Introduction to Pharmacokinetics

Advancements in biopharmaceutics have come about largely through the development and application of pharmacokinetics. Pharmacokinetics is the study and characterization of the time course of drug absorption, distribution, metabolism, and excretion, and the relationship of these processes to the intensity and time course of therapeutic and toxicologic effects of drugs. Pharmacokinetics is used in the clinical setting to enhance the safe and effective therapeutic management of the individual patient. This application has been termed *clinical pharmacokinetics*.

DISTRIBUTION AND ELIMINATION

The transfer of a drug from its absorption site to the blood, and the various steps involved in the distribution and elimination of the drug in the body, are shown in schematic form in Figure 1-1. In the blood, the drug distributes rapidly between the plasma and erythrocytes (red blood cells). Rapid distribution of drug also occurs between the plasma proteins (usually albumin but sometimes α_1 -acid glycoproteins and occasionally globulin) and plasma water. Since most drugs are relatively small molecules they readily cross the blood capillaries and reach the extracellular fluids of almost every organ in the body. Most drugs are also sufficiently lipid soluble to cross cell membranes and distribute in the intracellular fluids of various tissues. Throughout the body there is a distribution of drug between body water and proteins or other macromolecules that are dispersed in the body fluids or are components of the cells.

The body can be envisioned as a collection of separate compartments, each containing some fraction of the administered dose. The transfer of drug from one compartment to another is associated with

ΟΟΚΕ

a rate constant (k). The magnitude of the rate constant determines how fast the transfer occurs.

The transfer of drug from blood to extravascular fluids (i.e., extracellular and intracellular water) and tissues is called *distribution*. Drug distribution is usually a rapid and reversible process. Fairly quickly after intravenous (iv) injection, drug in the plasma exists in a distribution equilibrium with drug in the erythrocytes, in other body fluids, and in tissues. As a consequence of this dynamic equilibrium, changes in the concentration of drug in the plasma are indicative of changes in drug level in other tissues including sites of pharmacologic effect (bioreceptors).

The transfer of drug from the blood to the urine or other excretory compartments (i.e., bile, saliva, and milk), and the enzymatic or biochemical transformation (*metabolism*) of drug in the tissues or plasma to metabolic products, are usually irreversible processes. The net result of these irreversible steps, depicted in Figure 1–1, is called *drug elimination*. Elimination processes are responsible for the physical or biochemical removal of drug from the body.

The moment a drug reaches the bloodstream, it is subject to both distribution and elimination. The rate constants associated with distribution, however, are usually much larger than those related to drug elimination. Accordingly, drug distribution throughout the body is usually complete while most of the dose is still in the body. In fact, some drugs attain distribution equilibrium before virtually any of the dose is eliminated. In such cases, the body appears to have the characteristics of a single compartment.

This simplification, however, may not be applied to all drugs. For most drugs, concentrations in plasma measured shortly after iv injection reveal a

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
