## PEDOMETER

This application is a continuation of Application No. 09/181,738, filed October 28, 1998, the disclosure of which is incorporated by reference herein.  
*now US patent no. 6,175,608*

### FIELD AND BACKGROUND OF THE INVENTION

The present invention relates generally to pedometers having a waist mounted stride-counting device and transmitter, and a wrist-mounted receiver and display. The invention also relates to a distance calculation device that calculates a distance walked or run based on an algorithm that converts a base stride length and a base stride rate to an actual stride length for use in calculating the distance traveled.

10

Pedometers are known which include devices or algorithms for determining the distance a person travels on foot. For example, U.S. Patent 4,371,945 discloses an electronic pedometer that calculates distance by electronically measuring the length of each stride taken by a user. Stride length is measured by ultrasonic waves generated by an ultrasonic module strapped to one leg and an ultrasonic detector worn on the other leg. A program compensates for a variety of measurement errors and the results are displayed on

15

a wrist-mounted display after being transmitted by VHF waves from the leg to the wrist.

U.S. Patent 4,771,394 discloses a computer shoe with a heel-mounted electronic device with an inertia footstrike counter, a timer, a sound generating device, a battery, and a gate array for counting time and footstrikes to calculate distance and running time as a function of stride time. Although recognizing the important relationship of stride length and foot speed, the shoe in this patent requires data from at least 15 test runs or walks and the data must be user-entered in pairs of footstrikes and elapsed time to cover a pre-determined distance. Further, user adjustments of time must be performed to accommodate start and stop times, and the number of counted footstrikes is increased one percent to overcome inherent errors in the inertia step counter. The shoe-mounted device is subject to damage from impact, dirt, and water, and requires a stay-at-home computer with which to interface. There is no means disclosed to transmit data to a wrist-mounted display device or an "on-board" computing device that provides "real time" data to a runner.

U.S. Patent 4,855,942 discloses a pedometer and calorie measuring device that includes a wrist-mounted step counter and a fixed stride length to calculate distance traveled. Wrist-mounted step counters are known to be inaccurate because they assume a step for every arm movement. Even with error correction, such a device will provide less accurate step counts than a leg or waist-mounted counter. Further, fixed stride lengths do not take into account the fact that stride length varies with rate of movement.

U.S. Patent 5,117,444 discloses a pedometer and calibration method with two calibration modes. First, a user travels a predetermined "half-distance" for the device to count and store the number of strides in that distance. Next, the user travels a second distance with the step counter comparing actual steps to the steps in memory and a current trip memory are incremented by a tenth of a "whole unit" distance. There is no correlation between stride length and stride rate which requires the user to re-calibrate the device when walking as opposed to running.

U.S. Patent 5,475,725 discloses a pulse meter with pedometer function to determine pace and pulse rate of a user. The meter uses pulse wave base data compared to actual pulse wave data rates.

U.S. Patent 5,476,427 discloses a pace display device utilizing a base rate for traveling pre-set distances in successive trails. The device calculates step counts and rates, and compares actual step count rates to display data to a user for comparison of present running rates to previous rates.

5 Thus, there is a need for a simple, but highly accurate, pedometer that displays distance traveled, pace, speed, heart rate, and other important information on an easily read wrist-mounted device.

#### SUMMARY OF THE INVENTION

10 The present invention overcomes problems and shortcomings in the prior art by providing a device that includes a waist, chest, or leg-mounted stride counting device, a transmitter, and a wrist-mounted receiver/display device that provides highly accurate travel distances and other information. The device includes a computer that stores base stride length and rate data from traveling a pre-determined distance and compares that to actual stride rate data to calculate actual distance traveled, speed, and pace. The invention  
15 recognizes the interdependency of stride length and stride rate and uses that relationship to provide superior distance-calculating accuracy.

The invention also provides for improved display of relevant data on a wrist-mounted display that receives digital signals from devices worn on other body parts such as legs, waist, and chest. Transmitters that can send coded signals are desirable because  
20 they will not interfere with similar devices worn by other users in the vicinity.

The accuracy of the device is enhanced by the use of an algorithm that adjusts a base stride length based on actual stride rates. The algorithm is defined as: Actual Stride Length = Base Stride Length + Base Stride Length \*(((Actual Stride Rate - Base Stride Rate) N)/Base Stride Rate); where N is either an average value or a derived value from a  
25 plurality of samples.

The invention also includes a method for calculating an actual stride length including steps of: timing a first user run of a predetermined distance; counting the total number of strides in the user first run; dividing the first run distance by the stride count to obtain a base stride length; dividing the stride count by the first run time to obtain a base  
30 stride rate; counting strides during a user's second run to obtain an actual stride rate;

calculating the actual stride length using the formula: Actual Stride Length = Base Stride Length + Base Stride Length

\*(((Actual Stride Rate - Base Stride Rate )N)/Base Stride Rate); wherein N is an average value or a derived value.

5           The average value method can be refined by comparing Base Stride Rate to Actual Stride Rate to determine a percentage difference; and using  $N=1$  when the Actual Stride Rate  $\leq$  Base Stride Rate \* 1.02 and using  $N=3$  when Actual Stride Rate  $>$  Base Stride Rate \* 1.02. A preferred embodiment uses a plurality of sample runs over known distances to derive an accurate N value for each individual.

10

#### BRIEF DESCRIPTION OF THE DRAWINGS

Fig. 1 is a schematic diagram of a pedometer in accordance with the present invention.

#### DETAILED DESCRIPTION OF THE DRAWINGS

As illustrated in Fig. 1, the present invention is directed to an improved pedometer 15 20 including: a waist, chest, or leg mounted stride counter 24, and a wrist or waist mounted display unit 26. An optional chest-mounted heart monitor 28 can be included. All of the device components are mounted in suitable housings. The pedometer 20 includes a data processor 30 that is mounted in the same housing as either the step counter 24 or the display unit 26.

20           The step counter 24 is an inertia device that counts the number of steps a user takes. The number of steps is transmitted to a data archive 32 either directly or via a transmitter 34. The data archive 32 is mounted in the housing with the step counter 24 or the display 26.

25           The transmitter 34 is mounted in the step counter housing and is preferably an Rf telemetric signal transmitter with a 30 inches to 36 inches transmission range. Alternately, the transmitter is a wireless or wired digital transmitter with a coding function to limit or eliminate interference with other similar devices. The wireless transmission range is set between 30 inches and 36 inches to provide adequate range to transmit signals from a user's waist to wrist, but not so far as to cause interference with other Rf or digital devices 30 in the vicinity.

The transmitter 34 transmits either raw data or calculated distances, pace, etc. to a wrist-mounted display unit receiver 40. The receiver 40 relays a raw data signal to the data processor 30 or a calculated data signal directly to the display panel 42, such as an LCD or LED.

5 Similarly, the heart rate monitor 28 includes a transmitter 44 that transmits heart rate data to the display unit 26. The heart monitor transmitter 44 can transmit at the same or a different frequency as the stride counter 24, and to the same or a different receiver in the display unit 26. The heart rate transmitter 44 is preferably Rf, but can be digital for the reasons stated above. The range of the heart rate transmitter 44 should also be between  
10 30 inches and 36 inches to ensure effective communication with the receiver while limiting outside interference.

The data processor 30 can also include a programmable logic controller, a personal computer, a programmable read-only memory, or other suitable processor. The data processor 30 includes a data archive 32 to store historic data on stride length and  
15 pace to be used in an algorithm for calculating actual distances, speed, and rate for real-time conversion of data to useful information for a user.

The data processor 30 can also include closed loop or fuzzy logic programming to continually or periodically replace the base stride rate and length with recently calculated stride rates and lengths so that long term conditioning trends are accommodated in the  
20 base stride archive. Incorporating trend capabilities may further enhance accuracy of the distance and pace calculations.

The display unit 26 also includes an operator interface 46 such as a key pad, button, knob, etc. that enables the user to start and stop a clock 48 (or stop watch) and activate various use modes within the pedometer, such as a sampling mode and operation  
25 mode.

One option for using the pedometer 20, requires the user to operate a "sampling mode" and begin walking or running a pre-determined distance such as a mile or 1600 meters, preferably on a running track of a known size. Upon completion of the distance, a stop button on the operator interface 46 is pushed. The data processor 30 is programmed  
30 to then divide the distance by the number of strides counted to calculate an average stride

length. This value is stored in the data archive 32 as the "Base Stride Length."

Also, the data processor 30 is programmed to divide the number of strides by the time of the run or walk as measured by the clock 48 to arrive at a "Base Stride Rate."

The data processor 30 preferably includes programming that queries the user  
5 about the distance to be run during the sampling mode. By providing options or enabling  
the use of any distance during the sampling mode, the pedometer 20 provides maximum  
flexibility for use by people of various physical conditions, or having access to courses of  
different known distances. Thus, a user may be queried to input a distance to be used in  
the sampling mode and then be given a list of options such as 400 meters, 440 yards,  
10 1600 meters, or one mile, or be asked to simply input any distance known to the user that  
will be traveled during the sampling mode.

The present invention makes full use of the relationship between a faster rate of  
travel and longer stride lengths. In other words, the faster a user is moving, the longer will  
be the stride length. Over the course of the run or walk, the user's step rate and,  
15 therefore, stride length will change and the user will cover more ground when moving fast  
and less ground when moving slow.

Clearly, using a fixed average stride length in calculating distance traveled will  
result in errors using prior pedometers. This is particularly true if a user changes pace, or  
improves conditioning and speed to the point where the average stride length over a given  
20 run increases dramatically. The error compensators in prior devices do not adjust for  
changes in pace. With the old devices, a user needed to re-calibrate periodically to be  
close to getting an accurate reading, and could not change pace during a workout without  
decreasing accuracy.

To make the correction, the user activates a "Use Mode" in which the data  
25 processor 30 calculates an Actual Stride Rate based on data from the stride counter 24  
and the clock 48. For example, an Actual Stride Rate can be calculated every five  
seconds without the user doing more than activating the "Use Mode" button, while all the  
calculations are performed by the data processor automatically. The percentage change  
between the Actual Stride Rate and the Base Stride Rate is then computed by the data  
30 processor 30 to determine an Actual Stride Length. Again, if the Actual Stride Rate is

greater than the Base Stride Rate, the Actual Stride Length is longer than the Base Stride Length. If the Actual Steps Per Second is lower than the Base Steps Per Second, the Actual Stride Length is shorter than the Base Stride Length. The algorithm below provides a means for comparing the Actual and Base Stride rates to arrive at an accurate Actual Stride Length.

First, a comparison between the Actual Stride Rate and the Base Stride Rate is made to determine whether Actual Stride Rate is less than or equal to Base Stride Rate multiplied by 1.02. Stride Length is calculated by:

$$\text{Actual Stride Length} = \text{Base Stride Length} +$$

$$\text{Base Stride Length} * (((\text{Actual Stride Rate} - \text{Base Stride Rate})N) / \text{Base Stride Rate})$$

Where: N=1 when Actual Stride Rate is less than or equal to Base Stride Rate multiplied by 1.02, and N=3 when Actual Stride Rate is greater than Base Stride Rate multiplied by 1.02, although other N values in the range of one to three can be used.

The above algorithm is accurate for heel to toe activities such as walking or jogging, but is less accurate for sprinting (toe only).

A third method of calculating actual stride length uses three separate run or walk samples at three different paces. This is the most accurate option. With this method, the N values are unique for each individual. By deriving an N value for each individual, this value more accurately reflects the actual change in stride length with a change in pace. After a proper warmup, the user completes a sample run or walk on the track at a normal pace. This first sample S1, will establish the Base Stride and the Base Steps Per Second.

S1 SAMPLE:

$$S1 \text{ Stride} = \text{Base Stride} = \text{Distance} / \text{Number of Steps}$$

$$S1 \text{ Steps Per Second or } S1 \text{ Steps Per Second} = \text{Base Steps Per Second} = \text{Number of Steps Per Second}$$

Following completion of the first run or walk at normal pace, the user runs or walks the same course and the same distance at a faster run or walking pace, but not a sprinting pace. The user should not run on his toes, but maintain the normal heel to toe jogging style. This is the S2 sample. The purpose of the S2 sample is to calculate an N2

value for each individual which reflects the effect an increase in Steps Per Second has on this individual's stride length. Some individual's steps will lengthen more than others as Steps Per Second increases, and by finding the value for N2, this relative increase can be quantified for a more accurate and customized algorithm for each individual.

5 S2 SAMPLE:

To find the N2 value, which will be used by the algorithm when Actual Steps Per Second > Base Steps Per Second

$$N2 = ((S2 \text{ Stride} * S1 \text{ Steps Per Second}) - (S1 \text{ Stride} * S1 \text{ Steps Per Second})) / (S1 \text{ Stride} (S2 \text{ Steps Per Second} - S1 \text{ Steps Per Second}))$$

10 This value can be calculated since the distance is known, and both a Fast Stride Length (S2 Stride) and a Fast Steps Per Second (S2 Steps Per Second) can be calculated from the second sample.

Following completion of the fast run or walk, the user runs the same course and the same distance at a slower than normal run or walking pace. This pace cannot exceed  
15 the first sample pace. This is the S3 sample. The purpose of the S3 sample is to calculate an N3 value for each individual which reflects the effect a decrease in Steps Per Second has on this individual's stride length. Some individual's steps will shorten more than others as Steps Per Second decreases, and by finding the value for N3, this relative decrease can be quantified for a more accurate and customized algorithm for each individual.

20 S3 SAMPLE:

To find the N3 value, which will be used by the algorithm when Actual Steps Per Second < Base Steps Per Second.

$$N3 = ((S3 \text{ Stride} * S1 \text{ Steps Per Second}) - (S1 \text{ Stride} * S1 \text{ Steps Per Second})) / (S1 \text{ Stride} (S2 \text{ Steps Per Second} - S1 \text{ Steps Per Second}))$$

25 This value can be calculated since the distance is known and both a "Slow" Stride Length (S3 Stride) and a "Slow" Steps Per Second (S3 Steps Per Second) can be calculated from the third sample.

Once these three samples are completed and the information automatically calculated and stored in the data processor 30, then the following formula can be used for  
30 the most accurate measurements of speed and distance.

If: Actual Steps Per Second is less than or equal to Base Steps Per Second

Then:

Stride Length = Base Stride + Base Stride\*(((Actual Steps Per Second - Base Steps Per Second)N)/Base Steps Per Second)

And N = N3 (Stored Value)

If: Actual Steps Per Second > Base Steps Per Second

Then:

Stride Length = Base Stride + Base Stride\*(((Actual Steps Per Second - Base Steps Per Second)N)/Base Steps Per Second)

And N = N2 (Stored Value)

This third option for calculating stride length, and subsequently distance, speed, and pace, is a far more accurate method than a fixed stride length pedometer. This device and method are also practical, convenient, and has a relatively low manufacturing cost. If an individual's running or walking style is progressing with training and practice (as seen by significantly improved times), then it may be beneficial for them to recalibrate their device by repeating the three samples every 3 to 6 months. If there are no significant improvements in time, then recalibration is not necessary.

It is noted that any single stride length or pace discussed above can in fact be an average of a plurality of stride lengths or rates from test runs to further refine accuracy in the calculations of actual stride data.

Other variations on this device could also incorporate an altimeter which measures changes in elevation. The stride length could then be adjusted (shortened) when elevation is increasing, and lengthened when elevation is decreasing. This adjustment could be done with an average value, as we used in setting option 2, or with a derived value by running or walking over a known distance on a hilly course. This device can use two batteries so that the calibration data is not lost when the batteries are replaced one at a time.

Once the actual stride length is calculated for a given period of time, the value can be multiplied by the number of strides in that period to obtain a total distance for that period to be stored in a data archive file for that particular walk or run and added to other

actual stride lengths or distances for other periods in which stride length was calculated. When the run or walk is completed, the user engages the operator interface 46 to indicate that a total distance is to be displayed on the display unit. Preferably, there is continual display of the distance traveled.

5           As a result of accurately calculating distance traveled, the pedometer 20 also has the capability of calculating speed in miles per hour, for example or pace in minutes per mile, including average speed and pace over the course of that particular walk or run. Further, the pedometer 20 can include a port for coupling to a separate personal computer or computing device to create larger training histories, trends, etc.

10           Additional features can include stop watches, day, date and time displays, as well as, heart rate displays as discussed above. Also, it will be understood that all distances and time periods used above can be varied in length and units of measure (English, metric, seconds, minutes, hours, etc.).

15           The foregoing detailed description is provided for clearness of understanding only and no unnecessary limitations therefrom should be read into the following claims.

### DETAILED ACTION

#### *Claim Objections*

1. Claims 4 and 7 are objected to because of the following informalities: "calculated" and "signal", respectively, are misspelled. Appropriate correction is required.

#### *Claim Rejections - 35 USC § 102*

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(e) the invention was described in a patent granted on an application for patent by another filed in the United States before the invention thereof by the applicant for patent, or on an international application by another who has fulfilled the requirements of paragraphs (1), (2), and (4) of section 371(c) of this title before the invention thereof by the applicant for patent.

3. Claim 1 is rejected under 35 U.S.C. 102(e) as being clearly anticipated by Sham et al. Referring to Figure of Sham, an exercise monitoring device is taught which includes a strap for releasably securing the exercise monitoring device to a user (the strap connected to 14), a step counter (within 14) and a heart rate monitor (within 14) as recited in claim 1.

#### *Allowable Subject Matter*

4. Claims 2-6 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
5. Claims 7-9 are allowed.

WRITTEN OPINION

International application No.

PCT/US99/25314

**V. Reasoned statement under Rule 66.2(a)(ii) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

**1. statement**

Novelty (N)	Claims <u>14-16, 28-54</u>	YES
	Claims <u>1-13 and 17-27</u>	NO
Inventive Step (IS)	Claims <u>14, 16, 28-54</u>	YES
	Claims <u>1-13 and 17-27</u>	NO
Industrial Applicability (IA)	Claims <u>1-54</u>	YES
	Claims <u>NONE</u>	NO

**2. citations and explanations**

Claims 1-13, 17-28 lack novelty under PCT Article 33(2) as being anticipated by Hutchins.

Hutchins discloses a device which wirelessly transmits data from a wrist sensor to another location, includes a display and a data processor which calculates a distance traveled by multiplying the number of strides taken by a stride length that varies according to a rate at which strides are taken.

Claims 14-16 and 29-54 meet the criteria set out in PCT Article 33(2)-(4), because the prior art does not teach or fairly suggest use of data input from runs or walks over known distances to establish a range of stride rate versus stride length data.

## SPORTLINE 360 FITNESS PEDOMETER INSTRUCTIONS

Your new pedometer has been designed for your easy use and the accurate measurement of the distance you travel (travel distance records up to 7 days in memory), the steps you take, the calories "burned" while you walk or run, how long you exercise, what speed you walk or run, conversion of distance measurement from mile (MIL) to kilometer (KM) or kilometer to mile, and auto power on/off. Also included is a convenient Time-of-Day clock with 12 hour or 24 hour format to tell you what time it is. The unit will also measure your distance in miles/kilometers and fractions of miles/kilometers.

### UNIQUE SCAN FEATURE

Your pedometer has a very unique scanning feature. After you turn on the pedometer the display will be in STEP mode. Press "C" button once or repeatedly to show TIMER, CAL, KM/H or MIL/H, STEP/M and Time of Day modes. When you return back to the STEP mode, it will be "blinking". You are now in the Auto-Scan mode. Now the display will automatically show the blinking words "STEP, TIMER, CAL, KM/H or MIL/H, STEP/M and Clock". The pedometer will now rotate through each one of these displays for 3 seconds sequentially as long as the auto-scan function is activated... or until you press the "C" button once more for new data setting or viewing.

### HOW TO OPERATE YOUR NEW PEDOMETER

You will need to give your pedometer some information for it to operate properly. In the sections below you will see how to enter your personal STRIDE LENGTH (for walking, hiking), your WEIGHT (for calories), and TIME OF DAY. Once this information has been entered into the unit, you're ready to go!

#### YOUR STRIDE LENGTH (Your stride length and how to measure it)

This pedometer automatically records your exercise distance based upon your walking or running or hiking movements. The maximum distance reading is 999.99 miles/kilometers. The numbers to the right of the decimal point are fractions of a mile (just like your car's odometer) right down to 1/100 of a mile or kilometer. It is important to walk or run or hike consistently. If you vary your walking pace, your stride length will vary and your distance traveled will be different.

#### HOW TO MEASURE YOUR STRIDE

In order to measure your exercise distance accurately, you must enter your stride length into the Pedometer's "memory" so it knows how much distance you cover with each step you take. (Stride length is the length of each one of your steps, measured either from heel to heel or toe to toe). It's easy to find your stride length!

#### FOR WALKERS

1. Walk 10 steps. 2. Measure the distance. 3. Divide by 10 the distance covered to arrive at your stride length. 4. Example: Distance covered in 10 steps = 30 feet. Steps taken to cover the distance (10 steps), 30 feet divided by 10 steps = 3 feet, stride length = 3 feet.

#### FOR JOGGERS OR HIKERS

Follow the directions above, except jog or hike for 10 steps.

#### HOW TO ENTER YOUR "WALK" STRIDE LENGTH INTO THE PEDOMETER

1. Press the MODE button "C" on the display panel to STEP mode, and hold for 2 seconds to get to the WALK stride length setting mode. 2. Press button "A" + "B" for setting your WALK stride length information, every press of button "A" will increase 1 inch or 1 cm. Every press of button "B" will decrease 1 inch or 1 cm in the reverse order. 3. After you set your WALK stride length

3

information, the numbers of the stride length on the display will automatically return back to STEP mode automatically after 5 seconds.

#### HOW TO ENTER YOUR "RUN" STRIDE LENGTH INTO THE ODOMETER

1. Press the MODE button "C" on the display panel to STEP mode, and hold for 2 seconds to WALK stride length setting mode. Press MODE button "C" once again to get RUN stride length setting mode. 2. Press button "A" + "B" for setting your RUN stride length information (the same as above).

#### HOW TO SET CALORIE COUNTER

1. Press the MODE button "C" on the display panel until you see CALORIE mode.  
2. Press MODE button "C" and hold for 2 seconds to get WEIGHT setting mode.  
3. Press button "A" + "B" to set your weight information. Every press on button "A" increases the weight by 10 LB (pounds) or 4.5 KG (kilograms). Every press of button "B" decreases the weight by 10 LB (pounds) or 4.5 KG (kilograms). 4. Once you set the proper weight, the display will blink for 5 seconds and then the display will skip back to CALORIE mode.

#### HOW TO SET TIME OF DAY

1. Press the MODE button "C" on the display panel repeatedly to reach CLOCK mode.  
2. Press button "C" once and hold for 2 seconds to get 12 or 24 hour time setting mode. Press either button "A" or "B" once to set 12 hour time format or 24 hour time format. 3. Press MODE button "C" once to get into CLOCK setting. Press button "A" for hour setting and "B" button for minute setting. After completing the setting, display will automatically go back to CLOCK mode after 5 seconds.

#### TO START YOUR EXERCISE

1. Press "C" until the upper display will show STEP mode. 2. The display will show 00000 in the STEP mode in the upper display window (if numbers appear in either display, RESET the display by pressing "A" for 2 seconds), and 0.00 MIL or KM for distance on lower display window.  
3. Select WALK, RUN or WALK/RUN mode by pressing "C" button and holding it for 2 seconds for WALK, then pressing again quickly for RUN, pressing again for WALK/RUN. (Note: The WALK/RUN mode senses when you walk and uses the WALK stride, and uses the RUN stride when you run.) When you get the mode you want, simply wait for display to stop blinking. Begin your exercise

#### TO RESET YOUR Pedometer

Press the RESET button "A" and hold for 2 seconds. The upper display and lower display will be reset to zero except the CLOCK mode and the previous 7 days distance travel records. TO RESET THE 7 DAY MEMORY, press and hold "A" for 5 seconds. All the digits will show. Release "A". The memory will clear. However, this will also change MIL to KM, or KM to MIL. Simply press and hold "A" for 5 seconds again to change back to your preferred (KM or MIL) distance measurement.

#### MILE/KILOMETER CONVERSION

To change from MILE to KILOMETER, press and hold RESET button "A" for 5 seconds. This will change STRIDE setting measurement from feet to cm (centimeters) as well.

#### HOW TO USE THE TIMER COUNTER

This pedometer accurately measures the time you spend exercising. When you stop, the timer stops. When you exercise, the timer runs. Press MODE button "C" on the display panel until you get to the TIMER mode for viewing the record of your exercise time.

#### DISTANCE COUNTER FUNCTION

This feature allows you to count the distance you travel during an exercise period, or all day if you wish. Your target should be to walk or jog 4 miles each day. Try it.

1. Press the MODE button "C" to get to STEP mode. 2. Press RESET button "A" and hold for 2 seconds and begin walking, running or hiking. The display will show 00000 and will begin to record your steps and distance.

#### DISTANCE WITH 7 DAY MEMORY & ODOMETER FUNCTION

This feature allows you to view the record of any day in miles or kilometers for 7 days. Starting from the 8th day, new data will automatically replace the memory of the 1st day recorded, and the 9th day will replace the 2nd day recorded... and so forth. Press and release button "A" to view each consecutive day's memory, and press button "B" to view each previous day's memory and total distance traveled "ODO" (like your car's odometer). Please note: You can complete your viewing of the 7 days activities and total distance before you return to the main pedometer functions OR press "C" once to return to the main pedometer functions.

#### SPEED FUNCTION

This feature allows you to know what speed you travel per hour and how many steps per minute.

1. SPEED/HOUR: Press MODE button "C" repeatedly to locate SPEED mode to view speed function. The display will show MIL/H (mile per hour) or KM/H (kilometer per hour).  
2. STEP/MINUTE: Press MODE button "C" once to advance to the next display STEP/M (step/minute) mode to view step per minute function.

#### AUTO POWER ON/OFF

To save battery power this unit will automatically "go to sleep" when no activity has been detected.

#### **DISTANCE COUNTER FUNCTION**

This feature allows you to count the distance you travel during an exercise period, or all day if you wish. Your target should be to walk or jog 4 miles each day. Try it.

1. Press the MODE button "C" to get to STEP mode. 2. Press RESET button "A" and hold for 2 seconds and begin walking, running or hiking. The display will show 00000 and will begin to record your steps and distance.

2. STEP/MINUTE: Press MODE button "C" once to advance to the next display STEP/M (step/minute) mode to view step per minute function.

#### **AUTO POWER ON/OFF**

To save battery power, this unit will automatically "go to sleep" when no activity has been detected, for four (4) minutes. The lower display will show  whenever unit is not in use.

#### **HOW TO WEAR YOUR PEDOMETER**

Your pedometer clips easily to your trousers or shorts. For best results keep the unit in line with the "crease line" of your trousers.

#### **SENSITIVITY ADJUSTMENT**

Everyone's walking style is different. This pedometer has an automatic sensitivity adjuster that compensates for the different walking, running or jogging styles.

#### **BATTERY REPLACEMENT**

1. The battery hatch is on the side of your pedometer. Slide open the battery door with your finger to access the battery. 2. Replace battery with LR-44 type when display dims. 3. Reset the pedometer and reenter the WEIGHT / STRIDE length and CLOCK information.

#### **OTHER INFORMATION**

1. Treat your pedometer with care and it will work most efficiently. 2. Pedometer is NOT waterproof, so keep it dry.

Dear Sir:

In response to a November 13, 2001 official action, Applicant makes the following amendments and remarks. Reconsideration and allowance are respectfully requested. A marked-up version of the amended claims is attached herewith as Exhibit A.

Please amend the application as follows:

**In The Claims**

Please cancel claim 1 without prejudice.

1/2 (Amended.) An exercise monitoring device comprising:

a strap for releasably securing the exercise monitoring device to a user;

a

a

Applicant: Nathan Pyles  
Application No.: 09/756,647

a step counter joined to the strap;  
a heart rate monitor joined to the strap; and  
a data processor programmed to calculate a distance traveled by multiplying a  
number of steps counted by the step counter by a stride length  
that varies according to a rate at which steps are counted.

cont  
A1

~~2/~~ 3. (Amended.) An exercise monitoring device comprising:

a strap for releasably securing the exercise monitoring device to a user;  
a step counter joined to the strap;  
a heart rate monitor joined to the strap; and  
a data processor programmed to calculate a distance traveled by multiplying a  
number of steps counted by the step counter by a stride length that varies  
in accordance with a stride rate, wherein the stride length is determined  
with reference to a plurality of calibrations that each calculate a stride  
length as a function of a known stride rate.

~~3/~~ 4. (Amended.) The exercise monitoring device of claim ~~2/~~ 3, wherein the data processor is  
further programmed to recalibrate the stride length as a function of a subsequently calculated  
and known stride rate.

~~5/~~ 5. (Amended.) An exercise monitoring device comprising:

a strap for releasably securing the exercise monitoring device to a user;  
a step counter joined to the strap;  
a heart rate monitor joined to the strap; and

Applicant: Nathan Pyles  
Application No.: 09/756,647

cont

a data processor programmed to calculate a distance traveled by multiplying the number of steps counted by the step counter by a stride length that varies according to the rate at which steps are counted, and further programmed to derive the stride length from a range of stride lengths calculated from a range of corresponding stride rates calculated from a plurality of calibration samples.

6 7. (Amended.) A pedometer comprising:

a step counter;

a transmitter in communication with the step counter to generate a step count signal corresponding to each step and transmit the step count signal;

a receiver mountable on a user body portion to receive the step count signal transmitted from the transmitter; and

a data processor programmed to calculate a distance traveled by multiplying a number of steps counted by a stride length that varies according to a rate at which steps are taken, and further programmed to derive an actual stride length from a range of stride lengths calculated from a range of corresponding stride rates.

**Remarks**

In the November 13, 2001 official action, claim 1 was rejected under 35 U.S.C. §102(b), claims 2 to 6 were allowable if amended to overcome an objection as being dependent from a rejected base claim, and claims 7 to 9 were allowed. Claims 4 and 7 were objected to as including misspelled words that are corrected by the above amendment.

Applicant: Nathan Pyles  
Application No.: 09/756,647

Claim 1 has been canceled without prejudice because although Applicant disagrees with the basis for rejection, it wishes to expedite prosecution and allowance of this application.

Claims 2, 3, and 6, which all depended from rejected claim 1, have been amended into an independent claim format to include all of the limitations of claim 1. These claims are now believed to be allowable.

Claims 4 and 5 depended from claim 3, and require no amendment to overcome the objection because claim 3 is now in independent format. Claims 4 and 5 are, therefore, believed to be allowable.

Claims 7 to 9 were allowable and require no amendment or comment.

**Conclusion**

For the foregoing reasons, claims 2 to 9 are in allowable form. Applicant requests that this case be passed to issue.

Respectfully submitted,

Jeffrey W. Smith, Reg. No. 33455
