g., col. 3, lines 7 to 20, “<i>The torque data map indicative of torque curves T as shown in FIG. 2 has been stored in the ROM 8 in advance. The fuel consumption rate data map indicative of equal fuel consumption rate curves B as shown in FIG. 3 has been also stored in the ROM 8 in advance. In FIG. 2, each equal torque curve T was prepared by plotting and connecting equal torque points on the graph with respect to the engine speed vs. throttle valve opening.</i> In FIG. 3, each fuel consumption rate curve B was prepared by plotting and connecting equal fuel consumption rate points on a graph obtained in advance by experiment data with respect to the engine speed and the torques thus calculated.”</p> <p>E.g., col. 3, lines 44 to 61, “<i>In this case, as shown in FIG. 4, the operation of a main routine is started at a predetermined timing, e.g. periodical timing pulses from a timer (not shown) and the detection of the engine speed <math>N_e</math> from the sensor 1 is carried out and it is stored into the RAM 9 at the step 20. Then, the engine speed <math>N_e</math> is read from the RAM 9 and it is compared with a predetermined number N (=1000 rpm) to determine whether or not the <math>N_e</math> exceeds the value 1000 at the step 21.</i> If the result of the decision is YES, the next step 22 is executed. That is, in the step 22, the reading in of the opening of the throttle valve is performed through the throttle sensor 3 and the A/D converter 4. In the above case, if the result of the decision in step 21 is NO, the main routine is terminated by determining that the shift operation is not necessary and the engine speed <math>N_e</math> is read again at the predetermined timing and now the operation returns to the step 20.”</p> <p>E.g., Figure 4:</p>

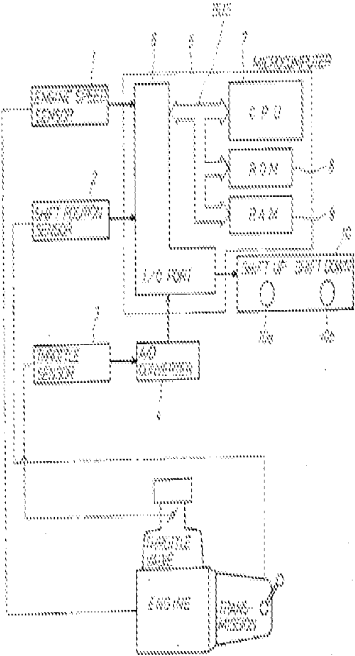

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
	<p>plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . .</p> <p><i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values with the help of control units and their self-diagnosis, thus detecting faults.</i>"</p>	 <pre> graph TD     START([START]) --&gt; READ_Nn[READ Nn]     READ_Nn --&gt; DEC{Nn &gt; 1000?}     DEC -- NO --&gt; END(( ))     DEC -- YES --&gt; READ_0[READ 0]   </pre>
<p>a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>"</p> <p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>"</p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque</i>"</p>	

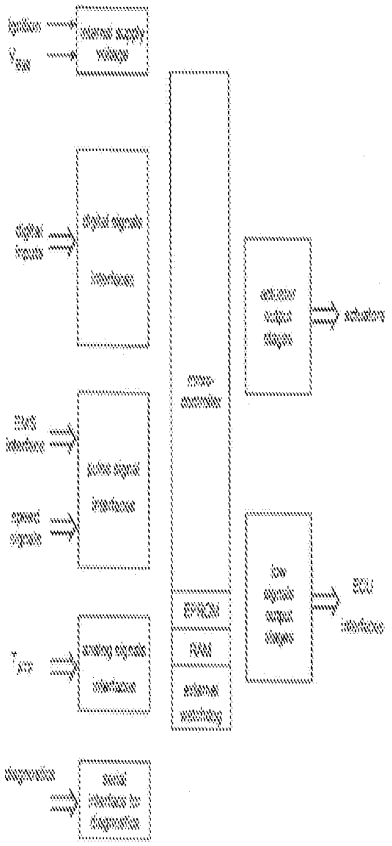

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)
	<p><i>and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque."</p>	
<p>an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;</p>	<p>E.g., page 13.7 to 13.9, "<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>"</p> <p>E.g., page 13.9, "The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed</i> (determined by the transmission output speed)."</p> <p>E.g., page 13.14, "In addition to these functions, <i>different shift maps can be implemented into the data field of the TCU [Transmission Control Unit].</i> For example, it is possible to have one shift map for low fuel consumption, which has shift points in the range of the best efficiency of the engine, and additionally to have another map for power operation, where the shift points are placed at points of highest engine output power."</p>	<p>E.g., col. 2, line 64 to col. 3, line 3, "<i>The indicator 10 includes a shift-up indicating lamp 10a and a shift-down indicating lamp 10b.</i></p> <p><i>The indicator 10 may be assembled by light emitting [sic] diodes (LED) so as to perform shift-up and shift-down indications by up and down directed arrow marks.</i> Alternatively, the indicator 10 may also be replaced with other voice combining circuit so as to announce the shift operations by voice instead of the indications."</p> <p>E.g., col. 5, line 63 to col. 6, line 2, "Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, <i>a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the driver that the speed change from current shift position to the one step shifting up position SP<sub>+1</sub> is preferable.</i>"</p> <p>E.g. col. 7, lines 29 to 38, "However, <i>only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate B<sub>n</sub>, the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated,</i> thus indicating the necessity of the speed change operation."</p>
<p>said processor subsystem determining, based upon data received from said plurality of</p>	<p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU</i></p>	<p>E.g., col. 2, lines 37 to 42, "<i>The microcomputer 5 further comprises an input/output port (I/O port) 6, a central processing unit (CPU) 7, a read only memory (ROM) 8, and a random access</i></p>

3. Claims 1, 7, and 13 are Obvious in View of the Combination of Jurgen and Volkswagen '070

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
<p>1. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, “The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.”</p>	<p>E.g., page 5 (English translation), “The present invention is based on the objective of providing <i>a device that assists the operator of the internal combustion engine equipped with a conventional transmission</i>, i.e., the driver of a motor vehicle, for example, in setting an operating point of the engine that is advantageous in terms of consumption, by way of gear shift operations.”</p>
<p>a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>E.g., page 7.6, “There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed</i>. This information is used for transmission control, engine control, cruise control, and possibly for a tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.”</p> <p>E.g., page 7.8, “In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio.”</p> <p>E.g., page 2.5, “Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold</i></p>	<p>E.g., page 6 (English translation), “As can be seen when viewing Figure 1 to begin with, output N of the engine has been plotted across engine speed n. a is the curve of the output at full load, b is a line that represents a constant setting of the output control element, i.e., a line that represents a constant <i>throttle valve angle</i> in a carburetor engine. As a measure thereof, in addition to the <i>throttle valve angle</i> itself, it is also possible to use the <i>induction manifold vacuum</i>. . . The operating ranges I and II are further delimited by <i>engine speed</i> values n<sub>1</sub> or n<sub>2</sub>, the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between approximately 40 and 70% of the maximum engine speed.”</p> <p>E.g., page 8 (English translation), “<i>The engine speed signal is obtained with the aid of known sensor systems</i>, which therefore need not be described in further detail here.”</p> <p>E.g., page 9 (English translation), “It is useful if in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the <i>injection manifold vacuum</i> as a measure of fuel</p>

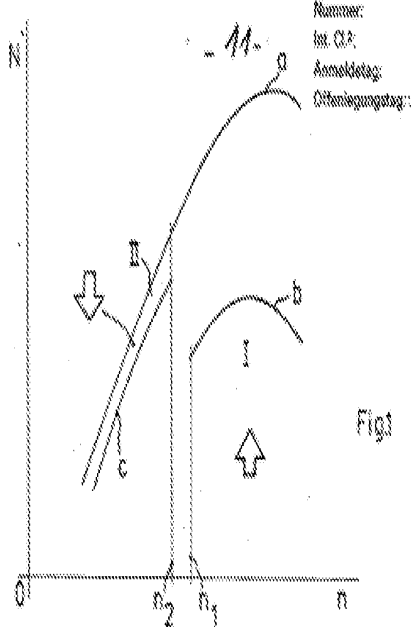

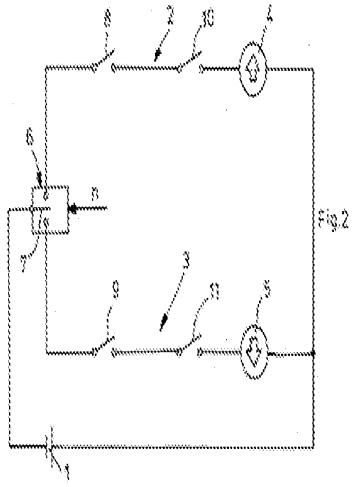

Limitation of '781 Patent Claim 1	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	<p><i>absolute pressure (MAP) sensors.</i>"</p> <p>E.g., page 2.7, "Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models."</p> <p>E.g., page 12.18, "To control the idle speed, the ECU uses inputs from the <i>throttle position sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed."</p> <p>E.g., page 12.21, "The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU."</p>	<p>consumption."</p>
<p>a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, "The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs."</p> <p>E.g., page 22.6, "During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>"</p> <p>E.g., page 13.4, "On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1)."</p> <p>E.g., Figure 13.1:</p>	<p>E.g., pages 7 to 8 (English translation), "<i>The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed n is forwarded</i> and which is developed in such a way that at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present."</p> <p>E.g., Figure 2:</p>

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
<p>7. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, "The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur."</p>	<p>E.g., page 5 (English translation), "The present invention is based on the objective of providing <i>a device that assists the operator of the internal combustion engine equipped with a conventional transmission</i>, i.e., the driver of a motor vehicle, for example, in setting an operating point of the engine that is advantageous in terms of consumption, by way of gear shift operations."</p>
<p>a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>E.g., page 7.6, "There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed.</i> This information is used for transmission control, engine control, cruise control, and possibly for a tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications."</p> <p>E.g., page 7.8, "In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio."</p> <p>E.g., page 2.5, "Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors.</i>"</p>	<p>E.g., page 6 (English translation), "As can be seen when viewing Figure 1 to begin with, output N of the engine has been plotted across engine speed n. a is the curve of the output at full load, b is a line that represents a constant setting of the output control element, i.e., a line that represents a constant <i>throttle valve angle</i> in a carburetor engine. As a measure thereof, in addition to the <i>throttle valve angle</i> itself, it is also possible to use the <i>induction manifold vacuum</i>. . . . The operating ranges I and II are further delimited by <i>engine speed</i> values <math>n_1</math> or <math>n_2</math>, the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between approximately 40 and 70% of the maximum engine speed."</p> <p>E.g., page 8 (English translation), "<i>The engine speed signal is obtained with the aid of known sensor systems</i>, which therefore need not be described in further detail here."</p> <p>E.g., page 9 (English translation), "It is useful if in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the <i>injection manifold vacuum</i> as a measure of fuel consumption."</p>

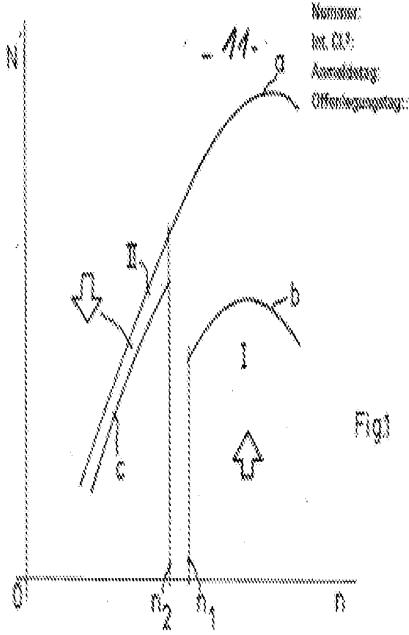

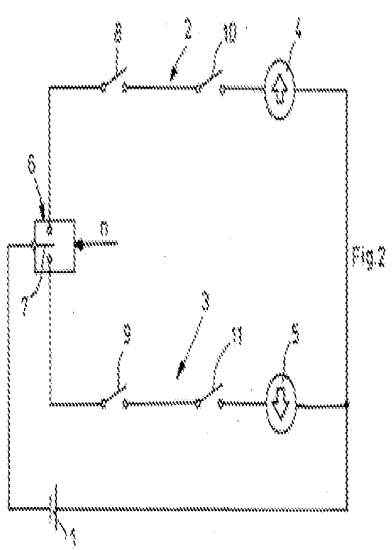

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	<p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p> <p>E.g., page 12.18, “To control the idle speed, the ECU uses inputs from the <i>throttle position sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed.”</p> <p>E.g., page 12.21, “The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU.”</p>	
<p>a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, “The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.”</p> <p>E.g., page 22.6, “During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>”</p> <p>E.g., page 13.4, “On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1).”</p> <p>E.g., Figure 13.1:</p>	<p>E.g., pages 7 to 8 (English translation), “<i>The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed n is forwarded</i> and which is developed in such a way that at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present.”</p> <p>E.g., Figure 2:</p>

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	 <p>FIGURE 13.3: Overview of hardware parts</p> <p>E.g., page 14.3, "The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor's signal</i> to within 1/32 m/h."</p>	 <p>Fig. 2</p> <p>E.g., page 6 (English translation), "As can be seen when viewing Figure 1 to begin with, <i>output N of the engine has been plotted across engine speed n.</i>"</p> <p>E.g., page 6 (English translation), "<i>The numerical values of the limits of the two operating ranges I and II are of course dependent on the individual situation.</i> In general, it can be said that these two operating ranges lie in such a way that by shift operations, it is possible to achieve</p>
<p>a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;</p>	<p>E.g., page 13.5, "The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs."</p>	<p>E.g., page 6 (English translation), "As can be seen when viewing Figure 1 to begin with, <i>output N of the engine has been plotted across engine speed n.</i>"</p> <p>E.g., page 6 (English translation), "<i>The numerical values of the limits of the two operating ranges I and II are of course dependent on the individual situation.</i> In general, it can be said that these two operating ranges lie in such a way that by shift operations, it is possible to achieve</p>

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	<p>E.g., page 12.9, "A subsystem of the fuel control system is lambda closed-loop control. . . ."</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory)."</p> <p>E.g., page 14.2, "Other safety-related items include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals."</p> <p>E.g., pages 22.2 to 22.3, "The most important test points of control units and sensors are tied to a diagnostic connector which</p>	<p>operating points in the output/engine speed diagram that are more favorable in terms of fuel consumption."</p> <p>E.g., page 8 (English translation), "<i>Furthermore, to define the two operating ranges I and II, load-dependent switches 8 and 9 are provided in control circuits 2 and 3 in Figure 2, the first of which is closed only below the line denoted by b in Figure 1, and switch 9 is closed only above the line denoted by c in Figure 1.</i>"</p> <p>E.g., Figure 1:</p> 

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	<p>is plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . .</p> <p><i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values with the help of control units and their self-diagnosis, thus detecting faults."</i></p>	
<p>a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption."</i></p> <p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed."</i></p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived</p>	<p>E.g., page 9 (English translation), "It is useful if in addition to this device, <i>a display of the route-specific fuel consumption is provided in a vehicle.</i> Such display devices are known per se; they generally utilize the injection manifold vacuum as a measure of fuel consumption."</p>

Limitation of '781 Patent Claim 7	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)
	<p>amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque."</p>	
<p>a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and</p>	<p>E.g., page 13.7 to 13.9, "<b><i>The basic functions of the transmission control are the shift point control</i></b>, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service."</p> <p>E.g., page 13.9, "The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <b><i>The shift point limitations are made</i></b>, on the one hand, by the highest admissible engine speed for each application and, on the other hand, <b><i>by the lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed</i></b> (determined by the transmission output speed)."</p> <p>E.g., page 13.14, "In addition to these functions, <b><i>different shift maps can be implemented into the data field of the TCU [Transmission Control Unit]</i></b>. For example, it is possible to have one shift map for low fuel consumption, which has shift points in the range of the best efficiency of the engine, and additionally to have another map for power operation, where the shift points are placed at points of highest engine output power."</p>	<p>E.g., pages 6 to 7 (English translation), "Looking initially at operating range I remote from full load, <b><i>the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear</i></b>, at an operating point that lies to the left of operating range I in the diagram of Figure 1. <b><i>Accordingly, the device of the present invention generates a signal that asks the operator, i.e., normally the driver, to shift to a higher gear, which is indicated in Figure 1 by the upward pointing arrow within operating range I.</i></b>"</p> <p>E.g., pages 7 to 8 (English translation), "The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed <math>n</math> is forwarded and which is developed in such a way that <b><i>at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position</i></b>, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present."</p> <p>E.g., Figure 1:</p>

Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics</p>	<p>E.g., col. 2, lines 37 to 42, "The microcomputer 5 further comprises an input/output port (I/O port) 6, a central processing unit (CPU) 7, a <i>read only memory (ROM) 8, and a random access memory (RAM) 9.</i> In the microcomputer 5, there is provided a bus BUS which communicates the I/O port 6 and the CPU 7, <i>ROM 8, and RAM 9.</i>"</p>	<p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires</i></p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
<p>a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;</p>	<p>and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs.”</p> <p>E.g., page 12.9, “A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic</p>	<p>E.g., col. 3, lines 7 to 20, “<i>The torque data map indicative of torque curves T as shown in FIG. 2 has been stored in the ROM 8 in advance. The fuel consumption rate data map indicative of equal fuel consumption rate curves B as shown in FIG. 3 has been also stored in the ROM 8 in advance. In FIG. 2, each equal torque curve T was prepared by plotting and connecting equal torque points on the graph with respect to the engine speed vs. throttle valve opening.</i> In FIG. 3, each fuel consumption rate curve B was prepared by plotting and connecting equal fuel consumption rate points on a graph obtained in advance by experiment data with respect to the engine speed and the torques thus calculated.”</p> <p>E.g., col. 3, lines 44 to 61, “<i>In this case, as shown in FIG. 4, the operation of a main routine is started at a predetermined timing, e.g. periodical timing pulses from a timer (not shown) and the detection of the engine speed <math>N_e</math> from the sensor 1 is carried out and it is stored into the RAM 9 at the step 20. Then, the engine speed <math>N_e</math> is read from the RAM 9 and it is compared with a predetermined number <math>N</math> (=1000 rpm) to determine whether or not the <math>N_e</math> exceeds the value 1000 at the step 21.</i> If the result of the decision is YES, the next step 22 is executed. That is, in the step 22, the reading in of the opening of the throttle valve is performed through the throttle sensor 3 and the A/D converter 4. In the above case, if the result of the decision in step 21 is NO, the main routine is terminated by determining that the shift operation is not necessary and the engine speed <math>N_e</math> is read again at the predetermined timing and now the</p>	<p>pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.”</p> <p>E.g., col. 12, line 59 to col 13, line 22, “The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <i>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</i></p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
	<p>control unit will revert back to the original production values that are written in ROM (read-only memory)."</p> <p>E.g., page 14.2, "Other safety-related items include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals."</p> <p>E.g., pages 22.2 to 22.3, "The most important test points of control units and sensors are tied to a diagnostic connector which is plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . . <i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values</i> with the help of control units and their self-diagnosis, thus detecting faults."</p>	<p>operation returns to the step 20."</p> <p>E.g., Figure 4:</p>  <pre> graph TD     START([START]) --&gt; READ_Nc[READ Nc 20]     READ_Nc --&gt; DEC{Nc &gt; 1000 21}     DEC -- NO --&gt; START     DEC -- YES --&gt; READ_B[READ B 22] </pre>	<p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164."</p>
<p>a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>E.g., page 7.6, "[W]heel speed sensing is required for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications. Linear speed sensing can be used to measure the ground speed. This measurement also has the possibly of use in ABS, ASR, and inertial navigation. <i>Similar types of sensors can be used in crash avoidance, proximity, and obstacle detection applications.</i>"</p>		<p>E.g., col. 3, lines 59 to 66, "The anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to <i>actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another</i>, which is equal to or less than a danger-of-collision distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision."</p> <p>E.g., col. 4, lines 14 to 16, "In the system described below, <i>there are two alarms: a Collision alarm, which is actuated when the vehicle is determined</i></p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
	<p>E.g., page 7.23, "Ultrasonics, infrared, laser, and microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas."</p>		<p><i>to be within the danger-of-collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor, e.g., 1.25."</i></p> <p>E.g., col. 6, lines 25 to 29, "Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and <i>whether or not there is a collision danger (region 46c).</i>"</p> <p>E.g., col. 6, lines 41 to 46, "Control panel 6 further includes a speaker 54 for producing an <i>audio alarm in the event of a collision danger, in addition to the visually-indicated alarms</i> of sections 46c and 48c of the displays 46 and 48."</p> <p>E.g., col. 8, lines 37 to 48, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: ... <i>a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...</i>"</p> <p>E.g., Figs. 3 and 6B (ref. no. 46C)</p>
<p>a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and</i></p>		

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
being supplied to said engine of said vehicle;	<p><i>fuel consumption.”</i></p> <p>E.g., page 12.4, “During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>”</p> <p>E.g., page 12.14, “Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes.”</p> <p>E.g., page 12.17, “<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a ‘bump’ feel when entering the fuel cutoff mode, due to the change in torque.”</p>		
an upshift	E.g., page 13.7 to 13.9, “ <i>The basic functions of</i>	E.g., col. 2, line 64 to col. 3, line 3, “ <i>The</i>	

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
<p>notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;</p>	<p><i>the transmission control are the shift point control</i>, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.”</p> <p>E.g., page 13.9, “The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application</i> and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. <i>The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed</i> (determined by the transmission output speed).”</p> <p>E.g., page 13.14, “In addition to these functions, <i>different shift maps can be implemented into the data field of the TCU [Transmission Control Unit]</i>. For example, it is possible to have one shift map for low fuel consumption, which has shift points in the range of the best efficiency of the engine, and additionally to have another map for power operation, where the shift points are placed at points of highest engine output power.”</p>	<p><i>indicator 10 includes a shift-up indicating lamp 10a and a shift-down indicating lamp 10b.</i></p> <p><i>The indicator 10 may be assembled by light emitting [sic] diodes (LED) so as to perform shift-up and shift-down indications by up and down directed arrow marks.</i> Alternatively, the indicator 10 may also be replaced with other voice combining circuit so as to announce the shift operations by voice instead of the indications.”</p> <p>E.g., col. 5, line 63 to col. 6, line 2, “Namely, in this step, the speed change operation indicating signal is applied to the indicator or display 10 from the microcomputer 5 through the I/O port 6. As a result, a particular lamp in this case, <i>a shift up indicating lamp in the indicator 10, is illuminated, thus indicating to the drive that the speed change from current shift position to the one step shifting up position SP<sub>+1</sub> is preferable.</i>”</p> <p>E.g. col. 7, lines 29 to 38, “However, <i>only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate B<sub>0</sub>, the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated</i>, thus indicating the necessity of the speed change operation.”</p>	
<p>said processor subsystem determining, based upon data received from said radar detector,</p>	<p>E.g., page 12.4, “During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position,</i></p>	<p>E.g., col. 2, lines 37 to 42, “<i>The microcomputer 5 further comprises an input/output port (I/O port) 6, a central processing unit (CPU) 7, a read only memory (ROM) 8, and a random access memory (RAM) 9.</i> In the microcomputer 5, there is provided a bus BUS which</p>	<p>E.g., col. 8, lines 37 to 43, “<i>The microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable</i></p>

		E.g. col. 7, lines 29 to 38, "However, <i>only when either one of the assumed fuel consumption rates above is better than the current fuel consumption rate B<sub>0</sub>, the corresponding shift-up lamp or shift-down lamp in the indicator 10 is illuminated</i> , thus indicating the necessity of the speed change operation."	
a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;	<p>E.g., page 7.6, "[W]heel speed sensing is required for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.</p> <p>Linear speed sensing can be used to measure the ground speed. This measurement also has the possibly of use in ABS, ASR, and inertial navigation. <i>Similar types of sensors can be used in crash avoidance, proximity, and obstacle detection applications.</i>"</p> <p>E.g., page 7.23, "Ultrasonics, infrared, laser, and microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas."</p>		<p>E.g., col. 3, lines 59 to 66, "The anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to <i>actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another</i>, which is equal to or less than a danger-of-collision distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision."</p> <p>E.g., col. 4, lines 14 to 16, "In the system described below, <i>there are two alarms: a Collision alarm, which is actuated when the vehicle is determined to be within the danger-of-collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor</i>, e.g., 1.25."</p> <p>E.g., col. 6, lines 25 to 29, "Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and <i>whether or not there is a collision danger (region 46c).</i>"</p> <p>E.g., col. 6, lines 41 to 46, "Control panel 6 further includes a speaker 54 for producing an <i>audio alarm in the event of a collision danger, in addition to the</i></p>

Limitation of '781 Patent Claim 26	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
			<p><i>visually-indicated alarms</i> of sections 46c and 48c of the displays 46 and 48.”</p> <p>E.g., col. 8, lines 37 to 48, “The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows:  <i>... a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...</i>”</p> <p>E.g., Figs. 3 and 6B (ref. no. 46C)</p>
<p>said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p>			<p>E.g., col. 8, lines 37 to 43, “The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...”</p> <p>E.g., col. 12, line 59 to col 13, line 11, “The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert</i></p>

Limitation of '781 Patent Claim 26	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)
			<p><i>the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated."</i></p> <p>E.g., col. 13, lines 17 to 22, "<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.</i>"</p>

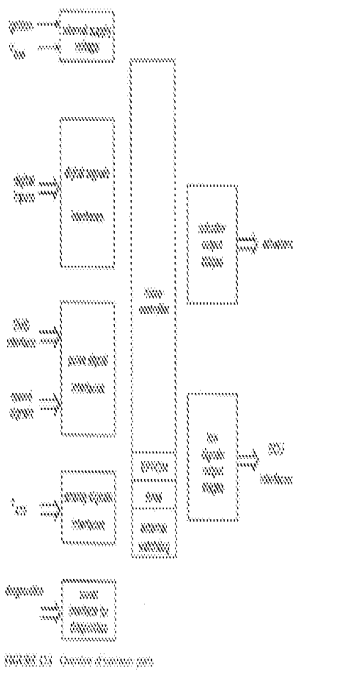

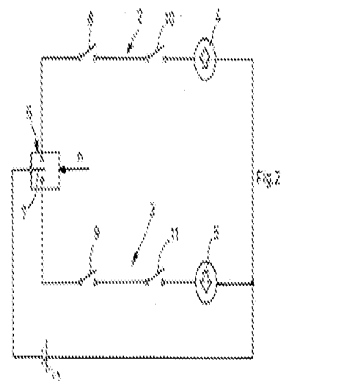

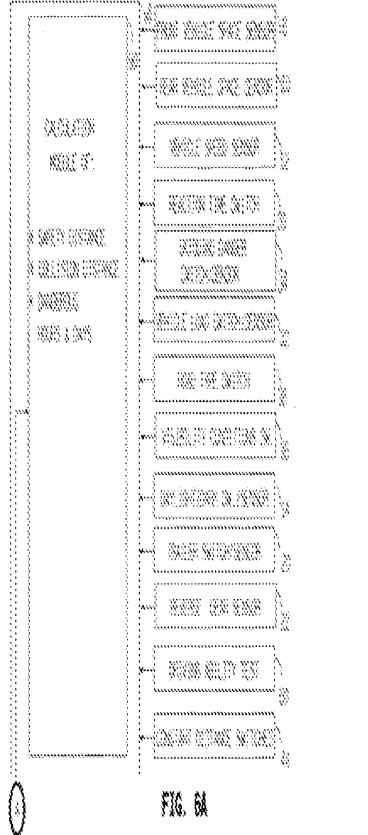

5. Claims 17–23 and 26 are Obvious in View of the Combination of Jurgen, Volkswagen '070, and Davidian

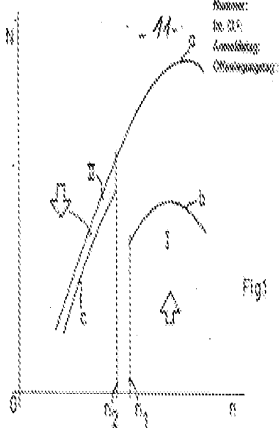

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>17. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, “The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.”</p>	<p>E.g., page 5 (English translation), “The present invention is based on the objective of providing <i>a device that assists the operator of the internal combustion engine equipped with a conventional transmission</i>, i.e., the driver of a motor vehicle, for example, in setting an operating point of the engine that is advantageous in terms of consumption, by way of gear shift operations.”</p>	<p>E.g., col. 1, lines 1 to 2, “The present invention relates to <i>an anti-collision system for vehicles</i>.”</p>
<p>a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>E.g., page 7.23, “Ultrasonics, infrared, laser, and <i>microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas</i>.”</p>		<p>E.g., col. 4, lines 52 to 66, “<i>Vehicle 2 further includes a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle, a corresponding rear space sensor 10, and a pair of side sensors 11</i>. All the space sensors are in the form of pulse (e.g., ultrasonic) transmitters and receivers, for determining the distance of the vehicle from an object, e.g., another vehicle, at front or rear. Space sensors may also be provided at the sides of the vehicle. Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
			<p>the Doppler effect, etc.”</p> <p>E.g., col. 10, lines 17 to 26, “FIG. 7 is a circuit diagram of the microcomputer 4 and the other components of the electrical system. The microprocessor is indicated by block 100, its power supply by block 102, and its watchdog circuit by block 104. <i>It includes a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 and the rear space sensor 10 for measuring the distance of the vehicle from objects in front of, and to the rear, of the vehicle, respectively.</i>”</p> <p>E.g., col. 10, lines 38 to 50, “As indicated earlier, the distance of the vehicle from an object is determined by the front space sensor 8 with respect to objects in front of the vehicle, and by the rear space sensor 10 with respect to objects at the rear of the vehicle. Each of these space sensors may be of known construction, including a transmitter as indicated at 106 in FIG. 7, and a receiver as indicated at 108. <i>Thus, pulses are continuously transmitted by each transmitter, and the echoes from the objects in front of or to the rear of the vehicle are received by the respective receiver. The computer then measures the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.</i>”</p>
at least one sensor coupled to said vehicle for monitoring operation thereof,	E.g., page 7.6, “There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed.</i> This information is used for transmission control, engine control, cruise control, and possibly for a tachometer.	E.g., page 6 (English translation), “As can be seen when viewing Figure 1 to begin with, output N of the engine has been plotted across engine speed n. a is the curve of the output at full load, b is a line that represents a constant setting of the	E.g., col. 4, lines 60 to 66, “Vehicle 2 is further equipped with <i>a speed sensor 12 which may sense the speed of the vehicle in any known manner</i> , for example using the speed measuring system of the vehicle itself, or a speed measuring system

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;</p>	<p>Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.”</p> <p>E.g., page 7.8, “In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio.”</p> <p>E.g., page 2.5, “Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors</i>.”</p> <p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p> <p>E.g., page 12.18, “To control the idle speed, the ECU uses inputs from the <i>throttle position</i></p>	<p>output control element, i.e., a line that represents a constant <i>throttle valve angle</i> in a carburetor engine. As a measure thereof, in addition to the <i>throttle valve angle</i> itself, it is also possible to use the <i>induction manifold vacuum</i>. . . . The operating ranges I and II are further delimited by <i>engine speed</i> values <math>n_1</math> or <math>n_2</math>, the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between approximately 40 and 70% of the maximum engine speed.”</p> <p>E.g., page 8 (English translation), “<i>The engine speed signal is obtained with the aid of known sensor systems</i>, which therefore need not be described in further detail here.”</p> <p>E.g., page 9 (English translation), “It is useful if in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the <i>injection manifold vacuum</i> as a measure of fuel consumption.”</p>	<p>independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc.”</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed.”</p> <p>E.g., page 12.21, “The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU.”</p>		
<p>a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;</p>	<p>E.g., page 12.1, “The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.”</p> <p>E.g., page 22.6, “During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>”</p> <p>E.g., page 13.4, “On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1).”</p> <p>E.g., Figure 13.1:</p>	<p>E.g., pages 7 to 8 (English translation), “<i>The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed <math>n_1</math> is forwarded</i> and which is developed in such a way that at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present.”</p> <p>E.g., Figure 2:</p>	<p>E.g., col. 8, lines 29 to 43, “<i>FIGS. 6a, 6b, are a block diagram illustrating the microcomputer 4 and its inputs and outputs described earlier which enable it to continuously monitor the operation of the vehicle</i> and to actuate first a Safety alarm, and then a Collision alarm whenever the vehicle may enter a danger-of-collision situation according to the various preset parameters and automatic parameters introduced into the computer.</p> <p><i>The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm.”</p> <p>E.g., col. 8, lines 58 to 60, “Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12.”</p> <p>E.g., Figure 6A:</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	 <p>E.g., page 14.3, "The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor's signal</i> to within 1/32 m/h."</p>		 <p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table</i>, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is <i>stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>"</p> <p>E.g., col. 12, line 59 to col 13, line 22, "The system</p>
<p>a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM</p>	<p>E.g., page 13.5, "The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs."</p>	<p>E.g., page 6 (English translation), "As can be seen when viewing Figure 1 to begin with, <i>output N of the engine has been plotted across engine speed n.</i>"</p> <p>E.g., page 6 (English translation), "<i>The numerical values of the limits of the two operating ranges I and II are of course dependent on the individual situation.</i> In general, it can be said that these two operating ranges lie in such a way that by shift operations, it is possible to achieve operating points in the</p>	<p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;</p>	<p>E.g., page 12.9, "A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory)."</p> <p>E.g., page 14.2, "Other safety-related items</p>	<p>output/engine speed diagram that are more favorable in terms of fuel consumption."</p> <p>E.g., page 8 (English translation), "<b>Furthermore, to define the two operating ranges I and II, load-dependent switches 8 and 9 are provided in control circuits 2 and 3 in Figure 2, the first of which is closed only below the line denoted by b in Figure 1, and switch 9 is closed only above the line denoted by c in Figure 1.</b>"</p> <p>E.g., Figure 1:</p> 	<p>then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <b>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</b> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p><b>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</b></p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p>include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals.”</p> <p>E.g., pages 22.2 to 22.3, “The most important test points of control units and sensors are tied to a diagnostic connector which is plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . .</p> <p><i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values with the help of control units and their self-diagnosis, thus detecting faults.</i>”</p>		<p>according to the deceleration alarm module 93, as indicated by block 164.”</p>
<p>a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>E.g., page 7.6, “[W]heel speed sensing is required for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.</p> <p>Linear speed sensing can be used to measure the ground speed. This measurement also has the possibly of use in ABS, ASR, and inertial navigation. <i>Similar types of sensors can be used in crash avoidance, proximity, and obstacle detection applications.</i>”</p> <p>E.g., page 7.23, “Ultrasonics, infrared, laser, and microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas.”</p>		<p>E.g., col. 3, lines 59 to 66, “The anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to <i>actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another</i>, which is equal to or less than a danger-of-collision distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision.”</p> <p>E.g., col. 4, lines 14 to 16, “In the system described below, <i>there are two alarms: a Collision alarm, which is actuated when the vehicle is determined to be within the danger-of-collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor, e.g., 1.25.</i>”</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
			<p>E.g., col. 6, lines 25 to 29, "Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and <i>whether or not there is a collision danger (region 46c).</i>"</p> <p>E.g., col. 6, lines 41 to 46, "Control panel 6 further includes a speaker 54 for producing an <i>audio alarm in the event of a collision danger, in addition to the visually-indicated alarms</i> of sections 46c and 48c of the displays 46 and 48."</p> <p>E.g., col. 8, lines 37 to 48, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: ... <i>a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...</i>"</p> <p>E.g., Figs. 3 and 6B (ref. no. 46C)</p>
<p>a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>"</p> <p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed</p>	<p>E.g., page 9 (English translation), "It is useful if in addition to this device, <i>a display of the route-specific fuel consumption is provided in a vehicle.</i> Such display devices are known per se; they generally utilize the injection manifold vacuum as a measure of fuel consumption."</p>	

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p>decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i></p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque."</p>		
an upshift notification circuit coupled to said processor subsystem, said upshift	E.g., page 13.7 to 13.9, " <i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i> "	E.g., pages 6 to 7 (English translation), "Looking initially at operating range I remote from full load, <i>the desired output at a lower specific fuel consumption is able to be achieved after upshifting into the next higher gear,</i> at an operating point that lies to the left of operating

<p>collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.”</p> <p>E.g., page 7.8, “In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio.”</p> <p>E.g., page 2.5, “Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors</i>.”</p> <p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p> <p>E.g., page 12.18, “To control the idle speed, the ECU uses inputs from the <i>throttle position sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM,</p>	<p>engine. As a measure thereof, in addition to the <i>throttle valve angle</i> itself, it is also possible to use the <i>induction manifold vacuum</i>. . . . The operating ranges I and II are further delimited by <i>engine speed</i> values <math>n_1</math> or <math>n_2</math>, the first of which usually lies between approximately 20 to 50% of the maximum engine speed, and the second usually lies between approximately 40 and 70% of the maximum engine speed.”</p> <p>E.g., page 8 (English translation), “<i>The engine speed signal is obtained with the aid of known sensor systems</i>, which therefore need not be described in further detail here.”</p> <p>E.g., page 9 (English translation), “It is useful if in addition to this device, a display of the route-specific fuel consumption is provided in a vehicle. Such display devices are known per se; they generally utilize the <i>injection manifold vacuum</i> as a measure of fuel consumption.”</p>	<p>effect, etc.”</p>

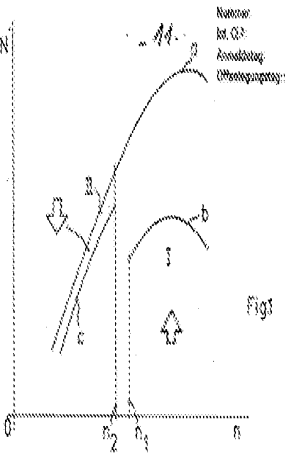

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p>and vehicle speed.”</p> <p>E.g., page 12.21, “The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU.”</p>		
<p>a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, “The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.”</p> <p>E.g., page 22.6, “During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>”</p> <p>E.g., page 13.4, “On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1).”</p> <p>E.g., Figure 13.1:</p>	<p>E.g., pages 7 to 8 (English translation), “<i>The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed <math>n</math> is forwarded</i> and which is developed in such a way that at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present.”</p> <p>E.g., Figure 2:</p> 	<p>E.g., col. 8, lines 29 to 43, “<i>FIGS. 6a, 6b, are a block diagram illustrating the microcomputer 4 and its inputs and outputs described earlier which enable it to continuously monitor the operation of the vehicle</i> and to actuate first a Safety alarm, and then a Collision alarm whenever the vehicle may enter a danger-of-collision situation according to the various preset parameters and automatic parameters introduced into the computer.</p> <p><i>The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm.</i>”</p> <p>E.g., col. 8, lines 58 to 60, “Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12.”</p> <p>E.g., Figure 6A:</p>

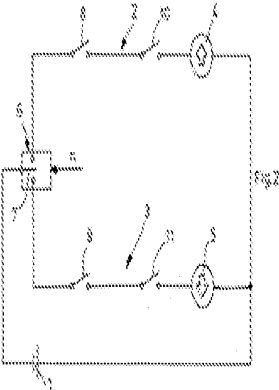

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	 <p>FIGURE 531</p> <p>E.g., page 14.3, “The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor’s signal</i> to within 1/32 m/h.”</p>		 <p>FIG. 6A</p>
<p>a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a</p>	<p>E.g., page 13.5, “The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs.”</p>	<p>E.g., page 6 (English translation), “As can be seen when viewing Figure 1 to begin with, <i>output N of the engine has been plotted across engine speed n.</i>”</p> <p>E.g., page 6 (English translation), “<i>The numerical values of the limits of the two operating ranges I and II are of course dependent on the individual situation.</i> In general, it can be said that these two operating ranges lie in such a way that by shift operations,</p>	<p>E.g., col. 9, lines 20 to 27, “<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>”</p>

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;</p>	<p>E.g., page 12.9, "A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory)."</p>	<p>it is possible to achieve operating points in the output/engine speed diagram that are more favorable in terms of fuel consumption."</p> <p>E.g., page 8 (English translation), "<i>Furthermore, to define the two operating ranges I and II, load-dependent switches 8 and 9 are provided in control circuits 2 and 3 in Figure 2, the first of which is closed only below the line denoted by b in Figure 1, and switch 9 is closed only above the line denoted by c in Figure 1.</i>"</p> <p>E.g., Figure 1:</p> 	<p>E.g., col. 12, line 59 to col 13, line 22, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <i>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</i></p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and</p>

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p>E.g., page 14.2, "Other safety-related items include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals."</p> <p>E.g., pages 22.2 to 22.3, "The most important test points of control units and sensors are tied to a diagnostic connector which is plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . . <i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values</i> with the help of control units and their self-diagnosis, thus detecting faults."</p>		<p>the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164."</p>
<p>a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>"</p> <p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position,</i></p>	<p>E.g., page 9 (English translation), "It is useful if in addition to this device, <i>a display of the route-specific fuel consumption is provided in a vehicle.</i> Such display devices are known per se; they generally utilize the injection manifold vacuum as a measure of fuel consumption."</p>	

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>engine RPM, and vehicle speed.”</i></p> <p>E.g., page 12.14, “Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes.”</p> <p>E.g., page 12.17, “<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a ‘bump’ feel when entering the fuel cutoff mode, due to the change in torque.”</p>		
<p>an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that</p>	<p>E.g., page 13.7 to 13.9, “<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>”</p> <p>E.g., page 13.9, “The basic shift point control uses shift maps, which are defined in data in the unit memory. fuel overinjection circuit and when to activate said downshift notification circuit;	<p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., pages 13.7 to 13.9, "<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>"</p> <p>E.g., page 13.9, "The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed (determined by the transmission output speed).</i>"</p>	<p><i>operating range I.</i>"</p> <p>E.g., pages 7 to 8 (English translation), "The two control circuits 2 and 3 are selectively closed by engine-speed dependent change-over switch 6, to which a signal that corresponds to the individual engine speed <math>n</math> is forwarded and which is developed in such a way that <i>at engine speeds that are greater than predefined engine speed <math>n_1</math> (see Figure 1), its shift lever pivots upwardly in Figure 2, but at engine speeds that are smaller than predefined engine speed <math>n_2</math>, it pivots in the downward direction from a neutral center position</i>, which it therefore assumes when engine speed values between <math>n_1</math> and <math>n_2</math> are present."</p> <p>E.g., page 7 (English translation), "<i>When the operating point lies in operating range II, the device according to the present invention generates a signal that asks the driver to downshift, which is indicated by the downward pointing arrow at operating range II in Figure 1.</i>"</p> <p>E.g., page 9 (English translation), "It is useful if in addition to this device, <i>a display of the route-specific fuel consumption is provided in a vehicle.</i> Such display devices are known per se; they generally utilize the injection manifold vacuum as a measure of fuel consumption."</p>	
a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle	E.g., page 7.6, "[W]heel speed sensing is required for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment		E.g., col. 3, lines 59 to 66, "The anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to <i>actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another</i> , which is equal to or less than a danger-of-collision

Limitation of '781 Patent Claim 26	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>applications. Linear speed sensing can be used to measure the ground speed. This measurement also has the possibly of use in ABS, ASR, and inertial navigation. <i>Similar types of sensors can be used in crash avoidance, proximity, and obstacle detection applications.</i></p> <p>E.g., page 7.23, "Ultrasonics, infrared, laser, and microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas."</p>		<p>distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision."</p> <p>E.g., col. 4, lines 14 to 16, "In the system described below, <i>there are two alarms: a Collision alarm, which is actuated when the vehicle is determined to be within the danger-of-collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor, e.g., 1.25.</i>"</p> <p>E.g., col. 6, lines 25 to 29, "Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and <i>whether or not there is a collision danger (region 46c).</i>"</p> <p>E.g., col. 6, lines 41 to 46, "Control panel 6 further includes a speaker 54 for producing an <i>audio alarm in the event of a collision danger, in addition to the visually-indicated alarms</i> of sections 46c and 48c of the displays 46 and 48."</p> <p>E.g., col. 8, lines 37 to 48, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: <i>... a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...</i>"</p> <p>E.g., Figs. 3 and 6B (ref. no. 46C)</p>
<p>said processor</p>			<p>E.g., col. 8, lines 37 to 43, "The <i>microcomputer</i></p>

Limitation of '781 Patent Claim 26	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
<p>subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p>			<p>4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...</i></p> <p>E.g., col. 12, line 59 to col 13, line 11, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated."</i></p>

Limitation of '781 Patent Claim 26	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
			<p>E.g., col. 13, lines 17 to 22, "<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.</i>"</p>

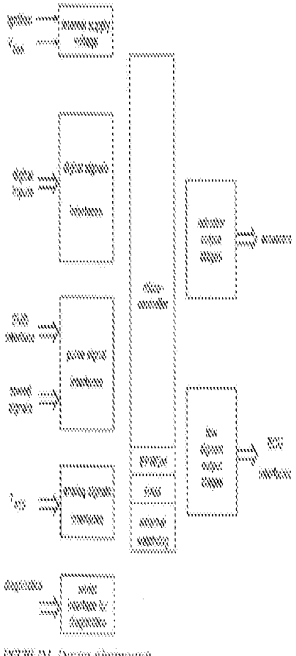

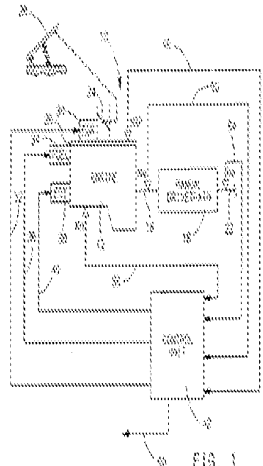

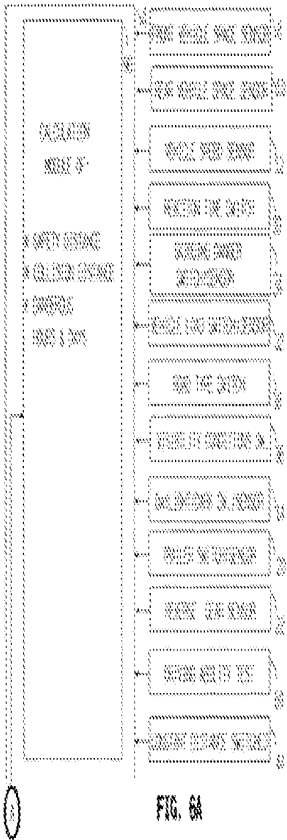

6. Claims 17–21 and 23 are Obvious in View of the Combination of Jurgen, Saturn '452, and Davidian

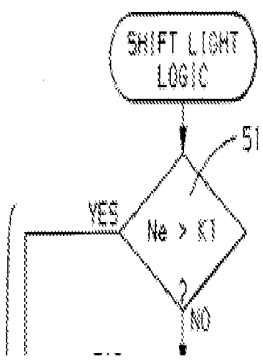

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
<p>17. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, “The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur.”</p>	<p>E.g., Abstract, “<i>A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear</i> from the present gear. <i>A method of determining the shift point</i> is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear.”</p>	<p>E.g., col. 1, lines 1 to 2, “The present invention relates to <i>an anti-collision system for vehicles.</i>”</p>
<p>a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>E.g., page 7.23, “Ultrasonics, infrared, laser, and <i>microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas.</i>”</p>		<p>E.g., col. 4, lines 52 to 66, “<i>Vehicle 2 further includes a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle, a corresponding rear space sensor 10, and a pair of side sensors 11.</i> All the space sensors are in the form of pulse (e.g., ultrasonic) transmitters and receivers, for determining the distance of the vehicle from an object, e.g., another vehicle, at front or rear. Space sensors may also be provided at the sides of the vehicle. Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent</p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
			<p>of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc.”</p> <p>E.g., col. 10, lines 17 to 26, “FIG. 7 is a circuit diagram of the microcomputer 4 and the other components of the electrical system. The microprocessor is indicated by block 100, its power supply by block 102, and its watchdog circuit by block 104. <i>It includes a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 and the rear space sensor 10 for measuring the distance of the vehicle from objects in front of, and to the rear, of the vehicle, respectively.</i>”</p> <p>E.g., col. 10, lines 38 to 50, “As indicated earlier, the distance of the vehicle from an object is determined by the front space sensor 8 with respect to objects in front of the vehicle, and by the rear space sensor 10 with respect to objects at the rear of the vehicle. Each of these space sensors may be of known construction, including a transmitter as indicated at 106 in FIG. 7, and a receiver as indicated at 108. <i>Thus, pulses are continuously transmitted by each transmitter, and the echoes from the objects in front of or to the rear of the vehicle are received by the respective receiver. The computer then measures the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.</i>”</p>
at least one sensor coupled to said vehicle	E.g., page 7.6, “There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed.</i> This	E.g., col. 1, lines 31 to 33, “Conventional shift indicator calibration typically involves setting <i>manifold pressure</i> (MAP) thresholds at a variety of	E.g., col. 4, lines 60 to 66, “Vehicle 2 is further equipped with a <i>speed sensor 12 which may sense the speed of the vehicle in any known</i>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
<p>for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;</p>	<p>information is used for transmission control, engine control, cruise control, and possibly for a tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <b>wheel speed sensing is required</b> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.”</p> <p>E.g., page 7.8, “In electronic transmission applications, <b>information from the road and engine speed sensors</b>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio.”</p> <p>E.g., page 2.5, “Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <b>manifold absolute pressure (MAP) sensors</b>.”</p> <p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <b>The speed-density system that uses the MAP sensor</b> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p>	<p>speeds.”</p> <p>E.g., col. 2, lines 13 to 18, “Referring to FIG. 1, the reference numeral 10 generally designates a motor vehicle drivetrain comprising a spark ignition <b>internal combustion engine (engine)</b> 12, engine output shaft 10 and the combination of conventional manual clutch, gearbox and final drive assembly (manual drivetrain) 16.”</p> <p>E.g., col. 2, lines 42 to 44, “Control unit 42 receives inputs required by the present embodiment including <b>manifold absolute pressure (MAP)</b>, on line 46, <b>engine speed (Ne)</b> on line 50 and output speed (No) on line 54.”</p> <p>E.g., col. 7, lines 13 to 21, “Throttle position “%T” is checked at block 515 against a closed position threshold K3. Closed throttle is indicative of vehicle coast, a state of operation wherein the engine is not imparting torque to the drive wheels and thus does not necessitate an upshift. Closed throttle may also be indicative of the operator purposefully using the drivetrain to decelerate the vehicle. <b>Therefore, where a closed throttle is detected</b>, control bypasses the upshift threshold steps 530 and proceeds with execution of block 552.”</p> <p>E.g., FIG. 1:</p>	<p><b>manner</b>, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc.”</p>

<p>fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i></p> <p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>"</p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount</p>		

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
	<p>of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque."</p>		
<p>an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;</p>	<p>E.g., page 13.7 to 13.9, "<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>"</p> <p>E.g., page 13.9, "The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application</i> and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. <i>The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed</i> (determined by the transmission output speed)."</p> <p>E.g., page 13.14, "In addition to these functions, <i>different shift maps can be implemented into the data field of the TCU [Transmission Control Unit]</i>. For example, it is possible to have one shift map for low fuel consumption, which has shift points in the range of the best efficiency of the engine, and additionally to have another map for power operation, where the shift points are placed at points of highest engine output power."</p>	<p>E.g., Abstract, "<i>A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear</i> from the present gear. <i>A method of determining the shift point</i> is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear."</p> <p>E.g., col. 1, lines 10 to 13, "Shift indicators are commonly used on manual transmission vehicles <i>to assist non-expert drivers in determining when it is appropriate to shift the transmission to a higher gear</i> in order to maximize driving fuel economy."</p> <p>E.g., col. 2, lines 42 to 55, "Control unit 42 receives inputs required by the present embodiment including manifold absolute pressure (MAP), on line 46, engine speed (Ne) on line 50 and output speed (No) on line 54. Knock sensing means Kn are also shown providing signal input via line 56 to control unit 42. <i>Control unit 42 indicates via line 60 the state of an upshift indicator light or equivalent visual display such as is found in conventional instrumentation in a motor vehicle. Line 60 may provide a logic signal to an instrument cluster for further processing or may drive a lamp directly via a power driver in control unit 42.</i> Control unit 42 may be mechanized with a conventional state of the art microcomputer controller including a central processing unit, memory and input-output devices."</p>	

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
		<p>E.g., col. 3, lines 60 to 65, "Finally, <i>control unit 42 outputs a signal online [sic] 60 as shown in FIG. 1 for indicating the state of the upshift indicator light</i> as well as various other output signals for instrument cluster displays such as vehicle speedometer, oil pressure and coolant temperature for example."</p>	
<p>said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.</p>	<p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>"</p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 13.7 to 13.9, "<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>"</p> <p>E.g., page 13.9, "The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made</i>, on the one hand, by the highest admissible engine speed for each application and, on the other hand, <i>by the</i></p>	<p>E.g., col. 2, lines 42 to 55, "Control unit 42 receives inputs required by the present embodiment including manifold absolute pressure (MAP), on line 46, engine speed (Ne) on line 50 and output speed (No) on line 54. Knock sensing means Kn are also shown providing signal input via line 56 to control unit 42. <i>Control unit 42 indicates via line 60 the state of an upshift indicator light or equivalent visual display such as is found in conventional instrumentation in a motor vehicle. Line 60 may provide a logic signal to an instrument cluster for further processing or may drive a lamp directly via a power driver in control unit 42.</i> Control unit 42 may be mechanized with a conventional state of the art microcomputer controller including a central processing unit, memory and input-output devices."</p> <p>E.g., col. 3, lines 60 to 65, "Finally, <i>control unit 42 outputs a signal online [sic] 60 as shown in FIG. 1 for indicating the state of the upshift indicator light</i> as well as various other output signals for instrument cluster displays such as vehicle speedometer, oil pressure and coolant temperature for example."</p> <p>E.g., FIG. 1:</p>	<p>E.g., col. 8, lines 37 to 43, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...</i>"</p> <p>E.g., col. 12, line 59 to col 13, line 11, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision</i></p>

Limitation of '781 Patent Claim 17	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed (determined by the transmission output speed)."</i></p>		<p><i>distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated."</i></p> <p>E.g., col. 13, lines 17 to 22, "<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164."</i></p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein:	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.
said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and			<p>E.g., col. 4, line 67 to col. 5, line 2, "The automatic sensors on vehicle 2 further include a daylight sensor 14, <i>a rain sensor 16</i>, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22."</p> <p>E.g., col. 8, lines 58 to 63, "Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12. <i>Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.</i>"</p>
said memory subsystem further storing a second vehicle speed/stopping distance table.			<p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>"</p> <p>E.g., col. 12, line 59 to col 13, line 22, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <i>In the illustrated example, the stopping distance is the sum of the</i></p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
			<p><i>reaction distance and the braking distance.</i> The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and <i>the braking distance is the product of the braking distance (as supplied by the manufacturer),</i> road type, <i>skidding danger,</i> vehicle load and braking factor. The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.”</p>

Limitation of '781 Patent Claim 19	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
19. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.
a throttle controller for controlling a throttle of said engine of said vehicle; and	E.g., page 14.4, "When the error signal has been computed, <i>an output signal to the servo actuators is generated to increase, hold, or decrease the throttle position.</i> . . . Throttle positioning is traditionally either a vacuum type servo or motor."		E.g., col. 2, line 67 to col. 3, line 2, "According to a further feature, the system includes an actuator for actuating a mechanical system of the vehicle, e.g., <i>the brakes of a train</i> , or steering of an aircraft, at the time the collision alarm is actuated."
said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.			<p>E.g., col. 2, line 67 to col. 3, line 2, "According to a further feature, the system includes an actuator for actuating a mechanical system of the vehicle, e.g., <i>the brakes of a train</i>, or steering of an aircraft, at the time the collision alarm is actuated."</p> <p>E.g., col. 8, lines 37 to 43, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...</i>"</p> <p>E.g., col. 12, line 59 to col 13, line 11, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. Limitation of '781 Patent Claim 19	Automotive Electronics Handbook (Jürgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
			<p>reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated."</i></p> <p>E.g., col. 13, lines 17 to 22, "<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.</i>"</p>

Limitation of '781 Patent Claim 20	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)
20. Apparatus for optimizing operation of a vehicle according to claim 19 wherein	See claim 19 claim chart, at page A-167.	See claim 19 claim chart, at page A-167.	See claim 19 claim chart, at page A-167.
said at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.	E.g., pages 7.21 to 22, "In antilock brake systems, speed sensors are attached to all wheels to determine wheel rotation speed and slip differential between wheels . . . <b><i>Brake pedal position and brake fluid pressure information are also required for control.</i></b> "		E.g., col. 6, lines 25 to 34, "Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and whether or not there is a collision danger (region 46c). A similar display, shown at 48 and having regions 48a, 48b and 48c, is provided with respect to the rear of the vehicle equipped with the system, whether a rear collision danger exists, and <b><i>the status of the rear brake light.</i></b> "  E.g., col. 8, lines 37 to 57, "The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: . . . a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, <b><i>the brake light actuator 26 and (e.g., in the case of a train) the vehicle brakes automatically;</i></b> a black box module 94, which controls the information recorded into and read out of the black box 28; and a driving ability test module 95, involved in the driving ability test 60 in the control panel of FIG. 2, or 80 in the control panel of FIG. 5. The operation of each of these modules (except the clock 91) is described more particularly below with reference to the flow charts of FIGS. 9-14."

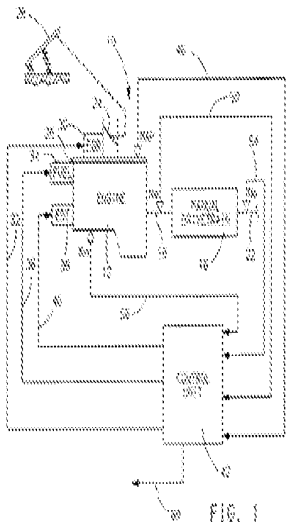

Limitation of '781 Patent Claim 21	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
21. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:	See claim 19 claim chart, at page A-167.	See claim 19 claim chart, at page A-167.	See claim 19 claim chart, at page A-167.
means for counting a total number of vehicle proximity alarms determined by said processor subsystem;			<p>E.g., col. 11, lines 7 to 11, "ALSF Alarm stopping front counter; ALSR Alarm stopping rear counter; ALCF Alarm collision front counter; ALCR Alarm collision rear counter."</p> <p>E.g., col. 11, lines 60 to 68, "The ALSF and ALSR counters, the ALCF and ALCR counters, and the ALFA and ALRA accumulators in the above table, and referred to in the flow charts below, would be provided in the black box 28 which records all the incidents in which the safety alarm and collision alarm were actuated, including the time, vehicle speed and vehicle distance for each alarm incident."</p> <p>E.g., col. 14, lines 8 to 12, "Whenever the measured distance is equal to or less than the stopping distance (block 225), the system increments the alarm stopping front counter (block 228), records the time, distance and speed in the black box, and also actuates the safety alarm (block 229)."</p>
means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.			<p>E.g., col. 2, line 67 to col. 3, line 2, "According to a further feature, the system includes an actuator for actuating a mechanical system of the vehicle, e.g., <i>the brakes of a train</i>, or steering of an aircraft, at the time the collision alarm is actuated."</p> <p>E.g., col. 8, lines 37 to 43, "The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...</i>"</p>

Limitation of '781 Patent Claim 21	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
			<p>E.g., col. 12, line 59 to col 13, line 11, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated."</i></p> <p>E.g., col. 13, lines 17 to 22, "<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.</i>"</p>

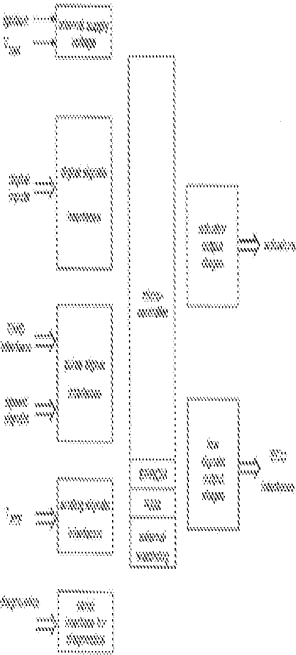

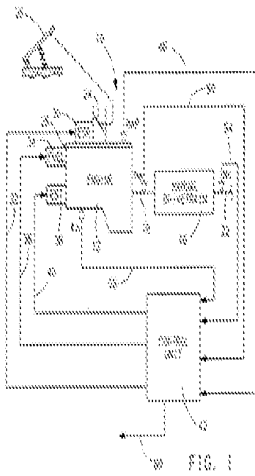

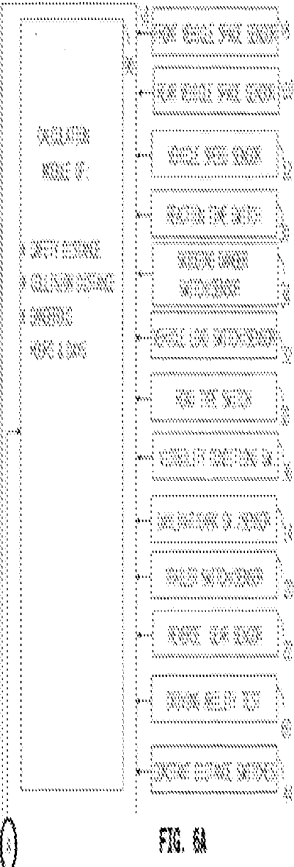

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
<p>23. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., page 12.1, "The electronic engine control system consists of sensing devices which continuously measure the operating conditions of the engine, <i>an electronic control unit (ECU) which evaluates the sensor inputs using data tables and calculations and determines the output to the actuating devices</i>, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.</p> <p>The motive for using an electronic engine control system is to provide the needed accuracy and adaptability in order to minimize exhaust emissions and fuel consumption, <i>provide optimal driveability for all operating conditions</i>, minimize evaporative emissions, and provide system diagnosis when malfunctions occur."</p>	<p>E.g., Abstract, "<i>A motor vehicle has a manual transmission and means for indicating to the operator a point in operation for upshifting to the next higher gear</i> from the present gear. <i>A method of determining the shift point</i> is provided based upon actual operating parameters of the motor vehicle effecting current wheel torque and predicted wheel torque in the next higher gear."</p>	<p>E.g., col. 1, lines 1 to 2, "The present invention relates to <i>an anti-collision system for vehicles.</i>"</p>
<p>a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>E.g., page 7.23, "Ultrasonics, infrared, laser, and <i>microwaves (radar) can be used in the detection of objects behind vehicles and in the blind areas.</i>"</p>		<p>E.g., col. 4, lines 52 to 66, "<i>Vehicle 2 further includes a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle, a corresponding rear space sensor 10, and a pair of side sensors 11.</i> All the space sensors are in the form of pulse (e.g., ultrasonic) transmitters and receivers, for determining the distance of the vehicle from an object, e.g., another vehicle, at front or rear. Space sensors may also be provided at the sides of the vehicle. Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by</p>

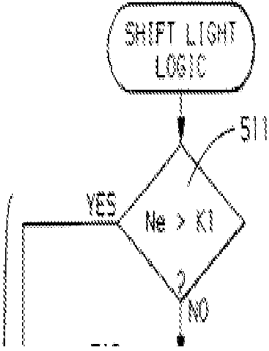

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
			<p>calculations based on the Doppler effect, etc.”</p> <p>E.g., col. 10, lines 17 to 26, “FIG. 7 is a circuit diagram of the microcomputer 4 and the other components of the electrical system. The microprocessor is indicated by block 100, its power supply by block 102, and its watchdog circuit by block 104. <i>It includes a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 and the rear space sensor 10 for measuring the distance of the vehicle from objects in front of, and to the rear, of the vehicle, respectively.</i>”</p> <p>E.g., col. 10, lines 38 to 50, “As indicated earlier, the distance of the vehicle from an object is determined by the front space sensor 8 with respect to objects in front of the vehicle, and by the rear space sensor 10 with respect to objects at the rear of the vehicle. Each of these space sensors may be of known construction, including a transmitter as indicated at 106 in FIG. 7, and a receiver as indicated at 108. <i>Thus, pulses are continuously transmitted by each transmitter, and the echoes from the objects in front of or to the rear of the vehicle are received by the respective receiver. The computer then measures the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.</i>”</p>
a plurality of sensors coupled to a vehicle having an engine, said	E.g., page 7.6, “There are several applications for rotational speed sensing. <i>First it is necessary to monitor engine speed.</i> This information is used for transmission control, engine control, cruise control, and possibly for a	E.g., col. 1, lines 31 to 33, “Conventional shift indicator calibration typically involves setting <i>manifold pressure</i> (MAP) thresholds at a variety of speeds.”	E.g., col. 4, lines 60 to 66, “Vehicle 2 is further equipped with a <i>speed sensor 12 which may sense the speed of the vehicle in any known manner</i> , for example using the speed measuring system of the vehicle itself, or a speed measuring

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
<p>plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;</p>	<p>tachometer. Electronics and electronic sensing in the automobile were brought about by the need for higher efficiency engines, better fuel economy, increased power and performance, and lower emissions. Second, <i>wheel speed sensing is required</i> for use in transmissions, cruise control, speedometers, antilock brake systems (ABS), traction control (ASR), variable ratio power steering assist, four-wheel steering, and possibly in inertial navigation and air bag deployment applications.”</p> <p>E.g., page 7.8, “In electronic transmission applications, <i>information from the road and engine speed sensors</i>, as well as torque data and throttle position are required for the MCU to select the optimum gear ratio.”</p> <p>E.g., page 2.5, “Automotive specification and testing guidelines have been developed and published by the Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors</i>.”</p> <p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p> <p>E.g., page 12.18, “To control the idle speed, the ECU uses inputs from the <i>throttle position</i></p>	<p>E.g., col. 2, lines 13 to 18, “Referring to FIG. 1, the reference numeral 10 generally designates a motor vehicle drivetrain comprising a spark ignition <i>internal combustion engine (engine)</i> 12, engine output shaft 10 and the combination of conventional manual clutch, gearbox and final drive assembly (manual drivetrain) 16.”</p> <p>E.g., col. 2, lines 42 to 44, “Control unit 42 receives inputs required by the present embodiment including <i>manifold absolute pressure (MAP)</i>, on line 46, <i>engine speed (Ne)</i> on line 50 and output speed (No) on line 54.”</p> <p>E.g., col. 7, lines 13 to 21, “Throttle position “%T” is checked at block 515 against a closed position threshold K3. Closed throttle is indicative of vehicle coast, a state of operation wherein the engine is not imparting torque to the drive wheels and thus does not necessitate an upshift. Closed throttle may also be indicative of the operator purposefully using the drivetrain to decelerate the vehicle. <i>Therefore, where a closed throttle is detected</i>, control bypasses the upshift threshold steps 530 and proceeds with execution of block 552.”</p> <p>E.g., FIG. 1:</p>	<p>system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc.”</p>

Limitation of '781 Patent Claim 23	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed.”</p> <p>E.g., page 12.21, “The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU.”</p>		
<p>a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, “The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.”</p> <p>E.g., page 22.6, “During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to.</i>”</p> <p>E.g., page 13.4, “On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and monitoring and safety circuits (Fig. 13.1).”</p>	<p>E.g., col. 2, lines 42 to 46, “<i>Control unit 42 receives inputs</i> required by the present embodiment including manifold absolute pressure (MAP), on line 46, engine speed (Ne) on line 50 and output speed (No) on line 54. Limitation of '781 Patent Claim 29	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,121,324 (Mack '324)
29. Apparatus according to claim 28 and further comprising:	See claim 28 claim chart, at page A-200.	See claim 28 claim chart, at page A-200.
a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;	<p>E.g., page 13.5, "The calculators inside the control units are usually microcontrollers. . . . <b>The memory devices for program and data are usually EPROMS.</b> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs."</p> <p>E.g., page 12.9, "A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <b>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</b> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <b>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</b> Only if power to the electronic control unit is disrupted (i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory)."</p> <p>E.g., page 14.2, "Other safety-related items include <b>program code to</b></p>	<p>E.g., col. 2, line 45 to col. 3, line 11, "The vehicle management and control module 100 is composed of a microprocessor 1001, a random access memory 1005, and an EPROM 1003, and an EEPROM 1004. The inputs to the microprocessor 1001 comprise a number of pulse width modulated (PWM) inputs 1007, a plurality of digital data inputs 1009, and a plurality of analog inputs 1011. The pulse inputs include a pulse signal from an mph sensor which is mounted near the vehicle's transmission output shaft so as to provide an electrical pulse each time one of the teeth of a tone wheel mounted on the transmission output shaft passes the tip of the sensor. The frequency of the mph sensor output pulses is proportional to the rotational velocity of the transmission output shaft. The road speed of the vehicle can thus be calculated by factoring the number of teeth on the tone wheel, the gear ratio between the transmission output shaft and the vehicle axle shaft, and the rolling circumference of the drive axle tires. These data values can be programmed into the module memory for each specific type of vehicle in which the system is installed. The timing event sensor is mounted proximate the fuel injection pump camshaft of the vehicle engine and generates a pulse when the fuel injection pump camshaft attains an angular position corresponding to port closure or beginning of fuel injection for a predetermined plunger of the injection pump. The engine position sensor is mounted proximate the engine crankshaft and generates a pulse when the crankshaft attains an angular position related to top dead center (TDC) of the corresponding piston of the cylinder to which the plunger is coupled, on its power stroke. The data line 20 is a pulse width modulation signal line which communicates engine speed and fuel quantity data to the microprocessor 1001 from the fuel injection control module 200."</p>

	<p>Society of Automotive Engineers (SAE) specifically for <i>manifold absolute pressure (MAP) sensors</i>.”</p> <p>E.g., page 2.7, “Manifold absolute pressure (MAP) is used as an input to fuel and ignition control in internal combustion engine control systems. <i>The speed-density system that uses the MAP sensor</i> has been preferred over mass air flow (MAF) control because it's less expensive, but stricter emission standards are causing more manufacturers to use mass air flow for future models.”</p> <p>E.g., page 12.18, “To control the idle speed, the ECU uses inputs from the <i>throttle position sensor</i>, air conditioning, automatic transmission, power steering, charging system, engine RPM, and vehicle speed.”</p> <p>E.g., page 12.21, “The electronic injection unit also houses the <i>throttle position sensor</i> and, in some cases, an inlet air temperature sensor which provides operating condition information to the ECU.”</p>	<p>vacuum trigger level which increases with increasing vehicle speed, a speed transducer 32 is provided which generates a series of voltage pulses having a frequency progressively increasing with increasing vehicle speed. The speed transducer 32 may take the form of a slotted disc rotated by a vehicle wheel adjacent a magnetic pickup whose output is a series of voltage pulses having the frequency related to vehicle speed. These voltage pulses are supplied to a frequency-to-voltage converter 34 whose output is a voltage having a magnitude progressively increasing with increasing vehicle speed. The output of the frequency-to-voltage converter 34 is coupled to the positive input of the summing switch 14 through a resistor 35. The resulting current supplied by the frequency-to-voltage converter 34, hereinafter referred to as the speed signal, has a magnitude progressively increasing with increasing vehicle speed.”</p> <p>E.g., FIG. 1</p>
<p>a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>E.g., page 12.1, “The electronic engine control system consists of <i>sensing devices which continuously measure the operating conditions of the engine, an electronic control unit (ECU) which evaluates the sensor inputs</i> using data tables and calculations and determines the output to the actuating devices, and actuating devices which are commanded by the ECU to perform an action in response to the sensor inputs.”</p> <p>E.g., page 22.6, “During the entire operating time of the vehicle, <i>the ECUs are constantly supervising the sensors they are connected to</i>.”</p> <p>E.g., page 13.4, “On the functional side, the hardware configuration can be divided into power supply, input signal transfer circuits, output stages, and <i>microcontroller</i>, including peripheral components and</p>	<p>E.g., FIG. 1</p> <p>E.g., col. 2, lines 52 to 58, “By conventional circuit design techniques, the magnitude of the speed signal may be made to equal the difference between the magnitude of the reference signal and the magnitude of the vacuum signal when the manifold vacuum is at the level determined to represent excessive fuel consumption at the instantaneous speed represented by the output of the speed transducer 32.”</p>

Limitation of '781 Patent Claim 28	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
	<p>monitoring and safety circuits (Fig. 13.1)."</p> <p>E.g., Figure 13.1:</p>  <p>E.g., page 14.3, "The speed sensor is one of the most critical parts in the system, because the <i>microcontroller calculates the vehicle speed from the speed sensor's signal</i> to within 1/32 m/h."</p>	
<p>a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p>E.g., page 12.22, "During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>"</p> <p>E.g., page 12.4, "During coasting and braking, fuel</p>	<p>E.g., col. 2, lines 10 to 15, "The lamp 30 may be located at the vehicle instrument panel or any other location where it is readily observable by the vehicle operator. Alternatively, the lamp 30 may be replaced with a buzzer to provide an audible indication."</p> <p>E.g., col. 2, lines 52 to 58, "By conventional circuit design techniques, the magnitude of the speed signal may be made to equal the difference between the magnitude of the reference signal and the magnitude of the vacuum</p>

Limitation of '781 Patent Claim 28	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
	<p>consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i></p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<i>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. The fuel is then shut off.</i> During the transition, the throttle bypass valve or the main throttle valve may remain open for a short period to allow fresh air to oxidize the remaining unburned HC and CO to further reduce exhaust emissions. During development of the fuel cutoff strategy, the advantage of reduced emission effects and catalyst temperature control must be balanced against driveability requirements. The use of fuel cutoff may change the perceived amount of engine braking felt by the driver. In addition, care must be taken to avoid a 'bump' feel when entering the fuel cutoff mode, due to the change in torque."</p>	<p>signal when the manifold vacuum is at the level determined to represent excessive fuel consumption at the instantaneous speed represented by the output of the speed transducer 32."</p> <p>E.g., col. 3, lines 20 to 27, "When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide an indication of fuel consumption in excess of the predetermined amount at that speed."</p>
<p>said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.</p>	<p>E.g., page 12.4, "During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i></p> <p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel</p>	<p>E.g., col. 2, lines 52 to 58, "By conventional circuit design techniques, the magnitude of the speed signal may be made to equal the difference between the magnitude of the reference signal and the magnitude of the vacuum signal when the manifold vacuum is at the level determined to represent excessive fuel consumption at the instantaneous speed represented by the output of the speed transducer 32."</p> <p>E.g., col. 2, lines 59 to 64, "By combining the speed</p>

Limitation of '781 Patent Claim 28	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
	<p>cutoff. <i>When the maximum speed is achieved, the fuel injectors are shut off.</i> When the speed decreases below the threshold, fuel injection resumes.”</p> <p>E.g., pages 13.7 to 13.9, “<i>The basic functions of the transmission control are the shift point control, the lockup control, engine torque control during shifting, related safety functions, and diagnostic functions for vehicle service.</i>”</p> <p>E.g., page 13.9, “The basic shift point control uses shift maps, which are defined in data in the unit memory. These shift maps are selectable over a wide range. <i>The shift point limitations are made, on the one hand, by the highest admissible engine speed for each application and, on the other hand, by the lowest engine speed that is practical for driving comfort and noise emission. The inputs of the shift point determination are the throttle position, the accelerator pedal position, and the vehicle speed (determined by the transmission output speed).</i>”</p>	<p>signal in proper sense with the reference signal, the manifold vacuum level at which the output of the summing switch 14 swings positive to effect energization of the lamp 30, herein referred to as the manifold vacuum trigger level, may be increased as a function of vehicle speed.”</p> <p>E.g., col. 3, lines 20 to 27, “When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide an indication of fuel consumption in excess of the predetermined amount at that speed.”</p>

Limitation of '781 Patent Claim 29	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
29. Apparatus according to claim 28 and further comprising:	See claim 28 claim chart, at page A-213.	See claim 28 claim chart, at page A-213.
a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;	<p>E.g., page 13.5, "The calculators inside the control units are usually microcontrollers. . . . <i>The memory devices for program and data are usually EPROMS.</i> Their storage capacity is, in present applications, up to 64 Kbytes. Future applications will necessitate storage sizes up to 128 Kbytes. The failure storages for diagnostics and the storage for adaptive data are in conventional applications, battery voltage-supplied RAMs. These are increasingly being replaced by EEPROMs."</p> <p>E.g., page 12.9, "A subsystem of the fuel control system is lambda closed-loop control. . . .</p> <p>[T]he engine control unit uses an anticipatory control strategy that uses engine load and RPM to determine the approximate fuel requirement. <i>The engine load information is provided by the manifold pressure sensor for speed density systems and by the air meter for air flow and air mass measurement systems and by the throttle valve position sensor. The engine control unit contains data tables for combinations of load and RPM.</i> This allows for rapid response to changes in operating conditions. The lambda sensor still provides the feedback correction for each load/RPM point. . . .</p> <p>[T]he electronic control unit has a feature for adapting changes in the fuel required for the load/RPM points. <i>At each load/RPM point, the lambda sensor continuously provides information that allows the system to adjust the fuel to the commanded A/F ratio. The corrected information is stored in RAM (random access memory) so that the next time the engine reaches that operating point (load/RPM), the anticipatory value will require less correction. These values remain stored in the electronic control unit even after the engine is shut off.</i> Only if power to the electronic control unit is disrupted</p>	<p>E.g., FIG. 1</p> <p>E.g., col. 2, lines 52 to 58, "By conventional circuit design techniques, the magnitude of the speed signal may be made to equal the difference between the magnitude of the reference signal and the magnitude of the vacuum signal when the manifold vacuum is at the level determined to represent excessive fuel consumption at the instantaneous speed represented by the output of the speed transducer 32."</p> <p>E.g., col. 3, lines 20 to 27, "When the vehicle is operated in a manner such that the manifold vacuum decreases below the manifold vacuum trigger level established at the instantaneous vehicle speed, the output of the summing switch 14 swings positive to effect energization of the lamp 30 to provide an indication of fuel consumption in excess of the predetermined amount at that speed."</p>

Limitation of '781 Patent Claim 29	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
	<p>(i.e., due to a dead battery), will the correction be lost. In that case, the electronic control unit will revert back to the original production values that are written in ROM (read-only memory).”</p> <p>E.g., page 14.2, “Other safety-related items include <i>program code to detect abnormal operating conditions and preserving into memory the data points associated with the abnormal condition for later diagnostics.</i> Abnormal conditions, for example, could be an intermittent vehicle speed sensor, or erratic driver switch signals.”</p> <p>E.g., pages 22.2 to 22.3, “The most important test points of control units and sensors are tied to a diagnostic connector which is plugged into the measuring instrument with a corresponding adapter for the respective vehicle. . . . <i>Modern electronics in vehicles support diagnosis by comparing the registered actual value with the internally stored nominal values</i> with the help of control units and their self-diagnosis, thus detecting faults.”</p>	
<p>said processor subsystem activating said fuel overinjection notification circuit upon determining that:</p>	<p>E.g., page 12.22, “During an acceleration transition, the ECU adds a correction factor (an increase) to the commanded injector pulse width. The sudden increase in air results in a lean mixture which must be corrected swiftly to obtain good transitional response. <i>During a deceleration transition, the fuel can be shut off by simply not providing a pulse width signal to the injector to minimize exhaust emissions and fuel consumption.</i>”</p> <p>E.g., page 12.4, “During coasting and braking, fuel consumption can be further reduced by shutting off the fuel until the engine speed decreases to slightly higher than the set idle speed. <i>The ECU determines when fuel shutoff can occur by evaluating the throttle position, engine RPM, and vehicle speed.</i>”</p>	<p>E.g., col. 2, lines 52 to 58, “By conventional circuit design techniques, the magnitude of the speed signal may be made to equal the difference between the magnitude of the reference signal and the magnitude of the vacuum signal when the manifold vacuum is at the level determined to represent excessive fuel consumption at the instantaneous speed represented by the output of the speed transducer 32.”</p> <p>E.g., col. 2, lines 59 to 64, “By combining the speed signal in proper sense with the reference signal, the manifold vacuum level at which the output of the summing switch 14 swings positive to effect energization of the lamp 30, herein referred to as the manifold vacuum trigger level, may be increased as a function of vehicle speed.”</p>

Limitation of '781 Patent Claim 29	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 3,925,753 (GM '753)
	<p>E.g., page 12.14, "Using the inputs of engine RPM and vehicle speed to the electronic control unit, thresholds can be established for limiting these variables with fuel cutoff. <b>When the maximum speed is achieved, the fuel injectors are shut off.</b> When the speed decreases below the threshold, fuel injection resumes."</p> <p>E.g., page 12.17, "<b>During transition to fuel cutoff, the ignition timing is retarded from its current setting to reduce engine torque and to assist in engine braking. 10. Claim 31 is Anticipated by Davidian

Limitation of '781 Patent Claim 31	U.S. Patent No. 5,357,438 (Davidian)
31. Apparatus for optimizing operation of a vehicle, comprising:	E.g., col. 1, lines 1 to 2, "The present invention relates to <i>an anti-collision system for vehicles.</i> "
a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;	<p>E.g., col. 4, lines 52 to 66, "<i>Vehicle 2 further includes a front space sensor 8 for sensing the space in front of the vehicle, such as the presence of another vehicle, a corresponding rear space sensor 10, and a pair of side sensors 11.</i> All the space sensors are in the form of pulse (e.g., ultrasonic) transmitters and receivers, for determining the distance of the vehicle from an object, e.g., another vehicle, at front or rear. Space sensors may also be provided at the sides of the vehicle. Vehicle 2 is further equipped with a speed sensor 12 which may sense the speed of the vehicle in any known manner, for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect, etc."</p> <p>E.g., col. 10, lines 17 to 26, "FIG. 7 is a circuit diagram of the microcomputer 4 and the other components of the electrical system. The microprocessor is indicated by block 100, its power supply by block 102, and its watchdog circuit by block 104. <i>It includes a transmitter 106 and a receiver 108 for transmitting and receiving the pulses (e.g., RF, ultrasound, laser, IR, etc.) in the front space sensor 8 and the rear space sensor 10 for measuring the distance of the vehicle from objects in front of, and to the rear, of the vehicle, respectively.</i>"</p> <p>E.g., col. 10, lines 38 to 50, "As indicated earlier, the distance of the vehicle from an object is determined by the front space sensor 8 with respect to objects in front of the vehicle, and by the rear space sensor 10 with respect to objects at the rear of the vehicle. Each of these space sensors may be of known construction, including a transmitter as indicated at 106 in FIG. 7, and a receiver as indicated at 108. <i>Thus, pulses are continuously transmitted by each transmitter, and the echoes from the objects in front of or to the rear of the vehicle are received by the respective receiver. The computer then measures the round-trip time from the pulse transmission to the echo reception in order to determine the distance of the vehicle from the object.</i>"</p>
at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor;	E.g., col. 4, lines 60 to 66, "Vehicle 2 is further equipped with <i>a speed sensor 12 which may sense the speed of the vehicle in any known manner,</i> for example using the speed measuring system of the vehicle itself, or a speed measuring system independent of the vehicle, e.g., an acceleration sensor, or by calculations based on the Doppler effect,

Limitation of '781 Patent Claim 31	U.S. Patent No. 5,357,438 (Davidian)
	etc.”
<p>a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;</p>	<p>E.g., col. 8, lines 29 to 43, “<i>FIGS. 6a, 6b, are a block diagram illustrating the microcomputer 4 and its inputs and outputs described earlier which enable it to continuously monitor the operation of the vehicle</i> and to actuate first a Safety alarm, and then a Collision alarm whenever the vehicle may enter a danger-of-collision situation according to the various preset parameters and automatic parameters introduced into the computer.</p> <p><i>The microcomputer 4 as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm.”</p> <p>E.g., col. 8, lines 58 to 60, “Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12.”</p> <p>E.g., Figure 6A:</p>

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

E.g., col. 9, lines 20 to 27, “Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.”

E.g., col. 12, line 59 to col 13, line 22, “The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as

Limitation of '781 Patent Claim 31	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</i></p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.”</p>
<p>a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>E.g., col. 3, lines 59 to 66, “The anti-collision system illustrated in FIGS. 1-14 is particularly useful for motor vehicles (passengers cars, buses, trucks) in order to <i>actuate an alarm when the vehicle is travelling at a distance behind another vehicle or in front of another</i>, which is equal to or less than a danger-of-collision distance computed by a computer such that if the front vehicle stops suddenly there is a danger of a rear-end collision.”</p> <p>E.g., col. 4, lines 14 to 16, “In the system described below, <i>there are two alarms: a Collision alarm, which is actuated when the vehicle is determined to be within the danger-of-collision distance; and a Safety alarm, which is actuated before the Collision alarm, at a distance greater than the danger-of-collision distance by a predetermined safety factor</i>, e.g., 1.25.”</p> <p>E.g., col. 6, lines 25 to 29, “Control panel 6 further includes a front distance display 46, in which are displayed the distance to the front vehicle (in region 46a), in which direction (by arrow 46b), and <i>whether or not there is a collision danger (region 46c).</i>”</p> <p>E.g., col. 6, lines 41 to 46, “Control panel 6 further includes a speaker 54 for producing an <i>audio alarm in the event of a collision danger, in addition to the visually-indicated</i></p>

Limitation of '781 Patent Claim 31	U.S. Patent No. 5,357,438 (Davidian)
	<p><i>alarms</i> of sections 46c and 48c of the displays 46 and 48.”</p> <p>E.g., col. 8, lines 37 to 48, “The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows:  <i>... a deceleration alarm module 93, which controls the Safety alarm and Collision alarm on the control panel, ...</i>”</p> <p>E.g., Figs. 3 and 6B (ref. no. 46C)</p>
<p>said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.</p>	<p>E.g., col. 8, lines 37 to 43, “The <i>microcomputer 4</i> as illustrated in FIGS. 6a, 6b is divided into various functional modules, as follows: a calculation module 90, <i>which receives data concerning the various parameters briefly described above</i> and as will be described more particularly below <i>to enable it to make the necessary computations for actuating the Safety alarm and the Collision alarm; ...</i>”</p> <p>E.g., col. 12, line 59 to col 13, line 11, “The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance. The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor. <i>The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</i></p> <p><i>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.”</i></p> <p>E.g., col. 13, lines 17 to 22, “<i>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.</i>”</p>

**11. Claims 31 and 32 are Obvious in View of the Combination of Tonkin and Doi et al.**

Limitation of '781 Patent Claim 31	PCT Publication No. WO 96/02853 (Tonkin)	U.S. Patent No. 5,708,584 (Doi et al.)
<p>31. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>E.g., Abstract, “The system comprising a controller fitted to a subject vehicle (16) and sensor means (20) operable to sense a distance of separation and relative velocity of a trailing vehicle (18). Also input to the controller is a velocity signal derived from a velocity sensing means (97) determining the ground speed of the subject vehicle using a doppler radar system. The controller calculates a safety envelope and activates a visible warning device attached to the rear of the subject vehicle if the trailing vehicle penetrates the safety envelope. An enhanced safety envelope determined by adverse road conditions is also established, any incursion into the enhanced envelope resulting generally in the visible warning being at a less prominent level. If however the closing speed of the trailing vehicle exceeds a predetermined threshold, penetration of the enhanced envelope results immediately in the full warning being displayed with full prominence to the driver of the trailing vehicle. The system has application to improving the safety of road vehicles.”</p>	<p>E.g., Abstract, “In a vehicle running mode detecting system, a relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object is calculated on the basis of a time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed.”</p>
<p>a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>E.g., page 1, lines 23 to 29, “According to one aspect of the invention there is provided a safety system for vehicles comprising a controller fitted in use to a subject vehicle, <b><u>sensor means fitted to the subject vehicle in use and operable to sense a distance of separation and/or a relative velocity of a trailing vehicle</u></b> and operable to input data signals representative thereof to the controller.”</p> <p>E.g., page 5, lines 4 to 9, “<i>The sensor means for sensing the distance and velocity of the trailing vehicle may comprise a radar system</i> transmitting and receiving radar pulses, from which received pulses information is derived sufficient to determine both the proximity and relative speed of the trailing vehicle.”</p>	<p>E.g., col. 2, lines 58 to 62, “The <i>radar head unit 3</i> emits a pulse laser beam (as a radar wave) forward of the vehicle 1 from the source and receives reflected light beam reflected by a forward object in the way such as a vehicle, thereby measuring the distance from the vehicle 1 to the forward object.”</p> <p>E.g., col. 2, line 66 to col. 3, line 7, “As shown in FIG. 2, <i>signals from the radar head unit 3 and the vehicle speed sensor 5 which detects the running speed of the vehicle 1 are input into the control unit 4</i> and the running mode of the vehicle 1 is determined by the control unit 4 and shown by the headup display 6. <i>When it is determined that the forward object is an obstruction for the vehicle 1 to clear, the alarm 7 operates and the vehicle control device 8 automatically causes brakes 8a</i></p>

	<p>be predetermined so as to correspond to typical parameters appropriate for driving under adverse road conditions. <i>These parameters may for example be stored in a look up table allowing the parameters to be determined from the signals received by the controller together with the parameters defining the normal safety envelope.</i>"</p> <p>E.g., page 16, lines 2 to 21, "The control system is designed to activate display 12 to provide a warning signal to a driver of the trailing vehicle when the trailing vehicle 18 when the trailing vehicle is closing too rapidly on the subject vehicle 16 for example, alternately a warning signal is displayed when the trailing vehicle 18 is too close to the subject vehicle 16. Even if they are travelling at the same speed for example, <i>there are known safe stopping distances such as those published by the Minister of Transport, in which a vehicle will stop when the brakes are applied.</i> Accordingly, by knowing the velocity of the subject vehicle 16 for example preferably using the radar ground sensing system described herein, which provides therefore a true ground speed, or other means in communication <i>with a microprocessor control system and by using a proximity sensor 20 to determine the separation of the subject vehicle 16 from the trailing vehicle 18 a safety envelope can be created behind the subject vehicle 16. Intrusion in the envelope by the trailing vehicle 18 causes an initial level of lamps 13 in array 12 to be lit.</i>"</p> <p>E.g., page 17, lines 7 to 25, "<i>Thus a warning system has been described using a ground speed sensor for a subject vehicle 16 coupled by a microprocessor with a proximity sensor 20.</i> In a more sophisticate [sic] version, proximity sensor 20 could be a radar device described herein for measuring velocity and could therefore be used to measure the relative velocity of a subject vehicle 16 and trailing vehicle 18. By knowing the closing speed of the trailing vehicle 18 predetermined</p>	<p>obstruction for the vehicle 1 to clear, the alarm 7 operates and the <i>vehicle control device</i> 8 automatically causes brakes 8a of the vehicle 1 to operate to decelerate vehicle 1."</p> <p>E.g., FIG. 3.</p>

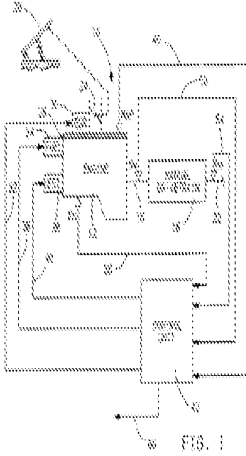

Limitation of '781 Patent Claim 32	PCT Publication No. WO 96/02853 (Tonkin)	U.S. Patent No. 5,708,584 (Doi et al.)
	<p>values could be used to trigger warning displays if the closing speed is too great. For example, a look-up table or database could again be provided for unsafe closing speeds. This look-up table might again be varied according to the velocity of the subject vehicle 16 in a similar manner to the safe stopping distance, or safety envelope distance. Therefore, whilst the safety envelope distance at 30mph is 25 metres, if the trailing vehicle is closing too rapidly, say, a difference in speed of 30mph, then the warning signal could be activated even when the trailing vehicle 18 is 50 metres behind the subject vehicle 16.”</p>	
<p>if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.</p>	<p>E.g., page 18, lines 16 to 19, “Thus, safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to weather and possibly for different severities of poor weather.”</p>

The right vertical wire is a simple connecting line. The entire circuit is enclosed in a dashed rectangular border.</p>	

15. Claim 18 is Obvious in View of the Combination of Jurgen, Toyota '599, Davidian, and Tonkin

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein:	See claim 17 claim chart, at page A-57.	See claim 17 claim chart, at page A-57.	See claim 17 claim chart, at page A-57.	E.g., Abstract, "The system comprising a controller fitted to a subject vehicle (16) and sensor means (20) operable to sense a distance of separation and relative velocity of a trailing vehicle (18). Also input to the controller is a velocity signal derived from a velocity sensing means (97) determining the ground speed of the subject vehicle using a doppler radar system. The controller calculates a safety envelope and activates a visible warning device attached to the rear of the subject vehicle if the trailing vehicle penetrates the safety envelope. An enhanced safety envelope determined by adverse road conditions is also established, any incursion into the enhanced envelope resulting generally in the visible warning being at a less prominent level. If however the closing speed of the trailing vehicle exceeds a predetermined threshold, penetration of the enhanced envelope results immediately in the full warning being displayed with full prominence to the driver of the trailing vehicle. The system has application to improving the safety of road vehicles."

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
<p>said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and</p>			<p>E.g., col. 4, line 67 to col. 5, line 2, "The automatic sensors on vehicle 2 further include a daylight sensor 14, <i>a rain sensor 16</i>, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22."</p> <p>E.g., col. 8, lines 58 to 63, "Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12. <i>Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.</i>"</p>	<p>E.g., page 18, lines 9 to 13, "The information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windscreen wipers are in use or have been in use recently due to rain (and not used with a water spray to clean the windscreen)."</p>
<p>said memory subsystem further storing a second vehicle speed/stopping distance table.</p>			<p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table</i>, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is <i>stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>"</p>	<p>E.g., page 18, lines 16 to 19, "Thus, safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to weather and possibly for different severities of poor weather."</p> <p>E.g., page 3, lines 25 to 32, "The size of the enhanced safe distance and enlarged safety envelope will generally be predetermined so as to correspond to typical parameters appropriate for driving under adverse road conditions. <i>These</i></p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
			<p>E.g., col. 12, line 59 to col 13, line 22, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <i>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance.</i> The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and <i>the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the</p>	<p><i>parameters may for example be stored in a look up table</i> allowing the parameters to be determined from the signals received by the controller together with the parameters defining the normal safety envelope."</p> <p>E.g., page 16, lines 2 to 21, "The control system is designed to activate display 12 to provide a warning signal to a driver of the trailing vehicle when the trailing vehicle 18 when the trailing vehicle is closing too rapidly on the subject vehicle 16 for example, alternately a warning signal is displayed when the trailing vehicle 18 is too close to the subject vehicle 16. Even if they are travelling at the same speed for example, <u>there are known safe stopping distances such as those published by the Minister of Transport</u>, in which a vehicle will stop when the brakes are applied. Accordingly, by knowing the velocity of the subject vehicle 16 for example preferably using the radar ground sensing system described herein, which provides therefore a true ground speed, or other means in communication with a microprocessor control system and by using a proximity sensor 20 to determine the separation of</p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
			<p>object come within the collision distance CD, the collision alarm is then actuated.</p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.”</p>	<p>the subject vehicle 16 from the trailing vehicle 18 a safety envelope can be created behind the subject vehicle 16. Intrusion in the envelope by the trailing vehicle 18 causes an initial level of lamps 13 in array 12 to be lit.”</p> <p>E.g., page 17, lines 7 to 25, “Thus a warning system has been described using a ground speed sensor for a subject vehicle 16 coupled by a microprocessor with a proximity sensor 20. In a more sophisticated [sic] version, proximity sensor 20 could be a radar device described herein for measuring velocity and could therefore be used to measure the relative velocity of a subject vehicle 16 and trailing vehicle 18. By knowing the closing speed of the trailing vehicle 18 predetermined values could be used to trigger warning displays if the closing speed is too great. <i>For example, a look-up table or database could again be provided for unsafe closing speeds. This look-up table might again be varied according to the velocity of the subject vehicle 16 in a similar manner to the safe stopping distance, or safety envelope distance.</i> Therefore, whilst the safety envelope distance at 30mph is 25 metres,</p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 4,559,599 (Toyota '599)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
				<p>if the trailing vehicle is closing too rapidly, say, a difference in speed of 30mph, then the warning signal could be activated even when the trailing vehicle 18 is 50 metres behind the subject vehicle 16.”</p>

16. Claim 18 is Obvious in View of the Combination of Jurgen, Volkswagen '070, Davidian, and Tonkin

			<p>such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164."</p>	<p>and by using a proximity sensor 20 to determine the separation of the subject vehicle 16 from the trailing vehicle 18 a safety envelope can be created behind the subject vehicle 16. Intrusion in the envelope by the trailing vehicle 18 causes an initial level of lamps 13 in array 12 to be lit."</p> <p>E.g., page 17, lines 7 to 25, "Thus a warning system has been described using a ground speed sensor for a subject vehicle 16 coupled by a microprocessor with a proximity sensor 20. In a more sophisticated [sic] version, proximity sensor 20 could be a radar device described herein for measuring velocity and could therefore be used to measure the relative velocity of a subject vehicle 16 and trailing vehicle 18. By knowing the closing speed of the trailing vehicle 18 predetermined values could be used to trigger warning displays if the closing speed is too great. <i>For example, a look-up table or database could again be provided for unsafe closing speeds. This look-up table might again be varied according to the velocity of the subject vehicle 16 in a similar manner to the safe stopping distance, or safety</i></p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	German Patent Application Publication No. 29 26 070 (Volkswagen '070)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
				<p><i>envelope distance.</i> Therefore, whilst the safety envelope distance at 30mph is 25 metres, if the trailing vehicle is closing too rapidly, say, a difference in speed of 30mph, then the warning signal could be activated even when the trailing vehicle 18 is 50 metres behind the subject vehicle 16.”</p>

17. Claim 18 is Obvious in View of the Combination of Jurgen, Saturn '452, Davidian, and Tonkin

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein:	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.	See claim 17 claim chart, at page A-153.	E.g., Abstract, "The system comprising a controller fitted to a subject vehicle (16) and sensor means (20) operable to sense a distance of separation and relative velocity of a trailing vehicle (18). Also input to the controller is a velocity signal derived from a velocity sensing means (97) determining the ground speed of the subject vehicle using a doppler radar system. The controller calculates a safety envelope and activates a visible warning device attached to the rear of the subject vehicle if the trailing vehicle penetrates the safety envelope. An enhanced safety envelope determined by adverse road conditions is also established, any incursion into the enhanced envelope resulting generally in the visible warning being at a less prominent level. If however the closing speed of the trailing vehicle exceeds a predetermined threshold, penetration of the enhanced envelope results immediately in the full warning being displayed with full prominence to the driver of the trailing vehicle. The system has application to improving the safety of road vehicles."

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
<p>said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and</p>			<p>E.g., col. 4, line 67 to col. 5, line 2, "The automatic sensors on vehicle 2 further include a daylight sensor 14, <i>a rain sensor 16</i>, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22."</p> <p>E.g., col. 8, lines 58 to 63, "Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12. <i>Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.</i>"</p>	<p>E.g., page 18, lines 9 to 13, "The information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windscreen wipers are in use or have been in use recently due to rain (and not used with a water spray to clean the windscreen)."</p>
<p>said memory subsystem further storing a second vehicle speed/stopping distance table.</p>			<p>E.g., col. 9, lines 20 to 27, "<i>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in the form of a look-up table</i>, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is <i>stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>"</p>	<p>E.g., page 18, lines 16 to 19, "Thus, safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to weather and possibly for different severities of poor weather." E.g., page 3, lines 25 to 32, "The size of the enhanced safe distance and enlarged safety envelope will generally be predetermined so as to correspond to typical parameters appropriate for driving under adverse road conditions. <i>These parameters may for example be</i></p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
			<p>E.g., col. 12, line 59 to col 13, line 22, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <i>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance.</i> The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and <i>the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the</p>	<p><i>stored in a look up table</i> allowing the parameters to be determined from the signals received by the controller together with the parameters defining the normal safety envelope."</p> <p>E.g., page 16, lines 2 to 21, "The control system is designed to activate display 12 to provide a warning signal to a driver of the trailing vehicle when the trailing vehicle 18 when the trailing vehicle is closing too rapidly on the subject vehicle 16 for example, alternately a warning signal is displayed when the trailing vehicle 18 is too close to the subject vehicle 16. Even if they are travelling at the same speed for example, <u>there are known safe stopping distances such as those published by the Minister of Transport</u>, in which a vehicle will stop when the brakes are applied. Accordingly, by knowing the velocity of the subject vehicle 16 for example preferably using the radar ground sensing system described herein, which provides therefore a true ground speed, or other means in communication with a microprocessor control system and by using a proximity sensor 20 to determine the separation of the subject vehicle 16 from the</p>

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
			<p>object come within the collision distance CD, the collision alarm is then actuated.</p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object to the front of the vehicle or to the rear of the vehicle comes within the stopping distance SD and the collision distance CD, the system operates according to the deceleration alarm module 93, as indicated by block 164.”</p>	<p>trailing vehicle 18 a safety envelope can be created behind the subject vehicle 16. Intrusion in the envelope by the trailing vehicle 18 causes an initial level of lamps 13 in array 12 to be lit.”</p> <p>E.g., page 17, lines 7 to 25, “Thus a warning system has been described using a ground speed sensor for a subject vehicle 16 coupled by a microprocessor with a proximity sensor 20. In a more sophisticate [sic] version, proximity sensor 20 could be a radar device described herein for measuring velocity and could therefore be used to measure the relative velocity of a subject vehicle 16 and trailing vehicle 18. By knowing the closing speed of the trailing vehicle 18 predetermined values could be used to trigger warning displays if the closing speed is too great. <i>For example, a look-up table or database could again be provided for unsafe closing speeds. This look-up table might again be varied according to the velocity of the subject vehicle 16 in a similar manner to the safe stopping distance, or safety envelope distance.</i> Therefore, whilst the safety envelope distance at 30mph is 25 metres, if the trailing vehicle is closing</p>

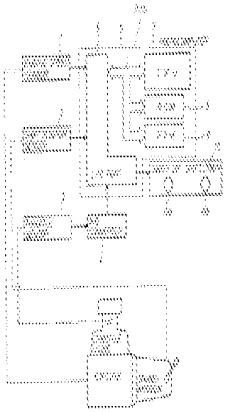

Limitation of '781 Patent Claim 18	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
				too rapidly, say, a difference in speed of 30mph, then the warning signal could be activated even when the trailing vehicle 18 is 50 metres behind the subject vehicle 16.”

18. Claims 24 and 25 are Obvious in View of the Combination of Jurgen, Saturn '452, Davidian, and Chasteen

Limitation of '781 Patent Claim 24	Automotive Electronics Handbook (Jurgen)	U.S. Patent No. 5,477,452 (Saturn '452)	U.S. Patent No. 5,357,438 (Davidian)	U.S. Patent No. 4,901,701 (Chasteen)

**21. Claim 32 is Obvious in View of the Combination of Davidian and Tonkin**

Limitation of '781 Patent Claim 32	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
<p>32. Apparatus for optimizing operation of a vehicle according to claim 31 wherein:</p>	<p>See claim 31 claim chart, at page A-225.</p>	<p>E.g., Abstract, “The system comprising a controller fitted to a subject vehicle (16) and sensor means (20) operable to sense a distance of separation and relative velocity of a trailing vehicle (18). Also input to the controller is a velocity signal derived from a velocity sensing means (97) determining the ground speed of the subject vehicle using a doppler radar system. The controller calculates a safety envelope and activates a visible warning device attached to the rear of the subject vehicle if the trailing vehicle penetrates the safety envelope. An enhanced safety envelope determined by adverse road conditions is also established, any incursion into the enhanced envelope resulting generally in the visible warning being at a less prominent level. If however the closing speed of the trailing vehicle exceeds a predetermined threshold, penetration of the enhanced envelope results immediately in the full warning being displayed with full prominence to the driver of the trailing vehicle. The system has application to improving the safety of road vehicles.”</p>
<p>said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and</p>	<p>E.g., col. 4, line 67 to col. 5, line 2, “The automatic sensors on vehicle 2 further include a daylight sensor 14, <b>a rain sensor 16</b>, a vehicle load sensor 18, a trailer-hitch sensor 20, and a reverse gear sensor 22.”</p> <p>E.g., col. 8, lines 58 to 63, “Thus, module 90 receives inputs from the front space sensor 8, the rear space sensor 10, and the vehicle speed sensor 12. <b>Module 90 also receives inputs from the sensors in case there is no depressible key, e.g., the daylight sensor 14, the trailer sensor 20, the reverse gear sensor 22, the rain sensor 16, and the vehicle load sensor 18.</b>”</p>	<p>E.g., page 18, lines 9 to 13, “The information regarding the weather might be obtained for example by enabling the warning system controller to ascertain if the windscreen wipers are in use or have been in use recently due to rain (and not used with a water spray to clean the windscreen).”</p>
<p>said memory subsystem further storing a second vehicle speed/stopping distance table;</p>	<p>E.g., col. 9, lines 20 to 27, “<b>Computer module 90 also includes information about the vehicle braking distances as a function of speed. This is preferably in</b></p>	<p>E.g., page 18, lines 16 to 19, “Thus, safe stopping distances can be adjusted for prevailing weather conditions, again by providing stored values according to</p>

Limitation of '781 Patent Claim 32	U.S. Patent No. 5,357,438 (Davidian)	PCT Publication No. WO 96/02853 (Tonkin)
	<p><i>the form of a look-up table</i>, for example, provided by the manufacturer for predetermined defined conditions concerning road type, skidding danger, vehicle load and tires pressure, and is <i>stored in a ROM (read-only memory) of the microcomputer so that it can be changed periodically if necessary.</i>"</p> <p>E.g., col. 12, line 59 to col 13, line 22, "The system then makes the computations illustrated (as an example) in block 162 to determine the stopping distance SD, which is equal to the reaction distance plus the braking distance multiplied by a stopping factor ST and a safety factor SF. <b><i>In the illustrated example, the stopping distance is the sum of the reaction distance and the braking distance.</i></b> The reaction distance is the product of the reaction time, visibility condition, daylight condition, reaction factor and speed; and <b><i>the braking distance is the product of the braking distance (as supplied by the manufacturer), road type, skidding danger, vehicle load and braking factor.</i></b> The stopping distance (SD) includes further safety factors, and determines when the safety alarm will be actuated to first alert the driver of an approaching collision danger.</p> <p>A determination is also made of the collision distance CD which is equal to the stopping distance SD divided by the collision safety factor CSF, e.g., 1.25 in the example illustrated above, such that should the distance between the vehicle and the object come within the collision distance CD, the collision alarm is then actuated.</p> <p>The foregoing calculations of stopping distance SD and collision distance CD with respect to objects at the front of the vehicle are also made with respect to objects at the rear of the vehicle, these calculations being RSD and RCD, respectively, also shown in block 162.</p> <p>Whenever the distance between the vehicle and an object</p>	<p>weather and possibly for different severities of poor weather."</p> <p>E.g., page 3, lines 25 to 32, "The size of the enhanced safe distance and enlarged safety envelope will generally be predetermined so as to correspond to typical parameters appropriate for driving under adverse road conditions. <b><i>These parameters may for example be stored in a look up table</i></b> allowing the parameters to be determined from the signals received by the controller together with the parameters defining the normal safety envelope."</p> <p>E.g., page 16, lines 2 to 21, "The control system is designed to activate display 12 to provide a warning signal to a driver of the trailing vehicle when the trailing vehicle 18 when the trailing vehicle is closing too rapidly on the subject vehicle 16 for example, alternately a warning signal is displayed when the trailing vehicle 18 is too close to the subject vehicle 16. Even if they are travelling at the same speed for example, <b><u>there are known safe stopping distances such as those published by the Minister of Transport</u></b>, in which a vehicle will stop when the brakes are applied. Accordingly, by knowing the velocity of the subject vehicle 16 for example preferably using the radar ground sensing system described herein, which provides therefore a true ground speed, or other means in communication with a microprocessor control system and by using a proximity sensor 20 to determine the separation of the subject vehicle 16 from the trailing vehicle 18 a safety envelope can be created behind the subject vehicle 16. Intrusion in the envelope by the trailing vehicle 18 causes an initial level of lamps 13 in array 12 to be lit."</p> <p>E.g., page 17, lines 7 to 25, "Thus a warning system has been described using a ground speed sensor for a subject vehicle 16 coupled by a microprocessor with a proximity sensor 20. ### [57] ABSTRACT

Apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, a road speed sensor, an engine speed sensor, a manifold pressure sensor, a throttle position sensor, a radar detector for determining the distance separating the vehicle from an object in front of it, a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, a brake sensor for determining whether the brakes of the vehicle have been activated, a fuel over-injection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, a downshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an insufficient engine speed, a vehicle proximity alarm circuit for issuing an alarm that the vehicle is too close to an object in front of the vehicle and a throttle controller for automatically reducing the amount of fuel supplied to the engine if the vehicle is too close to the object in front of it. Based upon data received from the sensors and data stored in the memory subsystem, the processor determines whether to activate the fuel overinjection notification circuit, the upshift notification circuit, the downshift notification circuit, the vehicle proximity alarm circuit or the throttle controller.

**METHOD AND APPARATUS FOR  
OPTIMIZING VEHICLE OPERATION**

**BACKGROUND OF THE INVENTION**

1. Field of the Invention

The present invention generally relates to an apparatus for optimizing vehicle operation and, more particularly, relates to a system which both notifies the driver of recommended corrections in vehicle operation and, under certain conditions, automatically initiates selected corrective action.

2. Description of Related Art

It has long been recognized that the improper operation of a vehicle may have many adverse effects. For example, the fuel efficiency of a vehicle may vary dramatically based upon how the vehicle is operated. More specifically, operating a vehicle at excessive speed, excessive RPM and/or excessive manifold pressure will result in both reduced fuel economy and increased operating costs. The aforementioned increased operating costs can be quite considerable, particularly for an owner or operator of a fleet of vehicles. To correct these types of improper vehicle operations are often surprisingly simple. For example, upshifting the drive gear will typically eliminate an excessive RPM condition. However, even when the solution is quite simple, oftentimes, the driver will be unaware of the need to take corrective action.

A variety of patents have disclosed systems, commonly referred to as "shift prompters", which monitor the operation of a vehicle and advises the operator of the vehicle when to take certain actions. Numerous ones of these devices include sensors which measure engine speed and vehicle speed. See, for example, U.S. Pat. No. 4,492,112 to Igarashi et al., U.S. Pat. No. 4,631,515 to Blee et al. and U.S. Pat. No. 4,701,852 to Ulveland. Certain ones, however, disclose the use of other types of sensors as well. For example, U.S. Pat. No. 4,524,460 to Weber is directed to a driving aid indicator which includes vehicle speed, manifold pressure, throttle position and engine speed sensors. U.S. Pat. No. 4,752,883 to Asakura et al. and U.S. Pat. No. 4,868,756 to Kawanabe et al. are directed to upshift notification devices which include sensors for measuring engine speed, vehicle speed, manifold pressure and cooling water temperature. Finally, U.S. Pat. No. 4,853,673 to Kido et al. discloses a shift indicator system which includes sensors for measuring engine speed and throttle position. Generally, the above-listed patents all provide displays intended to enable the driver to operate the vehicle in a manner leading to uniform performance and maximum fuel economy. However, Blee et al. discloses the use of audible warnings as well as a speed controller to prevent further increases in engine speed if the driver ignores previously issued warnings.

Improper vehicle operation has other adverse effects as well. It is well known that the faster a vehicle travels, the longer it takes to stop. Thus, what may be a safe separation distance between successive vehicles when a vehicle is traveling at 35 mph may be unsafe if that vehicle is traveling at 50 mph. Road conditions also play a role in determining the safe separation distance between vehicles. For example, greater separation distances are generally recommended when roads are wet. As a result, therefore, based on the combination of a vehicle's speed, the distance separating the vehicle from a second vehicle in front of it and road conditions, many vehicles are operated unsafely. To correct this situation, a reduction in operating speed, an increase in vehicle separation or some combination thereof, is required.

It may be readily seen from the foregoing that it would be desirable to provide a system which integrates the ability to

issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely. It is, therefore, the object of the invention to provide such a system.

**SUMMARY OF THE INVENTION**

In one embodiment, the present invention is directed to an apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, plural sensors, including road speed, manifold pressure and throttle position sensors, for collectively monitoring operation of the vehicle and a fuel overinjection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle. The processor subsystem receives data from the sensors and, from the received data, determines when to activate the fuel overinjection circuit. In one aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure and a manifold pressure set point stored in the memory subsystem and activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point.

In further aspects thereof, the sensors may include an engine speed sensor and the processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the fuel overinjection notification circuit if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing.

In still further aspects thereof, the apparatus may also include an upshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues notifications that the engine of the vehicle is being operated at excessive engine speeds. In this aspect, the processor subsystem determines when road speed for the vehicle is increasing, when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, compares engine speed to an RPM set point stored in the memory subsystem and activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point.

In still yet further aspects thereof, the apparatus may also include a downshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues a notification that the engine of the vehicle is being operated at an insufficient engine speed. The processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In still further aspects thereof, the fuel overinjection circuit, the upshift notification circuit or the downshift

3

notification circuit may include a horn for issuing a tone for a preselected time period.

In another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle. The apparatus includes road speed, engine speed, manifold pressure and throttle position sensors, a processor subsystem coupled to each of the sensors to receive data therefrom and a memory subsystem, coupled to the processor subsystem, for storing a manifold pressure set point, an engine speed set point and present and prior levels for each one of the sensors. The apparatus further includes a fuel overinjection notification circuit, an upshift notification circuit and a downshift notification circuit, all of which are coupled to the processor subsystem. The fuel overinjection notification circuit issues notifications that excessive fuel is being supplied to the engine of the vehicle, the upshift notification circuit issues notifications that the engine of the vehicle is being operated at an excessive engine speed and the downshift notification circuit issues notifications that the engine of the vehicle is being operated at an insufficient engine speed. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit, the upshift notification circuit and the downshift notification circuit. In one aspect thereof, the fuel overinjection circuit includes a first horn for issuing a first tone for a first preselected time period, the upshift notification circuit includes a second horn for issuing a second tone for a second preselected time period and the downshift notification circuit includes a third horn for issuing a third tone for a third preselected time period.

In another aspect thereof, the processor subsystem may determine when road speed for the vehicle is increasing or decreasing, engine speed is increasing or decreasing, throttle position for the vehicle is increasing and manifold pressure is increasing; may compare manifold pressure to the manifold pressure set point and engine speed to the RPM set point; and may activate the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing, the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point and the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In another aspect, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating a vehicle having an engine and an object in front of the vehicle and at least one sensor for monitoring operation of the vehicle. The apparatus further includes a processor subsystem, a memory subsystem and a vehicle proximity alarm circuit. The processor subsystem is coupled to the radar detector and the at least one sensor to receive data therefrom while the memory subsystem, in which a first vehicle speed/stopping distance table and present levels for each one of the at least one sensor are stored, and the vehicle proximity alarm circuit are coupled to the processor subsystem. Based on data received from the radar detector, the at least one sensor and the contents of the memory subsystem, the processor determines when to instruct the vehicle proximity alarm circuit to issue an alarm that the vehicle is too close to the object.

In one aspect thereof, the at least one sensor further includes a windshield wiper sensor for indicating whether a

4

windshield wiper of the vehicle is activated and a second vehicle speed/stopping distance table is stored in the memory subsystem. In another aspect thereof, the apparatus further includes a throttle controller for controlling a throttle of the engine of the vehicle. The processor subsystem may selectively reduce the throttle based upon data received from the radar detector, the at least one sensor and the memory subsystem or may also count a total number of vehicle proximity alarms determined by the processor subsystem and selectively reduce the throttle based upon the total number of vehicle proximity alarms, as well. In yet another aspect thereof, the at least one sensor further includes a brake sensor for indicating whether a brake system of the vehicle is activated.

In other aspects thereof, the apparatus may be further provided with a fuel overinjection notification circuit for issuing a notification that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an excessive engine speed or a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. If a fuel overinjection notification circuit is provided, the apparatus includes a manifold pressure sensor and a throttle position sensor which also provide the processor subsystem with data used, together with a manifold pressure set point and prior levels for the sensors stored in the memory subsystem, to determine when to activate the fuel overinjection circuit. If an upshift notification circuit is provided, the apparatus includes an engine speed sensor which also provides the processor subsystem with data used, together with an RPM set point stored in the memory subsystem, to determine when to activate the upshift notification circuit. Finally, if a downshift notification circuit is provided, the processor subsystem determines when to activate the downshift notification circuit based upon the data received from the plurality of sensors.

In still another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating the vehicle from an object in front of it, a plurality of sensors, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor, which collectively monitor the operation of the vehicle, a processor subsystem, a memory subsystem, a fuel overinjection notification circuit for issuing notification that excessive fuel is being supplied to the engine of the vehicle and a vehicle proximity alarm circuit for issuing alarms if the vehicle is too close to the object. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit. Based upon data received from the radar detector, the sensors and the memory subsystem, the processor subsystem also determines when to activate the vehicle proximity alarm circuit.

In one aspect of this embodiment of the invention, the processor subsystem determines when road speed for the vehicle is increasing or decreasing, when throttle position for the vehicle is increasing or decreasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, determines when manifold pressure for the vehicle is increasing or decreasing and determines when engine speed for the vehicle is increasing or decreasing. In this aspect, the processor subsystem activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle

5

are increasing and road speed and engine speed for the vehicle are decreasing.

In a further aspect thereof, the apparatus may also include an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, the processor subsystem determining when to activate the upshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem and compares engine speed to an RPM set point stored in the memory subsystem. In this aspect, the processor subsystem activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point.

In still another aspect thereof, the apparatus may also include a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. In this aspect, the processor subsystem determines when to activate the downshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is decreasing, determines when throttle position for the vehicle is increasing, determines when manifold pressure for the vehicle is increasing and determines when engine speed for the vehicle is decreasing. In this aspect, the processor subsystem activates the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

BRIEF DESCRIPTION OF THE DRAWINGS

The present invention may be better understood, and its numerous objects, features and advantages will become apparent to those skilled in the art by reference to the accompanying drawing, in which:

FIG. 1 is a block diagram of an apparatus for optimizing vehicle performance constructed in accordance with the teachings of the present invention; and

FIGS. 2A-B is a flow chart of a method for optimizing vehicle performance in accordance with the teachings of the present invention.

DETAILED DESCRIPTION

Referring first to FIG. 1, a system 10 for optimizing vehicle performance constructed in accordance with the teachings of the present invention will now be described in greater detail. The system 10 includes a processor subsystem 12, for example, a microprocessor, and a memory subsystem 14, for example, the memory subsystem 14 may include a nonvolatile random access memory (or "NVRAM"), coupled together by a bus 16 for bi-directional exchanges of address, data and control signals therebetween. The system 10 is installed in a vehicle (not shown) for which optimized performance and driver assist capabilities are desired. Although it is contemplated that the system 10 is suitable for use with any type vehicle, most commonly, the system 10 shall be installed in a truck.

Also coupled to the processor subsystem 12 are a series of sensors, each of which are periodically polled by the processor subsystem 12, to determine the respective states or

6

levels thereof. The sensors include a road speed sensor 18, an RPM sensor 20, a manifold pressure sensor 22, a throttle sensor 24, a windshield wiper sensor 30 and a brake sensor 32. The sensors are selected to be either state or level sensors, depending on whether the information to be collected thereby is a state, i.e., on/off or a level, for example, 35 mph. The road speed sensor 18 and the RPM sensor 20 are level sensors which respectively provide the processor subsystem 12 with signals which indicate the operating speed and engine speed for the vehicle. The road speed sensor 18 and the RPM sensor 20 may derive such information from any one of a variety of sources. For example, the road speed sensor 18 may be connected to receive the speed input signal transmitted to the vehicle's speedometer while the RPM sensor 20 may be connected to receive the RPM input signal to the vehicle's tachometer.

The manifold pressure sensor 22 is a level sensor which is positioned downstream of the throttle valve in the intake manifold of the vehicle to measure manifold pressure thereat. The throttle sensor 24 is a level sensor, attached to the throttle, which measures the extent to which the throttle is opened. The windshield wiper sensor 30 is a state sensor which determines whether the vehicle's windshield wipers are on or off. In alternate embodiments thereof, the windshield wiper sensor 30 may be electrically coupled to the on/off switch for the windshield wiper or to an output of the windshield wiper motor. Finally, the brake sensor 32 is a state sensor which determines whether the brakes of the vehicle have been engaged. For example, the brake sensor 32 may be electrically coupled to the brake system to detect the activation thereof.

Preferably, the memory subsystem 14 should include first and second registers 14a and 14b, each having sufficient bits for holding the state/level of each of the sensors 18, 20, 22, 24, 30 and 32. The first register 14a is used to hold the present state or level of each of the sensors 18, 20, 22, 24, 30 and 32 while the second register 14b is used to hold the prior state or level for each of the sensors 18, 20, 22, 24, 30 and 32. Each time the processor subsystem 12 writes the present state or level of the sensors 18, 20, 22, 24, 30 and 32 to the first register 14a, the prior contents of the first register 14a is written to the second register 14b which, in turn, discards the prior content thereof. The memory subsystem 14 is also used to hold information to be utilized by the processor subsystem 12 to determining whether to take corrective actions and/or issue notifications. Typically, such information is placed in the memory subsystem 14 while the system 10 is being initialized. The information includes one or more speed/distance tables which, when used in a manner which will be more fully described below in combination with data collected by the system 10, enable the processor subsystem 12 to determine if the vehicle is being operated unsafely and if corrective action is necessary. Speed/stopping distance table. The information also includes two pre-set threshold values—a manifold psi set point and an engine RPM set point. As will also be more fully described below, the processor subsystem 12 uses these threshold values to determine when to issue notifications as to recommended changes in vehicle operation which, when executed by the driver, will optimize vehicle operation. The speed/stopping distance table(s) are based upon National Safety Council guidelines, vary according to the class of the vehicle and provide the relationship between the speed at which a vehicle is travelling and the distance which the vehicle will require to come to a complete stop if travelling at that speed. The manifold psi set point and RPM set point are selected based upon the manufacturer's guidelines for

proper operation of the vehicle, vary based upon horsepower and engine size for the vehicle and represent thresholds above which the manifold pressure and engine rotation speed, respectively, for the vehicle should never exceed.

The system 10 also includes a throttle controller 26 capable of opening and/or closing the throttle, a radar detector 28 positioned to determine the distance separating the vehicle and an object in front of the vehicle, for example, a second vehicle travelling in the same direction, a series of circuits 34, 36, 38 and 40 for notifying the driver of the vehicle of recommended corrections in vehicle operation and alerting the driver to unsafe operating conditions and a power supply, for example a +12 v battery, for providing power to the energy-demanding components of the system 10. The circuits 34, 36, 38 and 40 include an upshift notification circuit 34 for notifying the driver that an upshift is recommended, a downshift notification circuit 36 for notifying the driver that a downshift is recommended, an overinjection notification circuit 38 for notifying the driver that too much fuel is being supplied to the vehicle and a vehicle proximity alarm circuit 40 for alerting the driver when an object in front of the vehicle is too close. The circuits 34, 36 and 38 may be configured to provide visual and/or audible notifications, for example, using lights and/or horns. For example, the upshift circuit 34, the downshift notification circuit 36 and the overinjection notification circuit 38 may each include a horn, or other tone generating device, from which an audible notification may be generated at a selected pitch. Preferably, each of the notification circuits 34, 36 and 38 may be configured to provide distinct audible notifications, for example, tones at distinct pitches, so that the driver may readily distinguish which of the notification circuits 34, 36 and 38 have been activated by the processor subsystem 12. The proximity alarm circuit 40 may include one or more visual and/or audible warning devices such as lights and/or horns. For example, the proximity alarm circuit 40 may include a warning light and a warning horn. If desired, the proximity alarm circuit may also include a display for displaying the speed of the object in the vehicle's path and/or the stopping distance in feet. The proximity alarm circuit 40 may be further equipped to provide audible indications of the speed of the object in the vehicle's path and/or the stopping distance in feet as well as selector circuitry for selecting both the information to be provided as well as the manner in which the information is to be conveyed.

Finally, the processor subsystem 12 is further provided with one or more mode select input lines which enable operator configuration of the operation of the system 10. For example, as described herein, the corrective operations consist of the combination of an automatic reduction of throttle and audio/visual alerts that the vehicle is being operated unsafely. It is specifically contemplated, however, that the system 10 include a mode select line for switching the system 10 between an "active" mode where both automatic throttle reduction and audio/visual alerts are generated and an "inactive" mode where only audio/visual alerts are generated.

Referring next to FIGS. 2A-B, a method for optimizing vehicle performance in accordance with the teachings of the present invention will now be described in greater detail. The method commences by powering up the processor subsystem 12, for example, by closing switch 42, thereby coupling the processor subsystem 12 to the power source 44 via line 43. Alternately, the processor subsystem 12 may be connected to the electrical system of the vehicle such that it will automatically power up when the vehicle is started. Of

course, any of the other devices which also form part of the system 10 and require power may also be coupled to the line 43. Appropriate voltage levels for the processor subsystem 12, as well as any additional power-demanding devices coupled to the power source 44, would be provided by voltage divider circuitry (not shown).

Once the system 10 is powered up, the method begins at step 50 by the processor subsystem 12 polling the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 to determine their respective levels or states and places the acquired information in the first data register 14a. Of course, it should be noted, however, that polling of the sensors by the processor subsystem 12 is but one technique by which the processor subsystem 12 may acquire the requisite information. Alternately, each sensor 20, 22, 24, 30 and 32 may periodically place its level or state in one or more bits of the first data register 14a. The processor subsystem 12 would then acquire information by checking the contents of the first data register 14a at selected time intervals.

Proceeding to step 52, the processor subsystem 12 examines the contents of the first data register 14a to determine the operating speed of the vehicle. If the processor subsystem 12 determines that the vehicle is stationary, i.e., the operating speed of the vehicle is zero, the processor subsystem 12 will return to step 50 where the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 will be repeatedly polled until an operating speed greater than zero is detected at step 52. While polling may be conducted at a variety of time intervals, a polling period of one second appears suitable for the uses contemplated herein.

Returning to step 52, once an operating speed greater than zero is detected by the processor subsystem 12, the method proceeds to step 54 where the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. In turn, the contents of the first data register 14a is placed in the second data register 14b.

Proceeding now to step 56, from the polled value of the road speed sensor 18, the processor subsystem 12 determines whether the vehicle is travelling faster than 20 mph. If the operating speed of the vehicle is less than 20 mph, the method returns to step 54 where the sensors 18, 20, 22, 24, 30 and 32 will be repeatedly polled and the value of the road speed sensor examined until the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph. If, however, the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph, the method proceeds to step 58 where the processor subsystem 12 then determines if the vehicle is travelling faster than 50 mph, again by checking the contents of the first data register 14a.

Past this juncture, the method of the present invention will proceed through a series of steps designed to optimize vehicle operation. However, prior to optimizing vehicle operation, the processor subsystem 12 will determine if the vehicle is being operated unsafely. If so, the processor subsystem 12 will initiate corrective operations before commencing vehicle operation optimization. More specifically, if the processor subsystem 12 determines at step 58 that the vehicle is travelling at a speed greater than 50 mph, the

processor subsystem 12 will initiate a process by which it will determine whether the vehicle is being operated unsafely.

The processor subsystem 12 determines that the vehicle is being operated unsafely if the speed of the vehicle is such that the stopping distance for the vehicle *d* is greater than the distance separating the vehicle from an object, for example, a second vehicle, in its path. In order to make this determination, the processor subsystem 12 is provided access to at least one speed/distance table. For example, stored at location 14c within the memory subsystem 14 is a first speed/stopping distance table. The speed/stopping distance table contains the relationship between vehicle speed and stopping distance. Thus, for any given speed, the processor subsystem 12 may look-up the stopping distance for that speed. Preferably, the memory subsystem 14 should contain multiple speed/stopping distance tables so that differences in road conditions and/or vehicle class may be taken into account. For example, the speed/stopping distance table stored at location 14c may be a speed/stopping distance table for dry roads while a speed/stopping distance table for wet roads may be stored at location 14d. If desired, the memory subsystem 14 may also contain additional speed/stopping distance tables for other vehicle classes. If such additional tables were provided, however, the disclosed method would need to be modified to include additional steps in which the operator provides the vehicle's class and the processor subsystem 12 selects the appropriate speed/stopping distance tables for the indicated class of vehicle.

To make the aforementioned determination of unsafe vehicle operation, the method proceeds to step 60 where the processor subsystem 12 sets the value of the expression ALARM to 1. The method then proceeds to step 62 where the processor subsystem 12 examines the state of the wiper sensor 32 and selects a speed/stopping distance table based upon the state of the wiper sensor 32. If the state of the wiper sensor 32 indicates that the windshield wiper is off, the processor subsystem 12 concludes that the vehicle is being operated in dry conditions and selects the speed/stopping distance table stored at the location 14c of the memory subsystem 14. If, however, the state of the wiper sensor 32 indicates that the windshield wiper is on, the processor subsystem 12 concludes that the vehicle is being operated in wet conditions and selects the speed/stopping distance table stored at the location 14d of the memory subsystem 14. From the selected speed/stopping distance table 14c or 14d, the processor subsystem 12 then retrieves the stopping distance for the speed at which the vehicle is travelling.

Continuing on to step 64, the processor subsystem 12 determines the distance of the vehicle to an object in its path, i.e., a second vehicle travelling in front of the vehicle and in the same direction. To do so, the processor subsystem 12 instructs the radar device 28 to determine the distance between the vehicle and the second vehicle in front of it. Upon determining the distance separating the two vehicles, the radar device 28 transmits the determined separation distance to the processor subsystem 12. At step 66, the processor subsystem 12 determines if the two vehicles are separated by a safe distance. To do so, the processor subsystem 12 compares the distance separating the two vehicles to the retrieved stopping distance for the vehicle. If the determined distance separating the two vehicles is greater than the retrieved stopping distance for the vehicle, the processor subsystem 12 determines that the vehicle is being operated safely. If, however, the determined distance separating the two vehicles is less than the retrieved stopping distance, the processor subsystem 12 determines that the vehicle is being operated unsafely.

If the processor subsystem 12 determines at step 66 that the vehicle is being operated unsafely, the processor subsystem 12 initiates appropriate corrective action. At step 68, the processor subsystem 12 determines whether the vehicle brake is on by examining the state of the brake sensor 32. If the brake is on, the processor subsystem 12 concludes that the driver is taking corrective action and that further corrective action is not necessary. If, however, the processor subsystem 12 determines that the vehicle brake is off, the method proceeds to step 70 where the processor subsystem examines the level of the vehicle speed sensor to determine if the speed of the vehicle is less than 35 mph. If the speed of the vehicle is less than 30 mph, the processor subsystem 12 concludes that no further corrective action will be taken.

If, however, the processor subsystem 12 determines that the speed of the vehicle is greater than 35 mph, the method proceeds to step 72 where the processor subsystem 12 selects a throttle reduction value based upon the value of the expression ALARM. Generally, the severity of the corrective action to be initiated by the processor subsystem 12 is varied depending on the number of times that corrective action has been taken and, more specifically, the severity of the selective corrective action increases with the value of the expression ALARM. For example, in the embodiment of the invention disclosed herein, if ALARM=1, a 25% throttle reduction is selected, if ALARM=2, a 50 throttle reduction is selected and, if ALARM $\geq$ 3, a 100% throttle reduction is selected. By reducing the throttle, the transport of fuel to the engine is retarded and the vehicle will begin to decelerate.

Continuing on to step 74, the processor subsystem 12 determines the extent to which the throttle is open using the throttle level provided by the throttle sensor 24 and, using throttle control 26, reduces the throttle by the selected percentage. At step 76, the processor subsystem 12 selects an alert mode, again based upon the value of the expression ALARM. As before, the severity of the alert mode may increase with the value of ALARM. For example, when ALARM=1, a warning light may be activated in a flash mode while, when  $2 \leq \text{ALARM} \leq 3$ , an audible alert which lasts for a first selected time period, for example, two seconds, may be activated in combination with the flashing warning light and when ALARM $\geq$ 4, an audible alert which lasts for a second, longer, time period, for example, six seconds, may be activated in combination with the flashing light.

Proceeding to step 78, the processor subsystem 12 issues an alert to the operator of the vehicle in accordance with the selected alert mode. To do so, the processor subsystem 12 activates vehicle proximity alarm circuit 40 in accordance with the selected alert mode. After issuing the alert at step 78, the method proceeds to step 80 where the processor subsystem 12 waits a selected period before taking any further action. The wait period is intended to provide sufficient time to see if the previously initiated corrective action eliminates the hazardous condition. As disclosed herein, a wait period of 10 seconds is suitable. However, wait periods of various lengths should be equally suitable for the uses contemplated herein.

Upon expiration of the wait period, the value of the expression ALARM is incremented by one at step 82 and, at step 84, the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. The method returns to step 64 where the distance between the vehicle and the object in its path is

11

re-determined. The processor subsystem 12 continues to take corrective action until it determines that the vehicle is no longer being operated in a hazardous manner. More specifically, the processor subsystem 12 will conclude that the hazardous condition has been corrected when it either: determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle, determines at step 68 that the vehicle brake is on or determines at step 70 that the speed of the vehicle is less than 35 mph. Upon making such a determination, the method proceeds to step 86 where the processor subsystem 12 deactivates the vehicle proximity alarm circuit 40 to turn off the flashing light.

The method of optimizing vehicle operation in accordance with the teachings of the present invention will now be described in greater detail. Returning now to step 58, if the processor subsystem 12 determines that the vehicle is travelling slower than 50 mph, or if the processor subsystem 12 determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle or if the processor subsystem 12 determines at step 68 that the vehicle brake is on or if the processor subsystem 12 determines at step 70 that the speed of the vehicle is less than 35 mph, the method proceeds, after deactivation of the vehicle proximity alarm circuit 40, to step 88 where the processor subsystem 12 determines if the road speed of the vehicle is changing. To do so, the processor subsystem 12 compares the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b.

If the vehicle speed maintained in the first register 14a is greater than the vehicle speed maintained in the second register 14b, the vehicle is accelerating. If so, the method continues to step 90 where the processor subsystem 12 determines if the throttle position is increasing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has not increased, the processor subsystem 12 determines that, since the vehicle is accelerating but fuel consumption is not increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 90 that the throttle position has increased, the method proceeds to step 92 where the processor subsystem 12 determines if the manifold pressure level maintained in the first register 14a has exceeded the manifold pressure set point for the vehicle. If the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is at or below the manifold pressure set point, the processor subsystem 12 proceeds to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are again polled and on to step 94 where the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the RPM set point stored in the memory subsystem 14 to determine if the engine speed has reached the RPM set point. If the engine speed has not reached the RPM set point, the method returns to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are repeatedly polled until the processor subsystem 12 determines that the engine speed has reached the RPM set point. Once the engine speed has reached the RPM set point, the processor subsystem 12 determines that the vehicle needs to be upshifted and, proceeding to step 95, the processor subsystem 12 will activate the upshift notification circuit 34 to issue an audible alert for a selected time period,

12

for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, an upshift should be performed. The method then returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

Returning to step 92, if the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is above the manifold pressure set point, the processor subsystem 12 determines that too much fuel is being provided to the engine and proceeding to step 96, the processor subsystem 12 will activate the overinjection notification circuit 38 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. The method then returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

Returning to step 88, if the processor subsystem 12 determines, when comparing the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b, that the speed of the vehicle is decreasing, the method proceeds to step 98 where the processor subsystem 12 determines if the throttle position is changing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has either remained constant or decreased, the processor subsystem 12 determines that, since fuel consumption is either constant or reduced, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 98 that the throttle position has increased, the method proceeds to step 100 where the processor subsystem 12 determines if the manifold pressure is increasing. To do so, the processor subsystem 12 compares the manifold pressure level maintained in the first register 14a to the manifold pressure level maintained in the second register 14b. If the manifold pressure level maintained in the first register 14a is less than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that, since manifold pressure is decreasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the manifold pressure level maintained in the first register 14a is greater than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that the manifold pressure for the vehicle is increasing and the method proceeds to step 102 where the processor subsystem 12 determines if the engine speed is increasing. To do so, the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the engine speed level maintained in the second register 14b. If the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since engine speed is increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22, 24, 30 and 32.

If, however, the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since the manifold pressure is increasing while

## 13

the engine speed is decreasing, too much fuel is being supplied to the engine. Accordingly, at step 104, the processor subsystem 12 activates the overinjection notification circuit 38 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced.

Proceeding on to step 106, the sensors 18, 20, 22 24, 30 and 32 are again polled and, at step 108, the processor subsystem 12 determines if the engine speed is decreasing, again by comparing the engine speed level maintained in the first and second registers 14a and 14b. If the engine speed has not decreased, the method returns to step 104 where the processor subsystem 12 again activates the overinjection notification circuit 38 to issue another audible alert notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. Thus, the driver will be repeatedly notified of the overinjection condition until the processor subsystem 12 determines, at step 108, that the engine speed is decreasing. The method will then proceed to step 110 where, since the processor subsystem 12 has determined that, since the engine speed is decreasing, the vehicle should be downshifted. Accordingly, at step 110, the processor subsystem 12 activates the downshift notification circuit 36 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the vehicle should be downshifted. The method then returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32. The method will repeatedly loop through the aforementioned process to continuously determine if the vehicle is being operated unsafely, take appropriate corrective action and to provide notifications to the driver as to how operation of the vehicle may be optimized until the processor subsystem 12 is powered down or the vehicle is turned off.

Thus, there has been described and illustrated herein, an apparatus for optimizing vehicle operation which combines both operator notifications of recommended corrections in vehicle operation with automatic modification of vehicle operation under certain circumstances. By incorporating the disclosed apparatus in a vehicle, not only will certain hazardous operations of the vehicle be prevented but also the driver will be advised of certain actions which will enable the vehicle to be operated with greater fuel efficiency. However, those skilled in the art will recognize that many modifications and variations besides those specifically mentioned herein may be made without departing substantially from the concept of the present invention. Accordingly, it should be clearly understood that the form of the invention described herein is exemplary only and is not intended as a limitation on the scope of the invention.

What is claimed is:

1. Apparatus for optimizing operation of a vehicle, comprising:
  - a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;
  - a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;
  - a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

## 14

- a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;
  - an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;
  - said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.
2. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:
    - means for determining when road speed for said vehicle is increasing;
    - means for determining when throttle position for said vehicle is increasing; and
    - means for comparing manifold pressure to said manifold pressure set point;
 said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.
  3. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.
  4. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:
    - means for determining when road speed for said vehicle is decreasing;
    - means for determining when throttle position for said vehicle is increasing;
    - means for determining when manifold pressure for said vehicle is increasing; and
    - means for determining when engine speed for said vehicle is decreasing;
 said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.
  5. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:
    - means for determining when road speed for said vehicle is increasing;
    - means for determining when throttle position for said vehicle is increasing;
    - means for comparing manifold pressure to said manifold pressure set point; and
    - means for comparing engine speed to said RPM set point;
 said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.
  6. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

15

- 7. Apparatus for optimizing operation of a vehicle, comprising:
  - a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;
  - a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;
  - a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;
  - a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;
  - a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and
  - said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.
- 8. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:
  - means for determining when road speed for said vehicle is increasing;
  - means for determining when throttle position for said vehicle is increasing; and
  - means for comparing manifold pressure to said manifold pressure set point;
  - said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.
- 9. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.
- 10. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:
  - means for determining when road speed for said vehicle is decreasing;
  - means for determining when throttle position for said vehicle is increasing;
  - means for determining when manifold pressure for said vehicle is increasing; and
  - means for determining when engine speed for said vehicle is decreasing;
  - said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.
- 11. Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.
- 12. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

16

- means for determining when road speed for said vehicle is decreasing;
- means for determining when throttle position for said vehicle is increasing;
- means for determining when manifold pressure for said vehicle is increasing; and
- means for determining when engine speed for said vehicle is decreasing;
- said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.
- 13. Apparatus for optimizing operation of a vehicle, comprising:
  - a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;
  - a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;
  - a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;
  - a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;
  - an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;
  - a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;
  - said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.
- 14. Apparatus for optimizing operation of a vehicle according to claim 13 wherein:
  - said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;
  - said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and
  - said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.
- 15. Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:
  - means for determining when road speed for said vehicle is increasing or decreasing
  - means for determining when throttle position for said vehicle is increasing;
  - means for comparing manifold pressure to said manifold pressure set point;
  - means for comparing engine speed to said RPM set point;

17

means for determining when manifold pressure is increasing; and  
 means for determining when engine speed is increasing or decreasing;  
 said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;  
 said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and  
 said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. Apparatus for optimizing operation of a vehicle according to claim 15 wherein:  
 said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;  
 said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and  
 said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. Apparatus for optimizing operation of a vehicle, comprising:  
 a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;  
 at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;  
 a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;  
 a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;  
 a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;  
 a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;  
 an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;  
 said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate

18

said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein:  
 said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and  
 said memory subsystem further storing a second vehicle speed/stopping distance table.

19. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:  
 a throttle controller for controlling a throttle of said engine of said vehicle; and  
 said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.

21. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:  
 means for counting a total number of vehicle proximity alarms determined by said processor subsystem;  
 means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:  
 a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and  
 said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. Apparatus for optimizing operation of a vehicle, comprising:  
 a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;  
 a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;  
 a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;  
 a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;  
 a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;  
 an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;  
 said processor subsystem determining, based upon data received from said plurality of sensors, when to activate

19

vate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

24. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

- means for determining when road speed for said vehicle is increasing or decreasing;
- means for determining when throttle position for said vehicle is increasing or decreasing; and
- means for comparing manifold pressure to said manifold pressure set point;
- means for determining when manifold pressure for said vehicle is increasing or decreasing; and
- means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

- means for determining when road speed for said vehicle is increasing;
- means for determining when throttle position for said vehicle is increasing;
- means for comparing manifold pressure to said manifold pressure set point; and
- means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. Apparatus for optimizing operation of a vehicle, comprising:

- a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;
- a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;
- a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;
- a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

20

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

- means for determining when road speed for said vehicle is decreasing;
- means for determining when throttle position for said vehicle is increasing;
- means for determining when manifold pressure for said vehicle is increasing; and
- means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. Apparatus for optimizing operation of a vehicle, comprising:

- a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;
- a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;
- a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. Apparatus according to claim 28 and further comprising:

- a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

- (1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;
- (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

and

21

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle exceeds said manifold pressure set point.

30. Apparatus according to claim 28, wherein: said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

22

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.

32. Apparatus for optimizing operation of a vehicle according to claim 31 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

## **EXHIBIT 2**

4. On information and belief, Defendant Audi of America, LLC is a corporation organized under the laws of the state of Delaware with an office and principal place of business located at 220 Ferdinand Porsche Dr., Herndon, VA 20171.

5. Audi advertises, markets, and distributes automobiles under the Audi brand throughout the United States.

#### **JURISDICTION AND VENUE**

6. This Court has jurisdiction over the subject matter of this action pursuant to 28 U.S.C. §§ 1331 and 1338(a).

7. This Court has personal jurisdiction over Audi because Audi has committed, and continues to commit, acts of patent infringement in Illinois, including in this judicial district, and otherwise transacts business in the state of Illinois, including in this district.

8. Venue is proper in this District under 28 U.S.C. §§ 1391(b)-(d) and 1400(b) because Audi is subject to personal jurisdiction in this judicial district and has committed, and continues to commit, acts of patent infringement giving rise to the claims alleged herein within this judicial district.

#### **THE PATENT-IN-SUIT**

9. On September 21, 1999, U.S. Patent No. 5,954,781 (“the ‘781 Patent”), entitled “METHOD AND APPARATUS FOR OPTIMIZING VEHICLE OPERATION” (Exhibit A), duly and legally issued.

10. Velocity owns all rights, title, and interest in and to the ‘781 patent and has the right to sue and recover for past, present, and future infringement.

**COUNT I - INFRINGEMENT OF THE '781 PATENT**

11. Paragraphs 1 through 10 are incorporated by reference as though fully stated herein.

12. Audi manufactures, uses, imports, offers for sale, and sells automobiles that include radar equipment and radar-based safety features, including, for example, automobiles equipped with a Driver Assistance package.

13. Audi also manufactures, uses, imports, offers for sale, and sells automobiles with information displays that provide drivers with information regarding, for example, fuel consumption, efficiency of operation, and safety.

14. Additionally, Audi manufactures, uses, imports, offers for sale, and sells automobiles that include engines with cylinder on demand technology, which allows the engine to switch between a mode in which all of the engine cylinders are active, and a mode in which only a portion of the engine cylinders are active.

15. Furthermore, Audi manufactures, uses, imports, offers for sale, and sells automobiles that include manual gear shifting features, including, for example, automobiles equipped with automatic transmissions and a manual shift program.

16. By manufacturing, using, importing, offering for sale, and selling automobiles equipped with one or more of the features described above, Audi has directly infringed, and continues to infringe, either literally or under the doctrine of equivalents, at least claim 17 of the '781 Patent in violation of 35 U.S.C. § 271.

17. Velocity has been damaged by Audi's infringement of the '781 Patent.

**PRAYER FOR RELIEF**

**WHEREFORE**, Plaintiff Velocity prays that this Court:

- A. Enter a judgment that Audi has infringed the '781 Patent;
- B. Award Velocity damages in an amount sufficient to compensate Velocity for Audi's infringement of the '781 Patent, but not less than a reasonable royalty;
- C. Award Velocity prejudgment interest pursuant to 35 U.S.C. § 284; and
- D. Grant Velocity such other and further relief as this Court may deem just and proper.

**JURY DEMAND**

Velocity hereby demands a jury trial on all issues appropriately triable by a jury.

Dated: November 21, 2013

[57] **ABSTRACT**

Apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, a road speed sensor, an engine speed sensor, a manifold pressure sensor, a throttle position sensor, a radar detector for determining the distance separating the vehicle from an object in front of it, a windshield wiper sensor for indicating whether a windshield wiper of the vehicle is activated, a brake sensor for determining whether the brakes of the vehicle have been activated, a fuel over-injection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, a downshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an insufficient engine speed, a vehicle proximity alarm circuit for issuing an alarm that the vehicle is too close to an object in front of the vehicle and a throttle controller for automatically reducing the amount of fuel supplied to the engine if the vehicle is too close to the object in front of it. Based upon data received from the sensors and data stored in the memory subsystem, the processor determines whether to activate the fuel overinjection notification circuit, the upshift notification circuit, the downshift notification circuit, the vehicle proximity alarm circuit or the throttle controller.

**METHOD AND APPARATUS FOR  
OPTIMIZING VEHICLE OPERATION**

**BACKGROUND OF THE INVENTION**

1. Field of the Invention

The present invention generally relates to an apparatus for optimizing vehicle operation and, more particularly, relates to a system which both notifies the driver of recommended corrections in vehicle operation and, under certain conditions, automatically initiates selected corrective action.

2. Description of Related Art

It has long been recognized that the improper operation of a vehicle may have many adverse effects. For example, the fuel efficiency of a vehicle may vary dramatically based upon how the vehicle is operated. More specifically, operating a vehicle at excessive speed, excessive RPM and/or excessive manifold pressure will result in both reduced fuel economy and increased operating costs. The aforementioned increased operating costs can be quite considerable, particularly for an owner or operator of a fleet of vehicles. To correct these types of improper vehicle operations are often surprisingly simple. For example, upshifting the drive gear will typically eliminate an excessive RPM condition. However, even when the solution is quite simple, oftentimes, the driver will be unaware of the need to take corrective action.

A variety of patents have disclosed systems, commonly referred to as "shift prompters", which monitor the operation of a vehicle and advises the operator of the vehicle when to take certain actions. Numerous ones of these devices include sensors which measure engine speed and vehicle speed. See, for example, U.S. Pat. No. 4,492,112 to Igarashi et al., U.S. Pat. No. 4,631,515 to Blee et al. and U.S. Pat. No. 4,701,852 to Ulveland. Certain ones, however, disclose the use of other types of sensors as well. For example, U.S. Pat. No. 4,524,460 to Weber is directed to a driving aid indicator which includes vehicle speed, manifold pressure, throttle position and engine speed sensors. U.S. Pat. No. 4,752,883 to Asakura et al. and U.S. Pat. No. 4,868,756 to Kawanabe et al. are directed to upshift notification devices which include sensors for measuring engine speed, vehicle speed, manifold pressure and cooling water temperature. Finally, U.S. Pat. No. 4,853,673 to Kido et al. discloses a shift indicator system which includes sensors for measuring engine speed and throttle position. Generally, the above-listed patents all provide displays intended to enable the driver to operate the vehicle in a manner leading to uniform performance and maximum fuel economy. However, Blee et al. discloses the use of audible warnings as well as a speed controller to prevent further increases in engine speed if the driver ignores previously issued warnings.

Improper vehicle operation has other adverse effects as well. It is well known that the faster a vehicle travels, the longer it takes to stop. Thus, what may be a safe separation distance between successive vehicles when a vehicle is traveling at 35 mph may be unsafe if that vehicle is traveling at 50 mph. Road conditions also play a role in determining the safe separation distance between vehicles. For example, greater separation distances are generally recommended when roads are wet. As a result, therefore, based on the combination of a vehicle's speed, the distance separating the vehicle from a second vehicle in front of it and road conditions, many vehicles are operated unsafely. To correct this situation, a reduction in operating speed, an increase in vehicle separation or some combination thereof, is required.

It may be readily seen from the foregoing that it would be desirable to provide a system which integrates the ability to

2

issue audible warnings which advise the driver to correct operation of the vehicle in a manner which will enhance the efficient operation thereof with the ability to automatically take corrective action if the vehicle is being operated unsafely. It is, therefore, the object of the invention to provide such a system.

**SUMMARY OF THE INVENTION**

In one embodiment, the present invention is directed to an apparatus for optimizing operation of an engine-driven vehicle. The apparatus includes a processor subsystem, a memory subsystem, plural sensors, including road speed, manifold pressure and throttle position sensors, for collectively monitoring operation of the vehicle and a fuel overinjection notification circuit for issuing notifications that excessive fuel is being supplied to the engine of the vehicle. The processor subsystem receives data from the sensors and, from the received data, determines when to activate the fuel overinjection circuit. In one aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure and a manifold pressure set point stored in the memory subsystem and activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point.

In further aspects thereof, the sensors may include an engine speed sensor and the processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the fuel overinjection notification circuit if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing.

In still further aspects thereof, the apparatus may also include an upshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues notifications that the engine of the vehicle is being operated at excessive engine speeds. In this aspect, the processor subsystem determines when road speed for the vehicle is increasing, when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, compares engine speed to an RPM set point stored in the memory subsystem and activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point.

In still yet further aspects thereof, the apparatus may also include a downshift notification circuit, activated by the processor subsystem based upon data received from the sensors, which issues a notification that the engine of the vehicle is being operated at an insufficient engine speed. The processor subsystem may determine when road speed for the vehicle is decreasing, when throttle position for the vehicle is increasing, when manifold pressure for the vehicle is increasing, when engine speed for the vehicle is decreasing and may activate the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In still further aspects thereof, the fuel overinjection circuit, the upshift notification circuit or the downshift

5,954,781

3

notification circuit may include a horn for issuing a tone for a preselected time period.

In another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle. The apparatus includes road speed, engine speed, manifold pressure and throttle position sensors, a processor subsystem coupled to each of the sensors to receive data therefrom and a memory subsystem, coupled to the processor subsystem, for storing a manifold pressure set point, an engine speed set point and present and prior levels for each one of the sensors. The apparatus further includes a fuel overinjection notification circuit, an upshift notification circuit and a downshift notification circuit, all of which are coupled to the processor subsystem. The fuel overinjection notification circuit issues notifications that excessive fuel is being supplied to the engine of the vehicle, the upshift notification circuit issues notifications that the engine of the vehicle is being operated at an excessive engine speed and the downshift notification circuit issues notifications that the engine of the vehicle is being operated at an insufficient engine speed. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit, the upshift notification circuit and the downshift notification circuit. In one aspect thereof, the fuel overinjection circuit includes a first horn for issuing a first tone for a first preselected time period, the upshift notification circuit includes a second horn for issuing a second tone for a second preselected time period and the downshift notification circuit includes a third horn for issuing a third tone for a third preselected time period.

In another aspect thereof, the processor subsystem may determine when road speed for the vehicle is increasing or decreasing, engine speed is increasing or decreasing, throttle position for the vehicle is increasing and manifold pressure is increasing; may compare manifold pressure to the manifold pressure set point and engine speed to the RPM set point; and may activate the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle are increasing and road speed and engine speed for the vehicle are decreasing, the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point and the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

In another aspect, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating a vehicle having an engine and an object in front of the vehicle and at least one sensor for monitoring operation of the vehicle. The apparatus further includes a processor subsystem, a memory subsystem and a vehicle proximity alarm circuit. The processor subsystem is coupled to the radar detector and the at least one sensor to receive data therefrom while the memory subsystem, in which a first vehicle speed/stopping distance table and present levels for each one of the at least one sensor are stored, and the vehicle proximity alarm circuit are coupled to the processor subsystem. Based on data received from the radar detector, the at least one sensor and the contents of the memory subsystem, the processor determines when to instruct the vehicle proximity alarm circuit to issue an alarm that the vehicle is too close to the object.

In one aspect thereof, the at least one sensor further includes a windshield wiper sensor for indicating whether a

4

windshield wiper of the vehicle is activated and a second vehicle speed/stopping distance table is stored in the memory subsystem. In another aspect thereof, the apparatus further includes a throttle controller for controlling a throttle of the engine of the vehicle. The processor subsystem may selectively reduce the throttle based upon data received from the radar detector, the at least one sensor and the memory subsystem or may also count a total number of vehicle proximity alarms determined by the processor subsystem and selectively reduce the throttle based upon the total number of vehicle proximity alarms, as well. In yet another aspect thereof, the at least one sensor further includes a brake sensor for indicating whether a brake system of the vehicle is activated.

In other aspects thereof, the apparatus may be further provided with a fuel overinjection notification circuit for issuing a notification that excessive fuel is being supplied to the engine of the vehicle, an upshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an excessive engine speed or a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. If a fuel overinjection notification circuit is provided, the apparatus includes a manifold pressure sensor and a throttle position sensor which also provide the processor subsystem with data used, together with a manifold pressure set point and prior levels for the sensors stored in the memory subsystem, to determine when to activate the fuel overinjection circuit. If an upshift notification circuit is provided, the apparatus includes an engine speed sensor which also provides the processor subsystem with data used, together with an RPM set point stored in the memory subsystem, to determine when to activate the upshift notification circuit. Finally, if a downshift notification circuit is provided, the processor subsystem determines when to activate the downshift notification circuit based upon the data received from the plurality of sensors.

In still another embodiment, the present invention is of an apparatus for optimizing operation of a vehicle which includes a radar detector for determining a distance separating the vehicle from an object in front of it, a plurality of sensors, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor, which collectively monitor the operation of the vehicle, a processor subsystem, a memory subsystem, a fuel overinjection notification circuit for issuing notification that excessive fuel is being supplied to the engine of the vehicle and a vehicle proximity alarm circuit for issuing alarms if the vehicle is too close to the object. Based upon data received from the sensors, the processor subsystem determines when to activate the fuel overinjection circuit. Based upon data received from the radar detector, the sensors and the memory subsystem, the processor subsystem also determines when to activate the vehicle proximity alarm circuit.

In one aspect of this embodiment of the invention, the processor subsystem determines when road speed for the vehicle is increasing or decreasing, when throttle position for the vehicle is increasing or decreasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem, determines when manifold pressure for the vehicle is increasing or decreasing and determines when engine speed for the vehicle is increasing or decreasing. In this aspect, the processor subsystem activates the fuel overinjection notification circuit if both road speed and throttle position for the vehicle are increasing and manifold pressure for the vehicle is above the manifold pressure set point or if both throttle position and manifold pressure for the vehicle

5,954,781

5

are increasing and road speed and engine speed for the vehicle are decreasing.

In a further aspect thereof, the apparatus may also include an upshift notification circuit for issuing notifications that the engine of the vehicle is being operated at an excessive engine speed, the processor subsystem determining when to activate the upshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is increasing, determines when throttle position for the vehicle is increasing, compares manifold pressure to a manifold pressure set point stored in the memory subsystem and compares engine speed to an RPM set point stored in the memory subsystem. In this aspect, the processor subsystem activates the upshift notification circuit if both road speed and throttle position for the vehicle are increasing, manifold pressure for the vehicle is at or below the manifold pressure set point and engine speed for the vehicle is at or above the RPM set point.

In still another aspect thereof, the apparatus may also include a downshift notification circuit for issuing a notification that the engine of the vehicle is being operated at an insufficient engine speed. In this aspect, the processor subsystem determines when to activate the downshift notification circuit based upon data received from the sensors. In a related aspect thereof, the processor subsystem determines when road speed for the vehicle is decreasing, determines when throttle position for the vehicle is increasing, determines when manifold pressure for the vehicle is increasing and determines when engine speed for the vehicle is decreasing. In this aspect, the processor subsystem activates the downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for the vehicle are increasing.

#### BRIEF DESCRIPTION OF THE DRAWINGS

The present invention may be better understood, and its numerous objects, features and advantages will become apparent to those skilled in the art by reference to the accompanying drawing, in which:

FIG. 1 is a block diagram of an apparatus for optimizing vehicle performance constructed in accordance with the teachings of the present invention; and

FIGS. 2A–B is a flow chart of a method for optimizing vehicle performance in accordance with the teachings of the present invention.

#### DETAILED DESCRIPTION

Referring first to FIG. 1, a system 10 for optimizing vehicle performance constructed in accordance with the teachings of the present invention will now be described in greater detail. The system 10 includes a processor subsystem 12, for example, a microprocessor, and a memory subsystem 14, for example, the memory subsystem 14 may include a nonvolatile random access memory (or “NVRAM”), coupled together by a bus 16 for bi-directional exchanges of address, data and control signals therebetween. The system 10 is installed in a vehicle (not shown) for which optimized performance and driver assist capabilities are desired. Although it is contemplated that the system 10 is suitable for use with any type vehicle, most commonly, the system 10 shall be installed in a truck.

Also coupled to the processor subsystem 12 are a series of sensors, each of which are periodically polled by the processor subsystem 12, to determine the respective states or

6

levels thereof. The sensors include a road speed sensor 18, an RPM sensor 20, a manifold pressure sensor 22, a throttle sensor 24, a windshield wiper sensor 30 and a brake sensor 32. The sensors are selected to be either state or level sensors, depending on whether the information to be collected thereby is a state, i.e., on/off or a level, for example, 35 mph. The road speed sensor 18 and the RPM sensor 20 are level sensors which respectively provide the processor subsystem 12 with signals which indicate the operating speed and engine speed for the vehicle. The road speed sensor 18 and the RPM sensor 20 may derive such information from any one of a variety of sources. For example, the road speed sensor 18 may be connected to receive the speed input signal transmitted to the vehicle’s speedometer while the RPM sensor 20 may be connected to receive the RPM input signal to the vehicle’s tachometer.

The manifold pressure sensor 22 is a level sensor which is positioned downstream of the throttle valve in the intake manifold of the vehicle to measure manifold pressure thereat. The throttle sensor 24 is a level sensor, attached to the throttle, which measures the extent to which the throttle is opened. The windshield wiper sensor 30 is a state sensor which determines whether the vehicle’s windshield wipers are on or off. In alternate embodiments thereof, the windshield wiper sensor 30 may be electrically coupled to the on/off switch for the windshield wiper or to an output of the windshield wiper motor. Finally, the brake sensor 32 is a state sensor which determines whether the brakes of the vehicle have been engaged. For example, the brake sensor 32 may be electrically coupled to the brake system to detect the activation thereof.

Preferably, the memory subsystem 14 should include first and second registers 14a and 14b, each having sufficient bits for holding the state/level of each of the sensors 18, 20, 22, 24, 30 and 32. The first register 14a is used to hold the present state or level of each of the sensors 18, 20, 22, 24, 30 and 32 while the second register 14b is used to hold the prior state or level for each of the sensors 18, 20, 22, 24, 30 and 32. Each time the processor subsystem 12 writes the present state or level of the sensors 18, 20, 22, 24, 30 and 32 to the first register 14a, the prior contents of the first register 14a is written to the second register 14b which, in turn, discards the prior content thereof. The memory subsystem 14 is also used to hold information to be utilized by the processor subsystem 12 to determining whether to take corrective actions and/or issue notifications. Typically, such information is placed in the memory subsystem 14 while the system 10 is being initialized. The information includes one or more speed/distance tables which, when used in a manner which will be more fully described below in combination with data collected by the system 10, enable the processor subsystem 12 to determine if the vehicle is being operated unsafely and if corrective action is necessary. Speed/stopping distance table. The information also includes two pre-set threshold values—a manifold psi set point and an engine RPM set point. As will also be more fully described below, the processor subsystem 12 uses these threshold values to determine when to issue notifications as to recommended changes in vehicle operation which, when executed by the driver, will optimize vehicle operation. The speed/stopping distance table(s) are based upon National Safety Council guidelines, vary according to the class of the vehicle and provide the relationship between the speed at which a vehicle is travelling and the distance which the vehicle will require to come to a complete stop if travelling at that speed. The manifold psi set point and RPM set point are selected based upon the manufacturer’s guidelines for

5,954,781

7

proper operation of the vehicle, vary based upon horsepower and engine size for the vehicle and represent thresholds above which the manifold pressure and engine rotation speed, respectively, for the vehicle should never exceed.

The system 10 also includes a throttle controller 26 capable of opening and/or closing the throttle, a radar detector 28 positioned to determine the distance separating the vehicle and an object in front of the vehicle, for example, a second vehicle travelling in the same direction, a series of circuits 34, 36, 38 and 40 for notifying the driver of the vehicle of recommended corrections in vehicle operation and alerting the driver to unsafe operating conditions and a power supply, for example a +12 v battery, for providing power to the energy-demanding components of the system 10. The circuits 34, 36, 38 and 40 include an upshift notification circuit 34 for notifying the driver that an upshift is recommended, a downshift notification circuit 36 for notifying the driver that a downshift is recommended, an overinjection notification circuit 38 for notifying the driver that too much fuel is being supplied to the vehicle and a vehicle proximity alarm circuit 40 for alerting the driver when an object in front of the vehicle is too close. The circuits 34, 36 and 38 may be configured to provide visual and/or audible notifications, for example, using lights and/or horns. For example, the upshift circuit 34, the downshift notification circuit 36 and the overinjection notification circuit 38 may each include a horn, or other tone generating device, from which an audible notification may be generated at a selected pitch. Preferably, each of the notification circuits 34, 36 and 38 may be configured to provide distinct audible notifications, for example, tones at distinct pitches, so that the driver may readily distinguish which of the notification circuits 34, 36 and 38 have been activated by the processor subsystem 12. The proximity alarm circuit 40 may include one or more visual and/or audible warning devices such as lights and/or horns. For example, the proximity alarm circuit 40 may include a warning light and a warning horn. If desired, the proximity alarm circuit may also include a display for displaying the speed of the object in the vehicle's path and/or the stopping distance in feet. The proximity alarm circuit 40 may be further equipped to provide audible indications of the speed of the object in the vehicle's path and/or the stopping distance in feet as well as selector circuitry for selecting both the information to be provided as well as the manner in which the information is to be conveyed.

Finally, the processor subsystem 12 is further provided with one or more mode select input lines which enable operator configuration of the operation of the system 10. For example, as described herein, the corrective operations consist of the combination of an automatic reduction of throttle and audio/visual alerts that the vehicle is being operated unsafely. It is specifically contemplated, however, that the system 10 include a mode select line for switching the system 10 between an "active" mode where both automatic throttle reduction and audio/visual alerts are generated and an "inactive" mode where only audio/visual alerts are generated.

Referring next to FIGS. 2A-B, a method for optimizing vehicle performance in accordance with the teachings of the present invention will now be described in greater detail. The method commences by powering up the processor subsystem 12, for example, by closing switch 42, thereby coupling the processor subsystem 12 to the power source 44 via line 43. Alternately, the processor subsystem 12 may be connected to the electrical system of the vehicle such that it will automatically power up when the vehicle is started. Of

8

course, any of the other devices which also form part of the system 10 and require power may also be coupled to the line 43. Appropriate voltage levels for the processor subsystem 12, as well as any additional power-demanding devices coupled to the power source 44, would be provided by voltage divider circuitry (not shown).

Once the system 10 is powered up, the method begins at step 50 by the processor subsystem 12 polling the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 to determine their respective levels or states and places the acquired information in the first data register 14a. Of course, it should be noted, however, that polling of the sensors by the processor subsystem 12 is but one technique by which the processor subsystem 12 may acquire the requisite information. Alternately, each sensor 20, 22, 24, 30 and 32 may periodically place its level or state in one or more bits of the first data register 14a. The processor subsystem 12 would then acquire information by checking the contents of the first data register 14a at selected time intervals.

Proceeding to step 52, the processor subsystem 12 examines the contents of the first data register 14a to determine the operating speed of the vehicle. If the processor subsystem 12 determines that the vehicle is stationary, i.e., the operating speed of the vehicle is zero, the processor subsystem 12 will return to step 50 where the road speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32 will be repeatedly polled until an operating speed greater than zero is detected at step 52. While polling may be conducted at a variety of time intervals, a polling period of one second appears suitable for the uses contemplated herein.

Returning to step 52, once an operating speed greater than zero is detected by the processor subsystem 12, the method proceeds to step 54 where the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. In turn, the contents of the first data register 14a is placed in the second data register 14b.

Proceeding now to step 56, from the polled value of the road speed sensor 18, the processor subsystem 12 determines whether the vehicle is travelling faster than 20 mph. If the operating speed of the vehicle is less than 20 mph, the method returns to step 54 where the sensors 18, 20, 22, 24, 30 and 32 will be repeatedly polled and the value of the road speed sensor examined until the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph. If, however, the processor subsystem 12 determines that the vehicle is travelling faster than 20 mph, the method proceeds to step 58 where the processor subsystem 12 then determines if the vehicle is travelling faster than 50 mph, again by checking the contents of the first data register 14a.

Past this juncture, the method of the present invention will proceed through a series of steps designed to optimize vehicle operation. However, prior to optimizing vehicle operation, the processor subsystem 12 will determine if the vehicle is being operated unsafely. If so, the processor subsystem 12 will initiate corrective operations before commencing vehicle operation optimization. More specifically, if the processor subsystem 12 determines at step 58 that the vehicle is travelling at a speed greater than 50 mph, the

5,954,781

9

processor subsystem 12 will initiate a process by which it will determine whether the vehicle is being operated unsafely.

The processor subsystem 12 determines that the vehicle is being operated unsafely if the speed of the vehicle is such that the stopping distance for the vehicle *d* is greater than the distance separating the vehicle from an object, for example, a second vehicle, in its path. In order to make this determination, the processor subsystem 12 is provided access to at least one speed/distance table. For example, stored at location 14c within the memory subsystem 14 is a first speed/stopping distance table. The speed/stopping distance table contains the relationship between vehicle speed and stopping distance. Thus, for any given speed, the processor subsystem 12 may look-up the stopping distance for that speed. Preferably, the memory subsystem 14 should contain multiple speed/stopping distance tables so that differences in road conditions and/or vehicle class may be taken into account. For example, the speed/stopping distance table stored at location 14c may be a speed/stopping distance table for dry roads while a speed/stopping distance table for wet roads may be stored at location 14d. If desired, the memory subsystem 14 may also contain additional speed/stopping distance tables for other vehicle classes. If such additional tables were provided, however, the disclosed method would need to be modified to include additional steps in which the operator provides the vehicle's class and the processor subsystem 12 selects the appropriate speed/stopping distance tables for the indicated class of vehicle.

To make the aforementioned determination of unsafe vehicle operation, the method proceeds to step 60 where the processor subsystem 12 sets the value of the expression ALARM to 1. The method then proceeds to step 62 where the processor subsystem 12 examines the state of the wiper sensor 32 and selects a speed/stopping distance table based upon the state of the wiper sensor 32. If the state of the wiper sensor 32 indicates that the windshield wiper is off, the processor subsystem 12 concludes that the vehicle is being operated in dry conditions and selects the speed/stopping distance table stored at the location 14c of the memory subsystem 14. If, however, the state of the wiper sensor 32 indicates that the windshield wiper is on, the processor subsystem 12 concludes that the vehicle is being operated in wet conditions and selects the speed/stopping distance table stored at the location 14d of the memory subsystem 14. From the selected speed/stopping distance table 14c or 14d, the processor subsystem 12 then retrieves the stopping distance for the speed at which the vehicle is travelling.

Continuing on to step 64, the processor subsystem 12 determines the distance of the vehicle to an object in its path, i.e., a second vehicle travelling in front of the vehicle and in the same direction. To do so, the processor subsystem 12 instructs the radar device 28 to determine the distance between the vehicle and the second vehicle in front of it. Upon determining the distance separating the two vehicles, the radar device 28 transmits the determined separation distance to the processor subsystem 12. At step 66, the processor subsystem 12 determines if the two vehicles are separated by a safe distance. To do so, the processor subsystem 12 compares the distance separating the two vehicles to the retrieved stopping distance for the vehicle. If the determined distance separating the two vehicles is greater than the retrieved stopping distance for the vehicle, the processor subsystem 12 determines that the vehicle is being operated safely. If, however, the determined distance separating the two vehicles is less than the retrieved stopping distance, the processor subsystem 12 determines that the vehicle is being operated unsafely.

10

If the processor subsystem 12 determines at step 66 that the vehicle is being operated unsafely, the processor subsystem 12 initiates appropriate corrective action. At step 68, the processor subsystem 12 determines whether the vehicle brake is on by examining the state of the brake sensor 32. If the brake is on, the processor subsystem 12 concludes that the driver is taking corrective action and that further corrective action is not necessary. If, however, the processor subsystem 12 determines that the vehicle brake is off, the method proceeds to step 70 where the processor subsystem 12 examines the level of the vehicle speed sensor to determine if the speed of the vehicle is less than 35 mph. If the speed of the vehicle is less than 30 mph, the processor subsystem 12 concludes that no further corrective action will be taken.

If, however, the processor subsystem 12 determines that the speed of the vehicle is greater than 35 mph, the method proceeds to step 72 where the processor subsystem 12 selects a throttle reduction value based upon the value of the expression ALARM. Generally, the severity of the corrective action to be initiated by the processor subsystem 12 is varied depending on the number of times that corrective action has been taken and, more specifically, the severity of the selective corrective action increases with the value of the expression ALARM. For example, in the embodiment of the invention disclosed herein, if ALARM=1, a 25% throttle reduction is selected, if ALARM=2, a 50 throttle reduction is selected and, if ALARM $\geq$ 3, a 100% throttle reduction is selected. By reducing the throttle, the transport of fuel to the engine is retarded and the vehicle will begin to decelerate.

Continuing on to step 74, the processor subsystem 12 determines the extent to which the throttle is open using the throttle level provided by the throttle sensor 24 and, using throttle control 26, reduces the throttle by the selected percentage. At step 76, the processor subsystem 12 selects an alert mode, again based upon the value of the expression ALARM. As before, the severity of the alert mode may increase with the value of ALARM. For example, when ALARM=1, a warning light may be activated in a flash mode while, when  $2 \leq \text{ALARM} \leq 3$ , an audible alert which lasts for a first selected time period, for example, two seconds, may be activated in combination with the flashing warning light and when ALARM $\geq$ 4, an audible alert which lasts for a second, longer, time period, for example, six seconds, may be activated in combination with the flashing light.

Proceeding to step 78, the processor subsystem 12 issues an alert to the operator of the vehicle in accordance with the selected alert mode. To do so, the processor subsystem 12 activates vehicle proximity alarm circuit 40 in accordance with the selected alert mode. After issuing the alert at step 78, the method proceeds to step 80 where the processor subsystem 12 waits a selected period before taking any further action. The wait period is intended to provide sufficient time to see if the previously initiated corrective action eliminates the hazardous condition. As disclosed herein, a wait period of 10 seconds is suitable. However, wait periods of various lengths should be equally suitable for the uses contemplated herein.

Upon expiration of the wait period, the value of the expression ALARM is incremented by one at step 82 and, at step 84, the processor subsystem 12 again polls the operating speed sensor 18, the RPM sensor 20, the manifold pressure sensor 22, the throttle sensor 24, the windshield wiper sensor 30 and the brake sensor 32, to determine their respective levels or states and places the acquired information in the first data register 14a. The method returns to step 64 where the distance between the vehicle and the object in its path is

5,954,781

11

re-determined. The processor subsystem 12 continues to take corrective action until it determines that the vehicle is no longer being operated in a hazardous manner. More specifically, the processor subsystem 12 will conclude that the hazardous condition has been corrected when it either: determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle, determines at step 68 that the vehicle brake is on or determines at step 70 that the speed of the vehicle is less than 35 mph. Upon making such a determination, the method proceeds to step 86 where the processor subsystem 12 deactivated the vehicle proximity alarm circuit 40 to turn off the flashing light.

The method of optimizing vehicle operation in accordance with the teachings of the present invention will now be described in greater detail. Returning now to step 58, if the processor subsystem 12 determines that the vehicle is travelling slower than 50 mph, or if the processor subsystem 12 determines at step 66 that the distance separating the vehicle and the object is within the stopping distance for the vehicle or if the processor subsystem 12 determines at step 68 that the vehicle brake is on or if the processor subsystem 12 determines at step 70 that the speed of the vehicle is less than 35 mph, the method proceeds, after deactivation of the vehicle proximity alarm circuit 40, to step 88 where the processor subsystem 12 determines if the road speed of the vehicle is changing. To do so, the processor subsystem 12 compares the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b.

If the vehicle speed maintained in the first register 14a is greater than the vehicle speed maintained in the second register 14b, the vehicle is accelerating. If so, the method continues to step 90 where the processor subsystem 12 determines if the throttle position is increasing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has not increased, the processor subsystem 12 determines that, since the vehicle is accelerating but fuel consumption is not increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 90 that the throttle position has increased, the method proceeds to step 92 where the processor subsystem 12 determines if the manifold pressure level maintained in the first register 14a has exceeded the manifold pressure set point for the vehicle. If the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is at or below the manifold pressure set point, the processor subsystem 12 proceeds to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are again polled and on to step 94 where the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the RPM set point stored in the memory subsystem 14 to determine if the engine speed has reached the RPM set point. If the engine speed has not reached the RPM set point, the method returns to step 93 where the sensors 18, 20, 22, 24, 30 and 32 are repeatedly polled until the processor subsystem 12 determines that the engine speed has reached the RPM set point. Once the engine speed has reached the RPM set point, the processor subsystem 12 determines that the vehicle needs to be upshifted and, proceeding to step 95, the processor subsystem 12 will activate the upshift notification circuit 34 to issue an audible alert for a selected time period,

12

for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, an upshift should be performed. The method then returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

Returning to step 92, if the vehicle's road speed and throttle position are increasing and the manifold pressure for the vehicle is above the manifold pressure set point, the processor subsystem 12 determines that too much fuel is being provided to the engine and proceeding to step 96, the processor subsystem 12 will activate the overinjection notification circuit 38 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. The method then returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

Returning to step 88, if the processor subsystem 12 determines, when comparing the speed of the vehicle maintained in the first register 14a to the speed of the vehicle maintained in the second register 14b, that the speed of the vehicle is decreasing, the method proceeds to step 98 where the processor subsystem 12 determines if the throttle position is changing. To do so, the processor subsystem 12 compares the throttle level, i.e., the extent to which the throttled is opened, maintained in the first register 14a to the throttle level maintained in the second register 14b. If the throttle position has either remained constant or decreased, the processor subsystem 12 determines that, since fuel consumption is either constant or reduced, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

If, however, the processor subsystem 12 determines at step 98 that the throttle position has increased, the method proceeds to step 100 where the processor subsystem 12 determines if the manifold pressure is increasing. To do so, the processor subsystem 12 compares the manifold pressure level maintained in the first register 14a to the manifold pressure level maintained in the second register 14b. If the manifold pressure level maintained in the first register 14a is less than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that, since manifold pressure is decreasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

If, however, the manifold pressure level maintained in the first register 14a is greater than the manifold pressure level maintained in the second register 14b, the processor subsystem 12 determines that the manifold pressure for the vehicle is increasing and the method proceeds to step 102 where the processor subsystem 12 determines if the engine speed is increasing. To do so, the processor subsystem 12 compares the engine speed level maintained in the first register 14a to the engine speed level maintained in the second register 14b. If the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since engine speed is increasing, no modification of vehicle operation is necessary. Accordingly, the method returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32.

If, however, the engine speed level maintained in the first register 14a is less than the engine speed level maintained in the second register 14b, the processor subsystem 12 determines that, since the manifold pressure is increasing while

5,954,781

13

the engine speed is decreasing, too much fuel is being supplied to the engine. Accordingly, at step 104, the processor subsystem 12 activates the overinjection notification circuit 38 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced.

Proceeding on to step 106, the sensors 18, 20, 22 24, 30 and 32 are again polled and, at step 108, the processor subsystem 12 determines if the engine speed is decreasing, again by comparing the engine speed level maintained in the first and second registers 14a and 14b. If the engine speed has not decreased, the method returns to step 104 where the processor subsystem 12 again activates the overinjection notification circuit 38 to issue another audible alert notifying the driver that, in order to optimize vehicle operation, the amount of fuel being supplied to the engine should be reduced. Thus, the driver will be repeatedly notified of the overinjection condition until the processor subsystem 12 determines, at step 108, that the engine speed is decreasing. The method will then proceed to step 110 where, since the processor subsystem 12 has determined that, since the engine speed is decreasing, the vehicle should be downshifted. Accordingly, at step 110, the processor subsystem 12 activates the downshift notification circuit 36 to issue an audible alert for a selected time period, for example, 6 seconds, thereby notifying the driver that, in order to optimize vehicle operation, the vehicle should be downshifted. The method then returns to step 54 for a next polling of the sensors 18, 20, 22 24, 30 and 32. The method will repeatedly loop through the aforementioned process to continuously determine if the vehicle is being operated unsafely, take appropriate corrective action and to provide notifications to the driver as to how operation of the vehicle may be optimized until the processor subsystem 12 is powered down or the vehicle is turned off.

Thus, there has been described and illustrated herein, an apparatus for optimizing vehicle operation which combines both operator notifications of recommended corrections in vehicle operation with automatic modification of vehicle operation under certain circumstances. By incorporating the disclosed apparatus in a vehicle, not only will certain hazardous operations of the vehicle be prevented but also the driver will be advised of certain actions which will enable the vehicle to be operated with greater fuel efficiency. However, those skilled in the art will recognize that many modifications and variations besides those specifically mentioned herein may be made without departing substantially from the concept of the present invention. Accordingly, it should be clearly understood that the form of the invention described herein is exemplary only and is not intended as a limitation on the scope of the invention.

What is claimed is:

1. Apparatus for optimizing operation of a vehicle, comprising:

- a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;
- a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;
- a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

14

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.

2. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing; and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

3. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

4. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing; and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

5. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point; and

means for comparing engine speed to said RPM set point; said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

6. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said upshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

5,954,781

15

7. Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.

8. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing; and

means for comparing manifold pressure to said manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.

9. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said fuel overinjection circuit further comprises a horn for issuing a tone for a preselected time period.

10. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing; and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

11. Apparatus for optimizing operation of a vehicle according to claim 10 wherein said downshift notification circuit further comprises a horn for issuing a tone for a preselected time period.

12. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:

16

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing; and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

13. Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.

14. Apparatus for optimizing operation of a vehicle according to claim 13 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

15. Apparatus for optimizing vehicle performance according to claim 13 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point;

means for comparing engine speed to said RPM set point;

5,954,781

17

means for determining when manifold pressure is increasing; and

means for determining when engine speed is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

16. Apparatus for optimizing operation of a vehicle according to claim 15 wherein:

said fuel overinjection circuit further comprises a first horn for issuing a first tone for a first preselected time period;

said upshift notification circuit further comprises a second horn for issuing a second tone for a second preselected time period; and

said downshift notification circuit further comprises a third horn for issuing a third tone for a third preselected time period.

17. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

a fuel overinjection circuit coupled to said processor subsystem, said fuel overinjection circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate

18

said vehicle proximity alarm circuit, when to activate said fuel overinjection circuit, and when to activate said upshift notification circuit.

18. Apparatus for optimizing operation of a vehicle according to claim 17 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table.

19. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a throttle controller for controlling a throttle of said engine of said vehicle; and

said processor subsystem selectively reducing said throttle based upon data received from said radar detector, said at least one sensor and said memory subsystem.

20. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said at least one sensor further includes a brake sensor for indicating whether a brake system of said vehicle is activated.

21. Apparatus for optimizing operation of a vehicle according to claim 19 wherein said processor subsystem further comprises:

means for counting a total number of vehicle proximity alarms determined by said processor subsystem;

means for selectively reducing said throttle based upon said total number of vehicle proximity alarms.

22. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.

23. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate

5,954,781

19

vate said fuel overinjection circuit and when to activate said upshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

24. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing or decreasing;

means for determining when throttle position for said vehicle is increasing or decreasing; and

means for comparing manifold pressure to said manifold pressure set point;

means for determining when manifold pressure for said vehicle is increasing or decreasing; and

means for determining when engine speed for said vehicle is increasing or decreasing;

said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

25. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is increasing;

means for determining when throttle position for said vehicle is increasing;

means for comparing manifold pressure to said manifold pressure set point; and

means for comparing engine speed to said RPM set point;

said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.

26. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;

20

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;

said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.

27. Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:

means for determining when road speed for said vehicle is decreasing;

means for determining when throttle position for said vehicle is increasing;

means for determining when manifold pressure for said vehicle is increasing; and

means for determining when engine speed for said vehicle is decreasing;

said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

28. Apparatus for optimizing operation of a vehicle, comprising:

a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;

a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;

a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

said processor subsystem determining whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

29. Apparatus according to claim 28 and further comprising:

a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is increasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and

5,954,781

21

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle exceeds said manifold pressure set point.

30. Apparatus according to claim 28, wherein:

said plurality of sensors coupled to said vehicle further include an engine speed sensor;

said processor subsystem activating said fuel overinjection notification circuit upon determining that:

(1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing;

(2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing;

(3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and

(4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.

31. Apparatus for optimizing operation of a vehicle, comprising:

a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;

at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor;

a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;

a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table;

a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;

22

said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.

32. Apparatus for optimizing operation of a vehicle according to claim 31 wherein:

said at least one sensor further includes a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and

said memory subsystem further storing a second vehicle speed/stopping distance table;

if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;

if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

[21] Appl. No.: 345,081

[57] **ABSTRACT**

[22] Filed: Apr. 28, 1989

A fuel injection system for a two-stroke cycle engine comprising an air manifold; a throttle valve; a fuel injector; a fuel supply system including a fuel pump; a battery voltage sensor; an air temperature sensor; an engine speed sensor; a timing sensor; a barometric pressure sensor; a throttle position sensor; a first data processor for receiving and processing sensing signals for determining fuel injector duration and timing and fuel pump operating speed; a first data processor temperature sensor for sensing the relative temperature of certain electronic components in the first data processor; a heater operatively associated with the first data processor electronic components for selectively heating the electronic components; and a second data processor operable independently of the first data processor for receiving an electronic component temperature sensing signal and for generating a control signal to the heater responsive thereto for heating the components when the temperature thereof is below a predetermined minimum value.

FIG. 5

FIG. 6

## TWO-CYCLE ENGINE WITH ELECTRONIC FUEL INJECTION

The present application is a continuation of U.S. patent application Ser. No. 119,626 filed Nov. 12, 1987.

### BACKGROUND OF THE INVENTION

The present invention relates generally to two-stroke operating cycle engines and, more particularly, to a two-stroke engine fuel injection system and control system therefor which are adapted for extreme weather conditions.

Two-stroke operating cycle engines (two-cycle engines), although less fuel-efficient than four-stroke operating cycle engines (four-cycle engines), are capable of developing greater horsepower and torque than a comparably-sized four-cycle engine. This feature has led to the use of two-cycle engines in many environments in which operating efficiency is secondary to torque and weight considerations.

Electronically-controlled fuel injection is widely used in four-cycle engines. In electronic fuel injection used in four-cycle engines, sensor readings associated with various engine operating parameters are used to calculate an optimum fuel/air mixture for the engine. Fuel is then injected directly into the engine's cylinders in the proper amount based upon this electronically determined fuel/air mixture. In some four-cycle engine fuel injection systems, the fuel is injected into an air plenum upstream of the cylinder and is subsequently allowed to enter the cylinder with the plenum air through operation of an intake valve. Electronic fuel injection systems have replaced conventional carburetors in many four-cycle engines, especially in the automotive industry. However, fuel injection is not in general use with two-cycle engines and has not heretofore been used with small-displacement two-cycle engines which are used under severe cold weather conditions, for a number of reasons. Small two-cycle engines are used in association with equipment that is relatively inexpensive as compared to automobiles and other machines with which electronic fuel injection has been widely used in the past. In relatively large, expensive machinery, the cost associated with modifying basic engine components to enable internal mounting of various engine parameter sensors may be justified by increased fuel savings and engine performance and may amount to a relatively small portion of the purchase price of such an automobile, etc. In smaller engine environments, the cost of internal engine modification to existing engine assemblies would, in most cases, far outweigh any fuel savings which might be achieved by an electronic fuel injection unit and would represent a substantial increase in the cost of the associated small machine, e.g. snowmobile, dirt bike, etc., powered by the two-cycle engine.

Fuel injection systems without electronic controls have been used on two-cycle engines, but have not been satisfactory on small-displacement, small-mass two-cycle engines. The reason that fuel injection without electronic control has not been used successfully in small two-cycle engines is that such engines lack flywheels and other high-mass rotating components which tend to stabilize engine operation. Due to this lack of a large rotating mass in such engines, even a short duration mismatch between the rate at which fuel is actually delivered to the engine and the optimum engine fuel

rate requirements will cause engine sputter or rapid deceleration and stalling. Small, two-cycle engines are especially subject to malfunction under variable operating conditions such as changes in sea level, with associated barometric changes and changes in ambient air temperature. Many machines such as snowmobiles, snowblowers, dirt bikes, etc., are operated in such widely variable operating conditions. In view of the costs associated with engine modification for sensors' need for electronic control of fuel injectors and in view of the fact that the engine parameters which are critical to control of fuel injectors for two-cycle engines were not, prior to the present invention, understood in the art, a successful electronically-controlled fuel injection system for small, two-cycle engines which are subject to extremes in operating conditions has not been developed in the prior art.

### OBJECTS OF THE INVENTION

It is an object of the present invention to provide an electronic fuel injection system for a two-cycle engine which requires no internal modification to the basic engine assembly.

It is another object of the present invention to provide an electronic fuel injection control system which may be readily adapted for use with any conventional two-stroke cycle engine assembly.

It is another object of the present invention to provide a relatively small two-stroke cycle engine with electronic fuel injection which is capable of operation under variable and extreme conditions of air temperature and under widely varying barometric pressure conditions.

It is another object of the present invention to provide a fuel injection system for a two-cycle engine in which fuel injection takes place in an air manifold.

It is another object of the present invention to provide a fuel injection and control system for a two-cycle engine in which all fuel injectors simultaneously inject fuel into portions of an air manifold which are associated with individual cylinder/crankcases.

It is another object of the present invention to provide a control system for a electronic fuel injection system which utilizes relatively inexpensive electronic components and which is not subject to electronic component malfunction associated with low-temperature operation.

It is another object of the present invention to provide an electronic fuel injection system for a two-cycle engine which includes an electronically-stored fuel map indicative of the optimum fuel requirements for the engine under standard operating conditions over variable engine speed conditions and variable throttle conditions.

It is another object of the present invention to provide an electronic fuel injection system which provides a selected set of operating condition sensor inputs which do not require internal engine unit modifications and which provide optimized engine performance.

### SUMMARY OF THE INVENTION

The present invention is directed to an electronic fuel injection system for a small two-cycle engine. One aspect of the invention is a temperature control assembly which is operably associated with an electronic central processing unit of the type having electronic components which are subject to malfunction under low temperature conditions. The electronic components of the

heating assembly are not subject to malfunction under low temperature conditions and are designed to produce a heating response which is inversely proportional to temperature below a predetermined threshold temperature. The heating assembly is preferably mounted within a relatively small enclosure which also houses the electronic control system central processing unit. The heating assembly senses the temperature within the relatively small enclosure and rapidly heats electronic components within the relatively small enclosure to a predetermined temperature in response to sensing an environmental temperature within the enclosure which is below the predetermined temperature. The heating system may be actuated at the same time the electronic control system is actuated such as by the turning of the ignition switch of an associated machine, such as a snowmobile, etc.

Another feature of the present invention is the provision of an electronically-controlled fuel injection system which has a plurality of sensor inputs which are limited to the sensor inputs which are critical to the operation of a two-cycle engine and which may be mounted externally of a main engine assembly comprising a cylinder crankcase, piston, and crankshaft exclusive of the carburetion/fuel injection system therefor. The electronically-controlled fuel injection system of the present invention may thus be used without modification of existing two-cycle engine assemblies and is controlled by a CPU which may include a programmable memory device such as an EPROM which may be selectively programmed for any particular engine assembly with which the electronic fuel injection system is to be used. Another feature of the invention is the injection of fuel from a fuel injector into a portion of an air manifold which is in direct fluid communication with the crankcase portion of each individual cylinder/crankcase assembly. This injection of fuel into a manifold upstream of a crankcase provides mixing of a precise amount of fuel and air prior to entry of fuel into the crankcase and also enables all fuel injectors to be opened and closed simultaneously, rather than being timed to the operation of each associated piston.

Thus, the present invention may comprise a control system for controlling the operation of a machine designed to be operated in a relatively broad air temperature, comprising: (a) at least one performance variable sensing means for sensing the present state of a preselected variable associated with machine performance and for generating a performance variable sensing signal indicative of said present state of said preselected performance variable; (b) a first data processing means for receiving and processing said performance variable sensing signal and for generating a control signal based upon the processing of said sensing signal for controlling at least one operating parameter of said machine; (c) said data processing means comprising at least one temperature-sensitive electronic circuit component which is subject to malfunction below a predetermined malfunction temperature which is within said relatively broad operating temperature range of said machine; (d) a component environment temperature sensing means for sensing the temperature within the immediate operating environment of said temperature-sensitive electronic circuit component and for generating a temperature signal representative of the sensed temperature; (e) a second data processing means which operates independently of said first data processing means and which is not subject to temperature-related malfunction within

said operating temperature range of said machine for processing said signal from said component environment temperature sensing means and generating a heating control signal responsive thereto when the temperature in said electronic circuit environment is sensed to be below said predetermined malfunction temperature; (e) heating means responsive to said heating control signal for heating said temperature sensitive electronic component environment in response to said control signal; (f) power supply means for providing electric energy for operating said control system; (g) switch means for selectively operably electrically connecting or disconnecting said energy supply means and electrically operated components of said control system.

The present invention may also comprise a fuel injection system for a two-stroke cycle engine of the type comprising at least one cylinder, a crankcase associated with said cylinder, a piston reciprocally mounted in said cylinder and crankcase; a reciprocally openable and closable crankcase inlet for enabling combustible fluid to be drawn into the crankcase, a reciprocally openable and closable transfer port for transferring combustible fluid compressed in said crankcase to said cylinder, an ignition system for igniting compressed combustible fluid in said cylinder, a reciprocally openable and closable exhaust port in said cylinder for enabling exhaust of burned combustible fluid from said cylinder, a crankshaft connected to said piston for transferring mechanical energy from said piston to a drive unit, and an electrical energy supply source including a battery for operating the ignition system and other electrical components, comprising: (a) air manifold means operably associated with said crankcase inlet; (b) throttle valve means operably positioned in said air manifold means for controlling airflow into said crankcase inlet, said throttle valve means dividing said manifold means into an upstream portion positioned remote from said crankcase inlet and a downstream portion positioned contiguously with said crankcase inlet; (c) fuel injection means for injecting a fine spray of fuel into said downstream portion of said manifold means whereby a mixture of air and fuel is provided in said downstream portion of said manifold means which is subsequently drawn into said crankcase through said crankcase inlet; (d) fuel supply means for supplying fuel to said fuel injection means comprising: (i) fuel reservoir means for holding a volume of fuel therein and having a reservoir inlet and a reservoir outlet; (ii) fuel circulation conduit means for transferring fuel from said fuel reservoir to said fuel injection means comprising a first end inlet in fluid communication with said fuel reservoir outlet, a second end outlet in fluid communication with said fuel reservoir inlet and an intermediately positioned fuel injection outlet positioned in fluid communication with said fuel injection means; (iii) fuel pump means operatively associated with circulation conduit means at a position thereon between said conduit means first end inlet and said conduit means fuel injector outlet for pumping fuel through said circulating conduit; (iv) pressure limiting regulator means operatively associated with said circulation conduit means at a position thereon between said conduit means fuel injector outlet and said conduit means second end outlet for preventing pressure in said conduit means from exceeding a predetermined maximum pressure; (e) battery voltage sensing means for sensing battery voltage and for providing a battery voltage sensing signal representative thereof; (f) air temperature sensing means for sensing the temperature

of air in said upstream portion of said manifold means and for providing an air temperature signal representative thereof; (g) engine speed sensing means for sensing the speed of revolution of said engine and for providing an engine speed signal representative thereof; (h) timing sensing means for sensing each occurrence of a predetermined cyclically repeating state of said engine and for providing a timing signal indicative thereof; (i) barometric pressure sensing means for sensing atmospheric air pressure and for generating a barometric pressure sensing signal representative thereof; (j) throttle position sensing means for sensing the relative amount of opening of said throttle valve means and for generating a throttle position signal representative thereof; (k) first data processing means for receiving and processing said sensing signals comprising: (i) means for processing said engine speed sensing signal and said throttle position sensing signal and for generating a priming control signal to said fuel injection means for selectively injecting or not injecting fuel into said manifold means based on said engine speed signal and said throttle position signal; (ii) means for receiving and processing said engine speed signal and throttle position signal for determining a base fuel injection value; (iii) means for receiving and processing said air temperature signal and calculating an air temperature modification value of said base fuel injection value; (iv) means for receiving and processing said barometric pressure sensing signal for calculating a barometric pressure modification value of said base fuel injection value; (v) means for receiving and processing said engine temperature signal for calculating an engine temperature modification value of said base fuel injection value; (vi) means for determining a total fuel injection value representative of the total fuel amount which is to be injected by said fuel injection means during a single two-stroke operating cycle of said piston from said base fuel injection value, said air temperature modification value, said barometric pressure modification value, and said engine temperature modification value; (vii) means for determining an injector open duration interval based on said total fuel injection value and a known fuel output rate capacity of said fuel injection means; (viii) means for generating a control signal for opening said injection means for said determined injector duration open interval at a predetermined point in time determined from said timing sensing signal; (ix) means for receiving and processing said engine speed signal for overridingly terminating fuel injection means operation in response to an engine speed sensing signal indicative of a predetermined maximum speed and for restoring fuel injection means operation in response to an engine speed sensing signal indicative of a predetermined restore operation speed lower than said predetermined maximum speed; (x) means for receiving and processing said engine speed sensing signal and for generating a pump control signal in response thereto for maintaining said pump at an optimum operating speed for providing said predetermined maximum operating pressure in said fuel circulation conduit means at said pump; (l) first data processing means temperature sensing means for sensing the relative temperature of certain electronic components in said first data processing means and providing a component temperature sensing signal indicative thereof; (m) heating means operative associated with said first data processing means electronic components for selectively heating said electronic components; (n) second data processing means operable independently of said first data process-

ing means for receiving said electronic component temperature sensing signal and for generating a control signal to said heating means responsive to said component temperature sensing signal for heating said components when the temperature thereof is below a predetermined minimum value.

#### BRIEF DESCRIPTION OF THE DRAWING

An illustrative and presently preferred embodiment of the invention is shown in the accompanying drawing in which:

FIG. 1 is a schematic illustration of a two-stroke cycle engine with electronically-controlled fuel injection.

FIG. 1A is a schematic illustration of the engine of FIG. 1 showing additional cylinder portions thereof.

FIG. 2 is a flow chart illustrating operations of the electronic control unit of the present invention including the operation of the central processing unit and also the operation of a central processing unit temperature control assembly.

FIG. 3 is a diagram illustrating sensor inputs and control signal outputs and basic functions performed by an electronic control unit.

FIG. 4 is a typical engine fuel map expressed in rectangular coordinates.

FIG. 5 is a schematic illustration of an electronic control unit for a fuel injection system.

FIG. 6 is a graph of heater output as a function of CPU temperature for a typical CPU temperature control assembly of the type illustrated in FIG. 5.

#### DETAILED DESCRIPTION OF THE INVENTION

A two-stroke engine unit 10 of the present invention is shown schematically in FIG. 1. In general, the two-stroke cycle engine unit 10 comprises an engine assembly 12, an ignition assembly 14, a fuel/air input assembly 16, an electronic control assembly 18 and an electrical power supply assembly 20.

#### ENGINE ASSEMBLY

The engine assembly 12 illustrated in FIG. 1 is of a type which is conventional and well known in the art. The engine assembly comprises a cylinder cavity 30 which is generally referred to in the art simply as a cylinder. The cylinder cavity is defined by a cylindrical sidewall 32 and a circular top wall 34 which is fixedly attached to the sidewall 32. The engine assembly also comprises a generally pear-shaped crankcase cavity 36 which is generally referred to in the art simply as a crankcase. The crankcase cavity is defined by a crankcase sidewall 38 which is fixedly connected at the upper portion thereof to a lower portion of cylindrical sidewall 32. The crankcase wall is fixedly connected at a lower portion thereof to a base plate 40. The cylindrical cavity 30 and crankcase cavity 36 thus provide the upper and lower portions of a continuous total engine cavity. A cylindrical piston 42 is slidingly mounted in cylindrical cavity 30 and is pivotally attached to a connecting rod 44 which is, in turn, pivotally attached to a portion of crankshaft 46 which rotates, as indicated at 47, about a crankshaft central axis of rotation 48. The reciprocal motion of piston 42 within cylinder 30 is transferred by connecting rod 44 and crankshaft 46 to a conventional drive assembly 50 of an associated machine such as, for example, a snowmobile 12.

A fuel/air mixture which is sometimes referred to herein as combustion fluid or combustion material is drawn into the crankcase 36 through a combustion fluid inlet 52 sometimes referred to herein as an intake port 52. The intake port 52 is positioned at an upper portion of crankcase 36 and is cyclically opened and closed by reciprocation of piston 42. Transfer passages 54, 56, etc., having crankshaft transfer passage openings 58, 60, etc., and cylinder transfer port openings 62, 64, etc., enable transfer of compressed combustion fluid within the crankcase 36 to the cylinder 30. The cylinder transfer passage openings 62, 64, etc., are cyclically opened and closed through reciprocal motion of piston 42. A cylinder exhaust gas outlet 66 sometimes referred to herein as exhaust port 66 is provided in the cylinder sidewall 32 to discharge burned combustion fluid from cylinder 30. Exhaust port 66 is also cyclically opened and closed by reciprocation of piston 42. The engine assembly may comprise a plurality of cylinder/crankcase/piston assemblies identical to those described above which are operably connected to common crankshaft 46.

The mechanical operation of the two-cycle engine assembly, in general, is as follows. During upward motion of piston 42, crankcase intake port 52 is progressively opened and cylinder transfer passage openings 62, 64 and cylinder exhaust port 66 are progressively closed causing fuel/air mixture to be drawn into crankcase 3 through port 52 and causing fluid air mixture in cylinder 30 to be retained therein and progressively compressed. When the piston 42 reaches approximately its upward limit of motion or "top dead center" (T.D.C.), sparkplug 70 ignites the fuel/air mixture driving piston 42 downwardly. During the downward movement of the piston, cylinder exhaust port 66 is progressively opened, cylinder transfer port openings 62 and 64 are progressively opened and crankcase inlet 52 is progressively closed causing fuel/air mixture within the crankcase to be compressed and forced through the transfer passages 54, 56 into cylinder 30. The inflow of fresh fuel/air mixture into cylinder 30 is physically channeled into the cylinder in a manner to drive out burned exhaust gas within the cylinder out through exhaust port 66. During the subsequent upward movement of the piston 42, the abovedescribed cylinder fuel/air compression and crankcase fuel/air intake is again repeated, etc.

#### Ignition Assembly

Ignition assembly 14 comprises a conventional sparkplug mounted within cylinder 34 for igniting the fuel/air mix therein. Sparkplug 70 is conventionally connected to an ignition coil 72 which is, in turn, conventionally connected to an electrical power supply 20 and conventional timing apparatus 74 which may be conventionally linked to crankshaft 46. In an engine assembly with a plurality of cylinder/crankcase/piston assemblies, each cylinder is provided with a spark plug.

#### Fuel Air Input Assembly

Fuel air input assembly 16 includes an air manifold 80 mounted in fluid communication with crankshaft intake port 52. A throttle valve 82, which in a preferred embodiment comprises a conventional butterfly valve, divides the air manifold 80 into an upstream portion 84 which is in fluid communication with atmospheric air 8 through conventional air filters, etc. (not shown) and a downstream manifold portion 86 which opens directly

into crankcase 36. In the case of a multiple cylinder engine, there may be a single manifold upstream portion and a plurality of downstream portions, one for each cylinder/crankcase. An electrically operated fuel injector 92 comprising a solenoid valve portion 94 and a gas jet nozzle portion 96 is mounted so as to discharge a gas spray into the downstream manifold portion 86 to produce a fuel/air mixture in the downstream manifold portion which is subsequently drawn into crankcase 36. The fuel injector may be of a convention commercial available type such as Bosch 280150-007 available from the Robert Bosch Company, or NAPA 217514 available from Echlin, Inc., Branford, Conn., 06405. The fuel injector 92 is connected at the solenoid valve end thereof to a fuel circulation conduit 98 which is in fluid communication with a fuel reservoir 102 in fuel tank 100. The fuel circulation conduit comprises a conduit first end 104 connected to a fuel tank outlet 106 and a second end 108 connected to a fuel tank return inlet 110. An electric fuel pump 112 is provided for pumping fuel, such as gasoline, through the conduit 98. The electric fuel pump 112 is operably connected in fluid communication with the conduit at a point thereon between the fuel tank outlet 106 and the fuel injector 92. Conventional speed control circuitry 113 is provided to control the relative pumping speed of the fuel pump in response to a signal from the electronic control assembly 18 as discussed in further detail below. The fuel pump is conventionally connected to the electrical power supply assembly 20 from which it draws its operating energy. A conventional mechanically operated pressure limiting regulator 114 is operatively mounted in the fuel circulation conduit at a point between the fuel injector 92 and the fuel tank return inlet 110. Pressure regulator 114 prevents the fluid pressure in the circulating conduit from exceeding a predetermined maximum pressure which may be, e.g. 42 psia. A conventional coarse fuel filter 116 may be provided in the circulating conduit between fuel tank outlet 106 and fuel pump 112. A conventional fine fuel filter 118 may be provided in the circulating conduit between the fuel pump and injector 92. As shown in phantom in FIG. 1, the abovedescribed fuel system may be employed to provide fuel to further fuel injectors 120, 122 which are attached in fluid communication with the circulating conduit between the first fuel injector 92 and the pressure regulator 114. These fuel injectors 120, 122 may be mounted in manifold assemblies which may be identical to manifold assembly 16 described above and which are in turn associated with ignition assemblies and cylinder/crankcase piston assemblies 121, 123 which may be identical to those described above and which may be operably connected to a common electronic control assembly 18 and electrical power supply assembly 20.

#### Electronic Control Assembly

Electronic control assembly 18 includes a central processing unit 130 described in further detail below which is operably connected to conventional interface circuitry 132 which may comprise conventional analog to digital (A/D) circuitry for converting analog sensor signal inputs to digital signal inputs and which may further comprise conventional digital to analog (D/A) interface circuitry used to convert digital CPU command signals to analog command signals which are used to control various engine operating components as described below.

The electronic control assembly comprises a number of sensors having sensor outputs which are provided to the CPU 130 through interface circuitry 132. These sensors may include a battery voltage sensor 134, an air temperature sensor 136, an engine temperature sensor 138, an engine speed sensor 140, an ignition timing sensor 142, a barometric pressure sensor 144, and a throttle position sensor 146. The battery voltage sensor may comprise a conventional sensor or current sensing circuit well-known in the art. The air temperature sensor 136 may comprise a T55101 NAPA sensor mounted in the engine manifold. The engine temperature sensor 138 is mounted on the cooling fins of an air-cooled engine or may comprise a TS 4000 NAPA mounted within the engine cooling water jacket of a liquid cooled engine. The engine speed sensor 140 may comprise a conventional electronic encoder mounted on the crankshaft or associate drive linkage. In such an engine speed sensor configuration, an engine speed value is determined by counting the number of encoder pulses occurring within a fixed time interval. This timing interval may be provided by an external clock pulse signal or a CPU internal clock signal. The ignition timing sensor 142 may comprise an electric signal sensor connected directly to the ignition coil 72 for sensing the time of ignition of each cylinder. In such an ignition timing sensor configuration, the CPU is programmed to respond to only one cylinder ignition pulse per engine revolution. Thus, for example, in a three cylinder engine, the CPU would respond to only the first ignition coil pulse in each three pulse set associated with a complete engine revolution. Similarly, the ignition timing sensor signal may be derived directly from encoder signal 140 simply through counting the number of encoder pulses which are associated with a single revolution of the engine and generating a timing pulse after the occurrence of such a predetermined number of encoder pulses.

Barometric pressure sensor 144 may be mounted in any convenient location where it is exposed to the atmosphere such as, for example, on the housing of the CPU 130. The barometric pressure sensor 144 may be any of a number of commercially available sensors such as a Motorola MPX 201. Throttle position 146 senses the relative amount of opening of the throttle butterfly valve 82 and may comprise a conventional potentiometer unit.

The CPU 130 receives and processes the signals from the various sensors described above and generates control signals which are used to control fuel pump speed, to maintain the speed of operation of the fuel pump at a rate which provides a pressure in the circulation conduit portion immediately downstream therefrom which is approximately equal to the preset maximum pressure of the pressure regulator 114. The CPU 130 also generates control signals which actuate the solenoid valve portion 94 of each fuel injector 92 to selectively open and close and injector to provide a proper amount of fuel injection into the manifold as determined by the CPU. The CPU 130 may also provide a number of other control functions as described in further detail below. The CPU 130, in a preferred embodiment of the invention, comprises a conventional microprocessor chip 171, FIG. 5, such as a Motorola 6502 and a conventional memory chip 173, FIG. 5, which may be a PROM or EPROM chip such as, for example, Motorola 2532.

The electronic control assembly may also comprise a CPU temperature control assembly. One embodiment

of such a temperature control system is illustrated in FIG. 5 in which CPU 130 is mounted within a relatively small, e.g. 10 cubic inches, CPU protective enclosure box 170 which defines a local CPU environmental enclosure 172. The box 170 may be 2.5 inches×5 inches×0.75 inches. Also positioned within the CPU environment enclosure are a conventional heating coil 174 having terminals 175, 177, which may have a resistance of 50 ohms, and a conventional thermistor 176, which may be, e.g., an NTC 750 ohm thermistor. The heater element and thermistor are connected as shown in an electronic circuit containing a second resistor 178 having terminals 183, 185 and having a resistance of 10,000 ohms, and a Darlington transistor 180 having a gate terminal 187, a collector terminal 189, and an emitter terminal 191, which may be a Motorola 6668 which may have an amplification of 400%. The circuit containing the circuit elements 174, 176, 178, 180 is connected to the positive pole of a battery 182 and a ground (or negative pole of a battery) 184. The battery 182 may also be used to provide power for CPU 130. Battery 182 may be same or different from the battery 150 used to provide energy to the engine ignition system, etc. The voltage drop across 182, 184 may be, e.g., 5 volts. The characteristics of the particular circuit elements 174, 176, 178, 180 may be selected to provide a heating energy response to particular temperature conditions such as indicated in FIG. 6 for rapidly heating the CPU environment 172 to a predetermined maximum threshold value such as 60° F. It will thus be seen that the heating circuit indicated generally at 186 is adapted to maintain the CPU at a temperature which is above a predetermined low temperature, e.g. 60° F., below which certain components of the CPU are subject to a greatly increased probability of malfunction. It will of course be appreciated that this predetermined temperature may be chosen to have a value well above a temperature at which malfunction is probable. A heating circuit such as illustrated at FIG. 5 may be provided relatively inexpensively and thus eliminates the need for expensive CPU chips which are adapted to be operable under low temperature conditions. The heating circuit such as illustrated at FIG. 5 is adapted to be particularly effective under conditions associated with the usage of snowmobiles and other winter operated machines such as snowblowers, etc.

#### Electric Power Supply

The engine electric power supply 20 may comprise conventional power supply components such as a battery 150 which may be a conventional 12-volt battery and other power generating devices such as alternator or generator which are represented schematically at 152. Power to the electronic control assembly 18, fuel input assembly 16, and other electrically-operated components may be provided through conventional conductors 154 operably connected to a switching assembly 156 which may be a snowmobile ignition switch, etc.

An engine unit comprising multiple cylinder/crankcase/piston assemblies 12A, 12B, 12C in engine assembly 12 and comprising an ignition assembly with multiple spark plugs 70A, 70B, 70 with a common crankshaft 146 and a common electronic control assembly 18 and a common power supply 20 is shown in FIG. 1A.

Having thus described the overall construction and operation of the two-stroke cycle engine unit 10 in

general, certain specific features of the electronic control assembly 18 will now be described in greater detail.

#### Control System Functions

The basic functional steps performed by the control assembly central processing unit 130 is illustrated in FIG. 2. As illustrated at 300, the control system becomes operational by switching the system on. In a typical use environment such as when the control system is used in associated with a snowmobile engine, step 300 would be performed by turning the snowmobile ignition switch to the "on" position. As illustrated at 301 switching the system on causes electrical energy to be provided to the CPU which initializes all ports and functions of the CPU. Next, the CPU reads the engine speed and throttle position which are indicated as RPM and T.P., respectively, in block 302. Next, as indicated in blocks 303-307, the CPU determines whether or not the engine is to be primed. The sequence of steps 302-307 comprises what will be referred to herein as a "cold start circuit". As indicated at 303, the CPU determines from the reading taken at 302 whether or not the engine RPM is greater than 0. If engine RPM is greater than 0, the CPU next makes the determination from the throttle position reading of 302 whether or not the throttle position is greater than a predetermined amount, such as 20°, as indicated in block 304. If throttle position is less than 20°, the CPU decision-making process returns to block 302. If the throttle position is greater than the predetermined amount and RPM=0, the CPU provides a control command to the engine fuel injector(s) to prime the engine. In a preferred embodiment of the invention, an engine priming pulse of a predetermined fixed duration associated with a predetermined fixed amount of fuel, e.g. 100 milliliters per injector, is sent to each fuel injector in response to a prime engine command from the CPU. After an initial engine priming function indicated at 305 has been performed, the CPU again reads throttle position as indicated at 306. After reading the throttle position, the CPU again determines whether or not the throttle position is greater than a predetermined amount such as 20°. If the throttle position is greater than 20°, then the CPU again returns to decision step 306 and repeats step 306, 307 until the throttle position is less than 20°. In a typical operating environment, this would be the equivalent of waiting for an operator to release an opened throttle lever/pedal. Once the throttle position is reduced to below 20°, as indicated at block 307, the CPU decision-making processing returns to block 302, causing the cold circuit decision-making process of blocks 302-307 to be repeated until engine RPM is greater than 0. After engine RPM becomes greater than 0, the CPU reads all of the input values from the various sensors, as shown schematically in FIG. 3.

Next, as indicated at 309, the CPU determines a base fuel value from a "fuel map" and the engine speed input and the throttle position input. A fuel map is prepared and stored in permanent memory of the CPU based upon the operating characteristics of the particular engine which is being controlled. The fuel map is prepared and stored in permanent CPU memory in an initial production step before the CPU is used to control the engine. A typical fuel map is illustrated in FIG. 3 in which the horizontal axis is indicative of engine RPM value and the vertical axis, as indicated at the right-hand side of the fuel map, is indicative of throttle position. Throttle position may be expressed, for example, in

angular degrees of throttle opening or may be expressed in assigned numbers relating, non-linearly, to throttle opening which enables a higher resolution of the fuel map in certain critical regions of an engine power curve. The data array shown in FIG. 3 indicates the optimum base fuel value in milliliters for an engine fuel injector single pulse under predetermined standard operating conditions for any given engine RPM and throttle position. For example, if the engine RPM is 6000 and the throttle position is 25, the optimum base fuel value as indicated from the fuel map is 20 milliliters under standard operating conditions. It will, of course, be appreciated that the information provided in the fuel map may be stored in various electronic forms such as in algorithm form as well as look-up table form. It will also be appreciated that the resolution of the fuel map may be provided to conform with the resolution of the RP and throttle position sensing signals and with the resolution requirements of the control system.

The base fuel value from the fuel map (FIG. 4) reading performed in block 309 and indicated as V-1 is stored in CPU memory and is modified in steps 310-313 based upon the various input values read in block 308. As indicated at block 310, the base fuel value is first modified based on the air temperature input. At a predetermined operating temperature, e.g. standard operation conditions of 70° F., no modification is performed. If the temperature is above or below this predetermined value, then the base fuel value is modified accordingly based upon a predetermined algorithm or look-up table which is stored in permanent memory. Algorithms for engine fuel requirement modification based upon ambient air temperature are well-known in the art. The modified base value determined based upon air temperature modification is indicated as V-2.

As indicated in block 311, the modified base value V-2 is next further modified based upon the barometric pressure reading. This modification may again be performed by use of a conventional algorithm or look-up table stored in permanent memory. The resulting modified fuel value is indicated as V-3.

As indicated in block 312, modified value V-3 is next further modified based upon engine temperature. The modified value is indicated as V-4. This modification may be made either from a stored algorithm or a stored look-up table which is prepared based upon the particular engine temperature operating characteristics of the subject engine.

Next, as indicated in block 313, the modified fuel value V-4, which is indicative of the total corrected (compensated) fuel amount that each injector should inject into the engine during each revolution thereof for optimum performance, is used to determine the duration of injector opening which is required to provide fuel injection in the amount of V-4 under predetermined fuel injector parameters, e.g. with a known, constant fixed fuel pressure and a known, fixed injector orifice size, etc. This duration is indicated at V-5 and may be expressed in milliseconds. An alternative to modifying base fuel value is sequential steps as described above in 310-312; relative correction factors may be simultaneously computed based on the variables indicated in 310-312 and a total correction factor may be derived therefrom and applied to the base fuel value to arrive at a total corrected fuel amount V-4.

Next, as illustrated in blocks 314 and 315, the CPU determines whether a predetermined cyclically reoccurring state (repeating once per engine revolution) of

the engine, such as, for example, a top dead center position of a selected one of the pistons, has been reached. Once that cyclically reoccurring engine state has been reached, the CPU provides a control command to the fuel injector(s) causing the fuel injector(s) to be opened for the predetermined length of time V-5 calculated in step 313. It will be appreciated that for a multiple cylinder engine the injectors may be opened sequentially at a predetermined spacing in time associated with the piston positions in the various cylinders, or all of the injectors may be opened simultaneously. In the preferred embodiment of the invention, all of the injectors are opened simultaneously due to the fact that, with the injection of fuel into the manifold, as opposed to conventional fuel injection into the crankcase, the sequential timing of injectors is unnecessary.

Next, as indicated in block 317, the engine RPM value from step 308 is compared to a predetermined maximum desired engine RPM such as, for example, 8500 RPM. If the engine speed is less than the predetermined maximum value, then the CPU again returns to operating step 308 and repeats steps 308-317. If the engine speed is greater than the predetermined value, then, as indicated in block 318, the CPU provides a control signal which closes the fuel injectors.

Next, as indicated in block 319, the CPU again reads the RPM input value. If the RPM input value is greater than a predetermined value which may be less than the maximum engine RPM (e.g. 8200 RPM), then the fuel injectors are retained in a closed position as indicated in step 318, and steps 319 and 320 are repeated. If the engine speed is less than 8200 RPM, then the CPU returns to step 308. Thus, once the engine reaches 8500 RPM, the fuel injectors are closed and remain closed until engine speed drops to 8200 RPM. This total termination of fuel as opposed to conventional speed control methods which simply reduce fuel injection amount or terminate ignition prevents damage to the engine or spark plug fouling associated with such prior art methods.

It will be understood by those with skill in the art that the total corrected (compensated) fuel value may be based on an average derived from several iterations of sensor inputs and total corrected fuel value calculations. It will also be appreciated that the actual fuel adjustments may be made at intervals less frequent than those in which total fuel value calculations are made, e.g. input readings and fuel value calculations may be made 100 times per second and total fuel injection duration may be adjusted 16 times per second.

The CPU 130 may also control pump speed based upon engine RPM. For example, at engine start up when RPM=0, the fuel pump may be actuated by a control signal from CPU 130 to cause it to run at full speed for one second and then stop until RPM is greater than zero. Above RPM=0, the CPU may cause the pump to run at 50% of its rated capacity (drawing one-half its normal maximum current amount) up to a predetermined engine speed, e.g. 3600 RPM. Above this predetermined speed, the CPU may cause the pump to operate at 100% of its rated capacity. Of course, more than two pumping rates may be provided, if desired, based upon a plurality of different engine RPM ranges. Such an arrangement, as well as providing optimum pressure, reduces energy draw on the electrical power supply at start-up and at low RPM.

As further indicated by FIG. 2, the switching on of the ignition, etc., at step 300 also operates a control

circuit which functions independently from the CPU 130 which performs the functions indicated in steps 300-320. In this independent circuit, as indicated at step 330, the temperature in the immediate environment of the chip components (e.g. microprocessor, EPROM, etc.) which comprise CPU 130 is initially determined. Next, as indicated at step 331, if the temperature within the CPU environment is greater than a predetermined temperature, such as, for example, 60° F., then the system returns to step 330 and cycles between 330 and step 331. When the temperature in the immediate operating environment of the CPU is sensed to be below the predetermined temperature, then the system actuates a temperature control device, such as a heating coil, to elevate the temperature in the environment of the CPU. Next, as indicated at step 333, the temperature within the operating environment is again read and compared to a predetermined temperature which may be the same or higher than the minimum temperature of step 331. If the temperature is below this second predetermined temperature, such as, e.g. 60° F., then the temperature control device continues to operate. If the temperature exceeds this second predetermined temperature, then the operation of the temperature control device is terminated and the system again returns to step 330.

It will be appreciated that these general control functions described in steps 330-335 apply to any system which is designed to maintain the temperature within a particular environment within a predetermined temperature range. Such temperature control could be performed by any number of conventional heating/air conditioning systems. In the presently preferred embodiment, a temperature control system which is not subject to malfunction at lowered temperatures, e.g. -60° F., is provided such as illustrated in FIG. 5 and discussed above.

All "Motorola" components indicated herein are commercially available from Motorola, Inc., 8201 E. McDowell Road, Scottsdale, Ariz., 85257-3812. All "NAPA" components indicated herein are commercially available from Echlin, Inc., Branford, Conn., 06405.

While an illustrative and presently preferred embodiment of the invention has been described in detail herein, it is to be understood that the inventive concepts may be otherwise variously embodied and employed and that the appended claims are intended to be construed to include such variations except insofar as limited by the prior art.

What is claimed is:

1. A fuel injection system for a two-stroke cycle engine of the type comprising at least one cylinder, a crankcase associated with said cylinder, a piston reciprocally mounted in said cylinder and crankcase; a reciprocally openable and closable crankcase inlet for enabling combustible fluid to be drawn into the crankcase, a reciprocally openable and closable transfer port for transferring combustible fluid compressed in said crankcase to said cylinder, an ignition system for igniting compressed combustible fluid in said cylinder, a reciprocally openable and closable exhaust port in said cylinder for enabling exhaust of burned combustible fluid from said cylinder, a crankshaft connected to said piston for transferring mechanical energy from said piston to a drive unit, and an electrical energy supply source including a battery for operating the ignition system and other electrical components, comprising:

15

- (a) fuel injection means for injecting fuel for combustion within said cylinder;
- (b) fuel supply means for supplying fuel to said fuel injection means;
- (c) battery voltage sensing means for sensing battery voltage and for providing a battery voltage sensing signal representative thereof;
- (d) air temperature sensing means for sensing the temperature of ambient air and for providing an air temperature signal representative thereof;
- (e) engine speed sensing means for sensing the speed of revolution of said engine and for providing an engine speed signal representative thereof;
- (f) timing sensing means for sensing each occurrence of a predetermined cyclically repeating state of said engine and for providing a timing signal indicative thereof;
- (g) barometric pressure sensing means for sensing atmospheric air pressure and for generating a barometric pressure sensing signal representative thereof;
- (h) throttle position sensing means for sensing the relative amount of opening of said throttle valve means and for generating a throttle position signal representative thereof;
- (i) first data processing means for receiving and processing said sensing signals comprising:
  - (i) means for processing said engine speed sensing signal and said throttle position sensing signal and for generating a priming control signal to said fuel injection means for selectively injecting or not injecting fuel into said manifold means based on said engine speed signal and said throttle position signal;
  - (ii) means for receiving and processing said engine speed signal and throttle position signal for determining a base fuel injection value;

40

45

50

55

60

65

16

- (iii) means for receiving and processing said air temperature signal and calculating an air temperature modification value of said base fuel injection value;
- (iv) means for receiving and processing said barometric pressure sensing signal for calculating a barometric pressure modification value of said base fuel injection value;
- (v) means for receiving and processing said engine temperature signal for calculating an engine temperature modification value of said base fuel injection value;
- (vi) means for determining a total fuel injection value representative of the total fuel amount which is to be injected by said fuel injection means during a single two-stroke operating cycle of said piston from said base fuel injection value, said air temperature modification value, said barometric pressure modification value, and said engine temperature modification value;
- (vii) means for determining an injector open duration interval based on said total fuel injection value and a known fuel output rate capacity of said fuel injection means;
- (viii) means for generating a control signal for opening said injection means for said determined injector duration open interval at a predetermined point in time determined from said timing sensing signal;
- (ix) means for receiving and processing said engine speed sensing signal for generating a pump control signal in response thereto for maintaining said pump at an optimum operating speed for providing said predetermined maximum operating pressure in said fuel circulation conduit means at said pump.

[57] **ABSTRACT**  
 An indicator panel 20 has an array of LED's 25A to 25Q to provide an indication to the driver of a road vehicle, particularly a diesel-powered truck, when he should change to the next highest gear during acceleration from rest or low speed. The LED's are lit progressively as the engine speed increases in each gear and, when lit, emit green light if the engine speed is below the optimum change-up speed for that gear. When the engine speed begins to exceed the optimum change-up speed, the next LED illuminated produces red light to the driver. An audible warning may also be produced. If the driver does not change up in response to such warning, further red LED's will show and a more strident audible warning may be given. The change-up speeds to which the system responds are pre-set so as to be the optimum speeds for increased fuel efficiency. The change-up speed corresponding to the lowest gear is relatively low and increases successively for the successively high gears. The system may be associated with engine speed control or limiting means so as positively to prevent further increase in engine speed if the driver ignores the warning. The system may also produce an indication of the optimum engine speeds at which the driver should change down to the next lower gear during vehicle deceleration.

FIG. 3.

## VEHICLE GEAR SHIFT INDICATOR

The invention relates to drive aids for vehicles such as, but not restricted to, road vehicles. Embodiments of the invention to be described provide indications facilitating the efficient control of a road vehicle, such as a diesel-engined truck, by its driver.

According to the invention, there is provided an indicating system for use on a mechanically powered vehicle to indicate to the driver thereof when he should change to a higher gear, comprising means responsive to the particular gear engaged at any time to produce a datum signal having a value representing a datum speed dependent on the identity of the gear, and indicating means responsive to the datum signal and to the actual engine speed and operative when the actual engine speed reaches the datum speed to produce an indication to the driver that he should change to the next higher gear, the values of the datum signals being respectively predetermined so that the respective datum speeds at which the said indications are produced are such that respective gear changes at those speeds promote engine efficiency.

According to the invention, there is also provided a system for indicating to the driver of a road vehicle when he should change to a higher gear, comprising gear-indicating means responsive to the identity of the actual gear engaged at any time to produce a gear-indicating signal, means responsive to the gear-indicating signal to generate an electrical datum signal having a predetermined engine-speed-representing value dependent on the identity of that gear and representing a relatively low engine speed for the lowest gear and successively higher engine speeds for the successively higher gears, an array of light sources for positioning in the vehicle where they may be seen by the driver, and light source control means responsive to each datum signal and to a signal representing actual engine speed to energise the light sources successively as the actual engine speed increases and to modify the indication provided to the driver by the energised light sources when the actual engine speed reaches the speed represented by the datum signal.

According to the invention, there is further provided indicating means for identifying the gear ratio which is currently engaged in a transmission system having a plurality of selectable fixed gear ratios, comprising first transducing means operative to produce a first signal which is proportional to the input speed to the transmission system, second transducing means operative to produce a second signal proportional to the output speed of the transmission system, and signal processing means operative to measure the ratio between the first and second signals to indicate the identity of the engaged gear ratio.

An electrical system embodying the invention and for indicating to the driver of a road vehicle when he should make each gear change for best efficiency, will now be described, by way of example only, with reference to the accompanying diagrammatic drawings in which:

FIG. 1 is a block circuit diagram of one form of the system;

FIG. 2 is a front elevation of an indicator panel showing, diagrammatically, the indication provided to the driver; and

FIG. 3 is a more detailed block circuit diagram of the system.

The system to be described is particularly designed for providing an indication to the driver of a diesel-engined truck when he should make each gear change. Large high-power diesel engines, particularly naturally aspirated types, produce maximum torque at relatively low engine rpm, and it is therefore inefficient and wasteful of fuel for the driver to operate the engine at a speed above the peak of the torque/rpm curve when high road speed of the vehicle is not required or possible. Specifically, when starting the truck from rest, it is wasteful of fuel for the driver to run the engine up to a high speed in the lower gears. When starting the truck from rest, the primary requirement in the lower gears is to take the engine speed up to that at which maximum torque is developed. As the truck speed increases, and as each higher gear is engaged in turn, the engine speed immediately prior to each gear change can be successively increased, assuming that the desired final road speed in the highest gear corresponds to an engine speed above the value at which maximum torque is developed.

In other words, for maximum efficiency, when starting the truck from rest, the driver should make each successive gear change at a successively higher engine speed. The system to be described facilitates this.

FIG. 1 shows the system in broad outline.

As shown, the system comprises an engaged gear detecting unit 5. The purpose of unit 5 is to produce an output signal on a line 6 identifying the particular gear through which the truck engine is driving the road wheels at any particular time (that is, representing the total gear ratio between the truck engine and the road wheels). The unit 5 receives an appropriate input signal on a line 8. For example, line 8 could be controlled by microswitches responsive to the settings of the driver's gear control lever(s). However, other means for producing the signal on line 8 will be described below.

The gear-indicating signal on line 6 is fed as an input to a data store 10. Store 10 stores a number of different datum signals, a different one for each of the truck's gears. The value of each datum signal represents the optimum engine speed at which the driver should change from that gear to the next higher gear, that is, "optimum" primarily in the sense of promoting maximum fuel efficiency. Therefore, as explained, the datum signal corresponding to the lowest gear will represent a relatively low engine speed and the datum signals for the higher gears will represent successively higher engine speed values. Store 10 responds to the particular gear indicated by the signal on line 6 by outputting the appropriate datum signal on a line 12 and this is fed into a signal processing unit 14. Unit 14 also receives a signal representing actual engine speed on a line 16 and produces an output signal on a line 18 which controls a driver's indicating unit 20. Unit 20 is positioned so as to enable the driver to respond readily to its indication. The unit 20 may provide its indication in any suitable form. For example, it may be a visible indication. Instead, it can be an audible indication. As another example, it could be a combination of visible and audible indications.

The signal processing unit 14 controls the indicating unit 20 so that it provides an indication to the driver when the engine speed of the truck in any particular gear reaches the value at which he should change to the next higher gear.

When he has changed to the next higher gear, the signal processing unit 14 receives the new datum signal

on line 12 and is thus able to control the indicating unit 20 so as to provide an indication when the actual engine speed has risen to the (higher) engine speed datum at which he should change up again.

As will be explained in more detail below, the signal processing unit 14 can also be arranged, by means of an appropriate speed control or speed limiting system, to provide a positive limit on the engine speed if the driver should ignore the gear-change-indication provided by the unit 20.

A particular form which the system FIG. 1 can take will now be described in detail with reference to FIGS. 2 and 3.

FIG. 2 shows one form which the driver's indicator 20 (see FIG. 1) may take. It comprises an array of lamps 25A, 25B . . . 25Q. In this example, therefore, there are seventeen lamps and each one corresponds to an engine rpm increment of 50 rpm. The lamps may cover a speed range from 1,000 to 1,800 rpm, say. As the engine speed increases, the lamps are progressively lit, starting with lamp 25A. Therefore, when the engine speed rises to 1,000 rpm, lamp 25A becomes lit. An increase in engine speed to 1,050 rpm causes lamp 25B to be lit, lamp 25A remaining lit; and so on, until, at an engine speed of 1,800 rpm, all the lamps are lit.

In a manner to be explained in more detail, the colours displayed by the illuminated lamps change so as to indicate to the driver when he should make a gear change.

The lamps 25A to 25Q are physically arranged in a curve which approximately matches the shape of the engine torque/engine rpm curve over the speed range (thus showing that peak torque occurs at about 1,300 rpm in this example). They may be light-emitting diodes (LED's).

The system will now be more specifically described with reference to FIG. 3.

As shown in FIG. 3, the system is energised by transducers 30 and 32, transducer 30 providing an electrical output on a line 34 representing engine speed and transducer 32 providing an electrical output on a line 36 representing road speed. The transducers 30 and 32 may be of any suitable type. For example, the engine speed transducer 30 may pick up an electrical signal from the driver's engine rpm indicator, and the road speed transducer may pick up an electrical signal from the vehicle tachograph. However, other arrangements are possible. The electrical outputs on lines 34 and 36 may be in analogue or digital form.

Lines 34 and 36 are fed to a dividing circuit 38 which measures the ratio of their signals. This ratio is solely dependent on the particular gear which is engaged, and the divider 38 compares the measured ratio with each of a number of pre-stored datum values, respectively equal to the ratios corresponding to the gears, and produces an electrical output on a line 40 which indicates which gear is engaged at any particular time.

It will be appreciated that the signal on line 40 could instead be generated by, for example, an electromechanical switch arrangement linked to the gearbox or to the gear selector. However, the arrangement specifically illustrated in FIG. 3 has the advantage of simplicity and absence of moving parts.

However generated, the signal on line 40 is then fed into a store 42. This may be in any suitable form and stores a series of electrical datum signals respectively corresponding to the different gears of the truck. The datum signal stored in store 42 for first gear has the

lowest value, and the values are progressively greater (but not necessarily in linear proportion) for each of the successively higher gears.

Store 42 accesses the appropriate datum signal, that is, the datum signal corresponding to the particular gear engaged (as indicated by the value of the signal on line 40), and outputs this datum signal on a line 46. This signal is passed to a processing unit 48.

The processing unit 48 has a bank of output lines 52A, 52B . . . 52Q (not all of which are shown) and these are respectively connected to level changing units 54A, 54B . . . 54Q (not all of which are shown), and the actual connections are mostly omitted to avoid unduly complicating the diagram.

The outputs of the level changing units 54A, 54B . . . 54Q are connected by respective lines 55A, 55B . . . 55Q to control respective ones of the lamps 25A, 25B . . . 25Q in the driver's display 20.

The processing unit 48 energises the lines 52A, 52B . . . 52Q according to the value of the signal on line 46, each line 52A, 52B . . . 52Q having either a HIGH value or a LOW value. When the signal level on line 46 is low, only the earliest one or ones in the sequence of lines 52A to 52Q are held at the LOW level and all the remainder are HIGH; for example, with the signal on line 46 at its lowest level (corresponding to first gear), only lines 52A and 52B, say, would be at the LOW level, with all the remainder at the HIGH level. For a signal level on line 46 corresponding to second gear, more of the lines in the series 52A to 52Q would be at the LOW level, such as lines 52A, 52B, 52C and 52D for example, with all the remainder at the HIGH level; and so on for all the other possible values of the signal on line 46. Thus, for a signal level on line 46 corresponding to the highest gear (the truck may have eight or nine gears for example), all the lines 52A to 52Q could be at the LOW level.

The engine speed-dependent signal on line 34 is also connected to feed a bank of comparators 64A, 64B . . . 64Q (only some of which are shown). Each comparator has a second input lines which carries a respective threshold signal (the sources of these thresholds not being shown in the Figure). The comparators 64A to 64Q are connected through the level changing units 54A to 54Q to the LED's by means of respective output lines 66A to 66Q.

When the engine speed is low (below 1,000 rpm in this example), none of the lines 66A to 66Q is energised. As the engine speed increases to 1,000 rpm and beyond, the lines 66A to 66Q successively become energised. The threshold signals applied to the comparators 64A to 64Q are set so that line 66A becomes energised when the engine speed is 1,000 rpm, line 66B becomes energised when the engine speed reaches 1,050 rpm, line 66C becomes energised when the engine speed reaches 1,100 rpm and so on, until line 66Q becomes energised when the engine speed reaches 1,800 rpm (all the earlier-energised lines remaining energised).

As each line 66A to 66Q becomes energised, it causes the corresponding LED 25A to 25Q to become illuminated. Assuming that the corresponding one of the lines 52A to 52Q is at a LOW level, the illuminated LED will emit green light. However, if the corresponding line 52A to 52Q is at a HIGH level, then the corresponding level changing unit 54A to 54Q will cause the illuminated LED to emit red light instead.

The operation of the system as so far described will now be considered.

If the truck is running at a steady relatively high speed in the highest gear, so that its engine speed is above 1,800 rpm, all the LED's 25A to 25Q will be green. If the truck speed now decreases, causing or as a result of a corresponding fall in engine speed, then the LED's will be extinguished one by one as the engine speed falls below 1,800 rpm. Assuming that the truck speed is falling at greater than the threshold rate represented by the signal on line 92, unit 94 will open gate 98 and the comparator 101 will be fed with the datum signal on line 100 representing the minimum appropriate speed for the current gear (top gear); this might be an engine speed of 1,400 rpm for example. Therefore, when comparator 101 determines that the actual engine speed has fallen to 1,400 rpm, it energises the lines 102A to 102I. The resultant signals applied to level changing units 54A to 54I cause the corresponding LED's 25A to 25I to change from green to red. This therefore provides an indication to the driver that he should change to a lower gear.

If the driver allows the engine speed to fall further without making a gear change, then the falling signal on line 34 will cause the comparators 64A to 64I (in this example) to extinguish the LED's one by one.

During such deceleration, the audible warning unit 74 may be disabled.

It will be appreciated that the detailed circuitry shown in FIG. 3 is merely exemplary of the many different possible forms which it can take, and many modifications are possible. For example, but without limitation, the interlinking of the gear change indication system with the speed control system 80 may be omitted, and/or the arrangement of the system so as to provide an indication to the driver when he should change to a lower gear may be omitted.

Although the systems described have been described in relation to trucks and more particularly to trucks powered by diesel engines, they may be applied (with appropriate modification if necessary) to vehicles other than trucks and to vehicles powered by other types of engine, and "vehicle" is not restricted to road vehicles; as examples, it may include rail vehicles and boats.

We claim:

1. An indicating system for use on a mechanically propelled vehicle having a driver-operated engine-driving wheels transmission system using a plurality of separate gears normally operable in an ascending or descending sequence and to indicate to the driver thereof when he should change from the particular one of the gears which is engaged at any time to the next gear in one of the sequences comprising

means responsive to the particular gear engaged to produce an electrical datum signal having a value representing a datum speed dependent on the identity of that gear,

indicating means comprising means operative in response to predetermined control signals to produce respective ones of a series of indications to the driver indicating with successively greater urgency that he should change to the next gear in the said sequence,

means responsive to the actual speed of the engine or of the vehicle to produce an electrical signal representing that speed,

control means responsive to the datum signal and to the electrical signal representing the actual speed and operative when the actual speed reaches the

datum speed to produce a first one of the said control signals,

means feeding the first control signal to the indicating means to cause the indicating means to produce the first said indication in the said series,

means responsive to the datum signal and to the electrical signal representing the actual speed and connected to sense whether the driver changes to the said next gear in the sequence in response to the said first indication in the said series and, if he does not, to produce successive further said control signals as the actual speed exceeds the datum speed by a respective predetermined amount or amounts, and

means connected to feed the said further control signals to the indicating means to cause the indicating means to produce in succession the other indications in the said series,

the values of the datum signals being respectively predetermined so that the respective datum signals are such that respective gear changes at those speeds promote engine efficiency, the datum signals having values which are pre-calculated and are independent of the actual operation of the vehicle at any time.

2. A system according to claim 1, in which the datum speed for the lowest gear represents a relatively low engine speed and the datum speeds for the higher gears represent successively higher engine speeds.

3. A system according to claim 1, in which each said indication is a visible indication.

4. A system according to claim 1, in which each said indication is an audible indication.

5. A system according to claim 1, in combination with a speed control arrangement connected to the vehicle engine and comprising means responsive to an engine speed control signal to positively prevent further increase in engine speed, the system including means responsive to the engine speed exceeding the respective said datum speed for the said particular one of the gears which is engaged at any time to generate a said engine speed control signal, and means feeding the engine speed control signal to the speed control arrangement.

6. A system for indicating to the driver of a road vehicle having a multiple-gear engine-driving wheels transmission system when he should change from a particular one of the gears which is engaged at any time to a higher gear, comprising

gear-indicating means responsive to the identity of the said particular one of the gears to produce an electrical gear-indicating signal indicating the identity of that particular gear,

means connected to receive and to be responsive to the gear-indicating signal to generate a respective one of a plurality of electrical datum signals having respective predetermined engine-speed-representing values dependent on the identity of the said particular one of the gears and representing a relatively low engine speed for the lowest gear of the transmission system and successively higher engine speeds for the successively higher gears thereof, an array of light sources for positioning in the vehicle where they may be seen by the driver, and

light source control means connected to control the array of light sources and connected to receive and to be responsive to each datum signal and to an electrical signal representing actual engine speed whereby to energise the light sources successively

5

As the truck moves off from rest in first gear, the engine speed will be below 1,000 rpm and none of the lines 66A to 66Q will be energised. Therefore, none of the LED's 25A to 25Q will be illuminated. The divider 18 will determine from the ratio of its inputs that first gear is engaged and store 42 will therefore produce the appropriate datum signal output. As explained, this will be at such a value that unit 48 will hold most of its output lines 52A to 52Q at the HIGH level with only lines 52A and 52B (in this example) being at the LOW level.

As the engine speed increases to 1,000 rpm (with the truck still in first gear), line 66A becomes energised and LED 25A becomes lit. Because the corresponding level changing unit 54A is receiving only a LOW level, line 66A is energised at a low level and LED 25A emits green light.

As the engine speed continues to increase, LED 25B will become illuminated and emit green light (because it is assumed in this example that line 52B is at a LOW level).

However, line 52C and all remaining lines up to 52Q are at a HIGH level. Therefore, when the engine speed reaches 1,100 rpm in this example, LED 25C becomes illuminated and emits red light, in contrast to LED's 25A and 25B which are green.

This provides an indication to the driver that he has reached an engine speed value which, for the particular gear engaged at the present time (first gear), is such that he should change to the next higher gear.

If he does not change gear, the engine speed will continue to rise and LED 25D will be illuminated and emit red light, and similarly for LED 25E assuming that he still does not make a gear change.

However, if he does make a gear change, this will be detected by the divider 38 and the store 42 will change the value of the signal on line 46 to a higher value. This causes the processing unit 48 to alter the energisation of the lines 52A to 52Q so that, for example, lines 52A, 52B, 52C and 52D are now all at a LOW level while the remainder (52E to 52Q) are at a HIGH level.

Therefore, LED 25C, which was previously emitting red light, will now change to green, assuming the engine speed is still at 1,100 rpm (clearly, the engine speed may fall slightly during the actual gear change but will then start to rise again in the higher gear).

When the engine speed has reached the appropriate limit for second gear, 1,250 in this example, LED 25E becomes illuminated and emits red light. This indicates to the driver that he must make the next gear change.

This process continues for each succeeding gear, so that the display 20 indicates to the driver the appropriate engine speed at which he should make each gear change.

The datum signals in store 42 are pre-selected so that the indicated gear-change speeds increase successively and according to an appropriate curve so as to obtain maximum fuel efficiency from the engine.

As shown, the lines 55A to 55Q are also connected to a counting unit 70 through level-responsive units 72A, 72B . . . 72Q only some of which are shown. The level-responsive units are set so that the counter is only affected by the signals on the lines 52A to 52Q when they have the higher levels corresponding to emission of red light from the associated LED. The counter 70 counts the number of lines 55A to 55Q carrying red-producing levels and operates an audible warning unit 74 accordingly. More specifically, when counter 70 detects one

6

line 55A to 55Q carrying a red-indicating level, it causes the audible warning unit 74 to emit an intermittent low-frequency sound warning to the driver, advising him that the gear-change limit has been reached. If the driver does not make a gear change, then, as explained, the next line of the lines 55A to 55Q will change to a red-indicating level. This will be detected by the counter 70 which causes the warning unit 74 to increase the frequency of its sound output. A still further increase in engine speed without gear change, producing a third red-indicating level input to counter 70, causes the unit 74 to emit a continuous sound output.

The truck may also be fitted with a road speed control system indicated diagrammatically by the block 80. Such a system may take any suitable form, such as, for example, described in our British Pat. Nos. 1386961 and 1493623. Normally such a system 80 operates only when the truck is in the highest gear, so as to limit the truck's road speed to a particular upper speed value (or to control it at that value) and this operation is independent of the gear-change indicating system as so far described. However, the gear-change indicating system described may be linked to the speed control system 80 by means of a line 84 from the counter 70.

Counter 70 energises line 84 when it determines that at least three of the lines 55A to 55Q are carrying red-indicating levels. When the speed control 80 receives the signal on line 84, it operates (irrespective of the particular gear engaged at that time) to prevent further increase in engine speed. Therefore, if the driver persists in ignoring the gear-change indication given by the display unit 20, further increase in engine speed will be positively prevented.

As so far described, the operation of the gear-change indicating system is that which occurs when the truck is accelerating. The operation is different if the vehicle is decelerating, as will now be described.

Deceleration of the truck is sensed by a differentiating unit 90 responsive to the road speed signal on line 36. If the vehicle is decelerating at at least a predetermined rate represented by a threshold on a line 92, a comparator 94 energises a line 96 to open a gate 98.

Besides producing the datum signal on line 46, store 42 produces a second datum signal on a line 100. In contrast to the datum signals on line 46, the datum signals on line 100 represent the minimum appropriate engine speed corresponding to each gear. Line 100 is connected through gate 98 to a comparator 101 which also receives the engine speed indicating signal from line 34. Gate 98 only passes the signal on line 96 to comparator 101 when the truck is decelerating at at least the speed set by the threshold on line 92. Comparator 101 has output lines 102A to 102K and these are connected to third inputs of the level changing units 54A to 54K, the actual connections being omitted. When comparator 101 determines that the actual engine speed has fallen to the level represented by the datum signal on line 100, it energises the corresponding output line 102A to 102K and also all the other ones of its output lines which represent lower speed values. Thus, for example, if the signal on line 100 represents a datum speed of 1,400 rpm, comparator 101 will energise its output line 102I (which is connected to the level changing unit 54I controlling the LED 25I representing 1,400 rpm); in addition, it will energise all the lines 102A to 102H.

The operation of this part of the system will now be considered in more detail.

9

as the actual engine speed increases, the light source means including modifying means adapted to modify the indication provided to the driver by the energised light sources and means responsive to each datum signal and to the electrical signal representing actual engine speed to sense the extent by which the actual engine speed exceeds the speed represented by the datum signal and operative to actuate the modifying means to cause the array of light sources to produce a series of indications to the driver indicating with successively greater urgency as the said extent increases that he should change to the said next higher gear.

7. A system according to claim 6, in which the light source control means modifies the indication provided by the energised light source or sources by changing the colour of the light emitted thereby.

8. A system according to claim 6, including an audible indicating unit responsive to each datum signal and to the electrical signal representing actual engine speed to produce an audible indication when the actual engine speed exceeds the speed represented by the respective datum signal.

10

9. A system according to claim 6, in which the light sources are light-emitting diodes.

10. A system according to claim 6, in which the array of light sources is physically arranged in a manner corresponding at least approximately to the shape of the torque versus engine speed characteristic of the engine.

11. A system according to claim 1, applied to a truck or similar heavy road vehicle powered by a diesel engine.

12. A system according to claim 1, in which the said actual speed is the engine speed.

13. A system according to claim 6 in which the gear-indicating means comprises

first transducing means operative to produce a first signal which is proportional to the input speed to the transmission system,

second transducing means operative to produce a second signal which is proportional to the output speed of the transmission system, and

signal processing means operative to measure the ratio between the first and second signals to indicate the identity of the engaged gear ratio.

14. A system according to claim 13, in which the first and second signals are electrical signals.

[57] **ABSTRACT**

[21] Appl. No.: 525,218

In a vehicle running mode detecting system, a relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object is calculated on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed. Whether the vehicle is running in a constant distance mode where the distance between the vehicle and the forward object is kept substantially constant or in a varying distance mode where the vehicle is accelerating or decelerating relative to the forward object and the distance between the vehicle and the forward object is varying is determined on the basis of the change in the distance between the vehicle and the forward object. The reference time is updated less frequently when the vehicle is running in the constant distance mode than when the vehicle is running in the varying distance mode.

## VEHICLE RUNNING MODE DETECTING SYSTEM

### BACKGROUND OF THE INVENTION

#### 1. Field of the Invention

This invention relates a vehicle running mode detecting system which is provided with a relative speed calculating means which calculates the relative speed of a vehicle to a forward object being ahead of the vehicle in the way on the basis of a time elapsed from a reference time and a change in the distance between the vehicle and the forward object during the time elapsed.

#### 2. Description of the Related Art

As disclosed, for instance, in Japanese Unexamined Patent Publication No. 61 (1986)-146644, there has been known a vehicle running mode detecting system in which the relative speed of a vehicle to the forward vehicle running ahead thereof is calculated on the basis of changes in the distance between the vehicles during different time intervals, thereby eliminating necessity of additional relative speed calculating means.

However in the system, since the relative speed is uniformly calculated independently from the running mode of the vehicle, i.e., whether the vehicle is running substantially at a constant distance from the forward vehicle or at a decreasing or increasing distance from the forward vehicle, efficiency of calculating the relative speed is low.

### SUMMARY OF THE INVENTION

In view of the foregoing observations and description, the primary object of the present invention is to provide a vehicle running mode detecting system which can detect the relative speed of a vehicle to a forward object (e.g., a forward vehicle) at a high efficiency.

In accordance with one aspect of the present invention, there is provided a vehicle running mode detecting system comprising a relative speed calculating means which calculates the relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed, a running mode determining means which determines whether the vehicle is running in a constant distance mode where the distance between the vehicle and the forward object is kept substantially constant or in a varying distance mode where the vehicle is accelerating or decelerating relative to the forward object and the distance between the vehicle and the forward object is varying on the basis of the change in the distance between the vehicle and the forward object, and a reference time updating means which receives an output of the running mode determining means and updates the reference time less frequently when the running mode determining means determines that the vehicle is running in the constant distance mode than when the running mode determining means determines that the vehicle is running in the varying distance mode.

In an embodiment, the reference time is updated at predetermined intervals which are set longer when the running mode determining means determines that the vehicle is running in the constant distance mode than when the running mode determining means determines that the vehicle is running in the varying distance mode.

In another embodiment, the running mode determining means determines that the vehicle is running in the constant

2

distance mode unless the distance to the forward object decreases or increases continuously.

In still another embodiment, the running mode determining means determines that the vehicle is running in the constant distance mode when the change in the distance to the forward object is small even if the distance to the forward object decreases or increases continuously.

In still another embodiment, the reference time updating means updates the reference time when the running mode determining means keeps determining that the vehicle is running in the constant distance mode for a time not shorter than a predetermined time.

In accordance with another aspect of the present invention, there is provided a vehicle running mode detecting system comprising a relative speed calculating means which calculates the relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed, a running mode determining means which determines that the vehicle is running in a varying distance mode where the vehicle is accelerating or decelerating relative to the forward object and the distance between the vehicle and the forward object is varying on the basis of the change in the distance between the vehicle and the forward object, and a reference time updating means which receives an output of the running mode determining means and updates the reference time more frequently as the degree of acceleration or deceleration of the vehicle increases.

### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a perspective view of a vehicle equipped with a running control system employing a vehicle running mode detecting system in accordance with an embodiment of the present invention.

FIG. 2 is a schematic block diagram of the running control system.

FIG. 3 is a block diagram of the control unit.

FIG. 4 is a flow chart for illustrating the basic control of the control unit.

FIG. 5 is a flow chart for illustrating the manner of determining the running mode of the vehicle, and

FIG. 6 is a view for illustrating the manner of determining the running mode of the vehicle.

### DESCRIPTION OF THE PREFERRED EMBODIMENT

In FIG. 1, a vehicle 1 is equipped with a running control system comprising a radar head unit 3 mounted in the front of the vehicle body 2, a control unit 4, a vehicle speed sensor 5, a headup display 6, an alarm 7 (FIG. 2) and a vehicle control device 8.

The radar head unit 3 emits a pulse laser beam (as a radar wave) forward of the vehicle 1 from a source and receives reflected light beam reflected by a forward object in the way such as a vehicle, thereby measuring the distance from the vehicle 1 to the forward object. The radar head unit 3 is of a scan type which causes a pulse laser beam, which is small in width and like a sector in a vertical cross-section, to scan horizontally through a relatively wide angle.

As shown in FIG. 2, signals from the radar head unit 3 and the vehicle speed sensor 5 which detects the running speed

3

of the vehicle 1 are input into the control unit 4 and the running mode of the vehicle 1 is determined by the control unit 4 and shown by the headup display 6. When it is determined that the forward object is an obstruction for the vehicle 1 to clear, the alarm 7 operates and the vehicle control device 8 automatically causes brakes 8a of the vehicle 1 to operate to decelerate the vehicle 1.

As shown in FIG. 3, the control unit 4 comprises an object recognition means 25 which receives a signal from the radar head unit 3 and recognizes a forward object such as a forward vehicle in the way of the vehicle 1, a relative speed calculating means 22 which receives signals from the object recognition means 25 and a timer means 21 and calculates the relative speed of the vehicle 1 to the forward object on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle 1 and the forward object during the time elapsed, a running mode determining means 23 which receives outputs of the object recognition means 25 and the vehicle speed sensor 5 and determines whether the vehicle 1 is running in a constant distance mode where the distance between the vehicle 1 and the forward object is kept substantially constant or in a varying distance mode where the vehicle 1 is accelerating or decelerating relative to the forward object and the distance between the vehicle 1 and the forward object is varying, and a reference time updating means 24 which receives an output of the running mode determining means 23 and sets the reference time updating frequency by the relative speed calculating means 22 lower when the running mode determining means 23 determines that the vehicle 1 is running in the constant distance mode than when the running mode determining means 23 determines that the vehicle 1 is running in the varying distance mode.

The control unit 4 further comprises an obstruction determining means 26 which receives outputs of the object recognition means 25 and the relative speed calculating means 22 and determines whether the forward object is an obstruction for the vehicle 1 to clear.

The running mode determining means 23 determines that the vehicle is running in the constant distance mode unless the distance to the forward object decreases or increases continuously and also determines that the vehicle is running in the constant distance mode when the change in the distance to the forward object is small even if the distance to the forward object decreases or increases continuously. Further the running mode determining means 23 determines whether the vehicle 1 is accelerating, decelerating or running at a constant speed on the basis of the signal from the vehicle speed sensor 5.

The reference time updating means 24 updates the reference time when the running mode determining means 23 keeps determining that the vehicle 1 is running in the constant distance mode for a time not shorter than a predetermined time in order to prevent deterioration in accuracy of detecting the relative speed.

The control by the control unit 4 will be described hereinbelow with reference to FIG. 4 assuming that a forward vehicle is recognized as the forward object. In this particular example, the object recognition means 25 detects the vehicle-to-vehicle distance (the distance between the forward vehicle and the vehicle 1) at regular intervals on the basis of the signal from the radar head unit 3. In the following description,  $L(i)$  denotes the current vehicle-to-vehicle distance.

In FIG. 4, the vehicle-to-vehicle distance  $L(i)$  is input. (step S1) More particularly, the last 19 vehicle-to-vehicle

4

distances  $L(i-19)$  to  $L(i-1)$  are stored by the object recognition means 25.

Then the running mode (R/M) of the vehicle 1 is determined on the basis of the change in the vehicle-to-vehicle distance calculated on the basis of the output of the object recognition means 25 and the running speed of the vehicle 1 detected by the vehicle speed sensor 5. (step S2) Then the running mode determining means determines whether the current running mode is the constant distance mode (CDM) or the varying distance mode (VDM). (step S3)

When it is determined that the current running mode is constant distance mode, it is registered in the obstruction determining means 26. (step S4) Thereafter it is determined whether the preceding running mode (the running mode one point before) was the constant distance mode. (step S5) When it is determined that the preceding running mode was also the constant distance mode, it is determined that the current base point (or the reference time) from which the time elapsed is measured is the point which is 21 point before. When it is determined in step S5 that the preceding running mode was not the constant distance mode, that is, when the preceding running mode was the varying distance mode, the base point is updated to the point 3 point before (step S7) and then the relative speed is calculated according to the following formula (step S8).

$$R_s = \{L(i) - L(BP)\} / t(i-BP)$$

wherein  $R_s$  represents the relative speed,  $L(i)$  represents the vehicle-to-vehicle distance at the current point,  $L(BP)$  represents the vehicle-to-vehicle distance at the base point BP and  $t(i-BP)$  represents the time difference (the time elapsed) between the current point and the base point BP.

For example, assuming that the time elapsed from the base point BP1 is  $T1$  and the change in the vehicle-to-vehicle distance during the time  $T1$  is  $L1$  in the part indicated at P1 in FIG. 6, the relative speed  $R_s$  is  $L1/T1$ .

When it is determined in step S6 that the current base point is the point which is 21 point before, the base point BP is updated to the point 1 point before (step S9) and then step S8 is executed. That is, when the running mode is the constant distance mode at successive tow points including the current point, the base point is not updated until the running mode keeps being the constant distance mode. In this particular embodiment, the base point is updated every 21 points when the running mode keeps being the constant distance mode.

When it is determined in step S3 that the current running mode is the varying distance mode, the step 7 is executed and the base point BP is updated to the point 3 point before after that the current running mode is the varying distance mode is registered in the obstruction determining means 26 in step S10. For example, when the vehicle-to-vehicle distance is decreasing, i.e., when the vehicle 1 is accelerating relative to the forward vehicle as in the part indicated at P2 in FIG. 6, the base point BP is changed from BP1 to BP2 and the relative speed  $R_s$  is  $L2/T2$  assuming that the time elapsed from the base point BP2 is  $T2$  and the change in the vehicle-to-vehicle distance during the time  $T2$  is  $L2$ . Thus when the varying distance mode continues, the base point BP is constantly updated to BP3, BP4 and so on so that the relative speed  $R_s$  can be calculated following abrupt change in the same.

In step S3, the running mode is determined in the manner shown in FIG. 5. That is, the changes in the vehicle-to-vehicle distance between each of last three points and the preceding point  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are calculated as follows. (step S11)

5

$$d(i)=L(i)-L(i-1)$$

$$d(i-1)=L(i-1)-L(i-2)$$

$$d(i-2)=L(i-2)-L(i-3)$$

Then it is determined whether or not the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are all negative or two of them are negative with the other being 0. (step S12) When it is determined that the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are all negative or two of them are negative with the other being 0, it is determined whether the sum of the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  is smaller than a predetermined value  $dc1$ . (step S13) When it is determined the former is smaller than the latter, that is, when the change in the vehicle-to-vehicle distance is large, it is determined that the vehicle 1 is accelerating relative to the forward vehicle. (step S14) Otherwise it is determined that the vehicle 1 is running at a constant distance from the forward vehicle since the degree of acceleration is low. (step S15)

When it is not determined in step S12 that the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are all negative or two of them are negative with the other being 0, it is determined whether or not the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are all positive or two of them are positive with the other being 0. (step S16) When it is determined that the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  are all positive or two of them are positive with the other being 0, it is determined whether the sum of the changes  $d(i)$ ,  $d(i-1)$  and  $d(i-2)$  is larger than a predetermined value  $dc2$ . (step S17) When it is determined the former is larger than the latter, that is, when the change in the vehicle-to-vehicle distance is large, it is determined that the vehicle 1 is decelerating relative to the forward vehicle. (step S18) Otherwise it is determined that the vehicle 1 is running at a constant distance from the forward vehicle since the degree of deceleration is low. (step S15)

Thus when all the changes in the vehicle-to-vehicle distance in the last three intervals are not of the same sign (including 0), the running mode is determined to be the constant distance mode and the relative speed is calculated without changing the base point. Further even if all the changes in the vehicle-to-vehicle distance in the last three intervals are of the same sign (including 0), the change in the vehicle-to-vehicle distance is determined to be not abrupt and the running mode is determined to be the constant distance mode if the absolute value of the sum of the changes is smaller than a predetermined value. For example, in the part indicated at P3 in FIG. 6, though the three successive changes in the vehicle-to-vehicle distance are all positive, it is determined that the running mode is the constant distance mode since the change L3 in the elapsed time T3 is small. In this case, the relative speed is  $L3/T3$ .

Thus in the vehicle running mode detecting system of the present invention, the reference time is updated less frequently when the vehicle is running in the constant distance mode where the relative speed of the vehicle to the forward object need not be calculated so accurately than when the vehicle is running in a varying distance mode where the relative speed should be calculated accurately. Accordingly, the efficiency of calculating the relative speed can be improved.

What is claimed is:

1. A vehicle running mode detecting system comprising a relative speed calculating means which calculates the relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed,

6

a running mode determining means which determines whether the vehicle is running in a constant distance mode where the distance between the vehicle and the forward object is kept substantially constant or in a varying distance mode where the vehicle is accelerating or decelerating relative to the forward object and the distance between the vehicle and the forward object is varying on the basis of the change in the distance between the vehicle and the forward object, and

a reference time updating means which receives an output of the running mode determining means and updates the reference time less frequently when the running mode determining means determines that the vehicle is running in the constant distance mode than when the running mode determining means determines that the vehicle is running in the varying distance mode.

2. A vehicle running mode detecting system as defined in claim 1 in which said reference time updating means updates the reference time at predetermined intervals which are set longer when the running mode determining means determines that the vehicle is running in the constant distance mode than when the running mode determining means determines that the vehicle is running in the varying distance mode.

3. A vehicle running mode detecting system as defined in claim 2 in which the running mode determining means determines that the vehicle is running in the constant distance mode unless the distance to the forward object decreases or increases continuously.

4. A vehicle running mode detecting system as defined in claim 3 in which the running mode determining means determines that the vehicle is running in the constant distance mode when the change in the distance to the forward object is small even if the distance to the forward object decreases or increases continuously.

5. A vehicle running mode detecting system as defined in claim 4 in which the reference time updating means updates the reference time when the running mode determining means keeps determining that the vehicle is running in the constant distance mode for a time not shorter than a predetermined time.

6. A vehicle running mode detecting system as defined in claim 1 in which the running mode determining means determines that the vehicle is running in the constant distance mode unless the distance to the forward object decreases or increases continuously.

7. A vehicle running mode detecting system as defined in claim 1 in which the running mode determining means determines that the vehicle is running in the constant distance mode when the change in the distance to the forward object is small even if the distance to the forward object decreases or increases continuously.

8. A vehicle running mode detecting system as defined in claim 1 in which the reference time updating means updates the reference time when the running mode determining means keeps determining that the vehicle is running in the constant distance mode for a time not shorter than a predetermined time.

9. A vehicle running mode detecting system comprising a relative speed calculating means which calculates the relative speed of a vehicle, equipped with the vehicle running mode detecting system, to a forward object on the basis of a time elapsed from a reference time based on which the time elapsed is measured and a change in the distance between the vehicle and the forward object during the time elapsed,

5,708,584

7

a running mode determining means which determines a degree of acceleration or deceleration of the vehicle relative to the forward object and a variation in the distance between the vehicle and the forward object on the basis of the change in the distance between the vehicle and the forward object, and

8

a reference time updating means which receives an output of the running mode determining means and updates the reference time more frequently as the degree of acceleration or deceleration of the vehicle increases.

## **EXHIBIT 6**

**A. Identification of Infringed Claims and Applicable Statutory Section of 35 U.S.C. § 271**

Claims 1-2, 4-5, 7-8, 10, 12-13, 15, and 17-32 of U.S. Patent No. 5,954,781 are directly infringed under 35 U.S.C § 271(a) by the accused Audi vehicles identified below.

**B. Identification of Accused Instrumentalities By Claim**

As set forth in the accompanying claim chart, Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster vehicles that include the identified features, infringe on or more of the claims identified above. On a claim-by-claim basis, the following Audi vehicles are accused of infringement by Velocity:

Claim 1 – Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 2 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 4 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 5 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 7 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 8 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 10 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 12 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 13 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 15 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster;

Claim 17 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 18 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 19 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 20 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 21 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 22 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 23 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 24 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 25 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 26 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 27 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 28 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 29 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 30 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 31 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7;

Claim 32 - Audi's A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, and Q7.

**C. Claim Chart Comparing Each Element of the Asserted Claims to the Accused Instrumentalities**

A claim chart identifying where each element of each asserted claim is found within each Accused Audi vehicle is attached.

**D. Identification of Whether Each Element of Each Asserted Claim is Present in the Accused Instrumentalities Literally or Under the Doctrine of Equivalents**

At this time, Velocity asserts that all of the asserted claim elements are literally present in the Accused Audi vehicles.

At this time, sections (e)-(f) of Local Patent Rule 2.2 are not applicable. Velocity expressly reserves the right to revise, amend and supplement these contentions as discovery progresses and new information becomes available.

**Velocity Patent LLC Preliminary Infringement Contentions Against Audi Defendants Pursuant to N.D. Ill. LPR 2.1**

Claim 1	Corresponding Element in Audi Vehicles <sup>1</sup>
1A. Apparatus for optimizing operation of a vehicle, comprising: <sup>2</sup>	<p>The accused Audi vehicles<sup>3</sup> include an apparatus for optimizing operation of a vehicle.</p> <p>For example, the accused Audi vehicles include computer-controlled vehicle systems with one or more computer processors that monitor various vehicle systems and optimize the fuel economy, safety and performance of the vehicle.</p>

---

<sup>1</sup> Velocity contends that the accused vehicles literally and directly infringe each element of the asserted claims.

<sup>2</sup> Velocity's citations related to any claim preamble in this claim chart should not be interpreted as an admission that the preamble is limiting.

<sup>3</sup> The accused features and vehicles identified in these preliminary contentions are representative only. Velocity accuses all Audi vehicle models for model years 2007 to 2014 that incorporate features that are similar to the accused features identified in these preliminary contentions, including the A3, A4, S4, A5, A5 Cabriolet, S5, S5 Cabriolet, RS5, A6, S6, A7, S7, RS7, A8, S8, S8, A8L, allroad, Q5, Q5 hybrid, SQ5, Q7, TT, TTS, TT Roadster, and TTS Roadster. Discovery has just begun in this case. Velocity reserves the right to supplement and identify additional infringing models (*e.g.*, 2015 models currently being tested) as it learns facts through discovery.

**Claim 1**

**Corresponding Element in Audi Vehicles<sup>1</sup>**

(See, e.g., Exhibit Audi-14, 3.0L V6 TFSI Self-Study Program at 44).

**Technical Description**

**Four Cylinder, Four Valve, FSI Turbocharged Gasoline Engine**

**Engine Block**

- Cast Iron Crankcase
- Balancer Shafts in Crankcase
- Forged Steel Crankshaft
- Self-Regulating Stamp-Mounted Oil Pump - Chain-Driven by Crankshaft
- Timing Case Cover - Front End of Engine
- Bolts - Chain Driven at Front End of Engine

**Cylinder Head**

- 4-Valve Cylinder Head
- 1.0L Intake Damper Air Adjuster
- Anti-Valve Lift System (V6/FSI on exhaust camshaft only)

**Intake Manifold**

- Turbo-Flap

**Fuel Supply**

- Demand Controlled on Low and High-Pressure Ends
- Multi-Port High-Pressure Injector

**Engine Management**

- MED 17 Engine Control
- Hot-Film Air Mass Flow with Integral Temperature Sensor
- Throttle Valve with Contactless Sensor
- Aira-Controlled Ignition with Cylinder-Selective Digital Knock Sensor
- Single-Spark Ignition Coils

**Turbocharging**

- Integral Exhaust Turbocharger
- Charge-Air Cooler
- Boost Pressure Control with Overpressure
- Electrical Diagnostic Valves

**Exhaust**

- Single-Chamber Exhaust System with Close-Coupled Pre-Catalyst

**Combustion Process**

- Fuel Straight Injection

(See, e.g., Exhibit Audi-15, 2.0L V4 TFSI Self-Study Program at 2).

Claim 1	Corresponding Element in Audi Vehicles <sup>1</sup>
	<p>(See, e.g., Exhibit Audi-16, 1.8L V4 TFSI Self-Study Program at 36).</p>

Claim 1	Corresponding Element in Audi Vehicles <sup>1</sup>
	<p>(See also Exhibits Audi-1 at 11; Audi-2 at 10; Audi-3 at 10; Audi-4 at 10; Audi-5 at 11; Audi-6 at 10; Audi-7 at 10; Audi-8 at 10; Audi-9 at 10; Audi-10 at 10; Audi-11 at 10; Audi-12 at 10 (all showing displays coupled to sensors for engine speed and road speed)).</p> <p>Additionally, on information and belief, vehicles equipped with Audi's FSI and TDI engines also include a plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor coupled to the engine control module ("ECM") of the vehicle.</p>
<p>1C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>The accused Audi vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.</p>

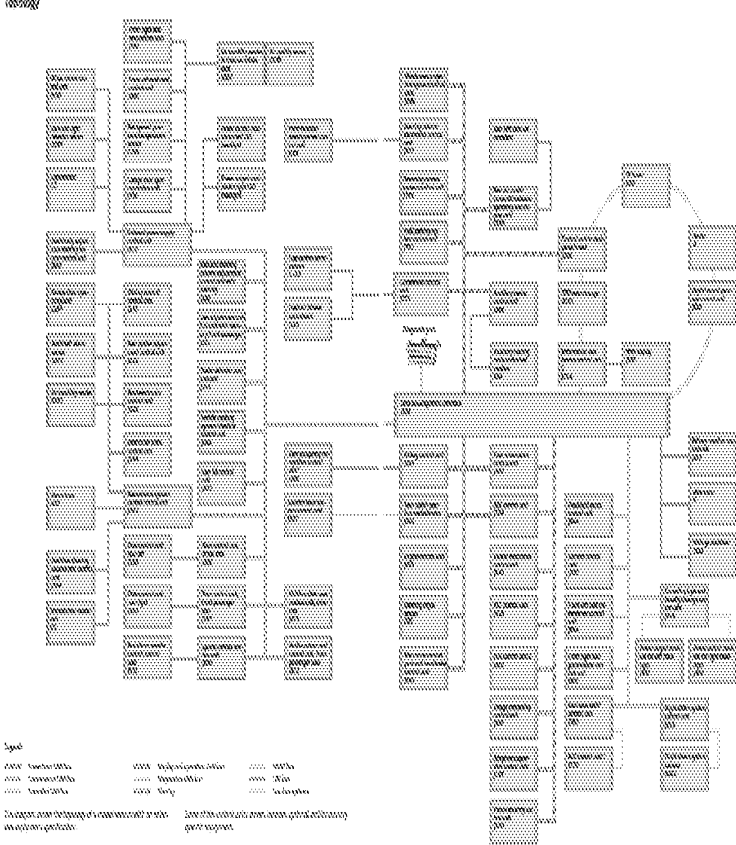

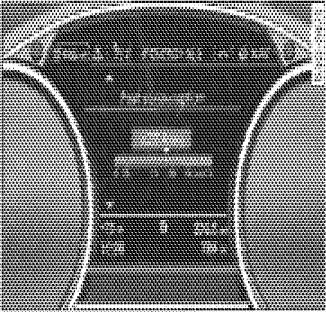

Claim 1	Corresponding Element in Audi Vehicles <sup>1</sup>
<p>coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;</p>	<p>processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.</p> <p>For example, the accused Audi vehicles include one or more memories that form a memory subsystem for storing information relating to vehicle system operations and features described in the vehicle manuals:</p>

Claim 1	Corresponding Element in Audi Vehicles <sup>1</sup>

Claim 1

Corresponding Element in Audi Vehicles<sup>1</sup>

Control unit with display in dash panel insert

The optimal indicator

dash insert 010101 010101 010101 010101 010101 010101 010101 010101 010101 010101

Function

The optimal indicator in the driver information system is a new function designed to help the driver to reduce fuel consumption. The function is integrated in the engine management software. It is featured in all petrol and diesel models with recent gearbox.

As modern vehicle engines deliver high torque even at low rpm, it is often possible to drive in a higher gear. In this case, a gearbox recommendation is indicated to the driver on the driver information system. The gearbox recommendation may involve skipping a gear.

The actual gear position is indicated continuously to the driver information system. The information is derived from the actual engine speed and road speed signals. Further, the actual gear position and any gearbox recommendations are indicated while the clutch is actuated for longer than 2 seconds. No gearbox recommendation is given when the engine is operating at full throttle either.

Normally no gearbox recommendation is issued when the vehicle is in a gear. However, if the engine speed drops below a critical threshold, a recommendation to shift down a gear will be given.

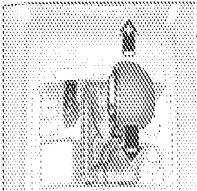

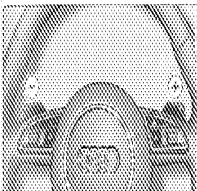

To implement the "optimal indicator" function, the engine control unit also requires information from the steering angle sensor G86, the ABS control unit J285 and the transmission system control unit J282. The engine control unit receives this information via CAN bus.

Indicator

The gearbox recommendations conveyed by the engine control unit is transmitted via CAN bus to the dash panel unit and displayed in the driver information system. There are two possible states of the display:

- 1 The actual gear position is displayed with or without a gearbox recommendation.
- 2 No display. This is the case if the clutch is actuated for longer than two seconds or if the driver has disengaged the function or the gear.

Claim 2	Corresponding Element in Audi Vehicles
	<p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “comparing manifold pressure to said manifold pressure set point” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to Manifold PSI Sensor 22, Memory Subsystem 14, and Processor Subsystem 12.</p>
<p>2E. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.</p>	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.</p> <p><i>See, e.g.,</i> citations for claim elements 1E, 1G.</p>

Claim 4	Corresponding Element in Audi Vehicles
4A. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:	<p>The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:</p> <p><i>See, e.g.,</i> citations for claim 1.</p>
4B. means for determining when road speed for said vehicle is decreasing;	<p>The accused Audi vehicles include a means for determining when road speed for said vehicle is decreasing.</p> <p><i>See, e.g.,</i> citations for claim element 2B.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when road speed for said vehicle is decreasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Road Speed Sensor 18, Memory Subsystem 14, and Processor Subsystem 12.</p>
4C. means for determining when throttle position for said vehicle is increasing; and	<p>The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim element 2C.</p>
4D. means for determining when manifold pressure for said vehicle is increasing; and	<p>The accused Audi vehicles include a means for determining when manifold pressure for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim elements 1B-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when manifold pressure for said vehicle is increasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Manifold PSI Sensor 22, Memory Subsystem 14, and Processor</p>

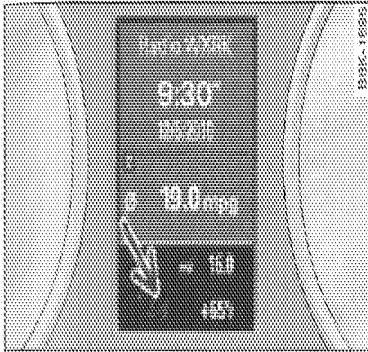

Claim 4	Corresponding Element in Audi Vehicles
	Subsystem 12.
4E. means for determining when engine speed for said vehicle is decreasing;	<p>The accused Audi vehicles include a means for determining when engine speed for said vehicle is decreasing.</p> <p><i>See, e.g.,</i> citations for claim elements 1B-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when engine speed for said vehicle is decreasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.</p>
4F. said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.</p> <p><i>See, e.g.,</i> citations for claim elements 1E, 1G.</p>

Claim 5	Corresponding Element in Audi Vehicles
5A. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:  <i>See, e.g.,</i> citations for claim 1.
5B. means for determining when road speed for said vehicle is increasing;	The accused Audi vehicles include a means for determining when road speed for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2B.
5C. means for determining when throttle position for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2C.
5D. means for comparing manifold pressure to said manifold pressure set point;	The accused Audi vehicles include a means for comparing manifold pressure to said manifold pressure set point.  <i>See, e.g.,</i> citations for claim element 2D.
5E. means for comparing engine speed to said RPM set point;	The accused Audi vehicles include a means for comparing engine speed to said RPM set point.  <i>See, e.g.,</i> citations for claim elements 1B-1D.  To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when engine speed for said vehicle is decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.
5F. said processor subsystem activating said	On information and belief, the accused Audi vehicles include a processor subsystem that activates said upshift notification circuit if both road speed and throttle position for said vehicle

Claim 5	Corresponding Element in Audi Vehicles
<p>upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p>	<p>are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p> <p><i>See, e.g.,</i> citations for claim elements 1F, 1G.</p>

Claim 7	Corresponding Element in Audi Vehicles
7A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle.  <i>See, e.g.,</i> citations for claim 1.
7B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Audi vehicles include a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;  <i>See, e.g.,</i> citations for claim element 1B.
7C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.  <i>See, e.g.,</i> citations for claim element 1C.
7D. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;	The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;  <i>See, e.g.,</i> citations for claim element 1D.
7E. a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection	The accused Audi vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

Claim 7	Corresponding Element in Audi Vehicles
notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	<i>See, e.g.</i> , citations for claim element 1E.
7F. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and	<p>The accused Audi vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and</p> <p>For example, the accused Audi vehicles include one or more downshift notification circuits coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient speed.</p> <p style="text-align: center;"><b>Efficiency program</b></p> <p style="text-align: center;">The efficiency program can help you to use less fuel. It evaluates driving information in reference to fuel consumption and shows other equipment influencing consumption as well as shift recommendations. ⇨ page 26. Fuel economy messages ⇨ page 27 provide tips for efficient driving. The efficiency program uses distance and consumption data from trip computer 1.</p> <p>(<i>See, e.g.</i>, Exhibits Audi-1 at 26; Audi-2 at 27-28; Audi-3 at 27-28; Audi-4 at 27; Audi-5 at 26; Audi-6 at 25; Audi-7 at 26; Audi-8 at 29; Audi-9 at 25; Audi-10 at 26; Audi-11 at 26-27; Audi-12 at 26-27).</p>

Claim 7	Corresponding Element in Audi Vehicles
	<p data-bbox="740 432 1032 474"><b>Gearshift Indicator</b></p> <p data-bbox="740 485 1094 541">Applies to vehicles with manual transmission and gearshift indicator</p> <p data-bbox="740 562 1032 596"><i>This indicator can help conserve fuel.</i></p>  <p data-bbox="740 982 971 1012">Fig. 12. Display: Gearshift indicator</p> <p data-bbox="740 1056 1105 1373">In order to become familiar with the gearshift indicator, at first just drive the way you are used to. If the current gear - and the driving situation - is not the best one for conserving fuel, then the indicator will display the recommended gear. The display shows the current gear and the gear that is recommended  ⇨ fig. 12.</p> <p data-bbox="740 1402 1084 1520">- <b>Upshifting</b> The display will light up to the right of the gear currently selected if it is recommending a higher gear.</p>

Claim 7	Corresponding Element in Audi Vehicles
	<p data-bbox="740 436 1096 552">-- Downshifting: The display will light up to the left of the gear currently selected if it is recommending a lower gear.</p> <p data-bbox="740 577 1063 651">Sometimes the indicator will recommend skipping a gear (3 &gt; 5).</p> <p data-bbox="740 676 1096 791">If there is no gearshift recommendation, then just drive in the appropriate gear for conserving fuel.</p> <p data-bbox="483 850 1036 892">(See, e.g., Exhibits Audi-2 at 27; Audi-3 at 27; Audi-8 at 24).</p>

**Claim 7**

**Corresponding Element in Audi Vehicles**

**Enhanced Shift Indicator**

Applies to vehicles with manual transmission and trip computer with efficiency program.

Fig. 14: Display enhanced shift indicator

► In the efficiency program, press the function selection switch → page 26, fig. 11 repeatedly until the enhanced shift indicator appears in the display.

The efficiency program also has an enhanced shift indicator. This enhanced shift indicator follows the same concept as the "standard" shift indicator → page 27. The selected and the recommended gears are highlighted in colors like a traffic light.

The color of the circle indicates if the most suitable gear is engaged or if you should shift up or down.

Green circle without or with a gear	No gear or the most suitable gear is engaged
Yellow circle → fig. 14	Shift up or down one gear
Red circle	Shift up two gears

**More**

This enhanced shift indicator can help you conserve fuel. It is not designed to recommend the correct gear in all driving situations. Only the driver can decide which

(See, e.g., Exhibits Audi-2 at 28; Audi-3 at 28).

**Claim 7**

**Corresponding Element in Audi Vehicles**

Automatic transmission 1

**⚠ WARNING**  
 will gasped, control center overcome physical limitations, so it may not be able to maintain a constant speed under all conditions. Always be ready to apply the brakes.

**⚠ WARNING**  
 applies to vehicles with 8-speed gearbox

Using the manual shift program you can manually select gears.

Fig. 129 Selecting manual shift mode

Fig. 130 Kick-down button

**Gear selection with selector lever**

The tiptronic mode can be selected either with the vehicle stationary or on the move.

- ▶ Push the selector lever to the right from D/S. In M appears in the instrument cluster display as soon as the transmission has shifted.
- ▶ To upshift, push the selector lever forward to the plus position (+) = fig. 119.
- ▶ To downshift, push the lever to the minus position (-).

**Gear selection with paddle levers\***

The shift buttons are activated when the selector lever is in D/S or the tiptronic manual shift program.

- ▶ To upshift, touch the button on the right (+) = fig. 120.
- ▶ To downshift, touch the button on the left (-).

The transmission automatically shifts up or down before normal engine speed is reached.

The transmission only allows manual shifting when the engine speed is within the permitted range.

**⚠ WARNING**

- When you shift into the next lower gear, the transmission will downshift only when there is no possibility of over-revving the engine.
- When the kick-down comes on, the transmission will shift down to a lower gear, depending on vehicle and engine speeds.
- Tiptronic is inoperative when the transmission is in the fail-safe mode.

**⚠ WARNING**  
 applies to vehicles with 8-speed gearbox

**Kick-down enables maximum acceleration**

When you depress the accelerator pedal beyond the resistance point, the automatic transmission downshifts into a lower gear, depending on vehicle speed and engine speed. The upshift into the next higher gear takes place once the maximum specified engine speed is reached.

**⚠ WARNING**

Please note that the driver wheels can spin if kick-down is used on a smooth slippery road - there is a risk of skidding.

(See, e.g., Exhibits Audi-1 at 113; Audi-2 at 96; Audi-3 at 86-87; Audi-4 at 89-90; Audi-5 at 111; Audi-6 at 127; Audi-7 at 140-41; Audi-8 at 99-100; Audi-9 at 118; Audi-10 at 89; Audi-11 at 85-

Claim 7	Corresponding Element in Audi Vehicles
<p>7G. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.</p>	<p>86; Audi-12 at 84).</p> <p>On information and belief, the accused Audi vehicles include a processor subsystem that determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.</p> <p><i>See, e.g.,</i> citations for elements 1G, 7F.</p>

Claim 8	Corresponding Element in Audi Vehicles
8A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	<p>The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:</p> <p><i>See, e.g.,</i> citations for claim 1.</p>
8B. means for determining when road speed for said vehicle is increasing;	<p>The accused Audi vehicles include a means for determining when road speed for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim element 2B.</p>
8C. means for determining when throttle position for said vehicle is increasing; and	<p>The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim element 2C.</p>
8D. means for comparing manifold pressure to said manifold pressure set point;	<p>The accused Audi vehicles include a means for comparing manifold pressure to said manifold pressure set point.</p> <p><i>See, e.g.,</i> citations for claim element 2D.</p>
8E. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.</p> <p><i>See, e.g.,</i> citations for claim element 2E.</p>

Claim 10	Corresponding Element in Audi Vehicles
10A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:  <i>See, e.g.</i> , citations for claim element 1.
10B. means for determining when road speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4B.
10C. means for determining when throttle position for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 2C.
10D. means for determining when manifold pressure for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 4D.
10E. means for determining when engine speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when engine speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4E.
10F. said processor subsystem activating said	On information and belief, the accused Audi vehicles include a processor subsystem that activates said downshift notification circuit if both road speed and engine speed are decreasing

Claim 10	Corresponding Element in Audi Vehicles
downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.	and both throttle position and manifold pressure for said vehicle are increasing.  <i>See, e.g.,</i> citations for claim elements 1G, 7F.

Claim 12	Corresponding Element in Audi Vehicles
12A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:  <i>See, e.g.</i> , citations for claim 1.
12B. means for determining when road speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4B.
12C. means for determining when throttle position for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 2C.
12D. means for determining when manifold pressure for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 4D.
12E. means for determining when engine speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when engine speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4E.
12F. said processor subsystem activating said fuel overinjection notification circuit if both	On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

Claim 12	Corresponding Element in Audi Vehicles
throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.	<i>See, e.g.</i> , citations for claim elements 1E, 1G.

Claim 13	Corresponding Element in Audi Vehicles
13A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle.  <i>See, e.g.</i> , citations for claim 1.
13B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Audi vehicles include a plurality of sensors coupled to the vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor  <i>See, e.g.</i> , citations for claim element 1B.
13C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.  <i>See, e.g.</i> , citations for claim element 1C.
13D. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point, and present and prior levels for each one of said plurality of sensors;	The accused Audi vehicles have a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point, and present and prior levels for each one of said plurality of sensors.  <i>See, e.g.</i> , citations for claim element 1D.
13E. a fuel overinjection notification circuit coupled	The accused Audi vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that

Claim 13	Corresponding Element in Audi Vehicles
to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	excessive fuel is being supplied to said engine of said vehicle.  <i>See, e.g.,</i> citations for claim element 1E.
13F. an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;	The accused Audi vehicles include an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.  <i>See, e.g.,</i> citations for claim element 1F.
13G. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and	The accused Audi vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and  <i>See, e.g.,</i> citations for claim element 7F.
13H. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift	The accused Audi vehicles include a processor subsystem that determines based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.  <i>See, e.g.,</i> citations for claim element 1G.

<b>Claim 13</b>	<b>Corresponding Element in Audi Vehicles</b>
notification circuit and said downshift notification circuit.	

Claim 15	Corresponding Element in Audi Vehicles
15A. Apparatus for optimizing operation of a vehicle according to claim 13 wherein said processor subsystem further comprises:	<p>The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 13 wherein said processor subsystem further comprises:</p> <p><i>See, e.g.</i>, citations for claim 1.</p>
15B. means for determining when road speed for said vehicle is increasing or decreasing;	<p>The accused Audi vehicles include a means for determining when road speed for said vehicle is increasing or decreasing.</p> <p><i>See, e.g.</i>, citations for claim element 2B.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when road speed for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to Road Speed Sensor 18, Memory Subsystem 14, and Processor Subsystem 12.</p>
15C. means for determining when throttle position for said vehicle is increasing;	<p>The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.</p> <p><i>See, e.g.</i>, citations for claim element 2C.</p>
15D. means for comparing manifold pressure to said manifold pressure set point;	<p>The accused Audi vehicles include a means for comparing manifold pressure to said manifold pressure set point.</p> <p><i>See, e.g.</i>, citations for claim element 2D.</p>
15E. means for comparing engine speed to said RPM set point;	<p>The accused Audi vehicles include a means for comparing engine speed to said RPM set point.</p> <p><i>See, e.g.</i>, citations for claim element 5E.</p>
15F. means for determining	<p>The accused Audi vehicles include a means for determining when manifold pressure is</p>

Claim 15	Corresponding Element in Audi Vehicles
when manifold pressure is increasing;	<p>increasing.</p> <p><i>See, e.g.,</i> citations for claim element 4D.</p>
15G. means for determining when engine speed is increasing or decreasing;	<p>The accused Audi vehicles include a means for determining when engine speed is increasing or decreasing.</p> <p><i>See, e.g.,</i> citations for claim element 4E.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when engine speed for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.</p>
15H. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing;	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.</p> <p><i>See, e.g.,</i> citations for claim elements 1E, 1G.</p>
15I. said processor	On information and belief, the accused Audi vehicles include a processor subsystem that

Claim 15	Corresponding Element in Audi Vehicles
<p>subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and</p>	<p>activates said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p> <p><i>See, e.g., citations for claim elements 1F, 1G.</i></p>
<p>15J. said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.</p>	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.</p> <p><i>See, e.g., citations for claim element 10F.</i></p>

Claim 17	Corresponding Element in Audi Vehicles
<p>17A. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>The accused Audi vehicles include an apparatus for optimizing operation of a vehicle.</p> <p><i>See, e.g.,</i> citations for claim 1.</p>
<p>17B. a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>The accused Audi vehicles include a radar detector that determines a distance separating a vehicle having an engine and another object in front of the accused vehicles.</p> <p>For example, the accused Audi vehicles include one or more systems with radar detectors that determine a distance separating a vehicle having an engine and another object in front of the accused vehicles.</p>

**Claim 17**

**Corresponding Element in Audi Vehicles**

**17B1. Audi Adaptive Cruise Control:**

**Audi adaptive cruise control**

Applies to vehicles with Audi adaptive cruise control

Fig. 89 Detection range

**What can adaptive cruise control do?**

The adaptive cruise control system uses video, radar and ultrasound. Moving vehicles ahead can be recognized up to about 150 feet (300 m) away.

On open roads with no traffic, adaptive cruise control works like a regular cruise control system. The stored speed is maintained. When approaching a moving vehicle detected up ahead, the adaptive cruise control system automatically slows down to match that vehicle's speed and then maintains the distance that the driver previously showed. As soon as the system does not detect a vehicle up ahead, adaptive cruise control accelerates back up to the stored speed.

In stop-and-go traffic, adaptive cruise control can brake until the vehicle stops and accelerate again under certain conditions and if this is possible within the system's limits and capabilities (page 56). Adaptive cruise control will not make an emergency stop.

(See, e.g., Exhibits Audi-1 at 88; Audi-2 at 101; Audi-3 at 92; Audi-4 at 95; Audi-5 at 86; Audi-6 at 109; Audi-7 at 114-15; Audi-9 at 95; Audi-10 at 93).

**Claim 17**

**Corresponding Element in Audi Vehicles**

*Overview*

ACC is also offered as an option for the X32.47. As already introduced for the X31.48, two radar sensors are used in the A7.

(See Exhibit Audi-18, 2012 A7 Running Gear and Suspension Systems Self-Study Program at 41).

**Claim 17**

**Corresponding Element in Audi Vehicles**

**17B2. Audi Braking Guard:**

**Audi braking guard**

Applies to vehicles with Audi adaptive cruise control.

Fig. 97. Instrument cluster approach warning

Braking guard uses radar sensors and a video camera. It also functions within the limits of the system when adaptive cruise control is switched off.

**What can braking guard do?**

When detected in time, the system can assist situations when a vehicle ahead brakes suddenly or if your own vehicle is traveling at a high speed and approaching a vehicle up ahead that is moving more slowly. Braking guard does not react if it cannot detect the situation.

The system advises you of various situations:

- The **distance warning** is given if you are too close to the vehicle ahead for a long time. If the vehicle ahead brakes sharply, you will not be able to avoid a collision. The indicator light in the display comes on.
- The **approach warning** is given when a detected vehicle up ahead in your lane is moving much more slowly than you are or if it brakes sharply. When this warning is given, it may only be possible to avoid a collision by swerving or braking sharply. The indicator light and indicator in the display will warn you about the danger in fig. 97. You will also hear an acoustic signal.

If you do not react fast enough or do not react at all to the situation, braking guard will intervene by braking.

- If a collision is imminent, the system will first provide an acoustic warning by briefly and sharply applying the brakes.
- If you do not react to the acoustic warning, braking guard can brake with increasing force within the limits of the system. This reduces the vehicle speed in the event of a collision.
- The system can initiate maximum braking shortly before a collision.<sup>1)</sup> Full deceleration at high speeds occurs only in vehicles with adaptive cruise control and side assist (pre sense plus).
- If the braking guard senses that you are not braking hard enough when a collision is imminent, it can increase the braking force.
- The pre sense functions also engage when a collision is imminent (page 134).

**Which functions can be controlled?**

You can switch braking guard and the distance/approach warning on or off in the MMI (page 93, Settings in the MMI).

**WARNING**

Lack of attention can cause collisions, other accidents and serious personal injuries. The braking guard is an assist system and cannot prevent a collision by itself. The driver must always intervene. The driver is always responsible for braking at the correct time.

- Always pay close attention to traffic, even when the braking guard is switched on. Be ready to intervene and be ready to take complete control whenever necessary. Always keep the safe and legal distance between your vehicle and vehicles up ahead.
- Braking guard works within limits and will not respond outside the system limits, for example when approaching a

(See, e.g., Exhibits Audi-1 at 92; Audi-2 at 105-06; Audi-3 at 96-97; Audi-4 at 99; Audi-5 at 90;

**Claim 17**

**Corresponding Element in Audi Vehicles**

Audi-6 at 113; Audi-7 at 127; Audi-9 at 99; Audi-10 at 97).

17B3. Audi Side Assist:

**Vehicles left behind**

If you slowly pass a vehicle, the Side Assist has detected the difference in speed between the vehicle and your vehicle is less than 8 mph or 13 km/h, the display in the exterior mirror turns on 30 times as the vehicle enters your blind spot.

The display will not turn on if you quickly pass a vehicle that can enter the detected 105° sensor arc ahead between the vehicle and your vehicle is greater than 8 mph or 13 km/h.

**Functional limitations**

The side sensors are designed to detect the left and right adjacent lanes using the road lines on the adjacent side. In certain situations, the display in the exterior mirror may turn on when a vehicle is in the adjacent lane that is not adjacent to your current lane.

- If the lanes are narrow or if you are driving on the edge of your lane. If this is the case, the system may have detected the vehicle in another lane that is not adjacent to your current lane.
- If you are driving through a curve. The sensor may react to a vehicle that is one lane over from the adjacent lane.
- If side assist reacts to other objects such as sign or obstacles guard rail.
- In poor weather conditions, the side assist functions are limited.

Do not cover the radar sensors of Fig. 105 with stickers, magnets, bicycle bells or other objects, because this will affect the function. Do not use the mirror when towing a trailer. For information on driving, refer to page 213.

**Vehicle that are approaching**

In certain cases, a vehicle will be classified as critical for a lane change when it is in the sensor field for a while. The Side Assist can detect the sensor the display in the exterior mirror will turn on.

**Vehicles traveling with you**

Vehicles traveling with you are indicated in the exterior mirror if they are classified as critical for a lane change. All vehicles detected by Side Assist are indicated by the time they enter your "blind spot" or the future.

**Warnings**

- Always pay attention to traffic and the area around your vehicle. The side assist does not replace a driver's attention. The driver always remains responsible for lane changes and similar driving maneuvers.

(See, e.g., Exhibits Audi-1 at 99; Audi-2 at 110; Audi-3 at 101; Audi-3 at 103; Audi-4 at 103; Audi-5 at 97; Audi-6 at 117; Audi-7 at 130-33; Audi-9 at 106; Audi-10 at 101).

17C. at least one sensor

The accused Audi vehicles include at least one sensor coupled to said vehicle for monitoring

Claim 17	Corresponding Element in Audi Vehicles
<p>coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor;</p>	<p>operation thereof, said at least one sensor including a road speed sensor, a manifold pressure sensor, a throttle position sensor and an engine speed sensor.</p> <p><i>See, e.g.,</i> citations for claim element 1B.</p>
<p>17D. a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;</p>	<p>The accused Audi vehicles include a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom.</p> <p><i>See, e.g.,</i> citations for claim element 1C.</p>
<p>17E. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor;</p>	<p>The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, a present level for each one of said at least one sensor and a prior level for each one of said at least one sensor.</p> <p><i>See, e.g.,</i> citations for claim elements 1A-1D.</p> <p>For example, on information and belief, the accused Audi vehicles include one or more systems that use one or more vehicle speed/stopping distance tables stored in one or more memories.</p>

**Claim 17**

**Corresponding Element in Audi Vehicles**

When approaching a moving vehicle up ahead, the adaptive cruise control system automatically brakes to match that object's speed and then maintains the stored distance. If the vehicle ahead accelerates, adaptive cruise control will also accelerate up to the stored speed.

The higher the speed, the greater the distance in yards (meters) is. The **Distance 3** setting is preprogrammed.

The distances provided are specified values. Depending on the driving situation and the how the vehicle ahead is driving, the actual distances may be more or less than these target distances.

The various symbols for the icons in **distance** appear briefly in the information line (page 88, fig. 23) when you change the setting.

Distance 1: This setting corresponds to a distance of 30 feet/9.1 meters when traveling at 62 mph (100 km/h), or a time interval of 1.3 seconds.

Distance 2: This setting corresponds to a distance of 116 feet/35 meters when traveling at 62 mph (100 km/h), or a time interval of 1.3 seconds.

Distance 3: This setting corresponds to a distance of 164 feet/50 meters when traveling at 62 mph (100 km/h), or a time interval of 1.8 seconds.

Distance 4: This setting corresponds to a distance of 216 feet/66 meters when traveling at 62 mph (100 km/h), or a time interval of 2.3 seconds.

**WARNING**

Following other vehicles too closely increases the risk of collisions and serious personal injury.

Setting short distances to the traffic ahead reduces the time and distance available to bring your vehicle to a safe stop and makes it even more necessary to pay close attention to traffic.

Always obey applicable traffic laws, use good judgment, and select a safe following distance for the traffic, road and weather conditions.

**Tip**

- Distance 3 is set automatically each time you switch the ignition on.
- Your standard settings are automatically stored and assigned to the remote control key being used.

(See, e.g., Exhibits Audi-1 at 90-91; Audi-2 at 104; Audi-3 at 95; Audi-4 at 97-98; Audi-5 at 88-89; Audi-6 at 111-12; Audi-7 at 118-20; Audi-9 at 97-98; Audi-10 at 95-96).

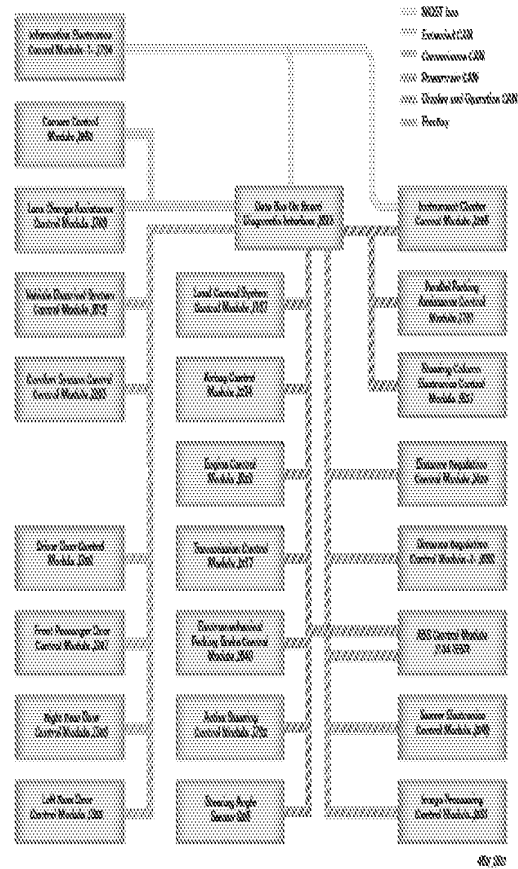

**Claim 17**

**Corresponding Element in Audi Vehicles**

**Networking/CAN Data Exchange**

The ACC control module needs approximately 1,700 different signals from other control modules and sensors.

The following overview shows the control modules involved in this data exchange.

(See, e.g., Exhibit Audi-19, 2011 A8 Running Gear and Suspension Systems Self-Study Program at 50).

**Claim 17**

**Corresponding Element in Audi Vehicles**

**17E2. Audi Braking Guard:**

**Audi braking guard**

Fig. 97. Instrument cluster approach warning

Braking guard uses radar sensors and a video camera. It also functions within the limits of the system when adaptive cruise control is switched off.

**What can braking guard do?**

When detected in time, the system can assess situations when a vehicle ahead brakes suddenly or if your own vehicle is traveling at a high speed and approaching a vehicle up ahead that is moving more slowly. Braking guard does not react if it cannot detect the situation.

The system advises you of various situations:

- The **distance warning** is given if you are too close to the vehicle ahead for a long time. If the vehicle ahead brakes sharply, you will not be able to avoid a collision. The indicator light  in the display comes on.
- The **approach warning** is given when a detected vehicle is ahead in your lane is moving much more slowly than you are or if it brakes sharply, when this warning is given, it may only be possible to avoid a collision by swerving or braking sharply. The multicolor light  and indicator in the display will warn you about the danger (Fig. 97). You will also hear an acoustic signal.

If you do not react fast enough or do not react at all to the situation, braking guard will intervene by braking.

- If a collision is imminent, the system will first provide an **acoustic warning** by briefly and sharply applying the brakes.
- If you do not react to the acoustic warning, braking guard can brake with increasing force within the limits of the system. This reduces the vehicle speed in the event of a collision.
- The system can initiate maximum braking shortly before a collision<sup>1)</sup>. Full deceleration at high speeds occurs only in vehicles with adaptive cruise control and side assist (lane sense plus).
- If the braking guard senses that you are not braking hard enough when a collision is imminent, it can increase the braking force.
- The pre-crash function also engages when a collision is imminent (page 134).

**Which functions can be controlled?**

You can switch braking guard and the distance/ approach warning on or off in the **MMI** (page 53), **Settings** or the **MMI**.

**ATTENTION**

Lack of attention can cause collisions, other accidents and serious personal injuries. The braking guard is an assist system and cannot prevent a collision by itself. The driver must always intervene. The driver is always responsible for braking at the correct time.

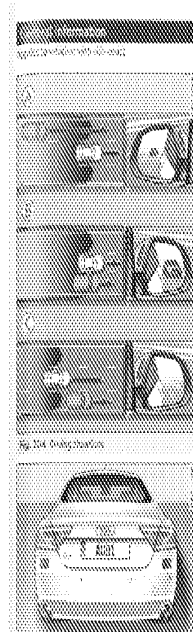

- Always pay close attention to traffic, even when the braking guard is switched on. Be ready to intervene and be ready to take complete control whenever necessary. Always keep the safe and legal distances between your vehicle and vehicles up ahead.
- Braking guard works within limits, and will not intervene outside the system limits. For extreme brake operation, a

(See, e.g., Exhibits Audi-1 at 92; Audi-2 at 105-06; Audi-3 at 96-97; Audi-4 at 99; Audi-5 at 90; Audi-6 at 113; Audi-7 at 127; Audi-9 at 99; Audi-10 at 97).

**Claim 17**

**Corresponding Element in Audi Vehicles**

17E3. Audi Side Assist:

**Vehicles left behind**

If you slowly pass a vehicle that side assist has detected (the difference in speed between the vehicle and your vehicle is less than 5 mph or 15 km/h), the display in the exterior mirror turns on as soon as the vehicle enters your blind spot.

The display will not turn on if you quickly pass a vehicle that side assist has detected (the difference in speed between the vehicle and your vehicle is greater than 8 mph or 15 km/h).

**Functional limitations**

The radar sensors are designed to detect the left and right adjacent lanes, when the road lanes are the normal width. In certain situations, the display in the exterior mirror may turn on even though there are no vehicles located in the area that is critical for a lane change. For example:

- If the lanes are narrow or if you are driving on the edge of your lane. If this is the case, the system may have detected the vehicle in another lane that is not adjacent to your current lane.
- If you are driving through a curve. Side assist may result in a vehicle that is one lane over from the adjacent lane.
- If side assist reacts to other objects such as a sign or displaced guard rail.
- In poor weather conditions. The side assist functions are limited.

Do not cover the radar sensors (Fig. 215) with stickers, tape, etc. because this will affect the function. Do not use side assist when being a trailer. For information on cleaning, refer to page 213.

**WARNING**

- Always pay attention to traffic and to the area around your vehicle. Side assist cannot replace a driver's attention. The driver is always responsible for lane changes and timely driving maneuvers.

**Vehicles that are approaching**

In certain cases, a vehicle will be classified as critical for a lane change even if it is still somewhat far away. The faster a vehicle approaches, the longer the display in the exterior mirror will turn on.

**Vehicles traveling with you**

Vehicles traveling with you are indicated in the exterior mirror if they are classified as critical for a lane change. All vehicles detected by side assist are indicated by the time they enter your "blind spot" or the lane.

**Fig. 214: Driving situation**

**Fig. 215: View in the vehicle mirror of the sensor**

Side assist functions at speeds above approximately 20 mph (30 km/h).

(See, e.g., Exhibits Audi-1 at 99; Audi-2 at 110; Audi-3 at 101; Audi-4 at 103; Audi-5 at 97; Audi-6 at 117; Audi-7 at 130-34; Audi-9 at 106; Audi-10 at 101).

Claim 17	Corresponding Element in Audi Vehicles
	<p>On information and belief, additional vehicle systems, including but not limited to electronic brake control systems (<i>e.g.</i>, ABS, TCS, BAS, ESC, <i>etc.</i>) and speed control systems (<i>e.g.</i>, electronic speed control (ESC) systems) included in the accused Audi vehicles, and safety and performance testing systems use vehicle speed/stopping distance tables stored in memory.</p>
<p>17F. a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to an object;</p>	<p>The accused Audi vehicles include a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to an object.</p> <p>For example, the accused Audi vehicles include one or more systems that include circuits that issue an alarm to indicate that the vehicle is too close to an object.</p>

**Claim 17**

**Corresponding Element in Audi Vehicles**

**17F1. Audi Adaptive Cruise Control:**

**Indicator lights**

**Adaptive cruise control is switched on:** No vehicles are detected up ahead. The entered speed is maintained.

**A moving vehicle is detected up ahead:** The adaptive cruise control system regulates the speed and distance to the moving vehicle ahead and accelerates/brakes automatically.

**Adaptive cruise control is switched on:** A moving vehicle up ahead was detected. Your vehicle remains stopped.

**When automatic braking is not able to keep enough distance to a previously detected moving vehicle up ahead, you must take control and brake:** Prompt for driver intervention.

**Display**

If adaptive cruise control is not shown in the display, you can call it up with the multifunction steering wheel buttons.

Based on the symbols in the display, you can determine if the system is maintaining a distance to the vehicle ahead and what that distance is.

**No vehicle** - No vehicle ahead was detected.

**White vehicle** - A vehicle ahead was detected.

**Red vehicle** - Prompt for the driver to take action.

**Both arrows on the scale** indicate the distance to the vehicle ahead. No arrow appears when the vehicle is on an open road and there is no object ahead. If an object is detected ahead, the arrow moves on the scale.

(See, e.g., Exhibits Audi-1 at 89; Audi-2 at 102; Audi-3 at 93; Audi-4 at 96; Audi-5 at 87; Audi-6

Claim 17	Corresponding Element in Audi Vehicles
	<p>at 110; Audi-7 at 120-22; Audi-9 at 96; Audi-10 at 94).</p> <p><i>Audi pre sense front (vehicles with adaptive cruise control)</i></p> <p><i>Audi pre sense front includes the functions in Audi pre sense basic. In addition, within the limits of the system, the likelihood of a collision with the vehicle immediately ahead is also calculated. If the system senses an imminent collision the following functions can be triggered:</i></p> <ul style="list-style-type: none"> <li>- Braking guard → page 92</li> <li>- Tightening the safety belts</li> <li>- Closing the windows and the sunroof (leaving a small open gap)</li> </ul> <p>(See, e.g., Exhibits Audi-1 at 194; Audi-5 at 192; Audi-6 at 110; Audi-9 at 196).</p>

**Claim 17**

**Corresponding Element in Audi Vehicles**

**17F2. Audi Braking Guard:**

**Audi braking guard**

The Audi instrument cluster displays the Braking Guard indicator.

Braking guard uses radar sensors and a wide camera. It also functions within the limits of the system when adaptive cruise control is active.

**What can braking guard do?**

When data that is close, the system can assess situations when a vehicle ahead brakes suddenly or if your own vehicle is traveling at a high speed and approaching a vehicle at a close distance moving more slowly. Braking guard does not react if it cannot detect the situation.

The system advises you of various situations:

- The **distance warning** is given if you are too close to the vehicle ahead for a long time. If the vehicle slows down suddenly, you will not be able to avoid a collision. The indicator light  in the display comes on.
- The **approach warning** is given when a detected vehicle is ahead in your lane: moving more slowly than you are or if it brakes abruptly. When this warning is given, it may only be possible to avoid a collision by slowing or braking abruptly. The indicator light  and indicator in the display will warn you about the danger (Fig. 57). You will also hear an acoustic signal.

If you do not react fast enough or do not react at all to the situation, braking guard will intervene by braking.

- If a collision is imminent, the system will first provide an acute warning by briefly and strongly applying the brakes.
- If you do not react to the acute warning, braking guard will brake with increasing force within the limits of the system. This reduces the vehicle speed in the event of a collision.
- The system can initiate maximum braking (stronger than a collision). It will do so even at high speeds only in vehicles with adaptive brake control and ABS with ESP (see Brake Plus).
- If the braking guard senses that you are not braking fast enough when a collision is imminent, it can increase the braking force.
- The pre-collision function also engages when a collision is imminent (page 124).

**Which functions can be controlled?**

You can control braking guard and the distance approach warning on in off in the MMI (page 81). See page 81.

- Lack of attention can cause collisions, with or without, and serious personal injuries. The braking guard is an assist system and cannot prevent a collision by itself. The driver must always observe the driver's block responsible for braking of the car in front.
- Always pay close attention to traffic, even when the braking guard is activated. Be ready to intervene and be ready to take complete control whenever necessary. Always keep the safe and legal distance between your vehicle and vehicles in front.
- Braking guard works within limits and will not intervene outside the system's limits. For example when approaching a

(See, e.g., Exhibits Audi-1 at 92; Audi-2 at 105-06; Audi-3 at 96-97; Audi-4 at 99; Audi-5 at 90; Audi-6 at 113; Audi-7 at 127; Audi-9 at 99; Audi-10 at 97).

The adaptive cruise control system regulates the speed and distance to the moving vehicle ahead and accelerates/brakes automatically.</li> <li> - Adaptive cruise control is switched on. A moving vehicle up ahead was detected. Your vehicle remains stopped.</li> <li> - When automatic braking is not able to keep enough distance to a previously detected moving vehicle up ahead, you must take control and brake <i>→ page 92, Prompt for driver intervention.</i></li> </ul> <p> <b>Display</b></p> <p>If adaptive cruise control is not shown in the display, you can call it up with the multifunction steering wheel buttons <i>→ page 24.</i></p> <p>Based on the symbols in the display, you can determine if the system is maintaining a distance to the vehicle ahead and what that distance is.</p> <ul style="list-style-type: none"> <li><b>No vehicle</b> - No vehicle ahead was detected.</li> <li><b>White vehicle</b> - A vehicle ahead was detected.</li> <li><b>Red vehicle</b> - Prompt for the driver to take action <i>→ page 92.</i></li> </ul> <p>Both arrows on the scale  indicate the distance to the vehicle ahead. No arrow appears when the vehicle is on an open road and there is no object ahead. If an object is detected ahead, the arrow moves on the scale.</p>

Claim 21	Corresponding Element in Audi Vehicles
	<p>(See, e.g., Exhibits Audi-1 at 89; Audi-2 at 102; Audi-3 at 93; Audi-4 at 96; Audi-5 at 87; Audi-6 at 110; Audi-7 at 120-22; Audi-9 at 96; Audi-10 at 94).</p> <p style="text-align: center;">Audi pre sense front (vehicles with adaptive cruise control*)</p> <p style="text-align: center;">Audi pre sense front includes the functions in Audi pre sense basic. In addition, within the limits of the system, the likelihood of a collision with the vehicle immediately ahead is also calculated. If the system senses an imminent collision the following functions can be triggered:</p> <ul style="list-style-type: none"> <li>-- Braking guard *page 92</li> <li>-- Tightening the safety belts</li> <li>-- Closing the windows and the sunroof* (leaving a small open gap)</li> </ul> <p>(See, e.g., Exhibits Audi-1 at 194; Audi-5 at 192; Audi-6 at 110; Audi-9 at 196).</p>

Claim 21

Corresponding Element in Audi Vehicles

21B2. Audi Braking Guard:

Audi braking guard

Applies to vehicles with full adaptive cruise control

Fig. 80 Instrument cluster adaptive braking

Braking guard uses radar sensors and a video camera. It also functions within the limits of the system when adaptive cruise control is switched off.

What can braking guard do?

When detected in time, the system can assist situations when a vehicle ahead brakes suddenly or if your own vehicle is traveling at a high speed and approaching a vehicle up ahead that is moving more slowly. Braking guard does not react if it cannot detect the situation.

The system advises you of various situations:

- The **distance warning** is given if you are too close to the vehicle ahead for a long time. If the vehicle ahead brakes sharply, you will not be able to avoid a collision. The indicator light in the display comes on.
- The **approach warning** is given when a detected vehicle up ahead in your lane is moving much more slowly than you are or if it brakes sharply. When this warning is given, it may only be possible to avoid a collision by swerving or braking sharply. The indicator light and indicator in the display will warn you about the danger in fig. 81. You will also hear an acoustic signal.

If you do not react fast enough or do not react at all to the situation, braking guard will intervene by braking.

- If a collision is imminent, the system will first provide an **across warning** by briefly and sharply applying the brakes.
- If you do not react to the across warning, braking guard can brake with increasing force within the limits of the system. This reduces the vehicle speed in the event of a collision.
- The system can initiate maximum braking shortly before a collision<sup>1)</sup>. Full deceleration at high speeds occurs only in vehicles with electronic cross control and side assist (pre sense plus).
- If the braking guard senses that you intend braking too strongly when a collision is imminent, it can increase the braking force.
- The pre sense functions also engage when a collision is imminent (page 129).

Which functions can be controlled?

You can switch braking guard and the distance approach warning on or off in the MMI (page 83, Settings in the MMI).

Lack of attention can cause collisions, other accidents and serious personal injuries. The braking guard is an assist system and cannot prevent a collision by itself. The driver must always intervene. The driver is always responsible for braking at the correct time.

Always pay close attention to traffic, even when the braking guard is switched on. Be ready to intervene and be ready to take complete control whenever necessary. Always keep the safe and legal distance between your vehicle and vehicles up ahead.

Braking guard works within limits and will not respond outside the system limits. For example, when approaching a

	alarms determined by said processor subsystem” are described in, for example, Figures 1 and 2 and associated text relating to the expression programmed in the Processor Subsystem 12.

Claim 22	Corresponding Element in Audi Vehicles
22A. Apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 17 and further comprising:  <i>See, e.g.,</i> citations for claim 17.
22B. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and	The accused Audi vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.  <i>See, e.g.,</i> citations for claim element 7F.
22C. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.	The accused Audi vehicles include a processor subsystem that determines, based upon data received from said plurality of sensors, when to activate said downshift notification circuit.  <i>See, e.g.,</i> citations for claim elements 1B, 1G.

Claim 23	Corresponding Element in Audi Vehicles
23A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle. <i>See, e.g.,</i> citations for claims 1, 17.
23B. a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;	The accused Audi vehicles include a radar detector that determines a distance separating a vehicle having an engine and another object in front of the accused vehicles. <i>See, e.g.,</i> citations for claim element 17B.
23C. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Audi vehicles include a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor <i>See, e.g.,</i> citations for claim element 1B.
23D. a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom; <i>See, e.g.,</i> citations for claim element 1C.
23E. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold	The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.

Claim 23	Corresponding Element in Audi Vehicles
pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;	<i>See, e.g.</i> , citations for claim element 17E.
23F. a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	<p>The accused Audi vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.</p> <p><i>See, e.g.</i>, citations for claim element 1E.</p>
23G. an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;	<p>The accused Audi vehicles include an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.</p> <p><i>See, e.g.</i>, citations for claim element 1F.</p>
23H. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit;	<p>The accused Audi vehicles include a processor subsystem that determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.</p> <p><i>See, e.g.</i>, citations for claim element 1G.</p>
23I. a vehicle proximity	The accused Audi vehicles include a vehicle proximity alarm circuit coupled to said processor

Claim 23	Corresponding Element in Audi Vehicles
<p>alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.</p> <p><i>See, e.g.,</i> citations for claim 17F.</p>
<p>23J. said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p>	<p>The accused Audi vehicles includes a processor subsystem that determines, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p> <p><i>See, e.g.,</i> citations for claim element 17I.</p>

Claim 24	Corresponding Element in Audi Vehicles
24A. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:	<p>The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:</p> <p><i>See, e.g.</i>, citations for claim 23.</p>
24B. means for determining when road speed for said vehicle is increasing or decreasing;	<p>The accused Audi vehicles include a means for determining when road speed for said vehicle is increasing or decreasing.</p> <p><i>See, e.g.</i>, citations for claim element 15B.</p>
24C. means for determining when throttle position for said vehicle is increasing or decreasing; and	<p>The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing or decreasing.</p> <p><i>See, e.g.</i>, citations for claim element 2C.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when throttle position for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to Throttle Sensor 24, Memory Subsystem 14, and Processor Subsystem 12.</p>
24D. means for comparing manifold pressure to said manifold pressure set point;	<p>The accused Audi vehicles include a means for comparing manifold pressure to said manifold pressure set point.</p> <p><i>See, e.g.</i>, citations for claim element 2D.</p>
24E. means for determining when manifold pressure for said vehicle is increasing or decreasing; and	<p>The accused Audi vehicles include a means for determining when manifold pressure for said vehicle is increasing or decreasing.</p> <p><i>See, e.g.</i>, citations for claim element 4D.</p>

Claim 24	Corresponding Element in Audi Vehicles
	To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when manifold pressure for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to Manifold PSI Sensor 22, Memory Subsystem 14, and Processor Subsystem 12.
24F. means for determining when engine speed for said vehicle is increasing or decreasing;	The accused Audi vehicles include a means for determining when engine speed for said vehicle is increasing or decreasing.  <i>See, e.g.,</i> citations for claim element 15G.
24G. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.	On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.  <i>See, e.g.,</i> citations for claim element 1G.

Claim 25	Corresponding Element in Audi Vehicles
25A. Apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 23 wherein said processor subsystem further comprises:  <i>See, e.g.,</i> citations for claim 23.
25B. means for determining when road speed for said vehicle is increasing;	The accused Audi vehicles include a means for determining when road speed for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2B.
25C. means for determining when throttle position for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2C.
25D. means for comparing manifold pressure to said manifold pressure set point;	The accused Audi vehicles include a means for comparing manifold pressure to said manifold pressure set point.  <i>See, e.g.,</i> citations for claim element 2D.
25E. means for comparing engine speed to said RPM set point;	The accused Audi vehicles include a means for comparing engine speed to said RPM set point.  <i>See, e.g.,</i> citations for claim element 5E.
25F. said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is	On information and belief, the accused Audi vehicles include a processor subsystem that activates said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.  <i>See, e.g.,</i> citations for claim element 5F.

Claim 25	Corresponding Element in Audi Vehicles
at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.	

Claim 26	Corresponding Element in Audi Vehicles
26A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle.  <i>See, e.g.,</i> citations for claims 1, 17.
26B. a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;	The accused Audi vehicles include a radar detector that determines a distance separating a vehicle having an engine and another object in front of the accused vehicles.  <i>See, e.g.,</i> citations for claim element 17B.
26C. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Audi vehicles include a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, and engine speed sensor, a manifold pressure sensor and a throttle position sensor.  <i>See, e.g.,</i> citations for claim element 1B.
26D. a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to said radar detector and each one of said plurality of sensors, to receive data therefrom;  <i>See, e.g.,</i> citations for claim element 1C.
26E. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold	The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a first vehicle speed/stopping distance table, a manifold pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors.

Claim 26	Corresponding Element in Audi Vehicles
pressure set point, RPM set point, and present and prior levels for each one of said plurality of sensors;	<i>See, e.g.</i> , citations for claim element 17E.
26F. a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	<p>The accused Audi vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.</p> <p><i>See, e.g.</i>, citations for claim element 1E.</p>
26G. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;	<p>The accused Audi vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;</p> <p><i>See, e.g.</i>, citations for claim element 7F.</p>
26H. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit;	<p>The accused Audi vehicles include a processor subsystem that determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.</p> <p><i>See, e.g.</i>, citations for claim element 7G.</p>
26I. a vehicle proximity	The accused Audi vehicles include a vehicle proximity alarm circuit coupled to said processor

Claim 26	Corresponding Element in Audi Vehicles
<p>alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;</p>	<p>subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object.</p> <p><i>See, e.g.,</i> citations for claim element 17F.</p>
<p>26J. said processor subsystem determining, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p>	<p>The accused Audi vehicles includes a processor subsystem that determines, based upon data received from said radar detector, said at least one sensor and said memory subsystem, when to activate said vehicle proximity alarm circuit.</p> <p><i>See, e.g.,</i> citations for claim element 17I.</p>

Claim 27	Corresponding Element in Audi Vehicles
27A. Apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 26 wherein said processor subsystem further comprises:  <i>See, e.g.</i> , citations for claims 1, 26.
27B. means for determining when road speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4B.
27C. means for determining when throttle position for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 4C.
27D. means for determining when manifold pressure for said vehicle is increasing; and	The accused Audi vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g.</i> , citations for claim element 4D.
27E. means for determining when engine speed for said vehicle is decreasing;	The accused Audi vehicles include a means for determining when engine speed for said vehicle is decreasing.  <i>See, e.g.</i> , citations for claim element 4E.
27F. said processor subsystem activating said downshift notification circuit if both road speed and engine speed are	On information and belief, the accused Audi vehicles include a processor subsystem that activates said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.  <i>See, e.g.</i> , citations for claim element 10F.

<b>Claim 27</b>	<b>Corresponding Element in Audi Vehicles</b>
decreasing and both throttle position and manifold pressure for said vehicle are increasing.	

Claim 28	Corresponding Element in Audi Vehicles
28A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle.  <i>See, e.g.</i> , citations for claim 1.
28B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Audi vehicles include a plurality of sensors coupled to the vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor  <i>See, e.g.</i> , citations for claim element 1B.
28C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.  <i>See, e.g.</i> , citations for claim element 1C.
28D. a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	The accused Audi vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.  <i>See, e.g.</i> , citations for claim element 1E.
28E. said processor subsystem determining whether to activate said fuel overinjection notification	The accused Audi vehicles include a processor subsystem that determines whether to activate said fuel overinjection notification sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.

<b>Claim 28</b>	<b>Corresponding Element in Audi Vehicles</b>
sensor based upon data received from said road speed sensor, said throttle position sensor and said manifold pressure sensor.	<i>See, e.g.</i> , citations for claim element 1G.

Claim 29	Corresponding Element in Audi Vehicles
29A. Apparatus according to claim 28 and further comprising:	The accused Audi vehicles include an apparatus according to claim 28 and further comprising:  <i>See, e.g.,</i> citations for claim 1, 28.
29B. a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point;	The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem maintaining a manifold pressure set point.  <i>See, e.g.,</i> citations for claim element 1D.
29C. said processor subsystem activating said fuel overinjection notification circuit upon determining that: (1) based upon data received from said road speed sensor, road speed of said vehicle is increasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle exceeds said manifold pressure set point.	On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit upon determining that: (1) based upon data received from said road speed sensor, road speed of said vehicle is increasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; and (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle exceeds said manifold pressure set point.  <i>See, e.g.,</i> citations for claim element 1G.

Claim 30	Corresponding Element in Audi Vehicles
30A. Apparatus according to claim 28, wherein:	<p>The accused Audi vehicles include an apparatus according to claim 28.</p> <p><i>See, e.g.,</i> citations for claims 1, 28.</p>
30B. said plurality of sensors coupled to said vehicle further include an engine speed sensor;	<p>The accused Audi vehicles include a plurality of sensors coupled to said vehicle further including an engine speed sensor;</p> <p><i>See, e.g.,</i> citations for claim element 1B.</p>
30C. said processor subsystem activating said fuel overinjection notification circuit upon determining that: (1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and (4) based upon data received from said engine speed sensor,	<p>On information and belief, the accused Audi vehicles include a processor subsystem that activates said fuel overinjection notification circuit upon determining that: (1) based upon data received from said road speed sensor, road speed of said vehicle is decreasing; (2) based upon data received from said throttle position sensor, throttle position for said vehicle is increasing; (3) based upon data received from said manifold pressure sensor, manifold pressure for said vehicle is increasing; and (4) based upon data received from said engine speed sensor, engine speed for said vehicle is decreasing.</p> <p><i>See, e.g.,</i> citations for claim element 1G.</p>

<b>Claim 30</b>	<b>Corresponding Element in Audi Vehicles</b>
engine speed for said vehicle is decreasing.	

Claim 31	Corresponding Element in Audi Vehicles
31A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle. <i>See, e.g.,</i> citations for claims 1, 17.
31B. a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;	The accused Audi vehicles include a radar detector that determines a distance separating a vehicle having an engine and another object in front of the accused vehicles. <i>See, e.g.,</i> citations for claim element 17B.
31C. at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor.	The accused Audi vehicles include at least one sensor coupled to said vehicle for monitoring operation thereof, said at least one sensor including a road speed sensor. <i>See, e.g.,</i> citations for claim element 1B.
31D. a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom;	The accused Audi vehicles include a processor subsystem, coupled to said radar detector and said at least one sensor, to receive data therefrom. <i>See, e.g.,</i> citations for claim element 17D.
31E. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table.	The accused Audi vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing a first vehicle speed/stopping distance table. <i>See, e.g.,</i> citations for claim element 17E.
31F. a vehicle proximity alarm circuit coupled to said	The accused Audi vehicles include a vehicle proximity alarm circuit coupled to said processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to

Claim 31	Corresponding Element in Audi Vehicles
processor subsystem, said vehicle proximity alarm circuit issuing an alarm that said vehicle is too close to said object;	said object.  <i>See, e.g.,</i> citations for claim element 17F.
31G. said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.	On information and belief, the accused Audi vehicles includes a processor subsystem that determines whether to activate said vehicle proximity alarm circuit based upon separation distance data received from said radar detector, vehicle speed data received from said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.  <i>See, e.g.,</i> citations for claim element 17I.

Claim 32	Corresponding Element in Audi Vehicles
32A. Apparatus for optimizing operation of a vehicle according to claim 31 wherein:	The accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 31.  <i>See, e.g.,</i> citations for claim 31.
32B. said at least one sensor further includes a	The accused Audi vehicles include at least one sensor further including a windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated.

Claim 32	Corresponding Element in Audi Vehicles
windshield wiper sensor for indicating whether a windshield wiper of said vehicle is activated; and	<i>See, e.g.</i> , citations for claim element 18B.
32C. said memory subsystem further storing a second vehicle speed/stopping distance table.	The accused Audi vehicles include a memory subsystem further storing a second vehicle speed/stopping distance table.  <i>See, e.g.</i> , citations for claim element 18C.
32D. if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem;	On information and belief, the accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 31 wherein if said windshield wiper sensor indicates that said windshield wiper is deactivated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said first vehicle speed/stopping distance table stored in said memory subsystem.  <i>See, e.g.</i> , citations for claim element 17I.
32E. if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm	On information and belief, the accused Audi vehicles include an apparatus for optimizing operation of a vehicle according to claim 31 wherein if said windshield wiper sensor indicates that said windshield wiper is activated, said processor subsystem determining whether to activate said vehicle proximity alarm circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.

Claim 32	Corresponding Element in Audi Vehicles
<p>circuit based upon data received from said radar detector, said road speed sensor and said second vehicle speed/stopping distance table stored in said memory subsystem.</p>	<p><i>See, e.g.</i>, citations for claim element 17I.</p>

## **EXHIBIT 7**

**A. Identification of Infringed Claims and Applicable Statutory Section of 35 U.S.C. § 271**

Claims 1-2, 4-5, 7-8, 10, 12-13, 15, and 17-32 of U.S. Patent No. 5,954,781 are directly infringed under 35 U.S.C § 271(a) by the accused Mercedes vehicles identified below.

**B. Identification of Accused Instrumentalities By Claim**

As set forth in the accompanying claim chart, the Mercedes-Benz S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class vehicles that include the identified features, infringe one or more of the claims identified above.

On a claim-by-claim basis, the following Mercedes vehicles are accused of infringement by Velocity:

Claim 1 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 2 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 4 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 5 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 7 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 8 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 25 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 26 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 27 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 28 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 29 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 30 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 31 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class;

Claim 32 - Mercedes S-Class, C-Class Coupe, C-Class Sedan, CL-Class, CLA-Class, CLS-Class, E-Class Coupe/Cabriolet, E-Class Sedan/Wagon, G-Class, GL-Class, GLK-Class, M-Class, SL-Class, SLK-Class, and SLS-Class.

**C. Claim Chart Comparing Each Element of the Asserted Claims to the Accused Instrumentalities**

A claim chart identifying where each element of each asserted claim is found within each Accused Mercedes vehicle is attached.

**D. Identification of Whether Each Element of Each Asserted Claim is Present in the Accused Instrumentalities Literally or Under the Doctrine of Equivalents**

At this time, Velocity asserts that all of the asserted claim elements are literally present in the Accused Mercedes vehicles.

At this time, sections (e)-(f) of Local Patent Rule 2.2 are not applicable. Velocity expressly reserves the right to revise, amend and supplement these contentions as discovery progresses and new information becomes available.

Dated: March 12, 2014

Respectfully submitted,

/s/ James A. Shimota

**Velocity Patent LLC Preliminary Infringement Contentions Against Mercedes-Benz Defendants Pursuant to N.D. III. LPR 2.1**

Claim 1	Corresponding Element in Mercedes-Benz Vehicles <sup>1</sup>
<p>1.A. Apparatus for optimizing operation of a vehicle, comprising:<sup>2</sup></p>	<p>The accused Mercedes-Benz vehicles<sup>3</sup> include an apparatus for optimizing operation of a vehicle.</p> <p>For example, the accused Mercedes-Benz vehicles include a motor electronics (ME) control unit with one or more computer processors that monitor various vehicle systems and optimize the fuel economy, safety and performance of the vehicle.</p>

<sup>1</sup> Velocity contends that each element of the asserted claims is literally and directly infringed by the accused vehicles.

<sup>2</sup> Velocity's citations related to any claim preamble in this claim chart should not be interpreted as an admission that the preamble is limiting.

<sup>3</sup> The accused features and vehicles identified in these preliminary contentions are representative only. Velocity accuses all Mercedes-Benz vehicle models for model years 2007 to 2014 that incorporate features that are similar to the accused features identified in these preliminary contentions, including at least the: a) S-Class; b) C-Class Coupe; c) C-Class Sedan; d) CL-Class; e) CL-Class; f) CLS-Class; g) E-Class Coupe and Cabriolet; h) E-Class Sedan and Wagon; i) G-Class; j) GL-Class; k) GLK-Class; l) M-Class; m) SL-Class; n) SLK-Class; and o) SLS-Class. Discovery has just begun in this case. Velocity reserves the right to supplement and identify additional infringing models (e.g., 2015 models currently being tested) as it learns facts through discovery.

**Claim 1**

**Corresponding Element in Mercedes-Benz Vehicles<sup>1</sup>**

**ME (motor electronics) control unit**

The MED 17.7.1 engine control builds on experiences with the MED 9 of previous engines. The following features have been implemented in this new engine control MED 17.7.1 in an identical modular housing:

- Modular design as a standardized control unit for all new V8 engines with direct injection
- In contrast to the predecessor unit, no separate water cooling of the injector power amplifiers but air convection via cooling fins instead
- No additional component carriers in the control unit for the injector power amplifiers
- Single-processor concept with 150 MHz clock frequency instead of dual-core concept with 66 MHz each
- Significantly increased flash and RAM memory capacities
- Weight reduction by 0.2 kg

PS4.2-317-1-00

*Engine M 157*

*N3/10 ME-SFI [ME] control unit*

--	---	--	--

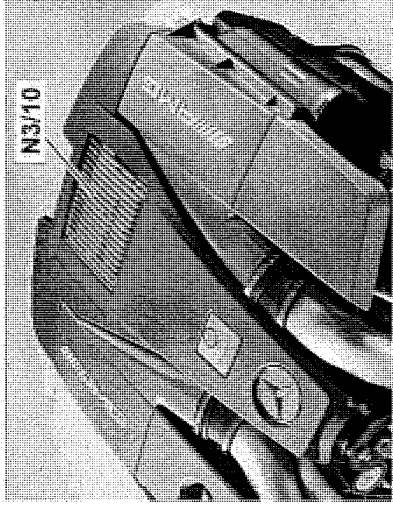

(See, e.g., Ex. Mercedes-Benz-1, Introduction of the New Generation of V-Engines, 8-cylinder M 157 AMG at 49-51).

While the citations above relate specifically to the Mercedes-Benz M157 engine, upon information and belief, Mercedes-Benz's other engines (e.g., the 4-cylinder M270/M274, 6-cylinder M272/M276, 8-cylinder M155/M156/M273/M278/M157/M159 and 12-cylinder M158/M275/M285) have the same or similar motor electronics (ME) control units with one or more computer processors.

The accused Mercedes-Benz vehicles include a plurality of sensors coupled to the vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor.

1B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said engine, said plurality of sensors, which collectively monitor operation of said engine, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor.

<p align="center"><b>Claim 1</b></p>	<p align="center"><b>Corresponding Element in Mercedes-Benz Vehicles<sup>1</sup></b></p>
<p>vehicle, including a road speed sensor, an engine pressure sensor and a throttle position sensor;</p>	<p>See, e.g., citations for claim element 1A (describing processor controlled vehicle systems that monitor vehicle system characteristics and operations).</p> <p>Upon information and belief, the accused Mercedes-Benz vehicles include an engine. More specifically, upon information and belief, the Mercedes-Benz engines include the 4-cylinder M270/M274, 6-cylinder M272/M276, 8-cylinder M155/M156/M273/M278/M157/M159 and 12-cylinder M158/M275/M285.</p> <p>1B1. The accused Mercedes-Benz vehicles include one or more road speed sensors, engine speed sensors, manifold pressure sensors, and throttle position sensors. For example, the Mercedes-Benz M157 engine includes a MED 17.7.1 engine control unit with a processor that is coupled to a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor. Upon information and belief, Mercedes-Benz's other engines have the same or similar engine control features.</p>

Claim 1	Corresponding Element in Mercedes-Benz Vehicles
<p><b>ME (motor electronics) control unit</b></p> <p>The MED 17.7.1 engine control builds on experiences with the MED 9 of previous engines. The following features have been implemented in this new engine control MED 17.7.1 in an identical modular housing:</p> <ul style="list-style-type: none"> <li>• Modular design as a standardized control unit for all new V8 engines with direct injection.</li> <li>• In contrast to the predecessor unit, no separate water cooling of the injector power amplifiers but air convection via cooling fins instead.</li> <li>• No additional component carriers in the control unit for the injector power amplifiers.</li> <li>• Single-processor concept with 150 MHz clock frequency instead of dual-core concept with 66 MHz each.</li> <li>• Significantly increased flash and RAM memory capacities.</li> <li>• Weight reduction by 0.2 kg.</li> </ul>	 <p><i>Engine M 157 N3/10 ME-SFI (ME) control unit</i></p> <p><small>PS4.2-13171-00</small></p>

Claim 1	Corresponding Element in Mercedes-Benz Vehicles <sup>1</sup>
	<p><b>Task</b></p> <p>The engine control unit combines with the sensors and actuators of engine M 157 to form the engine control system. The following systems and functions are controlled and coordinated by the engine control unit according to the input signals:</p> <ul style="list-style-type: none"> <li>• Ignition system</li> <li>• Fuel supply</li> <li>• Injection control</li> <li>• Electronic accelerator</li> <li>• Diagnosis and fault storage</li> <li>• Engine start/stop function</li> <li>• Drive authorization system and immobilizer</li> <li>• Controlled camshaft adjustment</li> <li>• Thermal management</li> <li>• Torque interface</li> <li>• Alternator interface</li> <li>• Oil pressure control</li> <li>• Lambda control</li> <li>• Tank diagnosis</li> <li>• Purging</li> </ul>

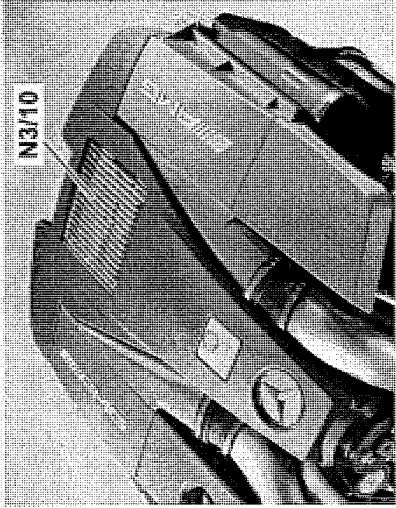

**Claim 1** **Corresponding Element in Mercedes-Benz Vehicles<sup>1</sup>**

A1	instrument cluster		
A164	Fuel reserve warning lamp		
A1654	Coolant temperature warning lamp		
A1658	Engine diagnosis indicator lamp		
A1613	Multifunction display		
A29/1	Front knock sensor (left side of engine)		
A29/2	Rear knock sensor (left side of engine)		
A30/1	Front knock sensor (right side of engine)		
A30/2	Rear knock sensor (right side of engine)		
B4/1	Fuel level indicator sensor, left tank half		
B4/2	Fuel level indicator sensor, right tank half		
B4/3	Tank pressure sensor with code (494 USA version)		
B4/7	Fuel pressure sensor		
B4/25	Fuel pressure and temperature sensor		
B6/4	Intake camshaft Hall sensor, left		
B6/5	Intake camshaft Hall sensor, right		
B6/6	Exhaust camshaft Hall sensor, left		
B6/7	Exhaust camshaft Hall sensor, right		
B11/4	Coolant temperature sensor		
B17	Intake air temperature sensor		
B28/4	Pressure sensor downstream of air filter, left cylinder bank		
B28/5	Pressure sensor downstream of air filter, right cylinder bank		
B28/6	Pressure sensor upstream of throttle valve actuator		
B28/7	Pressure sensor downstream of throttle valve actuator		
B37	Accelerator pedal sensor		
B40	Oil sensor (oil level, temperature and quality)		
B64/1	Brake vacuum sensor		
B70	Crankshaft Hall sensor		
G1	On-board electrical system battery		
G2	Alternator		
G3/3	Left O2 sensor upstream of catalytic converter		
G3/4	Right O2 sensor upstream of catalytic converter		
G3/5	Left O2 sensor downstream of catalytic converter		
G3/6	Right O2 sensor downstream of catalytic converter		
L6/1	Left front rpm sensor		
L6/2	Right front rpm sensor		
L6/3	Left rear rpm sensor		
L6/4	Right rear rpm sensor		
M1	Starter		
M3	Fuel pump		
M4/7	Engine and air conditioning electric suction fan with integrated control		
M16/6	Throttle valve actuator		
M44	Charge air cooler circulation pump		
N2/7	Restraint systems control unit		
N3/10	ME-SF [ME] control unit		
N10/1	Front SAM control unit with fuse and relay module		
N10/1AC	Circuit 87 relay, engine		
N10/1AD	Circuit 15 relay		
N10/1AH	Circuit 50 relay, starter		
N10/2	Rear SAM control unit with fuse and relay module		
N10/2KO	Circulation pump relay		
N22/1	A4C [KLA] control unit		
N47-5	ESP control unit		
N51/2	ABC control unit		

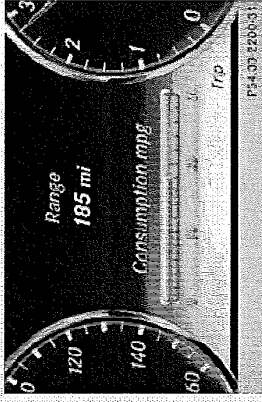

(See, e.g., Ex. Mercedes-Benz-1 at 49-51)

Claim 1	Corresponding Element in Mercedes-Benz Vehicles <sup>1</sup>
	<p><b>Safety fuel shutoff</b></p> <p>A safety fuel shutoff function guarantees road safety and the safety of the occupants.</p> <p>The engine control unit controls the safety fuel shutoff on the basis of the following sensors and signals:</p> <ul style="list-style-type: none"> <li>• Crankshaft Hall sensor, engine rpm</li> <li>• Throttle valve actuator, throttle valve position</li> <li>• Restraint systems control unit, direct crash signal</li> <li>• Restraint systems control unit, indirect crash signal via chassis CAN</li> </ul> <p>The safety fuel shutoff is activated by the engine control unit in the event of mechanical faults in the throttle valve actuator, on the absence of the engine speed signal or after receipt of a crash signal.</p>
<p>1C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;</p>	<p>(See, e.g., Ex. Mercedes-Benz-1 at 33).</p> <p>The accused Mercedes-Benz vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.</p>
<p>1D. a memory subsystem, coupled to said processor subsystem, said memory</p>	<p>See, e.g., citations for claim elements 1A (describing processor controlled vehicle systems that monitor vehicle system characteristics and operations) and 1B (describing an engine control unit with a processor coupled to sensors that measure system characteristics).</p> <p>On information and belief, the accused Mercedes-Benz vehicles have a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors.</p>

<b>Corresponding Element in Mercedes-Benz Vehicles</b>	
<p><b>Claim 1</b></p> <p>subsystem storing therein a manifold pressure set point, an RPM set point, and present and prior levels for each one of said plurality of sensors;</p>	<p>For example, the accused Mercedes-Benz vehicles include one or more memories that form a memory subsystem for storing information relating to vehicle system operations:</p> <p><b>ME (motor electronics) control unit</b></p> <p>The MED 17.7.1 engine control builds on experiences with the MED 9 of previous engines. The following features have been implemented in this new engine control MED 17.7.1 in an identical modular housing:</p> <ul style="list-style-type: none"> <li>• Modular design as a standardized control unit for all new V8 engines with direct injection</li> <li>• In contrast to the predecessor unit, no separate water cooling of the injector power amplifiers but air convection via cooling fins instead</li> <li>• No additional component carriers in the control unit for the injector power amplifiers</li> <li>• Single-processor concept with 150 MHz clock frequency instead of dual-core concept with 66 MHz each</li> <li>• Significantly increased flash and RAM memory capacities</li> <li>• Weight reduction by 0.2 kg</li> </ul> <div style="text-align: right;">  <p>PS4.2:13171-00</p> <p><b>Engine M 157</b> N3/10 ME-SFI [ME] control unit</p> </div>

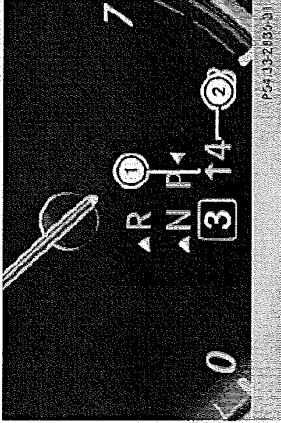

Claim 1	Corresponding Element in Mercedes-Benz Vehicles <sup>1</sup>
	<p data-bbox="347 1066 367 1115">Task</p> <p data-bbox="396 730 509 1115">The engine control unit combines with the sensors and actuators of engine M 157 to form the engine control system. Mercedes-Benz-15 at 153.)</p>
<p>1G, said processor subsystem determining, based upon data received from said plurality of sensors, when to activate</p>	<p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that determines based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said upshift notification circuit.</p> <p>See, e.g., citations for elements 1A-1F.</p>

Claim 1	Corresponding Element in Mercedes-Benz Vehicles <sup>1</sup>
said fuel overinjection circuit and when to activate said upshift notification circuit.	

Claim 2	Corresponding Element in Mercedes-Benz Vehicles
2A. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:	<p>The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:</p> <p><i>See, e.g.,</i> citations for claim 1.</p>
2B. means for determining when road speed for said vehicle is increasing;	<p>The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim elements IB-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when road speed for said vehicle is increasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Road Speed Sensor 18, Memory Subsystem 14, and Processor Subsystem 12.</p>
2C. means for determining when throttle position for said vehicle is increasing; and	<p>The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.</p> <p><i>See, e.g.,</i> citations for claim elements IB-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when throttle position for said vehicle is increasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Throttle Sensor 24, Memory Subsystem 14, and Processor Subsystem 12.</p>
2D. means for comparing manifold pressure to said manifold pressure set point;	<p>The accused Mercedes-Benz vehicles include a means for comparing manifold pressure to said manifold pressure set point.</p> <p><i>See, e.g.,</i> citations for claim elements IB-1D.</p>

Claim 2	Corresponding Element in Mercedes-Benz Vehicles
<p>2E. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.</p>	<p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “comparing manifold pressure to said manifold pressure set point” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Manifold PSI Sensor 22, Memory Subsystem 14, and Processor Subsystem 12.</p> <p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.</p> <p><i>See, e.g.,</i> citations for claim elements 1E, 1G.</p>

<b>Claim 4</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
<p>4A. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:</p>	<p>The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:  <i>See, e.g.,</i> citations for claim 1.</p>
<p>4B. means for determining when road speed for said vehicle is decreasing;</p>	<p>The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g.,</i> citations for claim element 2B.</p>
<p>4C. means for determining when throttle position for said vehicle is increasing; and</p>	<p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when road speed for said vehicle is decreasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Road Speed Sensor 18, Memory Subsystem 14, and Processor Subsystem 12.</p>
<p>4D. means for determining when manifold pressure for said vehicle is increasing; and</p>	<p>The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2C.</p> <p>The accused Mercedes-Benz vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim elements 1B-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when manifold pressure for said vehicle is increasing” are described in, for example, Figures 1 and 2 and associated text of the ’781 patent relating to Manifold PSI Sensor 22, Memory Subsystem 14, and Processor Subsystem 12.</p>

Claim 4	Corresponding Element in Mercedes-Benz Vehicles
<p>4E. means for determining when engine speed for said vehicle is decreasing;</p>	<p>The accused Mercedes-Benz vehicles include a means for determining when engine speed for said vehicle is decreasing. <i>See, e.g.,</i> citations for claim elements 1B-1D.</p> <p>To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when engine speed for said vehicle is decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.</p>
<p>4F. said processor subsystem activating said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.</p>	<p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing. <i>See, e.g.,</i> citations for claim elements 1E, 1G.</p>

<b>Claim 5</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
5A. Apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 1 wherein said processor subsystem further comprises:  <i>See, e.g., citations for claim 1.</i>
5B. means for determining when road speed for said vehicle is increasing;	The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is increasing.  <i>See, e.g., citations for claim element 2B.</i>
5C. means for determining when throttle position for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g., citations for claim element 2C.</i>
5D. means for comparing manifold pressure to said manifold pressure set point;	The accused Mercedes-Benz vehicles include a means for comparing manifold pressure to said manifold pressure set point.  <i>See, e.g., citations for claim element 2D.</i>
5E. means for comparing engine speed to said RPM set point;	The accused Mercedes-Benz vehicles include a means for comparing engine speed to said RPM set point.  <i>See, e.g., citations for claim elements 1B-1D.</i>
5F. said processor	To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of "determining when engine speed for said vehicle is decreasing" are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.  On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem

<b>Claim 5</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
<p>subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p>	<p>that activates said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p> <p><i>See, e.g., citations for claim elements 1F, 1G.</i></p>

Claim 7	Corresponding Element in Mercedes-Benz Vehicles
7A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle. <i>See, e.g.,</i> citations for claim 1.
7B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;	The accused Mercedes-Benz vehicles include a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, a manifold pressure sensor and a throttle position sensor;  <i>See, e.g.,</i> citations for claim element 1B.
7C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;	The accused Mercedes-Benz vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.  <i>See, e.g.,</i> citations for claim element 1C.
7D. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;	The accused Mercedes-Benz vehicles include a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point and present and prior levels for each one of said plurality of sensors;  <i>See, e.g.,</i> citations for claim element 1D.
7E. a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;	The accused Mercedes-Benz vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;

<p><b>Claim 7</b> notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p><b>Corresponding Element in Mercedes-Benz Vehicles</b> <i>See, e.g., citations for claim element 1E.</i></p>
<p>7F. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed;</p> <p>and</p>	<p>The accused Mercedes-Benz vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed.</p> <p>For example, the accused Mercedes-Benz vehicles include one or more downshift notification circuits coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient speed.</p>

Shift recommendation

Claim 7	Corresponding Element in Mercedes-Benz Vehicles
	<p>The gearshift recommendations assist you in adopting an economical driving style. The recommended gear is shown in the multifunction display.</p> <ul style="list-style-type: none"> <li>▶ Shift to recommended gear ② according to gearshift recommendation ① when shown in the multifunction display of the instrument cluster.</li> </ul>
	<p>(See, e.g., Ex. Mercedes-Benz-2 at 184-85; Ex. Mercedes-Benz-3 at 143-44; Ex. Mercedes-Benz-4 at 159-60; Ex. Mercedes-Benz-6 at 198; Ex. Mercedes-Benz-7 at 161; Ex. Mercedes-Benz-8 at 177-78; Ex. Mercedes-Benz-9 at 173; Ex. Mercedes-Benz-11 at 179-80; Ex. Mercedes-Benz-12 at 157; Ex. Mercedes-Benz-13 at 171; Ex. Mercedes-Benz-14 at 169-171; Ex. Mercedes-Benz-15 at 153-54.)</p>
	<p>As another example, the accused Mercedes-Benz vehicles include one or more downshift notification circuits coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient speed.</p> <p><b>Shifting gears</b></p> <p>If you pull on the left or right steering wheel paddle shifter, the automatic transmission switches to manual drive program M for a limited amount of time. Depending on which paddle shifter is pulled, the automatic transmission immediately shifts into the next gear down or up, if permitted.</p>

Claim 7	Corresponding Element in Mercedes-Benz Vehicles
<p>7G. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.</p>	<p><b>1</b> <b>AMG vehicles:</b> the automatic transmission will not shift up to the next gear when the engine speed is very low.</p> <p>▶ <b>To shift down:</b> pull on the left-hand steering wheel paddle shifter (&gt; page 183). The automatic transmission shifts down to the next gear.</p> <p><b>2</b> if the engine exceeds the maximum engine speed when shifting down, the automatic transmission protects against engine damage by not shifting down.</p> <p><b>3</b> Automatic down shifting occurs when coasting.</p> <p>(See, e.g., Ex. Mercedes-Benz-2 at 184; Ex. Mercedes-Benz-3 at 144; Ex. Mercedes-Benz-4 at 160; Ex. Mercedes-Benz-5 at 285; Ex. Mercedes-Benz-6 at 149; Ex. Mercedes-Benz-7 at 161; Ex. Mercedes-Benz-8 at 177; Ex. Mercedes-Benz-9 at 173; Ex. Mercedes-Benz-10 at 152; Ex. Mercedes-Benz-11 at 178-80; Ex. Mercedes-Benz-12 at 156; Ex. Mercedes-Benz-13 at 170; Ex. Mercedes-Benz-14 at 169; Ex. Mercedes-Benz-15 at 153; Ex. Mercedes-Benz-15 at 128.)</p> <p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that determines, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit and when to activate said downshift notification circuit.</p> <p>See, e.g., citations for elements 1G, 7F.</p>

Claim 8	Corresponding Element in Mercedes-Benz Vehicles
8A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:  <i>See, e.g., citations for claim 1.</i>
8B. means for determining when road speed for said vehicle is increasing;	The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is increasing.  <i>See, e.g., citations for claim element 2B.</i>
8C. means for determining when throttle position for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g., citations for claim element 2C.</i>
8D. means for comparing manifold pressure to said manifold pressure set point;	The accused Mercedes-Benz vehicles include a means for comparing manifold pressure to said manifold pressure set point.  <i>See, e.g., citations for claim element 2D.</i>
8E. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.	On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set point.  <i>See, e.g., citations for claim element 2E.</i>

<b>Claim 10</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
10A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:  <i>See, e.g., citations for claim element 1.</i>
10B. means for determining when road speed for said vehicle is decreasing;	The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g., citations for claim element 4B.</i>
10C. means for determining when throttle position for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g., citations for claim element 2C.</i>
10D. means for determining when manifold pressure for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g., citations for claim element 4D.</i>
10E. means for determining when engine speed for said vehicle is decreasing;	The accused Mercedes-Benz vehicles include a means for determining when engine speed for said vehicle is decreasing.  <i>See, e.g., citations for claim element 4E.</i>
10F. said processor subsystem activating said downshift notification circuit if both road speed	On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.

Claim 10	Corresponding Element in Mercedes-Benz Vehicles
<p>and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.</p>	<p>See, e.g., citations for claim elements IG, 7F.</p>

Claim 12	Corresponding Element in Mercedes-Benz Vehicles
12A. Apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 7 wherein said processor subsystem further comprises:  <i>See, e.g., citations for claim 1.</i>
12B. means for determining when road speed for said vehicle is decreasing;	The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is decreasing.  <i>See, e.g., citations for claim element 4B.</i>
12C. means for determining when throttle position for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g., citations for claim element 2C.</i>
12D. means for determining when manifold pressure for said vehicle is increasing; and	The accused Mercedes-Benz vehicles include a means for determining when manifold pressure for said vehicle is increasing.  <i>See, e.g., citations for claim element 4D.</i>
12E. means for determining when engine speed for said vehicle is decreasing;	The accused Mercedes-Benz vehicles include a means for determining when engine speed for said vehicle is decreasing.  <i>See, e.g., citations for claim element 4E.</i>
12F. said processor subsystem activating said fuel overinjection notification circuit if both throttle position and	On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.

<b>Claim 12</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
<p>manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.</p>	<p>See, e.g., citations for claim elements 1E, 1G.</p>

Claim 13	Corresponding Element in Mercedes-Benz Vehicles
13A. Apparatus for optimizing operation of a vehicle, comprising:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle.
13B. a plurality of sensors coupled to a vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor;	<p><i>See, e.g.,</i> citations for claim 1.</p> <p>The accused Mercedes-Benz vehicles include a plurality of sensors coupled to the vehicle having an engine, said plurality of sensors, which collectively monitor operation of said vehicle, including a road speed sensor, an engine speed sensor, a manifold pressure sensor and a throttle position sensor</p> <p><i>See, e.g.,</i> citations for claim element 1B.</p>
13C. a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom;	<p>The accused Mercedes-Benz vehicles include a processor subsystem, coupled to each one of said plurality of sensors, to receive data therefrom.</p> <p><i>See, e.g.,</i> citations for claim element 1C.</p>
13D. a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point, and present and prior levels for each one of said plurality of sensors;	<p>The accused Mercedes-Benz vehicles have a memory subsystem, coupled to said processor subsystem, said memory subsystem storing therein a manifold pressure set point, an engine speed set point, and present and prior levels for each one of said plurality of sensors.</p> <p><i>See, e.g.,</i> citations for claim element 1D.</p>
13E. a fuel overinjection notification circuit coupled to said processor subsystem,	The accused Mercedes-Benz vehicles include a fuel overinjection notification circuit coupled to said processor subsystem, said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle.

Claim 13	Corresponding Element in Mercedes-Benz Vehicles
<p>said fuel overinjection notification circuit issuing a notification that excessive fuel is being supplied to said engine of said vehicle;</p>	<p><i>See, e.g.,</i> citations for claim element 1E.</p>
<p>13F. an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed;</p>	<p>The accused Mercedes-Benz vehicles include an upshift notification circuit coupled to said processor subsystem, said upshift notification circuit issuing a notification that said engine of said vehicle is being operated at an excessive speed.</p> <p><i>See, e.g.,</i> citations for claim element 1F.</p>
<p>13G. a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and</p>	<p>The accused Mercedes-Benz vehicles include a downshift notification circuit coupled to said processor subsystem, said downshift notification circuit issuing a notification that said engine of said vehicle is being operated at an insufficient engine speed; and</p> <p><i>See, e.g.,</i> citations for claim element 7F.</p>
<p>13H. said processor subsystem determining, based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said</p>	<p>The accused Mercedes-Benz vehicles include a processor subsystem that determines based upon data received from said plurality of sensors, when to activate said fuel overinjection circuit, said upshift notification circuit and said downshift notification circuit.</p> <p><i>See, e.g.,</i> citations for claim element 1G.</p>

<p><b>Claim 13</b></p> <p>downshift notification circuit.</p>	<p><b>Corresponding Element in Mercedes-Benz Vehicles</b></p>
---	---

Claim 15	Corresponding Element in Mercedes-Benz Vehicles
15A. Apparatus for optimizing operation of a vehicle according to claim 13 wherein said processor subsystem further comprises:	The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle according to claim 13 wherein said processor subsystem further comprises:  <i>See, e.g.,</i> citations for claim 1.
15B. means for determining when road speed for said vehicle is increasing or decreasing;	The accused Mercedes-Benz vehicles include a means for determining when road speed for said vehicle is increasing or decreasing.  <i>See, e.g.,</i> citations for claim element 2B.  To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when road speed for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to Road Speed Sensor 18, Memory Subsystem 14, and Processor Subsystem 12.
15C. means for determining when throttle position for said vehicle is increasing;	The accused Mercedes-Benz vehicles include a means for determining when throttle position for said vehicle is increasing.  <i>See, e.g.,</i> citations for claim element 2C.
15D. means for comparing manifold pressure to said manifold pressure set point;	The accused Mercedes-Benz vehicles include a means for comparing manifold pressure to said manifold pressure set point.  <i>See, e.g.,</i> citations for claim element 2D.
15E. means for comparing engine speed to said RPM set point;	The accused Mercedes-Benz vehicles include a means for comparing engine speed to said RPM set point.  <i>See, e.g.,</i> citations for claim element 5E.

Claim 15	Corresponding Element in Mercedes-Benz Vehicles
15F. means for determining when manifold pressure is increasing.	The accused Mercedes-Benz vehicles include a means for determining when manifold pressure is increasing. <i>See, e.g.</i> , citations for claim element 4D.
15G. means for determining when engine speed is increasing or decreasing;	The accused Mercedes-Benz vehicles include a means for determining when engine speed is increasing or decreasing. <i>See, e.g.</i> , citations for claim element 4E.  To the extent that 35 U.S.C. §112(6) applies to this claim limitation, the structure(s), act(s), or materials(s) that perform the claimed function of “determining when engine speed for said vehicle is increasing or decreasing” are described in, for example, Figures 1 and 2 and associated text of the '781 patent relating to RPM Sensor 20, Memory Subsystem 14, and Processor Subsystem 12.
15H. said processor subsystem activating said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.	On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said fuel overinjection notification circuit if both road speed and throttle position for said vehicle are increasing and manifold pressure for said vehicle is above said manifold pressure set or if both throttle position and manifold pressure for said vehicle are increasing and road speed and engine speed for said vehicle are decreasing.  <i>See, e.g.</i> , citations for claim elements 1E, 1G.

Claim 15	Corresponding Element in Mercedes-Benz Vehicles
<p>15I. said processor subsystem activating said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point; and</p>	<p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said upshift notification circuit if both road speed and throttle position for said vehicle are increasing, manifold pressure for said vehicle is at or below said manifold pressure set point and engine speed for said vehicle is at or above said RPM set point.</p> <p><i>See, e.g.</i>, citations for claim elements 1F, 1G.</p>
<p>15J. said processor subsystem activating said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.</p>	<p>On information and belief, the accused Mercedes-Benz vehicles include a processor subsystem that activates said downshift notification circuit if both road speed and engine speed are decreasing and both throttle position and manifold pressure for said vehicle are increasing.</p> <p><i>See, e.g.</i>, citations for claim element 10F.</p>

<b>Claim 17</b>	<b>Corresponding Element in Mercedes-Benz Vehicles</b>
<p>17A. Apparatus for optimizing operation of a vehicle, comprising:</p>	<p>The accused Mercedes-Benz vehicles include an apparatus for optimizing operation of a vehicle.  See, e.g., citations for claim 1.</p>
<p>17B. a radar detector, said radar detector determining a distance separating a vehicle having an engine and an object in front of said vehicle;</p>	<p>The accused Mercedes-Benz vehicles include a radar detector that determines a distance separating a vehicle having an engine and another object in front of the accused vehicles.  For example, the accused Mercedes-Benz vehicles include one or more systems with radar detectors that determine a distance separating a vehicle having an engine and another object in front of the accused vehicles.  17B1. PRE-SAFE/PRE-SAFE PLUS:</p>
	<p><b>PRE-SAFE® PLUS (anticipatory occupant protection system PLUS)</b></p> <p><b>General information</b></p> <p>PRE-SAFE® PLUS is only available in vehicles with the Driving Assistance package.  Using the radar sensor system, PRE-SAFE® PLUS is able to detect that a head-on or rear-end collision is imminent. In certain hazardous situations, PRE-SAFE® PLUS takes pre-emptive measures to protect the vehicle occupants.</p>

<p><b>Claim 17</b></p>	<p style="text-align: center;"><b>Corresponding Element in Mercedes-Benz Vehicles</b></p> <p>(See, e.g., Ex. Mercedes-Benz-2 at 56; Ex. Mercedes-Benz-3 at 50; Ex. Mercedes-Benz-4 at 52; Ex. Mercedes-Benz-5 at 55; Ex. Mercedes-Benz-7 at 54-55; Ex. Mercedes-Benz-8 at 55-56; Ex. Mercedes-Benz-9 at 54-55; Ex. Mercedes-Benz-11 at 54-55; Ex. Mercedes-Benz-13 at 54; Ex. Mercedes-Benz-14 at 61; Ex. Mercedes-Benz-15 at 50).</p> <p>17B2. BAS PLUS (Brake Assist System PLUS):</p>
------------------------	--

<p><b>Claim 17</b></p>	<p style="text-align: center;"><b>Corresponding Element in Mercedes-Benz Vehicles</b></p> <p><b>BAS PLUS (Brake Assist System PLUS) with Cross-Traffic Assist</b></p> <p><b>General information</b></p> <p>🔔 Observe the "important safety notes" section (→ page 70).</p> <p>BAS PLUS is only available on vehicles with the Driving Assistance package.</p> <p>For BAS PLUS to assist you when driving, the radar sensor system and the camera system must be operational.</p> <p>With the help of a sensor system and a camera system, BAS PLUS can detect obstacles:</p> <ul style="list-style-type: none"> <li>• that are in the path of your vehicle for an extended period of time</li> <li>• that cross the path of your vehicle</li> </ul> <p>In addition, pedestrians in the path of your vehicle can be detected.</p> <p>BAS PLUS detects pedestrians by using typical characteristics such as the body contours and posture of a person standing upright.</p> <p>(See, e.g., Ex. Mercedes-Benz-2 at 72; Ex. Mercedes-Benz-3 at 63; Ex. Mercedes-Benz-4 at 66; Ex. Mercedes-Benz-5 at 66; Ex. Mercedes-Benz-7 at 67; Ex. Mercedes-Benz-8 at 70; Ex. Mercedes-Benz-9 at 68; Ex. Mercedes-Benz-11 at 68; Ex. Mercedes-Benz-12 at 68; Ex. Mercedes-Benz-13 at 68; Ex. Mercedes-Benz-14 at 72; Ex. Mercedes-Benz-15 at 60; Ex.</p>
------------------------	---

**Claim 17**

**Corresponding Element in Mercedes-Benz Vehicles**

Mercedes-Benz-16 at 72).

**17B3. COLLISION PREVENTION ASSIST/Distance Warning Function:**

**Function**

► **To activate/deactivate:** activate or deactivate the distance warning function in the on-board computer (→ page 261).

If the distance warning function is not activated, the  symbol appears in the assistance graphics display.

The distance warning function can help you to minimize the risk of a front-end collision with a vehicle ahead or reduce the effects of such a collision. If the distance warning function detects that there is a risk of a collision, you will be warned visually and acoustically. The distance warning function cannot prevent a collision without your intervention.

**Claim 17**

**Corresponding Element in Mercedes-Benz Vehicles**

Starting at a speed of around 4 mph (7 km/h), the distance warning function warns you if you rapidly approach a vehicle in front. An intermittent warning tone will then sound and the [A] distance warning lamp will light up in the instrument cluster.

▶ Brake immediately in order to increase the distance from the vehicle in front.

or

▶ Take evasive action, provided it is safe to do so.

Due to the nature of the system, particularly complicated but non-critical driving conditions may also cause the system to display a warning.

With the help of the radar sensor system, the distance warning function can detect obstacles that are in the path of your vehicle for an extended period of time.

(See, e.g., Ex. Mercedes-Benz-2 at 74; Ex. Mercedes-Benz-6 at 62-64; Ex. Mercedes-Benz-8 at 70-71; Ex. Mercedes-Benz-9 at 70-71; Ex. Mercedes-Benz-11 at 69-70; Ex. Mercedes-Benz-13 at 69-70).

17B4. COLLISION PREVENTION ASSIST/Adaptive Brake Assist.

Claim 17	Corresponding Element in Mercedes-Benz Vehicles
	<p>Adaptive Brake Assist aids you in braking during hazardous situations at speeds above 4 mph (7 km/h) and uses the radar sensor system to evaluate the traffic situation.</p> <p>With the help of Adaptive Brake Assist, the distance warning signal can detect obstacles that are in the path of your vehicle for an extended period of time.</p> <p>Should you approach an obstacle and Adaptive Brake Assist has detected a risk of collision, Adaptive Brake Assist calculates the braking force necessary to avoid a rear-end collision. Should you apply the brakes vigorously, Adaptive Brake Assist will automatically increase the braking force to a level suitable for the traffic conditions.</p> <p>(See, e.g., Ex. Mercedes-Benz-2 at 75; Ex. Mercedes-Benz-6 at 64-66; Ex. Mercedes-Benz-8 at 71-72; Ex. Mercedes-Benz-9 at 71-72; Ex. Mercedes-Benz-11 at 71-72; Ex. Mercedes-Benz-13 at 70-71).</p> <p>17B5: PRE-SAFE Brake:</p>

**Claim 17**

**Corresponding Element in Mercedes-Benz Vehicles**

**PRE-SAFE® Brake**

**General information**

ⓘ Pay attention to the important safety notes in the "Driving safety systems" section (▷ page 70).

PRE-SAFE® Brake is only available for vehicles with the Driving Assistance package. For PRE-SAFE® Brake to assist you when driving, the radar sensor system and the camera system must be switched on and be operational.

With the help of the radar sensor system and the camera system, PRE-SAFE® Brake can detect obstacles that are in front of your vehicle for an extended period of time.

In addition, pedestrians in the path of your vehicle can be detected.

(See, e.g., Ex. Mercedes-Benz-2 at 78; Ex. Mercedes-Benz-3 at 67; Ex. Mercedes-Benz-4 at 71; Ex. Mercedes-Benz-5 at 68; Ex. Mercedes-Benz-7 at 72; Ex. Mercedes-Benz-8 at 76-77; Ex. Mercedes-Benz-9 at 76-77; Ex. Mercedes-Benz-11 at 75; Ex. Mercedes-Benz-12 at 72; Ex. Mercedes-Benz-13 at 74; Ex. Mercedes-Benz-14 at 77; Ex. Mercedes-Benz-15 at 65; Ex. Mercedes-Benz-16 at 77).

17B6. DISTRONIC PLUS:
