Overview of the IOS SLB Feature

The IOS SLB feature is an IOS-based solution that provides IP server load balancing. Using the IOS SLB feature, you can define a *virtual server* that represents a group of *real servers* in a cluster of network servers known as a *server farm*. In this environment, the clients connect to the IP address of the virtual server. When a client initiates a connection to the virtual server, the IOS SLB function chooses a real server for the connection based on a configured *load-balancing algorithm*.

Note

IOS SLB does not support load balancing of flows between clients and real servers that are on the same local area network (LAN) or virtual LAN (VLAN). The packets being load balanced cannot enter and leave the load-balancing device on the same interface.

IOS SLB also provides firewall load balancing, which balances flows across a group of *firewalls* called a *firewall farm*.

[Figure 1](#) illustrates a logical view of a simple IOS SLB network.

Functions and Capabilities

This section describes the following functions and capabilities provided by IOS SLB.

Note

Some IOS SLB functions are specific to one platform and are not described in this feature module. For information about those functions, refer to the appropriate platform-specific documentation.

- [Algorithms for Server Load Balancing, page 5](#)
- [Alternate IP Addresses, page 6](#)
- [Automatic Server Failure Detection, page 6](#)
- [Automatic Unfail, page 6](#)
- [Avoiding Attacks on Server Farms and Firewall Farms, page 7](#)
- [Backup Server Farms, page 7](#)
- [Bind ID Support, page 7](#)
- [Client-Assigned Load Balancing, page 7](#)
- [Content Flow Monitor Support, page 8](#)
- [Delayed Removal of TCP Connection Context, page 8](#)
- [DFP Agent Subsystem Support, page 8](#)
- [Dynamic Feedback Protocol for IOS SLB, page 8](#)
- [Firewall Load Balancing, page 9](#)
- [GPRS Load Balancing, page 10](#)
- [Maximum Connections, page 11](#)

- [TCP Session Reassignment, page 16](#)
- [Transparent Webcache Load Balancing, page 16](#)
- [WAP Load Balancing, page 17](#)

Algorithms for Server Load Balancing

IOS SLB provides the following load-balancing algorithms:

- [Weighted Round Robin, page 5](#)
- [Weighted Least Connections, page 6](#)

You can specify one of these algorithms as the basis for choosing a real server for each new connection request that arrives at the virtual server.

Weighted Round Robin

The weighted round robin algorithm specifies that the real server used for a new connection to the virtual server is chosen from the server farm in a circular fashion. Each real server is assigned a weight, n , that represents its capacity to handle connections, as compared to the other real servers associated with the virtual server. That is, new connections are assigned to a given real server n times before the next real server in the server farm is chosen.

For example, assume a server farm comprised of real server ServerA with $n = 3$, ServerB with $n = 1$, and ServerC with $n = 2$. The first three connections to the virtual server are assigned to ServerA, the fourth connection to ServerB, and the fifth and sixth connections to ServerC.

Note

Assigning a weight of $n=1$ to all of the servers in the server farm configures the IOS SLB device to use a simple round robin algorithm.

GPRS load balancing requires the weighted round robin algorithm. A server farm that uses weighted least connections can be bound to a virtual server providing GPRS load balancing, but you cannot place the virtual server **INSERVICE**. If you try to do so, IOS SLB issues an error message.

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
