### ISSUE NOTIFICATION

The projected patent number and issue date are specified above.

#### **Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)** (application filed on or after May 29, 2000)

The Patent Term Adjustment is 0 day(s). Any patent to issue from the above-identified application will include an indication of the adjustment on the front page.

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (<http://pair.uspto.gov>).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Application Assistance Unit (AAU) of the Office of Data Management (ODM) at (571)-272-4200.

APPLICANT(s) (Please see PAIR WEB site <http://pair.uspto.gov> for additional applicants):

Kenneth P. Weiss, Newton, MA;

The United States represents the largest, most dynamic marketplace in the world and is an unparalleled location for business investment, innovation, and commercialization of new technologies. The USA offers tremendous resources and advantages for those who invest and manufacture goods here. Through SelectUSA, our nation works to encourage and facilitate business investment. To learn more about why the USA is the best country in the world to develop technology, manufacture products, and grow your business, visit [SelectUSA.gov](http://SelectUSA.gov).

**PART B - FEE(S) TRANSMITTAL**

**Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE  
 Commissioner for Patents  
 P.O. Box 1450  
 Alexandria, Virginia 22313-1450  
 or Fax (571)-273-2885**

**INSTRUCTIONS:** This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

---	--

5. **Change in Entity Status** (from status indicated above)

Applicant certifying micro entity status. See 37 CFR 1.29

NOTE: Absent a valid certification of Micro Entity Status (see form PTO/SB/15A and 15B), issue fee payment in the micro entity amount will not be accepted at the risk of application abandonment.

Applicant asserting small entity status. See 37 CFR 1.27

NOTE: If the application was previously under micro entity status, checking this box will be taken to be a notification of loss of entitlement to micro entity status.

Applicant changing to regular undiscounted fee status.

NOTE: Checking this box will be taken to be a notification of loss of entitlement to small or micro entity status, as applicable.

---

NOTE: The Issue Fee and Publication Fee (if required) will not be accepted from anyone other than the applicant; a registered attorney or agent; or the assignee or other party in interest as shown by the records of the United States Patent and Trademark Office.

### Warnings:

### Information:

**Total Files Size (in bytes):** 252903

**This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.**

#### **New Applications Under 35 U.S.C. 111**

**If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.**

#### **National Stage of an International Application under 35 U.S.C. 371**

**If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.**

#### **New International Application Filed with the USPTO as a Receiving Office**

**If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.**

NOTICE OF ALLOWANCE AND FEE(S) DUE

37462 7590 07/01/2013
LANDO & ANASTASI, LLP
ONE MAIN STREET, SUITE 1100
CAMBRIDGE, MA 02142

Table with 2 columns: EXAMINER (CHEUNG, CALVIN K), ART UNIT (3662), PAPER NUMBER (7352)

DATE MAILED: 07/01/2013

Table with 5 columns: APPLICATION NO. (13/237,184), FILING DATE (09/20/2011), FIRST NAMED INVENTOR (Kenneth P. Weiss), ATTORNEY DOCKET NO. (W0537-701320), CONFIRMATION NO. (7352)

TITLE OF INVENTION: UNIVERSAL SECURE REGISTRY

Table with 7 columns: APPLN. TYPE (nonprovisional), ENTITY STATUS (SMALL), ISSUE FEE DUE (\$890), PUBLICATION FEE DUE (\$300), PREV. PAID ISSUE FEE (\$0), TOTAL FEE(S) DUE (\$1190), DATE DUE (10/01/2013)

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the ENTITY STATUS shown above. If the ENTITY STATUS is shown as SMALL or MICRO, verify whether entitlement to that entity status still applies. If the ENTITY STATUS is the same as shown above, pay the TOTAL FEE(S) DUE shown above. If the ENTITY STATUS is changed from that shown above, on PART B - FEE(S) TRANSMITTAL, complete section number 5 titled "Change in Entity Status (from status indicated above)". For purposes of this notice, small entity fees are 1/2 the amount of undiscounted fees, and micro entity fees are 1/2 the amount of small entity fees.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

**PART B - FEE(S) TRANSMITTAL**

**Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE  
 Commissioner for Patents  
 P.O. Box 1450  
 Alexandria, Virginia 22313-1450  
 or Fax (571)-273-2885**

**INSTRUCTIONS:** This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 0 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 0 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

## Privacy Act Statement

**The Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

<b>Notice of Allowability</b>	<b>Application No.</b> 13/237,184	<b>Applicant(s)</b> WEISS, KENNETH P.	
	<b>Examiner</b> CALVIN CHEUNG	<b>Art Unit</b> 3662	<b>AIA (First Inventor to File) Status</b> No

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address--**

All claims being allowable, PROSECUTION ON THE MERITS IS (OR REMAINS) CLOSED in this application. If not included herewith (or previously mailed), a Notice of Allowance (PTOL-85) or other appropriate communication will be mailed in due course. **THIS NOTICE OF ALLOWABILITY IS NOT A GRANT OF PATENT RIGHTS.** This application is subject to withdrawal from issue at the initiative of the Office or upon petition by the applicant. See 37 CFR 1.313 and MPEP 1308.

1.  This communication is responsive to 6/19/2013.  
 A declaration(s)/affidavit(s) under **37 CFR 1.130(b)** was/were filed on \_\_\_\_\_.
2.  An election was made by the applicant in response to a restriction requirement set forth during the interview on \_\_\_\_\_; the restriction requirement and election have been incorporated into this action.
3.  The allowed claim(s) is/are 1 and 4-28. As a result of the allowed claim(s), you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see [http://www.uspto.gov/patents/init\\_events/oph/index.jsp](http://www.uspto.gov/patents/init_events/oph/index.jsp) or send an inquiry to [PPHfeedback@uspto.gov](mailto:PPHfeedback@uspto.gov).
4.  Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

**Certified copies:**

- a)  All    b)  Some    \*c)  None of the:
1.  Certified copies of the priority documents have been received.
  2.  Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3.  Copies of the certified copies of the priority documents have been received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

\* Certified copies not received: \_\_\_\_\_.

**Interim copies:**

- a)  All    b)  Some    c)  None of the: Interim copies of the priority documents have been received.

Applicant has **THREE MONTHS FROM THE "MAILING DATE"** of this communication to file a reply complying with the requirements noted below. Failure to timely comply will result in **ABANDONMENT** of this application.

**THIS THREE-MONTH PERIOD IS NOT EXTENDABLE.**

5.  CORRECTED DRAWINGS ( as "replacement sheets") must be submitted.  
 including changes required by the attached Examiner's Amendment / Comment or in the Office action of Paper No./Mail Date \_\_\_\_\_.  
**Identifying indicia such as the application number (see 37 CFR 1.84(c)) should be written on the drawings in the front (not the back) of each sheet. Replacement sheet(s) should be labeled as such in the header according to 37 CFR 1.121(d).**
6.  DEPOSIT OF and/or INFORMATION about the deposit of BIOLOGICAL MATERIAL must be submitted. Note the attached Examiner's comment regarding REQUIREMENT FOR THE DEPOSIT OF BIOLOGICAL MATERIAL.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

- See attached certification statement.
- The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.
- A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Matthew H. Grady/	Date (YYYY-MM-DD)	2013-06-19
Name/Print	Matthew H. Grady	Registration Number	52957

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

**Privacy Act Statement**

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**This is a Request for Continued Examination (RCE) under 37 CFR 1.114 of the above-identified application.**  
Request for Continued Examination (RCE) practice under 37 CFR 1.114 does not apply to any utility or plant application filed prior to June 8, 1995, or to any design application. The Instruction Sheet for this form is located at WWW.USPTO.GOV

**SUBMISSION REQUIRED UNDER 37 CFR 1.114**

Note: If the RCE is proper, any previously filed unentered amendments and amendments enclosed with the RCE will be entered in the order in which they were filed unless applicant instructs otherwise. If applicant does not wish to have any previously filed unentered amendment(s) entered, applicant must request non-entry of such amendment(s).

Previously submitted. If a final Office action is outstanding, any amendments filed after the final Office action may be considered as a submission even if this box is not checked.

This collection of information is required by 37 CFR 1.114. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.11 and 1.14. This collection is estimated to take 12 minutes to complete, including gathering, preparing, and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450.

*If you need assistance in completing the form, call 1-800-PTO-9199 and select option 2.*

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

I hereby certify that this paper (along with any paper referred to as being attached or enclosed) is being transmitted via the Office electronic filing system in accordance with 37 CFR § 1.6(a)(4).

MS RCE  
Commissioner for Patents  
P.O. Box 1450  
Alexandria, VA 22313-1450

Dear Madam:

Pursuant to 37 C.F.R. § 1.56, 1.97 and 1.98, the attention of the Patent and Trademark Office is hereby directed to the references listed on the attached PTO/SB/08. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the references be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

The applicant would like to bring to the Examiner's attention the following co-pending applications and patents that may contain subject matter related to this application:

<b>Serial No.</b>	<b>Filing Date</b>	<b>Inventor</b>	<b>Patent/Publication No.</b>
13/621,609	17-Sep-2012	Kenneth P. Weiss	US 2013-0024374 A1
11/706,732	08-Jun-2007	Kenneth P. Weiss	7,809,651
11/706,729	08-Jun-2007	Kenneth P. Weiss	7,805,372

11/677,490	21-Feb-2007	Kenneth P. Weiss	8,001,055

12/393,586	26-Feb-2009	Kenneth P. Weiss	8,234,220
13/234,874	16-Sep-2011	Kenneth P. Weiss	US 2012-0240195 A1

This Information Disclosure Statement, pursuant to 37 C.F.R. § 1.114(c), accompanies the Request for Continued Examination (37 C.F.R. § 1.114) submitted herewith.

In accordance with 37 C.F.R. § 1.98(a)(2)(ii), Applicant has not submitted copies of U.S. patents and U.S. patent applications. Applicant submits herewith copies of foreign patents and non-patent literature in accordance with 37 C.F.R. § 1.98(a)(2).

In accordance with 37 C.F.R. § 1.97(g), the filing of this Information Disclosure Statement shall not be construed to mean that a search has been made or that no other material information as defined in 37 C.F.R. § 1.56(a) exists. In accordance with 37 C.F.R. § 1.97(h), the filing of this Information Disclosure Statement shall not be construed to be an admission that any patent, publication or other information referred to therein is “prior art” for this invention unless specifically designated as such.

It is submitted that the Information Disclosure Statement is in compliance with 37 C.F.R. § 1.98 and the Examiner is respectfully requested to consider the listed references.

The Director is hereby authorized to charge any deficiency in the fees filed, asserted to be filed or which should have been filed herewith (or with any paper hereafter filed in this application by this firm) to our Deposit Account No. 50/2762, under Order No. W0537-701320.

Dated: June 19, 2013

Respectfully submitted,

(54) Title: METHOD AND APPARATUS FOR PERSONAL IDENTIFICATION

(57) Abstract

A method and apparatus for providing improved security for a personal identification number (PIN) in a personal identification and verification system of the type wherein a time dependent unpredictable code is generated at a device in the possession of the individual (36), which code is unique to the individual and this code is communicated to, and compared with a unpredictable code generated at a central verification computer (46). In this system, the PIN is mixed with the unpredictable code before transmission of these values to the central verification computer (38). A nonsecret code (30) is previously transmitted to the central verification computer and is used by the verification computer to retrieve the PIN and independently generate the time dependent appropriate unpredictable code for the user (74). These retrieved PIN and generated code values are used by the verification computer either (a) to strip the PIN from the transmitted unpredictable code (42) and the stripped PIN and remaining unpredictable code are compared with the corresponding retrieved values in order to determine verification (44, 46); or (b) to be mixed and then compared with the mixed PIN and code which is transmitted to the verification computer (144).

METHOD AND APPARATUS FOR PERSONAL IDENTIFICATIONCross Reference to Other Applications

5 This application is a continuation-in-part of application serial no. 07/341,932 filed April 21, 1989, which is a continuation-in-part of application serial no. 802,579 filed November 27, 1985, issued December 5, 1989 as U.S. Patent No. 4,885,778, which application is itself a continuation-in-part of application serial no. 676,626 filed November 30, 1984, now U.S. Patent No. 4,720,860, issued January 10 19, 1988. The disclosures and specifications of all of the foregoing applications/patents are incorporated herein by reference as if fully set forth.

- 2 -

Field of the Invention

This invention relates to methods and apparatus for identifying an individual and more particularly to methods and apparatus for providing improved security for a personal identification number (PIN) utilized in conjunction with such an identification system.

Background of the Invention

Personal identification systems may be based on something someone has, such as a card or badge, something that someone knows, such as a PIN, or some characteristic of the individual, such as his fingerprints or speech pattern. Security for such systems is enhanced by utilizing two or more of the above in performing the identification.

For example, parent Patent No. 4,720,860, discloses a personal identification system wherein the individual has a card or other small, portable device which contains a microprocessor programmed to utilize a secret algorithm to generate a nonpredictable number from a stored value unique to the individual and a time varying value provided for example by a clock. The nonpredictable value is preferably displayed on the device. The individual then enters his secret PIN into a central verification system, either directly or over a telephone line, causing the central system to access

- 3 -

stored information corresponding to the individual and to utilize at least some of this information to generate a nonpredictable value at the central computer utilizing the same algorithm as at the individual's microprocessor. At the same time this is being done, the individual is entering the number appearing at that period of time on the display of his device. The two values will match, signifying identification of the individual, only if the individual has entered the correct PIN and if the individual has the proper device so that the nonpredictable code displayed corresponds to that being generated at the central verification computer.

In other systems, such as those shown in U.S. Patent No. 4,599,489 issued July 8, 1986, the PIN may either be stored in the user's device, or may be entered by the user. If the PIN is stored in the device, it is read from the device by a suitable reader and causes the central verification computer to generate a unique challenge code to the individual. This challenge code may either be entered by the individual into his machine, or may be automatically sensed by the machine, and is operated on by the user's device to generate a unique nonpredictable code which is then entered into the central computer to effect verification.

One potential difficulty with either of the systems indicated above is that an unauthorized

- 4 -

individual may be able to obtain access to the user's PIN by electronic eavesdropping, reducing the security provided by the system. If, for example, the PIN is transmitted over public lines, such as telephone lines, from the user to the central verification computer, it may be possible to tap these lines and intercept the PIN as it is being transmitted. If the PIN is stored in the device, someone obtaining the device surreptitiously may, through sophisticated means, be able to determine the PIN stored in the device and thus defeat the security of the system. Furthermore, any storing of a PIN or password in the portable device for comparison defeats the purpose of an independent identification factor and reduces security to a "thing" possessed.

A need therefore exists for an improved means of communicating a PIN or other user identification code to a central verification system such that someone tapping the line over which the code is being sent will be unable to determine the secret identification number and someone obtaining possession of the user device will also not be able to obtain access to the user's secret identification number from the device.

- 5 -

Summary of the Invention

In accordance with the above, this invention provides a method for personal identification and apparatus for the practice thereof wherein a device  
5 in the possession of the individual is utilized to generate a unique, time varying, nonpredictable code; the nonpredictable code generated at a given time is mixed with a secret PIN for the individual; the mixed output is communicated to a central  
10 verification computer; and the verification computer typically strips the PIN from the communicated value and utilizes the stripped PIN and remaining nonpredictable code to perform a verification operation. Alternatively and equivalently, the  
15 mixed output which is communicated to the verification computer may be verified in the verification computer without stripping of the PIN. Preferably, before the mixed value is communicated to the verification computer, a nonsecret  
20 identifying code for the individual is communicated to the verification computer; the verification computer utilizes the nonsecret identifying code to obtain the PIN and appropriate nonpredictable code for the individual; and the verification operation  
25 includes the PIN and appropriate nonpredictable code obtained during the obtaining step being compared with the stripped PIN and remaining nonpredictable code. Alternatively the PIN may not be stripped

- 6 -

from the mixed value, the verification computer may utilize the nonsecret identifying code to retrieve or obtain the PIN and appropriate nonpredictable code, combine the retrieved PIN and appropriate nonpredictable code, and perform a verification operation between the mixed value communicated to the verification computer and the combination of the retrieved PIN and appropriate nonpredictable code. The verification computer may also generate a unique challenge value in response to the nonsecret identifying code which challenge code is communicated to the device in possession of the individual. For one embodiment, the challenge code is communicated to the individual and the individual inputs the challenge value and the PIN to his device, the device includes means responsive to the challenge value for generating the nonpredictable code. During the mixing step, the device may receive the PIN and the nonpredictable code and generate an output which is a predetermined function of the inputs. The predetermined function may, for example, be a sum of the inputs, for example the sum of the inputs without carry.

The foregoing and other objects, features and advantages of the invention will be apparent from the following more particular description of preferred embodiments of the invention as illustrated in the accompanying drawings.

- 7 -

In the Drawings

Fig. 1 is a semi-block schematic diagram of the verification system of a first embodiment of the invention.

5 Fig. 2 is a block schematic diagram of a second embodiment of the invention.

Fig. 3 is a block flow diagram illustrating the operation of the first embodiment of the invention and alternative steps for the second embodiment of the invention.

10

Detailed Description

Fig. 1 shows illustrative structure for a personal identification system of a first embodiment of the invention. In this figure, a user

15 verification device 10 is provided which is of the type described in the parent applications. The device is preferably of the general size and shape of a standard credit card, although its thickness dimension may be slightly greater than that of such

20 cards. The device 10 has a clock which generates a time-dependent digital output to a microprocessor which is programmed with a unique algorithm to operate on the time-dependent clock input and on a stored static value unique to a given user to

25 generate a multi-bit nonpredictable code. A plurality of input areas 12 are provided on the face of device 10. These areas are preferably each

- 8 -

indicative of a numerical digit, for example the  
digits 1 - 0 as shown in Fig. 1, and may be  
pressure-sensitive pads or otherwise adapted to  
generate an electrical output indicative of the area  
5 when the area is touched by the user. Spacing may  
be provided between the individual areas 12 to  
assure distinctive outputs. As will be described in  
greater detail hereinafter, the user may input his  
unique PIN on areas 12 which are mixed in the  
10 processor in device 10 with the nonpredictable code  
generated therein in response to the time-dependent  
and static inputs to generate a multi-bit  
nonpredictable code which is displayed on area 14 of  
device 10. Area 14 may be a liquid crystal display  
15 or other suitable display device for producing  
numeric or alpha-numeric characters. Each area of  
display 14 is adapted to display a different digit  
of the nonpredictable code.

The user initially transmits a nonsecret  
20 identifying code to verification computer 16 by  
keying this number into a telephone 18 at his  
location. This number is transmitted over telephone  
lines 20 to telephone 22 at the verification station  
and through a modem 24 at this station to the  
25 verification computer. The user may then use the  
telephone 18 to key in and transmit the  
nonpredictable code being displayed at that time on  
display 14.

- 9 -

Fig. 3 is a flow diagram illustrating in greater detail the operation of the system of Fig. 1 to perform a verification operation. Referring to Fig. 3, the first step in the operation, step 30, is for the user to send his nonsecret code to verification computer (VC) 16. As previously indicated, this is accomplished by the user keying his nonsecret identification number into telephone 18 for transmission through telephone line 20, telephone 22 and modem 24 to the verification computer.

In response to the user input of his nonsecret code, the verification computer retrieves the user's PIN and generates the nonpredictable code for the user, using the same algorithm and stored static value as user device 10, and using a time-related value from a clock device at the verification computer, which is maintained in synchronism with the clock at the user device in a manner discussed in the parent application (step 32). At the same time that the verification computer is retrieving the PIN and nonpredictable code for the user, the user is inputting his PIN into his device 10 using key pads or areas 12 (step 34). While the user is inputting his pin, the user device is continuously generating nonpredictable code values at its internal processor in response to the clock value and the stored static value using the unique algorithm at the user device processor (step 36).

- 10 -

The next step in the operation, step 38, is for the generated nonpredictable code and the inputted pin to be mixed by the processor in device 10 to generate a new nonpredictable code which is  
5 displayed on display 14. The mixing operation may be a simple addition of the two values without carry, or with carry, (a constant added to a pseudo random number produces a pseudo random number) or may involve a more sophisticated mixing algorithm.

10 During step 40, the user transmits the displayed value by use of telephone 18 through telephone line 20, telephone 22, and modem 24 to verification computer 16.

15 During the next step in the operation, step 42, the verification computer uses the PIN for the user which was retrieved during step 32 to strip the PIN from the inputted nonpredictable code, the result being a PIN value and a nonpredictable code value. During step 44 the stripped PIN is compared with the  
20 PIN retrieved during step 32 and during step 46 the nonpredictable code remaining after the inputted value has the PIN stripped therefrom is compared with the retrieved nonpredictable code. If matches are obtained during both steps 44 and 46 (step 48)  
25 the verification computer signifies verification. If a match is not found during either step 44 or step 46 (step 50) then the user is rejected.

- 11 -

Alternatively to steps 42, 44, 46, 48 and 50, the PIN and nonpredictable code which are retrieved in step 32 may be combined or mixed by the verification computer during step 142 according to the same mixing operation which was carried out by the processor or user device 10 in step 38, e.g. by a simple addition of the two values without carry, with carry, or according to some other more sophisticated algorithm. During alternative step 144 the separate results of the mixing operations carried out by the user device 10 and the verification computer 16 are compared. If a match is obtained, step 148, the user is verified. If a match is not found, step 150, the user is rejected.

A procedure is thus provided wherein user verification may be obtained using the simple and inexpensive procedure disclosed in the parent applications while still providing a high level of security for the user PIN. This security is achieved since the user PIN is never available on an open line which could be tapped except in the form of a word which is a mixture of the PIN with a nonpredictable code and which is virtually impossible to decipher.

Fig. 2 illustrates an alternative configuration in which the teachings of this invention may be utilized. In Fig. 2, the user device 10 is of the same type shown in Fig. 1. However, for this

- 12 -

embodiment of the invention, the user device is adapted to be used in proximity to the verification station rather than from a remote location over telephone lines. For this embodiment of the invention, the verification station 60 includes a computer 62, a display 64, such as for example a CRT display, and an input device 66 which may, for example, be a standard computer input keyboard. Referring again to Fig. 3, the operation with this embodiment of the invention starts with step 30, during which the user sends a nonsecret code to the verification computer 62 by, for example, keying this code into input device 66. In response to receiving the nonsecret code, computer 60 retrieves the PIN and generates the nonpredictable code for the user (step 32) and also retrieves a challenge code for the user which is displayed on display 64 (step 70). The user inputs his PIN and the challenge code in an order established for the system to user device 10 using input pads 12 (step 72). During step 74, the processor in device 10 uses the inputted challenge code and the time inputted from its clock to generate a nonpredictable code which, during step 38, is mixed with the inputted pin and the results are displayed on display 14 of device 10. From this point on, the operation for this embodiment of the invention is the same as that previously described with respect to the embodiment of Fig. 1.

- 13 -

Thus, with this embodiment of the invention, as with the prior embodiment of the invention, the pin in uncoded form is never transmitted in a manner such that it could be observed and is not resident in the user's device where it might, using sophisticated technology, be retrieved.

As an alternative to the embodiment shown in Fig. 2, the nonsecret code may be recorded in machine-readable form on device 10 and input device 66 might include a card reader which the card is inserted into to permit the nonsecret code to be read into computer 62.

While the invention has been shown and described above with reference to preferred embodiments, the foregoing and other changes in form and detail may be made therein by one skilled in the art without departing from the spirit and scope of the invention.

What is claimed is:

- 14 -

CLAIMS

1. In a personal identification system of the type wherein a user is provided with a device generating a unique, time-varying, nonpredictable code, with a nonsecret identifying code and with a secret PIN, the nonpredictable code at a given instant and the PIN being provided to a central verification computer to effect verification; apparatus for providing improved security for the PIN comprising:

means for mixing the nonpredictable code generated by the device at a given time with the PIN according to a predetermined algorithm to generate a combined coded value;

means for separately communicating the nonsecret identifying code and the combined coded value to the central verification computer; and

wherein the central verification computer includes means for utilizing the nonsecret identifying code to retrieve the PIN and generate an appropriate, unique, time varying nonpredictable code for the individual, and at least one of:

(a) a means for utilizing the retrieved PIN, appropriate nonpredictable code and the combined coded value in performing a verification operation; or

- 15 -

(b) a means for stripping the PIN from the combined coded value received from the means for communicating, the nonpredictable code remaining after stripping of the PIN and means for utilizing the retrieved PIN, and appropriate nonpredictable code for performing a verification operation.

2. Apparatus as claimed in claim 1 including means operative prior to the communicating of the value from the mixing means for communicating the nonsecret identifying code to said verification computer.

3. Apparatus as claimed in claim 2 wherein said verification computer includes means for utilizing the communicated nonsecret identifying code to retrieve the PIN and a unique challenge value for the individual; and means for communicating the challenge value to the device.

4. Apparatus as claimed in claim 3 wherein said challenge value communicating means includes means for communicating the challenge value to the individual; and wherein the device includes means for permitting the individual to input the challenge value and his PIN to the device.

- 16 -

5. Apparatus as claimed in claim 4 wherein said device includes means responsive to the challenge value for generating the nonpredictable code; and

5                    wherein said mixing means includes means, included as part of the device, for receiving the inputted PIN and the generated nonpredictable value and for generating an output which is a predetermined function of the input.

10                   6. Apparatus as claimed in claim 5 wherein said mixing means adds the PIN to the nonpredictable code.

15                   7. Apparatus as claimed in claim 1 wherein said device includes means for permitting the individual to input his PIN to the device; and  
                     wherein said means for mixing is included as part of said device and is adapted to receive the PIN inputted by the individual and the nonpredictable code and to generate an output which  
20                   is a predetermined function of the input.

8. Apparatus as claimed in claim 7 wherein said mixing means adds the PIN to the nonpredictable code.

- 17 -

5 9. Apparatus as claimed in claim 1 wherein said verification computer includes a means for mixing the retrieved PIN and appropriate nonpredictable code generated by the verification computer at a given time according to the predetermined algorithm to generate a second combined coded value.

10 10. Apparatus as claimed in claim 9 wherein the verification operation comprises comparing the combined coded value with the second combined coded value.

15 11. Apparatus as claimed in claim 1 wherein the means for performing a verification operation includes means for comparing the PIN and nonpredictable code obtained in response to the nonsecret identifying code with the stripped PIN and remaining nonpredictable code.

20 12. A method for identifying an individual comprising the steps of:  
utilizing a device in the possession of the individual to generate a unique time-varying, nonpredictable code;  
25 mixing the nonpredictable code generated at a given time with a secret PIN for the individual to generate a combined code; and

- 18 -

communicating a nonsecret identifying code for the individual and the combined code to a central verification computer;

5 the verification computer utilizing the nonsecret identifying code to retrieve the PIN and generate an appropriate, unique, time-varying nonpredictable code for the individual, and at least one of:

- 10 (a) utilizing the retrieved PIN, appropriate nonpredictable code, and the combined code to perform a verification operation; or
- (b) stripping the PIN from the communicated combined code and utilizing the retrieved PIN and nonpredictable code, the stripped
- 15 PIN and the remaining nonpredictable code to perform a verification operation.

13. A method as claimed in claim 12 wherein the verification

20 computer also generates a unique challenge value in response to the nonsecret identifying code; and including the step of communicating the challenge value to the device in possession of the individual.

14. A method as claimed in claim 13 wherein the

25 challenge value is communicated to the individual; and

- 19 -

including the step of the individual inputting the challenge value and his PIN to the device.

5 15. A method as claimed in claim 14 wherein the device includes means responsive to the challenge value for generating the nonpredictable code; and  
wherein the mixing step includes the device receiving the PIN and the nonpredictable code and generating an output which is a predetermined  
10 function of the inputs.

16. A method as claimed in claim 15 wherein said predetermined function is a sum of said inputs.

15 17. A method as claimed in claim 15 including the step of the individual inputting his PIN to the device; and  
wherein the mixing step includes the device receiving the PIN inputted by the individual and the nonpredictable code and generating an output which is a predetermined function of the inputs.

20 18. A method as claimed in claim 17 wherein said predetermined function is a sum of said input.

19. A method as claimed in claim 12 wherein the verification computer utilizes the retrieved PIN and

- 20 -

appropriate nonpredictable code by combining them to obtain a second combined code.

5           20. A method as claimed in claim 19 wherein the verification operation comprises comparing the combined code and the second combined code.

10           21. A method as claimed in claim 12 wherein the verification operation includes comparing the retrieved PIN and the nonpredictable code generated by the verification computer with the stripped PIN and the remaining nonpredictable code.

(54) Title: TOKENLESS IDENTIFICATION SYSTEM FOR AUTHORIZATION OF ELECTRONIC TRANSACTIONS AND ELECTRONIC TRANSMISSIONS

(57) Abstract

A tokenless identification system and method are principally based on a correlative comparison of a unique biometrics sample, such as a finger print or voice recording, gathered directly from the person of an unknown user, with an authenticated biometrics sample of the same type obtained and stored previously (1). It can be networked to act as a full or partial intermediary between other independent computer systems (3), or maybe the sole computer systems carrying out all necessary executions.

**TOKENLESS IDENTIFICATION SYSTEM FOR  
AUTHORIZATION OF ELECTRONIC TRANSACTIONS AND  
ELECTRONIC TRANSMISSIONS**

5  
By:  
Ned Hoffman  
David Pare  
Jonathan Lee

10  
**Cross-Reference**

The present application is a continuation-in-part of United States Patent Application Serial No. 08/345,523, filed November 28, 1994, which is incorporated herein by reference.

15  
**Background**

The use of tokens and credit cards in today's financial world is pervasive. A token would be any inanimate object which confers a capability to the individual presenting the object. Remote access of every financial account is through the use of tokens or plastic cards. Whether buying groceries with debit cards or consumer goods with credit cards, at the heart of that transaction is a money transfer enabled by a token, which acts to identify an individual and the financial account he is accessing.

20  
The reason for the migration from metal coins to plastic cards is simple and straightforward: access to money in this money transfer system is vastly safer and more convenient for both merchants and consumers than handling large quantities of coins and notes.

25  
Unfortunately, current technology in combination with this convenient token-based money transfer system results in a system that is prone to theft and fraud.

30  
As verification of user identity is based solely on data placed on the token, which can be easily reproduced and transferred between individuals, such security must rely on both the diligence and the luck of the authorized user and merchant in maintaining this information as proprietary. However, by their very nature, tokens do not have a very strong connection with the individual. Identification of the rightful owner of the token through the token is tenuous at best. This is easily

demonstrated by the fact that individuals other than the rightful owners of the tokens have been using these tokens to defraud merchants and other consumer goods suppliers.

5 The mammoth expansion of the consumer credit industry during the 1980s brought with it large profits for issuers, and newfound convenience for consumers. However, as consumer credit became easier for consumers to acquire, it also became a target for criminals. Much as the mobility of the automobile led to a rash of bank robberies in the late 1920's and early 1930's, so too did the ubiquity of consumer credit lead to vastly  
10 increased opportunities for criminals.

Initially, the banking industry was willing to accept a certain amount of loss due to fraud, passing the cost on to the consumer. However, as criminals became more organized, more technically adept, and as credit retail stations began to be manned by people who were more and  
15 more poorly trained in credit card security matters, the rate of increase of fraud losses skyrocketed. The staggering statistics on fraud and cost of preventive steps, has forced the credit card companies in particular, to look for other solutions to the problem.

20 Fraud losses in the credit card industry stem from many different areas due to the highly vulnerable nature of the system, but they are mainly due to either lost, stolen, or counterfeit cards. Credit cards operate without the use of a personal identification code (PIC), therefore a lost credit card can be turned into cash if the card falls into the wrong hands. While theft of a token constitutes the majority of fraud in the  
25 system, the use of counterfeit credit cards has been on the rise. Counterfeit credit cards are manufactured by a more technically sophisticated criminal by acquiring a cardholder's valid account number and then producing a counterfeit card using that valid number. The counterfeiter encodes the magnetic strip, and embosses the counterfeit plastic card with the account  
30 number. The card is then presented to merchants and charged up to the rightful cardholder's account. Another form of loss is by a criminal merchant who surreptitiously obtains the cardholder's account number. Yet another type of fraud is committed by the authorized cardholder when the token is used for making purchases and thereafter a claim is made that  
35 the token was either lost or stolen. It is estimated that losses due to all types of fraud exceeds \$950 million dollars annually.

Generally, debit cards are used in conjunction with a personal identification code (PIC). Counterfeiting a debit card is more difficult as the criminal must acquire not only the account number, but also the PIC, and then manufacture the card as in the credit card example. However, various strategies have been used to obtain PICs from unwary cardholders; these range from Trojan horse automated teller machines, or ATMs, in shopping malls that dispense cash but record the PIC, to merchant point of sale devices that also record the PIC, to individuals with binoculars that watch cardholders enter PICs at ATMs. The subsequently manufactured counterfeit debit cards are then used in various ATM machines until the unlucky account is emptied.

The financial industry is well aware of the trends in fraud expense, and is constantly taking steps to improve the security of the card. Thus fraud and theft of token have an indirect impact on the cost to the system.

Card blanks are manufactured under very tight security. Then they are individualized with the account number, expiration date, and are then mailed to the cardholder. Manufacturing and distributing the card alone costs the industry approximately one billion dollars annually. The standard card costs the financial industry \$2 for each, but only \$0.30 of this \$2 is associated with actual manufacturing cost.

Over the last ten years, the industry has altered the tokens because of counterfeiting fraud, without any fundamental changes in the use of the credit transaction system. The remedy has been mostly administrative changes such as having customers call the issuer to activate their card. Other changes include addition of a hologram, a picture ID, or an improved signature area. These type of changes in particular, are an indication that the systems susceptibility to fraud is due to lack of true identification of the individual. It is estimated that this could double the manufacturing cost to two billion dollars annually.

In the near future, the banking industry expects to move to an even more expensive card, called a "smart card". Smart cards contain as much computing power as did some of the first home computers. Current cost projections for a first-generation smart card is estimated at approximately \$3.50, not including distribution costs, which is significantly higher than the \$0.30 plastic card blank.

5 This significant increase in cost has forced the industry to look for new ways of using the power in the smart card in addition to simple transaction authorization. It is envisioned that in addition to storing credit and debit account numbers, smart cards may also store phone numbers, frequent flyer miles, coupons obtained from stores, a transaction history, electronic cash usable at tollbooths and on public transit systems, as well as the customer's name, vital statistics, and perhaps even medical records. Clearly, the financial industry trend is to further establish use of tokens.

10 The side effect of increasing the capabilities of the smart card is centralization of functions. The flip side of increased functionality is increased vulnerability. Given the number of functions that the smart card will be performing, the loss or damage of this monster card will be excruciatingly inconvenient for the cardholder. Being without such a card will financially incapacitate the cardholder until it is replaced. Additionally, 15 losing a card full of electronic cash will also result in a real financial loss as well. Furthermore, ability of counterfeiters to one day copy a smartcard is not addressed.

20 Unfortunately, because of the projected concentration of functions onto the smart card, the cardholder is left more vulnerable to the loss or destruction of the card itself. Thus, after spending vast sums of money, the resulting system will be more secure, but threatens to levy heavier and heavier penalties for destruction or loss of this card on the consumer.

25 The financial industry recognizes the security issues associated with smartcards, and efforts are currently underway to make each plastic card difficult to counterfeit. Billions of dollars will be spent in the next five years in attempts to make plastic ever more secure. To date, the consumer financial transaction industry has had a simple equation to balance: in order 30 to reduce fraud, the cost of the card must increase.

35 In addition to and associated with the pervasiveness of electronic financial transactions, there is now the widespread use of electronic facsimiles, electronic mail messages and similar electronic communications. Similar to the problem of lack of proper identification of individuals for financial transactions is the problem of lack of proper identification of individuals for electronic transmissions. The ease and

speed of electronic communication, and its low cost compared to conventional mail, has made it a method of choice for communication between individuals and businesses alike. This type of communication has expanded greatly and is expected to continue to expand. However, millions of electronic messages such as facsimiles and electronic mail (or "E-mail" or "email") messages are sent without knowing whether they arrive at their true destination or whether a certain individual actually sent or received that electronic message. Furthermore, there is no way to verify the identify the individual who sent or who received an electronic message.

Recently, various attempts have been made to overcome problems inherent in the token and code security system. One major focus has been to encrypt, variablize or otherwise modify the PIC to make it more difficult for an unauthorized user to carry out more than one transaction, largely by focusing on manipulation of the PIC to make such code more fraud resistant. A variety of approaches have been suggested, such as introducing an algorithm that varies the PIC in a predictable way known only to the user, thereby requiring a different PIC code for each subsequent accessing of an account. For example, the PIC code can be varied and made specific to the calendar day or date of the access attempt. In yet another approach, a time-variable element is introduced to generate a non-predictable personal identification code that is revealed only to an authorized user at the time of access. Although more resistant to fraud than systems incorporating non-variable codes, such an approach is not virtually fraud-proof because it still relies on data that is not uniquely and irreproducibly personal to the authorized user. Furthermore, such systems further inconvenience consumers that already have trouble remembering constant codes, much less variable ones. Examples of these approaches are disclosed in United States Patents 4,837,422 to Dethloff et al.; 4,998,279 to Weiss; 5,168,520 to Weiss; 5,251,259 to Mosley; 5,239,538 to Parrillo; 5,276,314 to Martino et al.; and 5,343,529 to Goldfine et al. all of which are incorporated herein by reference.

More recently, some have turned their attention from the use of personal identification codes to the use of unique biometrics as the basis of identity verification, and ultimately computer access. In this approach, authenticated biometrics are recorded from a user of known identity and stored for future reference on a token. In every subsequent access attempt,

5 the user is required to enter physically the requested biometrics, which are  
then compared to the authenticated biometrics on the token to determine if  
the two match in order to verify user identity. Because the biometrics are  
uniquely personal to the user and because the act of physically entering the  
biometrics are virtually irreproducible, a match is putative of actual  
identity, thereby decreasing the risk of fraud. Various biometrics have been  
suggested, such as finger prints, hand prints, voice prints, retinal images,  
handwriting samples and the like. However, because the biometrics are  
10 generally stored in electronic (and thus reproducible) form on a token and  
because the comparison and verification process is not isolated from the  
hardware and software directly used by the individual attempting access, a  
significant risk of fraudulent access still exists. Examples of this approach  
to system security are described in United States Patents 4,821,118 to  
Lafreniere; 4,993,068 to Piosenka et al.; 4,995,086 to Lilley et al.;  
15 5,054,089 to Uchida et al.; 5,095,194 to Barbanell; 5,109,427 to Yang;  
5,109,428 to Igaki et al.; 5,144,680 to Kobayashi et al.; 5,146,102 to  
Higuchi et al.; 5,180,901 to Hiramatsu; 5,210,588 to Lee; 5,210,797 to  
Usui et al.; 5,222,152 to Fishbine et al.; 5,230,025 to Fishbine et al.;  
20 5,241,606 to Horie; 5,265,162 to Bush et al.; 5,321,242 to Heath, Jr.;  
5,325,442 to Knapp; 5,351,303 to Willmore, all of which are incorporated  
herein by reference.

As will be appreciated from the foregoing discussion, a dynamic  
but unavoidable tension arises in attempting to design a security system  
that is highly fraud resistant, but nevertheless easy and convenient for the  
25 consumer to use. Unfortunately, none of the above-disclosed proposed  
improvements to the token and code system adequately address, much less  
attempt to balance, this tension. Such systems generally store the  
authenticated biometrics in electronic form directly on the token that can  
presumably be copied. Further, such systems do not adequately isolate the  
30 identity verification process from tampering by someone attempting to gain  
unauthorized access.

An example of token-based security system which relies on a  
biometrics of a user can be found in United States Patent 5,280,527 to  
Gullman et al. In Gullman's system, the user must carry and present a  
35 credit card sized token (referred to as a biometrics security apparatus)  
containing a microchip in which is recorded characteristics of the

authorized user's voice. In order to initiate the access procedure, the user must insert the token into a terminal such as an ATM, and then speak into the terminal to provide a biometrics input for comparison with an authenticated input stored in the microchip of the presented token. The process of identity verification is generally not isolated from potential tampering by one attempting unauthorized access. If a match is found, the remote terminal may then signal the host computer that access should be permitted, or may prompt the user for an additional code, such as a PIN (also stored on the token), before sending the necessary verification signal to the host computer.

Although Gullman's reliance of comparison of stored and input biometrics potentially reduces the risk of unauthorized access as compared to numeric codes, Gullman's use of the token as the repository for the authenticating data combined with Gullman's failure to isolate the identity verification process from the possibility of tampering greatly diminishes any improvement to fraud resistance resulting from the replacement of a numeric code with a biometrics. Further, the system remains somewhat cumbersome and inconvenient to use because it too requires the presentation of a token in order to initiate an access request.

Almost uniformly, patents that disclose token-based systems teach away from biometrics recognition without the use of tokens. Reasons cited for such teachings range from storage requirements for biometrics recognition systems to significant time lapses in identification of a large number of individuals, even for the most powerful computers.

In view of the foregoing, there has long been a need for a computer access system that is highly fraud-resistant, practical, and efficient for the user to operate and carry out electronic transactions and transmissions expeditiously.

There is also a need for a computer system that is completely tokenless and that is capable of verifying a user's personal identity, based solely upon a personal identification code and biometrics that is unique and physically personal to an authorized user, as opposed to verifying an individual's possession of any physical objects that can be freely transferred between different individuals. Such biometrics must be easily and non-intrusively obtained; must be easy and cost-effective to store and to analyze; and must not unduly invade the user's privacy rights.

5 A further need in computer access system design is user convenience. It is highly desirable for a consumer to be able to access the system spontaneously, particularly when unexpected needs arise, with a minimum of effort. In particular, there is a need for a system that greatly reduces or eliminates the need to memorize numerous or cumbersome codes, and that eliminates the need to possess, carry, and present a proprietary object in order to initiate an access request.

10 Such systems must be simple to operate, accurate and reliable. There is also a need for a computer access system that can allow a user to access multiple accounts and procure all services authorized to the user, and carry out transactions in and between all financial accounts, make point of purchase payments, receive various services, etc.

15 There is further a great need for a computer access system that affords an authorized user the ability to alert authorities that a third party is coercing the user to request access without the third party being aware that an alert has been generated. There is also a need for a system that is nevertheless able to effect, unknown to the coercing third party, temporary restrictions on the types and amounts of transactions that can be undertaken once access is granted.

20 Furthermore, the computer system must be affordable and flexible enough to be operatively compatible with existing networks having a variety of electronic transaction and transmission devices and system configurations.

25 Finally, there is a need for secured sending and receipt of electronic mail messages and electronic facsimiles, where content of the electronic message is protected from disclosure to unauthorized individuals, and the identity of the sender or recipient can be obtained with a high degree of certainty.

### 30 Summary of the Invention

35 The present invention satisfies these needs by providing an improved identification system for determining an individual's identity from a comparison of an individual's biometrics sample and personal identification code gathered during a bid step with biometrics sample and personal identification code for that individual gathered during a registration step and stored at a remote site wherein there is a data

processing center. The invention comprises a computer network host system with means for comparing the entered biometrics sample and personal identification code, and is equipped with various data bases and memory modules. Furthermore, the invention is provided with biometrics and personal identification code input apparatus and terminals for entering data to provide information for execution of the requested transactions and transmissions by the host system once the identity of the individual is determined. The invention is also provided with means for connecting the host system with the terminal and the biometrics input apparatus.

The computer also has means for execution of various transactions and transmission in addition to traditional storing of and modification of data. Additionally, the computer can output the evaluation of the biometrics- PIC ("personal identification code") comparison, and the determination of an identification evaluation, or status of any execution of transactions or transmissions. Furthermore, the computer system notifies and authenticates to the individual being identified that the computer system was accessed, by returning to the individual a private code which was previously selected by that individual during the registration step.

Preferably, the computer system is protected from electronic eavesdropping and electronic intrusion and viruses. Further, the devices used by the computer for gathering biometric samples and personal identification codes would comprise: a) at least one biometric input device for gathering biometric samples, which would have a hardware and a software component; b) at least one terminal device that is functionally partially or fully integrated with the biometric input means for input of and appending ancillary information; c) at least one data entry device for input of a personal identification code whereby this data entry device is integrated either with the biometric input device or the terminal device; and, d) a means for interconnecting the biometric input device, data entry device and the terminal. The terminal device also has at least one display device for displaying data and information. For additional security the computer system uniquely identifies the biometric input apparatus, and the counter party or merchant through a counter party or merchant identification code relating to the terminal that is connected to the biometric input device. It is also preferred that the biometric input apparatus be secured from physical and electronic tampering, and that in

case of physical breach of the device, means be employed to physically and/or electronically destroy components within the apparatus and/or erase critical data from the device's memory modules.

5 In addition, the biometric input apparatus would have a hardware component comprising: a) at least one computing module for data processing; b) erasable and non-erasable memory modules for storage of data and software; c) a biometric scanner device for input of biometric data; d) a data entry device for entering data; e) a digital communications port; f) a device for prevention of electronic eavesdropping.

10 In order to protect the integrity and confidentiality of electronic data sent between the biometric input apparatus, the terminal, and the computer network, it is preferred that the data be encrypted and sealed.

The host computer network is also connected to and is able to communicate with other independent computer systems, databases, facsimile machines, and other computer networks through conventional means.

15 The method of the present invention includes voluntarily identifying an individual without the use of any tokens by means of examination of at least one biometrics sample provided by that the individual and a personal identification code also provided by that individual. During a registration step, the individual is to register with the system an authenticated biometric sample, a personal identification code and a private code. Thereafter, during a bid step the biometrics sample and personal identification code of the individual is gathered and compared to the ones registered during the registration step. A match of the personal identification codes and biometrics sample will result in the positive identification of the individual. In order to authenticate to the identified individual that the real computer system was accessed, the individual's private code, which was collected at the registration step, is returned to the individual.

20 25 30 35 It is preferred that the method of the invention include a method for examining the biometrics samples during registration and comparing such biometrics with a collection of biometrics samples from individuals who have been designated as having previously attempted to perpetrate or who have actually perpetrated fraud upon the system.

In a preferred embodiment, the invention includes a method for notifying authorities of the presence of exigent circumstances or that the authorized user is under duress.

5 It is also preferred that a method of encryption and sealing of data be used to protect the data, including the digitized biometrics sample, from being revealed accidentally or unveiled from criminal elements during transmission.

10 It is also preferred that the method include steps for the individual to choose various financial accounts, and choose various modes of electronic transmissions.

It is also preferred that the method include a method for archiving of data and electronic transmissions, and retrieval of the archived data using a tracking code.

15 It is furthermore preferred that any document, such as a facsimile or an electronic mail message be uniquely checksummed using algorithm for future identification of the document.

20 Yet another method of the invention is to be able to rapidly identify an individual from an examination of his biometrics sample and personal identification code by storing several dissimilar biometrics samples from different individuals in an electronic basket that is identified by one personal identification code.

25 In one embodiment of the invention, the computer system can allow individuals to select their own personal identification code (or "PIC") from a group of PICs selected by the remote data processing center. This is performed in a method whereby once the individual's biometric is gathered, the data processing center selects several PICs at random which may be conducive to being memorized. The data processing center then conducts a comparison of the biometric gathered with those already in those PIC baskets or groups. In the event the new registrant's biometric is too similar to any previously registered biometric which has been allotted to any one of those randomly selected PIC groups, then that PIC is rejected by the database for use by the new individual and an alternative PIC is selected for another such biometric comparison. Once the data processing center has generated several PIC options without a confusingly similar biometric, 30 those PICs are presented to the new registrant from which the individual may select one PIC .

In one embodiment of the invention, there is a method for rapid search of at least one first previously stored biometric sample from a first individual, using a personal identification code-basket that is capable of containing at least one algorithmically unique second biometric sample that is from at least one second individual, and which is identified by said personal identification code-basket, comprising, firstly, a storage step further comprising: a) the selection of a private code by a first individual; b) the selection of a personal identification code by said first individual; c) the entering a biometric sample from said first individual; d) locating the personal identification code-basket identified by the personal identification code selected by said first individual; e) comparison of the biometric sample taken from said first individual with any previously stored biometric samples in said selected personal identification code-basket to make sure that the biometric sample entered by said first individual is algorithmically unique from the previously stored at least one biometric sample provided by at least one second individual, and; f) storage of the entered biometric sample from said first individual in the selected personal identification code-basket if said sample is algorithmically unique from the at least one previously stored biometric sample from said at least one second individual. There is also a bid step further comprising: a) entering said selected personal identification code by said first individual, and; b) entering a biometric sample by said first individual. There is also a comparison step comprising: a) finding the personal identification code-basket that is identified by said personal identification code entered by said first individual, and; b) comparison of the entered biometric sample from said first individual with said at least one stored biometric sample from said at least one second individual in said entered personal identification code-basket for producing either a successful or failed identification result. There could also be: a) an execution step wherein a command is processed and executed to produce a determination; b) an output step wherein said identification result or said determination is externalized and displayed, and; c) a presentation step wherein on successful identification of said first individual, said private code is presented to said first individual.

According to one embodiment of the invention, the host system is positioned in series between the individual being identified and other computer networks that are to be accessed, thereby acting as an interface. It will be appreciated that in this embodiment, the user tenders an access request directly to the host computer system of the invention, which is operationally interactive with other independent secured computer systems such as VISANET. The computer system would therefore maintain authenticated biometrics data samples for all authorized users of each secured computer system that it services. These data would be cross-referenced by each authorized user. Thus, after identity verification is completed, the security system provides to the user a listing of systems that he is authorized to access, and prompts the user to select the desired network. Thereafter, the requested execution step and information regarding the transaction is forwarded to the selected independent computer network similar to the type of communications sent today between merchants and credit card companies.

In a second embodiment the host system may also carry out the functions of the other independent computer systems such as debiting or crediting a financial account. In this system, the computer system of the invention carries out the functions requested by the individual without use of external, independent computer networks.

According to a further embodiment of the invention, a means is provided for alerting predesignated authorities during an access attempt during which the user has been coerced by a third party to request access to the host computer system. In such an embodiment, an authorized user would have a number of codes, most of which would be recognized by the computer system as the standard access codes, and others which would be recognized as emergency codes. The comparison means of the computer system of the invention would be configured to accept and recognize at least one code per authorized user, and to activate the emergency alert means whenever the code entered by the user matched an emergency code. At the same time, the determination of an authorized identity for the user would result in the user being afforded access to the requested secured computer system perhaps on an access level that has been predetermined to be restricted or perhaps resulting in the display of misleading data (i.e., "false screens"), thereby preventing the coercing third party from knowing

5 that an emergency notification had been entered by the user. The  
emergency code would be entered as a part of or simultaneously with the  
user's personal identification code or by selecting an emergency account  
index during the access of the computer system. In either case, the  
well-being of the user requesting access might be jeopardized if the  
coercing party discovered that the user was attempting to notify  
authorities. Thus, it is critical that the access procedure continue  
uninterruptedly and that access be granted to an authorized user so that the  
coercing party believes that everything is proceeding normally. Although  
10 these features can be incorporated into the invention's host computer  
network, it is also possible that an independent computer network can also  
carry out the same or modified versions of the above-mentioned features.

15 The present invention is clearly advantageous over the prior art  
in a number of ways. First, it is extremely easy and efficient for the user,  
particularly where the user is accessing financial accounts, because it  
eliminates the need to carry and present any tokens in order to access one's  
accounts. The present invention eliminates all the inconveniences  
associated with carrying, safeguarding and locating any desired tokens.  
Further, because tokens are often specific to a particular computer system  
20 that further requires remembering a secret code assigned to the particular  
token, this invention eliminates all such tokens and thereby significantly  
reduces the amount of memorization and diligence increasingly required of  
consumers by providing access to all assets using only one personal  
identification code. Thus, in a single, tokenless transaction, the consumer  
25 can efficiently and securely conduct virtually any commercial exchange or  
electronic message, from withdrawing cash from a bank account, to  
authorization his agreement to the terms of a contract, to making a  
purchase directly from television, to paying local property taxes. The  
consumer is now uniquely empowered, by means of this invention, to  
30 conveniently conduct his personal and/or professional electronic  
transmissions and transactions at any time without dependence upon tokens  
which may be stolen, lost or damaged.

35 The invention is clearly advantageous from a convenience  
standpoint to retailers and financial institutions by making purchases and  
other financial transactions less cumbersome and more spontaneous. The  
paper work of financial transactions is significantly reduced as compared to

current systems, such as credit card purchase wherein separate receipts are generated for use by the credit card company, the merchant and the consumer. Such electronic transactions also save merchants and banks considerable time and expense by greatly reducing operational costs. Because the system of the invention is designed to provide a consumer with simultaneous direct access to all of his financial accounts, the need for transactions involving money, checks, commercial paper and the like will be greatly reduced, thereby reducing the cost of equipment and staff required to collect and account for such transactions. Further, the substantial manufacturing and distributing costs of issuing and reissuing credit cards, ATM cards, calling cards and the like will be eliminated, thereby providing further economic savings to merchants, banks, and ultimately to consumers. In fact, the system of the invention will likely spur economic growth since all of a consumer's electronic financial resources will be available at the mere input of his fingerprint or other biometrics.

The invention is markedly advantageous and superior to existing systems in being highly fraud resistant. As discussed above, present computer systems are inherently unreliable because they base determination of a user's identity on the physical presentation of a unique manufactured object along with, in some cases, information that the user knows. Unfortunately, both the token and information can be transferred to another, through loss, theft or by voluntary action of the authorized user. Thus, unless the loss or unintended transfer of these items is realized and reported by the authorized user, anyone possessing such items will be recognized by existing security systems as the authorized user to whom that token and information is assigned.

By contrast, the present invention virtually eliminates the risk of granting access to non-authorized users by determining user identity from an analysis of one or more of a user's unique, biometrics characteristics. Even in the very rare circumstance of coercion, where an authorized individual is coerced by a coercing party to access his accounts, the system anticipates an emergency account index, whereby the authorized user can alert authorities of the transgression without the knowledge of the coercing party.

5 The invention further enhances fraud resistance by maintaining authenticating data and carrying out the identity verification operations at a point in the system that is operationally isolated from the user requesting access, thereby preventing the user from acquiring copies of the authenticating data or from tampering with the verification process. Such a system is clearly superior to existing token-based systems wherein authenticating information, such as personal codes, is stored on and can be recovered from the token, and wherein the actual identity determination is potentially in operational contact with the user during the access process.

10 It is an object of the invention therefore to provide a computer access identification system that eliminates the need for a user to possess and present a physical object, such as a token, in order to initiate a system access request.

15 It is another object of the invention to provide a computer access identification system that is capable of verifying a user's identity, as opposed to verifying possession of proprietary objects and information.

It is yet another object of the invention to verify user identity based upon one or more unique characteristics physically personal to the user.

20 Yet another object of the invention is to provide a system of secured access that is practical, convenient, and easy use.

Still another object of the invention is to provide a system of secured access to a computer system that is highly resistant to fraudulent access attempts by non-authorized users.

25 Yet another object of the invention is to provide a computer access identification system that enables a user to notify authorities that a particular access request is being coerced by a third party without giving notice to said third party of the notification.

30 There is also a need for a computer access identification system that automatically restricts a user's transactional capabilities on the computer system according a desired configuration provided by the user.

35 These and other advantages of the invention will become more fully apparent when the following detailed description of the invention is read in conjunction with the accompanying drawings.

**Brief Description of the Drawings**

**FIG. 1** is a diagram of the system of the present invention;

**FIG. 2** is a diagram of the Data Processing Center (DPC) and its internal data bases and execution modules;

### **Detailed Description of the Drawings**

As noted, the main objective of this invention is to provide a tokenless, secure, reliable, safe, and consistent, apparatus and method, for identifying individuals for the purpose of performing financial transactions and non-financial transmissions, which can accommodate large numbers of users. It is the essence of this invention that consumers have the ability to conduct these transactions without the use of any tokens, credit cards, badges or identification cards including drivers licenses. In order to be functional it is important that the system operate at speeds required for completing financial transactions such as credit card purchases and ATM services, from multiple banks and credit accounts. The system must be secure, such that individuals records and their biometrics information remain confidential and safe, both within the computer system that identifies the individual and authorizes transactions, or during transfer of data between the computer system and remote sites with which the computer system communicates. Furthermore, the system must be reliable

in that errors in identification and authorization must not hamper or make use of the system cumbersome. Since only the use of biometrics are contemplated for identification of individuals, the system must also have security measures to either reduce access, even to the authorized user, or notify authorities in emergency cases. It is appreciated that the system must be able to handle a large number of users, and accommodate storage and transfer of large amounts of data, such as bio-characteristic information, commensurate with speeds at which financial transactions are carried on today.

Turning now to the figures, the overall configuration of the invention and its components are shown in FIG. 1. Essentially a Data Processing Center (DPC) 1 is connected to various terminals 2 through various type of communication means 3 which can be one of several types. The DPC is also connected and communicates with independent computer networks 4. The DPC contains several data bases and software execution modules as shown in FIG. 2. In a preferred embodiment of the invention, the data bases are backed up or "mirrored" for safety reasons. The Firewall Machine 5 is responsible for prevention of electronic intrusion of the system while the Gateway Machine 6 is responsible for carrying out all requests from the user, including adding, deleting and otherwise modifying all data bases. The Gateway Machine is also responsible for decryption and de-packaging of data that has arrived from the terminals using the MACM module 7, MDM module 8, and the SNM module 9. The PGL module 10, and the IML module 11 are used to locate the proper personal identification code and biometrics sample basket. FIG. 3 depicts an example of a terminal and the biometrics input device 12, which has a biometrics scanner 13, data entry means such as a key pad or PIN pad 14, and a display panel 15. The biometrics scanner can be any one of finger print scanner, voice recognition, palm print scanner, retinal scanner or the like, although the fingerprint scanner will be used as an example. The biometrics input device is further equipped with computing modules 16, device drivers, and erasable and non-erasable memory modules. The biometrics input device communicates with the terminal through preferably a serial port 17. The terminal 2 communicates through a conventional modem 18 with the DPC 1 through request packets 19 and response packets 20 using one of the interconnecting means in FIG. 1 such as cable

network, cellular telephone networks, telephone networks, Internet, ATM network, or X.25. FIG. 4 shows a representational diagram of the request packet 19 and its method of generation by the biometrics input device software. FIG. 5 and FIG. 6 show a representational diagram of the request packet and response packet with optional and mandatory data segments. Furthermore, it is shown which parts of the packets are encrypted and which ones are sealed. FIG. 7 is a block diagram of the overall process for data encryption and sealing showing the use of DUKPT key data 20 for encryption of data before appending additional data before sealing the request packet with a Message Authentication Code Key (MAC) 21. FIG. 8 and FIG. 9 show the decryption and encryption process at the DPC. FIG. 12 through 19 and 21 through 22 are block diagrams of selected examples of execution steps carried on at the DPC.

Description of the drawings, diagrams, flow charts and the description of the invention, including hardware components, software components, execution modules, data bases, connection means, the data transferred between them, and the method of the invention is described in detail as follows.

## 1.1. Biometric Input Apparatus (BIA)

### 1.1.1. Introduction

The BIA is a combination of hardware and software whose job is to gather, encode, and encrypt biometric input for use in individual identification. All actions of the BIA are directed by an outside controlling entity called a terminal, which issues commands and receives results over the BIA's serial line.

BIA hardware comes in four basic versions: standard, wireless, integrated phone/cable television (or "CATV")/fax, and ATM. Each BIA hardware variant addresses a particular need in the marketplace, and because of the differences in construction, each variant has a different level of security.

BIA software comes in seven basic versions: personal computer (or "PC"), retail, ATM, registration, internal, issuer, and integrated remote. Each software load provides a different, use-specific command set. For

instance, the registration software load does not accept requests to form retail transaction messages. Likewise, the retail software command set cannot send individual registration messages. To provide another layer of security, the DPC knows what software package is loaded into each BIA; any attempts by an BIA to send a message that it is normally not able to send is rejected, and treated as a major security violation.

The ability of the invention to detect and combat merchant-based fraud relies on the fact that the BIA's external interface is strictly limited, that the construction of the BIA makes it extremely difficult to tamper with the contents, that each BIA has its unique encryption codes that are known only to the DPC, and that each BIA is only allowed to perform operations limited to its designated function. Each biometric input means has a hardware identification code previously registered with the DPC, which makes the biometric input means uniquely identifiable to the DPC in each subsequent transmission from that biometric input device.

The BIA is constructed with the assumption that the controlling terminal is a source for fraud and deception. Terminals range from software applications running on personal computers to dedicated hardware/software systems developed for a particular use such as a retail point of sale. Regardless of the particular model, no BIA reveals unencrypted biometric information. BIA models without display means (such as LCD, LED, or quartz screens) must reveal selected information (such as individual private codes) to the terminal for display, and as a result those particular terminal-BIA combinations are considered to be less secure.

Depending on the task at hand, BIA models are either partially or fully integrated with the terminal. Partially integrated devices are physically separate from the terminal, and they include wireless and standard retail point of sale BIAs. Fully integrated devices are contained within the physical enclosure of the terminal itself, for instance, an ATM, or a telephone.

No BIA ever discloses any secret encryption codes to any external source.

### 1.1.2. BIA Models

Particular BIA hardware models have different configurations. They are introduced in brief here:

#### BIA

Standard model has computing module (i.e., multichip modules), biometric scanner (i.e., single fingerprint scanner), display means (i.e., LCD screen), communications port (i.e., serial port), data entry means (i.e., a manual data entry key board or PIC pad) encased in tamper-resistant case, and electronic detection means (i.e., RF shielding).

#### BIA/Wireless

Standard model, but serial line replaced with spread-spectrum wireless communications module using external antenna. Used in restaurant point of sale.

#### BIA/ATM

Has heavy-duty scanner and serial port, along with a multichip module. The fact that the LCD is part of the terminal and not the BIA means lower security because it must reveal the private code to the terminal. Used in ATMs.

#### BIA/Catv

Has light-duty scanner, otherwise like ATM. Used in telephones, CATV remotes, and fax machines. Weakest security, both because the LCD and PIC pad are part of the terminal not the BIA, and because of the low-cost nature of the market.

### 1.1.3. BIA Command Set Messages

Each BIA software command set provides a different set of operations. They are introduced briefly here:

#### BIA/ATM

Account Access

**BIA/Catv**

Remote Transaction Authorization

**BIA/Fax**

Secure Fax Submit

Secure Fax Data

Secure Fax Tracking

Secure Fax Retrieve

Secure Fax Reject

Secure Fax Archive

Secure Fax Contract Accept

Secure Fax Contract Reject

Electronic Document Archive Retrieve

**BIA/Internal**

Individual Identification

**BIA/Issuer**

Issuer Batch

**BIA/PC**

Electronic Document Submit

Electronic Document Data

Electronic Document Tracking

Electronic Document Retrieve

Electronic Document Reject

Electronic Document Archive

Electronic Document Archive Retrieve

Electronic Signature Submission

Electronic Signature Check

Remote Transaction Authorization

Network Credential

Secured Connection

**BIA/Registration**

Individual Identification

Biometric Registration

5

**BIA/Retail**

Transaction Authorization

**1.1.4. BIA Hardware: Standard Model**

10

The Standard BIA hardware is a multichip module combined with a single-print scanner, an LCD screen, a serial port, and a PIC pad encased in a hard tamper-resistant case that makes attempts to penetrate obvious while also providing RF shielding for the contents.

15

The following components are amalgamated into a multichip module, called the BIA Multichip Module (a process for encapsulating several processors in one physical shell, well known in the industry), constructed to protect the communications pathways between the devices from easy wiretapping.

20

- Serial processor
- PIC pad processor
- LCD screen processor
- CCD scanner A/D processor
- High-speed DSP processor containing both flash and mask ROM
- General purpose microprocessor
- Standard RAM
- EEPROM

25

30

The following software packages and data are stored in mask ROM. Mask ROM is cheaper than other types of read only memory, but it is easily reverse engineered, and is not electronically erasable. As such we only place the noncritical commonly available code here. (Mask ROM is well known in the industry).

35

- MAC calculation library
- DUKPT Key Management library
- DES (with CBC) Encryption library
- Base-64 (8-bit to printable ASCII) converter library
- Public Key Encryption library
- Embedded Operating System
- Serial line device driver
- LCD device driver
- PIC pad device driver
- Scanner device driver
- Unique hardware identification code
- Multi-Language profiles

The following standard data and software packages are stored in flash ROM. Flash ROM is more expensive, but it is much more difficult to reverse engineer, and most importantly, it is electronically erasable. All of the more critical information is stored here. Flash ROM is used in an attempt to increase the difficulty of duplicating an BIA. (Flash ROM is well known in the industry).

- Unique DUKPT Future Key Table
- Unique 112-bit MAC Key
- DSP biometric quality determination algorithm
- DSP biometric encoding algorithm
- Random number generator algorithm
- Command function table

The message sequence number, incremented each time a message is sent from the BIA, is stored in the EEPROM. EEPROM can be erased many times, but is also nonvolatile — its contents remain valid across power interruptions. (EEPROM is well known in the industry).

The following data is stored in RAM. RAM is temporary in nature, and is lost whenever power is lost.

- Encoded Biometric Register
- PIC Register

- Account Index Code Register
- Title Index Code Register
- Amount Register
- Document Name Register
- 5     • PIC-Block Key
- Message Key
- Response Key
- Shared Session Key
- Private Session Key
- 10    • 8 General Registers
- stack and heap space

Each multichip module contains a "write-once" memory location that is irreversibly set following the initialization of the flash ROM. Whenever an attempt is made to download software to the flash ROM, this memory location is checked; if it is already been set, then the BIA refuses to load. This way, critical software and data keys may only be downloaded once into the device, at the time of manufacture.

All registers and keys are explicitly zeroed when a transaction is canceled. Once a transaction is completed, registers are cleared as well. Once a "form message" command is executed, biometric, PIC, and account index code registers are also cleared, along with any encryption keys that aren't required for subsequent use.

It is important that the software not keep copies of registers or keys in stack variables (known in the industry).

The following associated hardware components comprise the standard BIA hardware module.

- BIA Multichip module
- CCD single-print scanner
- capacitance detector plate (known in the industry)
- lighted PIC keypad
- 2-line 40-column LCD screen
- RF shielding
- tamper-resistant case

- serial connection (up to 57.6kb)
- breach detection hardware (known in the industry)
- optional thermite charge attached to Multichip module (known in the industry)

5  
10  
All temporary storage and internal hardware and software used to calculate these values are secured, which means they resist any attempts to determine their current values, or their means of functioning. This feature is essential for the security of the invention, just as it is critical that the "wiretapping" of an BIA and specifically the gathering of a Biometric-PIC Block for fraudulent means is made as difficult as possible.

The multichip module and the components are, where practical, physically connected to each other without exposed wiring being present.

15  
20  
The enclosure protecting the electronic components of the BIA is welded shut during manufacture; it cannot be opened under any circumstances without significant damage to the case. Upon detecting any opening (or damage) of the enclosure, the BIA performs an emergency electronic zero of any and all keys residing in flash ROM, followed by all of the software libraries. Specific breach detection methods are kept confidential and proprietary.

In addition to protecting the contents, the case also shields the internal operations from RF signal detectors.

25  
Supersecure versions of the BIA exist whereby breach detection methods are connected to a mechanism that physically destroys the multichip module as well as the detection methods themselves.

#### **1.1.5. BIA Hardware: Wireless Model**

30  
The Wireless version of BIA hardware is identical to the Standard model in construction, except that it exports a spread-spectrum wireless communications module using an external antenna instead of an external serial port.

This version is designed to be used in restaurants, where transactions are authorized at the customer's convenience.

In the following descriptions, items which are added to the standard set are signified by the + character, while items that are removed from the standard set are signified by the – character.

5

**Multichip Module:**

- Document Name Register
- Shared Session Key
- Private Session Key
- Message Key

10

**Components:**

- Serial port
- + External antenna
- + Spread-spectrum wireless serial module (known in the industry)

15

**1.1.6. BIA Hardware: ATM Model**

20

The ATM version of BIA hardware is a multichip module combined with a heavy-duty single-print scanner and a serial port. The components are encased in a tamper-resistant case that makes attempts to penetrate obvious while also providing RF shielding for the contents.

25

This version is designed to be retrofitted into ATM locations. As such, the scanner pad is a heavy-duty sensor pad, and the entire construction makes use of the existing screens and keypads present in the ATM itself.

30

In the following descriptions, items which are added to the standard set are signified by the + character, while items that are removed from the standard set are signified by the – character.

**Multichip Module:**

- Amount Register
- Document Name Register
- Shared Session Key
- Private Session Key
- Message Key

35

**Components:**

- lighted PIC keypad
- 2-line 40-column LCD screen

5 Note that since the ATM has no LCD screen or PIC keypad, it really has no need of those device drivers in the mask ROM.

**1.1.7. BIA Hardware: Phone/CATV Model**

10 The Phone/CATV version of BIA hardware is a multichip module combined with a single-print scanner and a serial port. The module is physically attached to the scanner, and the whole is encased in plastic in order to make tampering more difficult. Some amount of RF shielding is provided for the components.

15 This version is designed to be integrated with telephones, television remote controls, and fax machines. As a result, it makes use of the existing keypads and LCD or television screens to enter or display values. It also uses the communication facilities of the host terminal. For example, the fax machine uses the built-in fax modem and the television remote uses the CATV cable network.

20 This hardware model is (in comparison with other models) relatively insecure, as it is intended that these devices cost as little as possible, be lightweight, and integrate easily with existing low-cost devices.

25 Of course, higher-security versions with more complete enclosures are possible and encouraged.

In the following descriptions, items which are added to the standard set are signified by the + character, while items that are removed from the standard set are signified by the - character.

**Multichip Module:**

- Document Name Register
- Shared Session Key
- Private Session Key
- Message Key

**Components:**

- lighted PIC keypad
- 2-line 40-column LCD screen

5

**1.2. BIA Software****1.2.1. BIA Software Command Interface:**

10

The external interface to the BIA is much like a standard modem; commands are sent to it from a controlling terminal using the external serial line. When a command completes, a response code is sent from the BIA to the terminal.

15

Each BIA software load supports a different set of operations. For instance, a retail load supports only transaction authorizations, while a registration load supports individual identification and biometric registration.

20

All BIA data fields are in printable ASCII, with fields separated by field separator (or "fs") control character, and records separated by newlines. Encrypted fields are binary converted to 64-bit ASCII using the base-64 conversion library (all known in the industry).

Some commands are not available in some configurations. For instance, the ATM BIA cannot "Get PIC", since there is no attached PIC pad. Instead, the ATM BIA supports a "Set PIC" command.

25

**Response Codes:****Out of time:**

30

The time allotted for the command has expired. A message to that effect will be displayed on the LCD screen, if available. When time expires for a given command, the BIA acts as if the cancel button was pushed.

**Canceled:**

35

The "cancel" button has been pushed, and the entire operation has been canceled. This has the side effect of clearing all information

which was gathered. A message to that effect will be displayed on the LCD screen, if available.

**Ok:**

The command was successful.

**Other:**

Each command may have specific other response codes which are valid only for it. These response codes will generally have text accompanying the code, which will be displayed on the LCD screen if it is available.

**Message:**

This indicates that the command is ongoing, but that the BIA wants to send a message to the terminal with an interim result message. The result is also displayed on the LCD, if available. This facility is used for prompts, as well as status messages.

**Commands:**

In the argument list of the commands below, the <> characters surround individual arguments, [] characters surround optional arguments, and the | character indicates that a given argument may be comprised of one of the choices presented.

**Set Language <language-name>**

This command selects from one of a number of different languages encoded within the BIA for prompting for user input.

**Get Biometric <time> [primary|secondary]**

This command requests the BIA to activate its scanner to get biometric input from the individual, storing it into the Encoded Biometric Register.

First, the message "Please place finger on lighted panel" is displayed on the LCD panel and returned to the terminal. The scanner pad is illuminated, prompting the individual to enter his biometric.

A <time> value of zero means that there is no limit to the time for biometric scan input.

When in scanning mode, a fingerprint scan is taken and given a preliminary analysis by the print quality algorithm. If the scan is not good enough, the BIA continues to take new scans until <time> seconds pass. As time passes and snapshots of the print are taken and analyzed, messages are posted to the LCD screen and sent to the terminal based on the problems detected by the print quality software. If no print of appropriate quality is forthcoming, the BIA returns an error code of time expired, displaying a message to that effect on the LCD.

Once the print quality algorithm affirms the quality of the print scan, the print's minutiae are then extracted by the print encoding algorithm. Only a subset of the minutiae are selected at random, with care taken to retain enough sufficient for identification. These minutiae are then ordered randomly, and are placed in the Encoded Biometric Register. Then the BIA responds with the success result code.

If the [primary|secondary] is specified (only available in the biometric registration command set) then the entire minutiae set is selected, not just the smaller subset. Likewise, primary/secondary biometric selection ends up placing the encoded biometric into the appropriate register.

Whether or not the operation succeeds, as soon as scanning has terminated, the light indicating that scanning is in progress is turned off.

It is very important that the same biometric input yields different encodings, so as to complicate the task of anyone attempting to discover the encryption codes of a captured BIA. This is accomplished by the selection of a random subset and random ordering of the encoded biometric.

### **Get PIC <time>**

This command requests the BIA to fill the PIC Register by reading from the keypad.

First, the message "Please enter your PIC, then press <enter>" is displayed on the LCD display and sent to the terminal, the appropriate keypad lights are turned on, and then keypad scanning begins.

Scanning terminates when either <time> number of seconds runs out, or when the individual hits the "enter" key.

Note that the individual digits of the PIC are not displayed on the LCD panel, but for each digit the individual types, a star "\*" appears to give the individual feedback. When the "correction" key is pressed, the last digit entered is erased, allowing the individual to fix input mistakes.

When PIC input terminates, the keypad lights turns off.

If successful, the command returns OK.

#### Get Account Index Code <time>

First, the message "Now enter your account index code, then press <enter>" is displayed on the LCD and sent to the terminal. This prompts the individual to enter his account index code. When each key is pressed, that value appears on the LCD panel. The correction button can be pressed to erase one of the values. When the "enter" button is pressed, the Account index code register is set.

During input, the appropriate keypad keys are lit, and when input is concluded, the keypad lights are turned off.

If successful, the command returns OK.

#### Get Title Index Code <time>

First, the message "Please enter your title index code, then press <enter>" is displayed on the LCD and sent to the terminal. This prompts the individual to enter his title index code. When each key is pressed, that value appears on the LCD panel. The correction button can be pressed to erase one of the values. When the "enter" button is pressed, the Title Index Code register is set.

During input, the appropriate keypad keys are lit, and when input is concluded, the keypad lights are turned off.

If successful, the command returns OK.

#### Validate Amount <amount> <time>

The Validate Amount command sends the message "Amount <amount> OK?" to the terminal, and displays it on the LCD screen. If the individual confirms the amount by hitting the "yes" (or enter) button, the Amount Register is set to <amount>. The <amount> value must be a valid number,

with no control characters or spaces, etc. During prompting, the yes, no, and cancel buttons are lit. Once prompting is complete, all the lights are turned off.

If the individual enters "no", then the transaction is canceled.

5

#### **Enter Amount <time>**

The Enter Amount command sends the message "Enter amount" to the terminal, and also displays it on the LCD screen as well. The individual must then enter the dollar amount himself. Each character entered is displayed on the LCD screen. All appropriate buttons are lit. If the enter button is hit, the Amount Register is set to be the value entered on the keyboard. Once entry is complete, all the lights are turned off.

10

#### **Validate Document <name> <time>**

The Validate Document command sends the message "Document <name> OK?" to the terminal, and displays it on the LCD screen as well. If the individual confirms the document by hitting the "yes" (or enter) button, the Document Name Register is set to <name>. The <name> must be printable ASCII, with no control characters, and no leading or trailing spaces. During prompting, the yes, no, and cancel buttons are lit. Once prompting is complete, all the lights are turned off.

15

20

If the individual enters "no", the transaction is canceled.

#### **Assign Register <register> <text>**

The assign register command sets the designated General <register> to have the value <text>. This is used to set information such as the merchant code, the product information, and so on.

25

#### **Get Message Key**

The Get Message Key command causes the BIA to generate a 56-bit random key to be used by the controlling hardware to encrypt any message body that the controlling device wishes to add to the message. That generated key is returned by the BIA in hexadecimal format (known in the industry). The message key are then added to the biometric-PIC block.

30

35

**Form Message <type=identification|transaction|account access...>**

The form message command instructs the BIA to output a message containing all the information it has gathered. It also checks to make sure that all the registers appropriate to that specific message <type> have been set. If all required registers are not set, the BIA returns with an error. The specific command set software will determine which messages can be formed by that BIA model; all others will be rejected.

Each message includes a transmission code consisting of the BIA's unique hardware identification code and an incrementing sequence number. The transmission code allows the DPC to identify the sending BIA and to detect resubmission attacks.

The BIA uses the DUKPT key management system to select the biometric-PIC block encryption 56-bit DES key from the Future Key Table. This key is then used to encrypt the Biometric-PIC Block using cipher block chaining (CBC). In addition, a response DES key is also generated randomly, and is used by the DPC to encrypt the portions of the response that need to be encrypted.

Note: splitting the response key from the biometric-PIC block key is very important, since each encryption key must be used only within the context of its own responsibilities. That way, if someone were to break the key encoding the private code, it would not result in the disclosure of the biometric-PIC.

The Biometric-PIC block consists of the following fields:

- 300-byte authorization biometric
- 4-12 digit PIC
- 56-bit response key
- [optional 56-bit message key]

Note that the message key is only present if the controlling terminal has requested a message key for this message. It is up to the controlling terminal to encrypt any message body attached to the transaction authorization request using the message key.

Once all encryption is complete, the BIA outputs the body of the appropriate request message (such as a Transaction Authorization

Request message), terminated by and protected with the Message Authentication Code (MAC).

5 The MAC field is calculated using the BIA's secret 112-bit DES MAC key, and covers all message fields from first to last. The MAC assures the DPC that nothing in the message has changed effectively sealing the message, while still allowing the plaintext fields to be inspected by the controlling terminal.

10 When the Form Message command is done, the BIA sends the message "I'm talking to DPC Central" to the terminal as well as displaying it on the LCD screen, indicating that work is proceeding on the request.

The command returns OK in addition to returning the entire formed message upon completion of the command.

#### **Show Response <encrypted response> <time>**

15 The Show Response command instructs the BIA to use its current Response Key to decrypt the private code from the system.

20 After decryption, a chime sounds, and the private code is displayed on the LCD screen for <time> seconds. At no time does this command transmit the decrypted private code to the controlling terminal.

#### **Validate Private <encrypted validation> <time>**

25 This command is used by a terminal during a secure network communications session to ask the individual to validate a message from an outside source. The message comes encrypted and in two parts: the challenge, and the response.

30 Upon receipt of a Validate Private command, the BIA displays the text of the challenge message as in "OK <challenge>?" on the LCD screen, but does not send this to the terminal. When the individual validates the challenge, the response is encrypted by the BIA using the Private Session Key, and then returned to the terminal along with the OK response code. If the individual does not validate the challenge, then the BIA returns with a "failed" response code, along with the text "transaction canceled at your request," which is also displayed on the LCD screen.

35 Note that the terminal is never allowed to see the plaintext of either the challenge or the response.

**Reset**

The Reset command instructs the BIA to clear all temporary registers, the LCD screen, all temporary Key registers, and to turn off all keypad lights that may be on.

5

**Set PIC <value>**

This command assigns the BIA's PIC Register to be <value>.

Note that allowing a non-secured device to provide the PIC is a potential security problem, because non-secured devices are much more vulnerable to wiretapping or replacement.

10

**Set Account index code <value>**

This command assigns the BIA's Account index code Register to be <value>.

15

Note that allowing a non-secured device to provide the account index code is a potential security problem, because non-secured devices are much more vulnerable to wiretapping or replacement.

20

**Set Title Index Code <value>**

This command assigns the BIA's Title Index Code Register to be <value>.

Note that allowing a non-secured device to provide the Title Index Code is a potential security problem, because non-secured devices are much more vulnerable to wiretapping or replacement.

25

**Set Amount <value>**

This command assigns the BIA's Amount Register to be <value>.

30

**Decrypt Response <encrypted response message>**

The Decrypt Response command instructs the BIA to use its current Response Key to decrypt the encrypted portion of the response message. Once decrypted, the response is returned to the controlling device, presumably for display on the ATM terminal's LED screen.

35

Note that providing this decryption ability is a security problem, as once the plaintext leaves the BIA, the terminal has the ability to do with it what it will.

### 1.2.2. BIA Software: Support Libraries

The BIA software is supported by several different software libraries. Some of them are standard, generally available libraries, but some have special requirements in the context of the BIA.

#### 1.2.2.1. Random Number Generator

Since the BIA is constantly selecting random DES keys for use in the message body and message response encryption, it is important that the keys selected be unpredictable keys. If the random number generator is based on time of day, or on some other externally-predictable mechanism, then the encryption keys will be much more easily guessed by an adversary that happens to know the algorithm. In order to assure the security of the encryption techniques used in the BIA, it is assumed that both the random number generator algorithm as well as the encryption algorithms are both publicly known.

A standard random number algorithm for generating DES keys is defined in ANSI X9.17, appendix C (known in the industry).

#### 1.2.2.2. DSP Biometric Encoding Algorithms

The biometric encoding algorithm is a proprietary algorithm for locating the minutiae that are formed by ridge endings and bifurcations on human fingertips. A complete list of minutiae is stored in the DPC as a reference, while only a partial list is required by the algorithm when performing a comparison between an identification candidate and a registered individual.

During both biometric registration as well as identification, the encoding algorithm ensures that enough minutiae are found before ending the biometric input step.

### 1.2.2.3. Operating System and Device Drivers

5 The BIA is a realtime computing environment, and as such requires a realtime embedded operating system to run it. The operating system is responsible for taking interrupts from devices and scheduling tasks.

10 Each device driver is responsible for the interface between the operating system and the specific hardware, such as the PIC pad device driver, or the CCD Scanner device driver. Hardware is the source for events such as "PIC pad key pressed", or "CCD Scanner scan complete". The device driver handles such interrupts, interprets the events, and then takes action on the events.

### 1.2.2.4. DES Encryption Library

15 There are any number of DES implementations publicly available. DES implementations provide a secret key-based encryption from plaintext to ciphertext, and decryption from ciphertext to plaintext, using 56-bit secret keys.

### 1.2.2.5. Public Key Encryption Library

20 Public Key encryption support libraries are available from Public Key Partners, holders of the RSA public key patent (known in the industry). Public Key cryptosystems are asymmetric encryption systems that allow communication to take place without requiring a costly exchange of secret keys. To use a public key encryption system, a public key is used to encrypt a DES key, and then the DES key is used to encrypt a message. The BIA uses public key cryptosystems to provide for the secure exchange of secret keys.

25 Unfortunately, public key systems are significantly less well tested than secret-key systems, and as such there is an overall lower level of confidence in such algorithms. As a result, the invention uses public key cryptography for communications security and short-lived credential exchange, and not long-term storage of secrets. Both the end-user individual and the bank are identified by the DPC to create the network

credential. The network credential includes the end-user individual's identification as well as the context of the connection (i.e., the TCP/IP source and destination ports).

#### 5                   1.2.2.6. DUKPT Key Management Library

10                   The derived unique key per transaction key (DUKPT) management library is used to create future DES keys given an initial key and a message sequence number. Future keys are stored in a Future Key Table. Once used, a given key is cleared from the table. Initial keys are only used to generate the initial future key table. Therefore the initial key is not stored by the BIA

15                   The use of DUKPT is designed to create a key management mechanism that provided a different DES key for each transaction, without leaving behind the trace of the initial key. The implications of this are that even successful capture and dissection of a given future key table does not reveal messages that were previously sent, a very important goal when the effective lifetime of the information transmitted is decades. DUKPT is fully specified in ANSI X9.24 (known in the industry).

20                   DUKPT was originally developed to support PIC encryption mechanisms for debit card transactions. In this environment, it was critical to protect all transactions. An assumption is made that a criminal records encrypted transactions for a six month period, and then captures and successfully extracts the encryption code from the PIC pad. The criminal could then manufacture one new counterfeit debit card for each message that had been transmitted over that six month period. Under DUKPT, however, the criminal's theft and dissection would not allow him to decrypt previous messages (although new messages would still be decryptable if the criminal were to replace the PIC pad subsequent to dissection).

30                   In the biometric-PIC situation, the criminal has an even harder time, as even if messages are decrypted, turning a digital biometric-PIC into a physical fingerprint is much harder than turning an account number-PIC into a plastic card, which is one of the significant benefits of the tokenless system.

35                   Still, if a criminal can decrypt, he can encrypt, which might allow him to electronically submit a biometric-PIC to the system to

authorize a fraudulent transaction. While this is quite difficult, it is still best to restrict the options available to the criminal as much as possible, hence the use of DUKPT.

### 1.3. BIA Software Command Sets

#### 1.3.1. BIA Software: Retail Command Set

The BIA/Retail software interface exports an interface that allows specific retail point of sale terminals to interact with the system.

The BIA/Retail interface is designed to allow the terminal to perform the following operation:

##### Transaction Authorization

In order to implement those operations, the BIA/Retail provides the following command set:

Set Language <language-name>  
 Get Biometric <time>  
 Get PIC <time>  
 Assign Register <register> <value>  
 Get Account index code <time>  
 Validate Amount <amount> <time>  
 Enter Amount <time>  
 Form Message <type>  
 Show Response <encrypted response> <time>  
 Reset

#### 1.3.2. BIA Software: CATV (Integrated Remote) Command Set

The BIA/CATV software interface exports a command set that allows terminals integrated with a Phone/CATV BIAs to interact with the system. The following operation is supported:

##### Remote Transaction Authorization

In order to implement that operation, the BIA/CATV provides the following command set:

5                   Get Biometric <time>  
                   Set PIC <text>  
                   Assign Register <register> <text>  
                   Set Account index code <text>  
                   Form Message <type>  
 10                  Decrypt Response <encrypted response message>  
                   Reset

### 1.3.3. BIA Software: Integrated FAX Command Set

15                   The BIA/Fax software interface exports a command set that allows terminals integrated with a fax BIA to interact with the system. The following operations are supported:

20                   Secure Fax Submit  
                   Secure Fax Data  
                   Secure Fax Tracking  
                   Secure Fax Retrieve  
                   Secure Fax Reject  
                   Secure Fax Archive  
 25                   Secure Fax Contract Accept  
                   Secure Fax Contract Reject  
                   Electronic Document Archive Retrieve

30                   In order to implement these operations, the BIA/Fax provides the following command set:

35                   Get Biometric <time>  
                   Set PIC <text>  
                   Set Title Index Code <text>  
                   Assign Register <register> <value>  
                   Get Message Key

Form Message <type>  
 Decrypt Response <encrypted response message>  
 Reset

#### 1.3.4. BIA Software: Registration Command Set

The BIA/Reg software interface exports an interface that allows general purpose computers to interact with the system to identify and register individuals. The following operations are supported:

Individual Identification  
 Biometric Registration

In order to support those operations, the BIA/Reg provides the following command set:

Set Language <language-name>  
 Get Biometric <time> [primary|secondary]  
 Get PIC <time>  
 Assign Register <register> <text>  
 Get Message Key  
 Form Message <type>  
 Show Response <encrypted response> <time>  
 Reset

#### 1.3.5. BIA Software: PC Command Set

The BIA/PC software interface exports a command set that allows general purpose computers to send, receive, and sign electronic documents, conduct transactions across the network, and provide biometric-derived credentials to sites on the network. The following operations are supported:

Electronic Document Submit  
 Electronic Document Data  
 Electronic Document Tracking

Electronic Document Retrieve  
 Electronic Document Reject  
 Electronic Document Archive  
 Electronic Document Archive Retrieve  
 Electronic Signature Submission  
 Electronic Signature Check  
 Remote Transaction Authorization  
 Network Credential  
 Secured Connection

In order to support those operations, the BIA/PC provides the following command set:

Set Language <language-name>  
 Get Biometric <time>  
 Get PIC <time>  
 Get Account index code <time>  
 Validate Amount <amount> <time>  
 Enter Amount <time>  
 Validate Document <name> <time>  
 Assign Register <register> <text>  
 Get Message Key  
 Form Message <type>  
 Show Response <encrypted response> <time>  
 Validate Private <encrypted validation> <time>  
 Reset

### 1.3.6. BIA Software: Issuer Command Set

The BIA/Iss software interface exports an interface that allows general purpose computers to interact with the system to authenticate and submit batch change requests. The following operation is supported:

Issuer Batch

In order to implement this operation, the BIA/Iss provides the following command set:

5           Set Language <language-name>  
           Get Biometric <time> [primary|secondary]  
           Get PIC <time>  
           Assign Register <register> <value>  
           Get Message Key  
 10          Form Message <type>  
           Show Response <encrypted response> <time>  
           Reset

### 1.3.7. BIA Software: Internal Command Set

15           The BIA/Int exports a command set that allows general purpose computers to interact with the system to identify individuals. The following operation is supported:

#### Individual Identification

20           In order to implement this operation, the BIA/Int provides the following command set:

25           Set Language <language-name>  
           Get Biometric <time>  
           Get PIC <time>  
           Assign Register <register> <value>  
           Get Message Key  
           Form Message <type>  
 30          Show Response <encrypted response> <time>  
           Reset

### 1.3.8. BIA Software: ATM Command Set

35           The BIA/ATM software interface exports a command set that allows ATMs to identify individuals. The following operation is supported:

## Account Access

5 In order to implement this operation, the BIA/ATM provides  
the following command set:

Get Biometric <time>  
Set PIC <text>  
Set Account index code <text>  
10 Assign Register <register> <value>  
Form Message <type>  
Decrypt Response <encrypted response message>  
Reset

## 15 1.4. Terminals

### 1.4.1. Introduction

20 The terminal is the device that controls the BIA and connects to  
the DPC via modem, X.25 connection, or Internet connection — methods  
well-known to the industry. Terminals come in different shapes and sizes,  
and require different versions of the BIA to perform their tasks. Any  
electronic device, which issues commands to and receives results from the  
biometric input device, can be a terminal.

25 Some terminals are application programs that run on a general  
purpose microcomputer, while other terminals are combinations of special  
purpose hardware and software.

30 While the terminal is critical for the functioning of the system as  
a whole, the system itself places no trust in the terminal whatsoever.  
Whenever a terminal provides information to the system, the system always  
validates it in some manner, either through presentation to the individual  
for confirmation, or by cross-checking through other previously registered  
information.

35 While terminals are able to read some parts of BIA messages in  
order to validate that the data was processed properly by the BIA,

terminals cannot read biometric identification information including the biometric, the PIC, encryption keys, or account index codes.

5 Specific BIAs export some security functionality to the terminal, such as PIC entry, and private code display. As a result, such devices are regarded as somewhat less secure than their entirely self-contained counterparts, and as such have consequently lower security ratings.

10 There are many different terminal types; each is connected to a specific model BIA. Each terminal is described in brief below:

**ATM (Automated Teller Machinery)**

Integrated BIA/ATM with ATM software load provides biometric-PIC access to ATM cash dispensers.

15 **BRT (Biometric Registration Terminal)**

Standard BIA with Registration software load attached to a microcomputer provides banks with the ability to register new individuals with the system along with their financial asset accounts and other personal information.

20 **CET (Certified Email Terminal)**

Standard BIA with PC software load attached to a microcomputer provides individuals with the ability send, receive, archive, reject, and track certified email messages.

25 **CPT (Cable-TV Point of Sale Terminal)**

BIA/catv with CATV software load attached to the CATV broadband provides individuals with biometric-television (or "TV") remotes with the ability to authorize television shopping purchases.

30 **CST (Customer Service Terminal)**

Standard BIA with Internal software load attached to a microcomputer system authorizes employees to construct database requests for the purposes of customer service.

**EST (Electronic Signature Terminal)**

Standard BIA with personal computer software load attached to a microcomputer provides individuals with the ability to construct and verify electronic signatures on documents.

5

**IPT (Internet Point of Sale Terminal)**

Standard BIA with personal computer software load attached to a microcomputer provides individuals with internet connections the ability to purchase products from a merchant that is connected to the Internet.

10

**IT (Issuer Terminal)**

Standard BIA with Issuer software load attached to a microcomputer provides banks with the ability to send batched changes of asset accounts to the DPC.

15

**ITT (Internet Teller Terminal)**

Standard BIA with personal computer software load attached to a microcomputer with an internet connection provides individuals with the ability to perform transactions with their favorite Internet Bank.

20

**PPT (Phone Point of Sale Terminal)**

BIA/catv with CATV software load integrated with a telephone provides individuals with the ability to authorize transactions over the telephone.

25

**RPT (Retail Point of Sale Terminal)**

Standard BIA with Retail software load attached to an X.25 network or using a modem allows an individual to purchase items using transaction authorizations in a store.

30

**SFT (Secure Fax Terminal)**

BIA/catv with Fax software load integrated with a fax machine provides individuals with the ability to send, receive, reject archive, and track secured fax messages.

35

## 1.4.2. Terminal: Retail Point of Sale Terminal

### 1.4.2.1. Purpose

5           The purpose of the RPT is to allow individuals to purchase items at a store without having to use either cash, check, or a debit or credit card.

10           The RPT uses a BIA/Retail to authorize financial transactions from an individual to a merchant. In addition to being used to accept biometric-PIC authorizations, the RPT provides standard debit and credit card scanning functions as well.

15           Note that only the biometric-related transactions are described in detail here. It is assumed that the RPT will also consist of standard credit and debit magnetic stripe card readers, as well as optional smart card readers too.

### 1.4.2.2. Construction

20           Each RPT is connected to the DPC by a modem, an X.25 network connection, an ISDN connection, or similar mechanism. The RPT may also be connected to other devices, such as an electronic cash register, from which it obtains the amount of the transaction and the merchant code.

25           The RPT consists of:

- an BIA/Retail
  - an inexpensive microprocessor
  - 9.6 kb modem/X.25 network interface hardware
  - merchant identification code number in non-volatile RAM
  - a DTC serial port for connecting to the BIA
  - magnetic stripe card reader (known in the industry)
  - ECR (electronic cash register) connection port
  - optional smart card reader (known in the industry)
- 30

### 1.4.2.3. Identification

Two entities need to be identified for the DPC to respond positively to an BIA transaction authorization request: the individual, and the merchant.

The individual is identified by the biometric-PIC, and the merchant is identified by the DPC, which cross-checks the merchant code contained in the BIA's VAD record with the merchant code added to the transaction request by the RPT.

### 1.4.2.4. Operation

First, the merchant enters the value of the transaction into his electronic cash register. Then, the individual enters his biometric-PIC, his account index code, and then validates the amount. The RPT then adds the product information and the merchant code to the BIA, instructs the BIA to construct the transaction, and then sends the transaction to the DPC through its network connection (modem, X.25, etc).

When the DPC receives this message, it validates the biometric-PIC, obtains the account number using the index code, and cross-checks the merchant code in the message with the registered owner of the BIA. If everything checks out, the DPC forms and sends a credit/debit transaction to execute the exchange. The response from the credit/debit network is added to the private code to form the transaction response message, which the DPC then sends back to the RPT. The RPT examines the response to see whether or not the authorization succeeded, and then forwards the response to the BIA, which then displays the individual's private code, concluding the transaction.

### 1.4.2.5. Security

Messages between the RPT and the DPC are secured by encryption and MAC calculation from the BIA. The MAC allows the RPT to review the unencrypted parts of the message, but the RPT cannot change them. Encryption prevents the encrypted part of the message from being disclosed to the RPT.

Each retail BIA must be registered to a merchant. This helps to discourage BIA theft. Furthermore, because the RPT adds the merchant code onto each message, replacing a merchant's BIA with a different BIA is detected by the cross-check performed at the DPC.

### **1.4.3. Terminal: Internet Point of Sale Terminal**

#### **1.4.3.1. Purpose**

The purpose of an Internet Point of sale Terminal (IPT) is to authorize credit and debit financial transactions from an individual at a computer to a merchant, both of whom are on the Internet.

Note that the Internet simply represents a general purpose network where a merchant, the DPC, and the IPT can all connect to each other in real time. As a result, this mechanism would work exactly the same on any other general purpose network.

#### **1.4.3.2. Construction**

The IPT consists of:

- an BIA/PC
- a microcomputer
- an Internet Shopper software application
- an Internet (or other network) connection

#### **1.4.3.3. Identification**

In addition to identifying the individual, the IPT must also identify the remote merchant who is the counterparty to the transaction. The merchant must also identify both the DPC and the IPT.

The Internet Shopper program stores the hostname (or other form of net name) of the merchant from which the purchase is taking place in order to verify the merchant's identity. Since the merchant registers all of his legitimate internet hosts with the DPC, this allows the DPC to cross-check the merchant code with the merchant code stored under that hostname to verify the merchant's identity.

#### 1.4.3.4. Operation

First, the IPT connects to the merchant using the Internet.

5 Once a connection is established, the IPT secures it by generating and then sending a Session Key to the merchant. In order to assure that the session key is protected from disclosure, it is encrypted with the merchant's Public Key using Public Key Encryption. When the merchant receives this  
10 encrypted Session Key, he decrypts it using his Private Key. This process is called securing a connection through a Public Key Encrypted secret key exchange.

Once connected, the IPT downloads the merchant code, and both price and product information from the merchant. Once the individual is ready to make a purchase, he selects the merchandise he wishes to buy.  
15 Then, the individual enters the biometric-PIC using the BIA/PC, the IPT sends the merchant code, the product identification information, and the amount to the BIA, and instructs it to construct a Remote Transaction Authorization request. Then the IPT sends the request to the merchant via the secure channel.

20 The merchant is connected to the DPC via the same sort of secure connection that the IPT has with the merchant, namely, using Public Key Encryption to send a secure session key. Unlike the IPT-merchant connection, however, merchant-DPC session keys are good for an entire day, not for just one connection.

25 The merchant connects to the DPC, securing the connection using the session key, forwarding the transaction to the DPC for validation. The DPC validates the biometric-PIC, cross-checks the merchant code contained in the request with the merchant code stored under the hostname that was sent in the request, and then sends a transaction to the credit/debit  
30 network. Once the credit/debit network responds, the DPC constructs a reply message including the credit/debit authorization, an encrypted private code, and the address of the individual, and sends that message back to the merchant.

35 Once the merchant receives the reply, it copies the individual's mailing address out of the reply, makes note of the authorization code, and forwards the reply message to the IPT.

The IPT hands the reply to the BIA, which decrypts the private code and displays it on the LCD screen, indicating that the DPC recognized the individual. The IPT also shows the result of the transaction as well, be it success or failure.

#### 1.4.3.5. Security

Since the system in general assumes that an adversary inhabiting the network can hijack network connections at any point, all parties must have secure communications during their realtime interactions. The main concern isn't disclosure of information, but rather insertion or redirection of messages.

The whole system of Public Key Encryption relies on having a trusted source for the Public Keys. These trusted sources are called Certifying Authorities, and we assume that such a source will be available on the Internet in the near future.

#### 1.4.4. Terminal: Internet Teller Terminal

##### 1.4.4.1. Purpose

The Internet Teller Terminal (ITT) is used to identify individuals for internet banking sessions. The DPC, the bank's computer system, and the individual are all connected to the Internet.

There are two main tasks. The first is providing a secure communications channel from the ITT to an internet bank. The second is providing unimpeachable identity credentials to the internet bank. Once both are accomplished, the ITT can provide a secure internet banking session. In addition, the BIA's challenge-response verification capability is used to provide additional security for all high-value and/or irregular transactions.

#### 1.4.4.2. Construction

The ITT consists of:

- an BIA (standard PC model)
- a microcomputer
- an Internet Teller software application
- an Internet connection

The ITT accepts biometric identification using an BIA/PC connected to the microcomputer serving as the individual's Internet terminal.

#### 1.4.4.3. Identification

Both the individual and the bank are identified by the DPC to create the network credential. The network credential includes the individual's identification as well as the context of the connection (i.e., the TCP/IP source and destination ports).

The DPC identifies the bank by cross-checking the code that the bank sends to the ITT with the bank's hostname that the ITT sends to the DPC.

#### 1.4.4.4. Operation

First, the ITT connects to the internet bank, making sure that the bank has the computing resources required to handle a new session for the individual. If the bank has sufficient resources, it sends back the bank identification code to the ITT.

Once connected, the ITT instructs the BIA to obtain the biometric-PIC and the account index code from the individual. Then the ITT adds both the bank's hostname as well as the bank code. Using all this information, the BIA is then asked to form a network credential request message which the ITT sends to the DPC via the Internet.

When the DPC receives this message, it validates the biometric-PIC, obtains the account number using the index code, and makes sure that the bank code from the message matches the bank code stored under the

5 bank's hostname in the Remote Merchant database. The DPC also checks to make sure that the account number returned by the index code belongs to the bank as well. If all checks out, then the DPC creates a network credential using the individual's account identification, the time of day, and the bank code. The DPC signs this credential using Public Key Encryption and the DPC's Private Key. The DPC retrieves the bank's public key, and the individual's private code, and with the credential forms the network credential response message. The response message is encrypted using the BIA response key, and is then sent back to the ITT.

10 When the ITT receives the response, it hands the response message to the BIA. The BIA decrypts and then displays the individual's private code on the LCD screen. The bank's public key is stored in the Public Key register. Two random session keys are generated by the BIA. The first key, called the Shared Session Key, is revealed in plaintext to the ITT. The ITT uses this shared session key to secure the connection with the bank.

15 The other session key, called the Private Session Key, is not shared with the ITT. It is used for the BIA's challenge-response mechanism, a mechanism that allows the bank to obtain specific validation for non-routine transactions straight from the individual, without involving the (untrustworthy) ITT.

20 After receiving the Shared Session Key, the ITT asks the BIA to form a Secure Connection Request message, which includes both session keys and the network credential, and are all encrypted with the bank's public key. The ITT then sends the Secure Connection Request message to the bank.

25 When the bank receives the request message, it decrypts the message using its own Private Key. Then, it decrypts the actual network credential using the DPC's public key. If the network credential is valid and has not expired (a credential times out after a certain number of minutes), the individual is authorized, and the conversation continues, with the session key used to ensure security.

30 Whenever the individual performs any non-routine or high-value transactions, the bank may wish to ask the individual to validate those transactions for extra security. To do so, the bank sends a challenge-response message encrypted with the Private Session Key to the

35

5 ITT, which forwards that challenge-response message to the BIA. The BIA decrypts the message, displays the challenge (usually of the form "Transfer of \$2031.23 to Rick Adams OK?"), and when the individual validates by hitting the OK button, the BIA re-encrypts the response with the Private Session Key and sends that message to the ITT, which forwards it to the bank, validating the transaction.

#### 1.4.4.5. Security

10 The system makes use of public key cryptography to both provide credentials and to secure communications between the ITT and the bank.

15 For this mechanism to function properly, the bank must know the DPC's public key, and the DPC must know the bank's public key. It is critical to the security of the system that both parties keep the respective public keys secure from unauthorized modification. Note that public keys are readable by anyone, they just cannot be modifiable by anyone. Of course, any session or secret keys must be kept secure from observation, and those secret keys must be destroyed after the session has ended.

20 The extra validation step for non-routine transactions is necessary because of the relative difficulty involved in securing personal computer applications on the Internet due to viruses, hackers, and individual ignorance. Banks should probably restrict routine money transfers available to ITT's to include only money transfers to well-known institutions, such as utility companies, major credit card vendors, and so on.

#### 1.4.5. Terminal: Electronic Signature

##### 1.4.5.1. Purpose

30 The electronic signature terminal (EST) is used by individuals to generate electronic signatures that cannot be forged for electronic documents. The EST either allows individuals to sign electronic documents, or verifies electronic signatures already on such documents.

#### 1.4.5.2. Construction

The EST consists of:

- an BIA/PC
- a microcomputer
- a message digest encoder algorithm
- a modem, an X.25 connection, or an Internet connection
- an electronic signature software application

The EST uses an BIA/PC attached to a microcomputer, with events controlled by an electronic signature software application.

#### 1.4.5.3. Identification

To create a digital signature without using some sort of public/private keyed token, three things need to be done. First, the document to be signed needs to be uniquely identified, the time of day needs to be recorded, and the individual performing the signature needs to be identified. This links the document, the individual, and the time, creating a unique time stamped electronic signature.

#### 1.4.5.4. Operation

First the document to be signed is processed by a message digest encoding algorithm that generates a message digest code. One such algorithm is the MD5 algorithm by RSA, which is well known in the industry. By their nature, message digest algorithms are specifically designed so that it is almost impossible to come up with another document that generates the same message digest code.

Then, the individual enters his biometric-PIC using the BIA, the message digest code is handed to the BIA, the name of the document is added, and the resulting Digital Signature request message is sent to the DPC for authorization and storage.

When the DPC receives the request, it performs a biometric identity check, and once the individual is verified, it collects the message digest encoding, the individual's biometric account number, the current

5 time of day, the name of the document, and the identification of the BIA that gathered the signature, and stores them all in the Electronic Signatures Database (ESD). The DPC then constructs a signature code text string that consists of the ESD record number, the date, the time, and the name of the signer, and sends this signature code along with the individual's private code back to the EST.

10 To check an electronic signature, the document is sent through the MD5 algorithm (known in the industry), and the resulting value together with the electronic signature codes are given to the BIA along with the requesting individual's biometric-PIC, and the message is sent to the DPC. The DPC checks each signature for validity, and responds as appropriate.

#### 15 **1.4.5.5. Security**

The BIA doesn't encrypt any of the data relating to electronic signatures, so document titles along with specific MD5 values are sent in plaintext. The same situation holds true for signature validations.

20 Thus while signatures cannot be forged, some of the details (including document names) are vulnerable to interception.

#### **1.4.6. Terminal: Certified Email Terminal**

##### 25 **1.4.6.1. Purpose**

The purpose of the Certified Email Terminal (CET) is to provide individuals a way of delivering electronic messages to other individuals in the system while providing for identification of sender, verification of both receipt and recipient, and assuring confidentiality of message delivery.

30 The CET uses a BIA/PC to identify both the sender and the recipient. Security is established by encrypting the message, and then by encrypting the message key using the sender's BIA during the upload, and then decrypting the message key using the recipient's BIA during the download.

#### 1.4.6.2. Construction

Both the transmitter and the recipient CET consists of:

- a BIA
- a microcomputer
- a modem, an X.25 connection, or an Internet connection
- the ability to receive email
- a certified electronic mail application

A CET is actually a microcomputer with an electronic mail application and a network connection which invokes the BIA to generate biometric-PIC authorizations to send and receive certified electronic mail.

#### 1.4.6.3. Identification

In order to guarantee delivery of the message, both sender and recipients must be identified.

The sender identifies himself using his biometric-PIC when he uploads the message to the DPC. Each recipient the sender wishes to send the document to is identified either by biometric account identification number, or by fax number, and extension. In order for a recipient to download the message, he identifies himself using his biometric-PIC. This procedure resembles a person-to-person telephone call.

#### 1.4.6.4. Operation

Message delivery starts with an individual uploading a document or message, and identifying himself using his biometric-PIC. The individual then verifies the name of the document, and the email message is encrypted and uploaded.

Once a message is uploaded, the sender receives a message identification code that can be used to request the current delivery status of the document to each of the recipients.

The DPC sends an electronic mail message to each recipient, notifying them when a certified message has arrived.

Once the recipient receives the notification, the recipient may at his leisure either choose to accept or refuse that message or a group of messages by submitting his biometric-PIC and having it validated by the DPC.

5 Once successfully transmitted to all recipients, a document is removed after a predetermined period, generally 24 hours. Individuals wishing to archive the document, along with an indication of all of the individuals to whom the message was sent may submit message archival requests prior to the deletion of the message.

#### 10 **1.4.6.5. Security**

In order to effect the secure aspect of the transmission, the document is protected from disclosure en route. The CET accomplishes this using the 56-bit Message Key generated by the BIA. Since the BIA takes responsibility for encrypting the Message Key as part of the biometric-PIC, the encryption key is securely sent to the DPC.

15 When an individual downloads the message, the message key is sent encrypted along with the private code, to allow the recipient to decrypt the message. Note that it is fine to have all recipients have this message key, as they all receive the same message.

20 As with the ITT, individuals must take care to secure their CET application software from surreptitious modification, as a modified CET can send any document it wishes to once the individual validates the document name.

#### 25 **1.4.7. Terminal: Secure Fax Terminal**

##### 30 **1.4.7.1. Purpose**

The purpose of the secure fax terminal (SFT) is to provide individuals a way of delivering fax messages to other individuals in the system while providing for identification of sender, verification of both receipt and recipient, and assuring confidentiality of message delivery.

Each SFT uses an integrated BIA/catv to identify both the sender and the recipient. Communications security is accomplished through encryption.

#### 1.4.7.2. Construction

Both the transmitter and the recipient SFT consists of:

- an BIA/catv
- a fax machine
- optional ISDN modem

A SFT is a fax machine connected to the DPC via a modem. The system treats faxes as just another type of certified electronic mail.

#### 1.4.7.3. Identification

There are several different levels of security for secure faxes, but in the most secure version, the identity of the sender and all recipients is verified.

The sender identifies himself using his biometric-PIC and title index code when he sends his message to the DPC. To pick up the fax, each recipient listed identifies himself, again using biometric-PIC and title index code.

In addition, the receiving site is identified by phone number. This phone number is registered with the DPC. For secured- confidential faxes, each recipient is identified with the phone number and the extension.

#### 1.4.7.4. Operation

There are five basic types of faxes that an SFT can send.

##### I. Unsecured Faxes

Unsecured faxes are equivalent to a standard fax. The sender enters the phone number of the recipient site, and sends the fax. In this case, the sender remains unidentified, and the fax is sent to a given phone

number in the hopes that it will be delivered to the proper recipient. An SFT marks the top line on all such unsecured faxes prominently as being "UNSECURED". All faxes received from non-SFT fax machines are always marked as being unsecured.

## II. Sender-Secured Faxes

In a sender-secured fax, the sender selects the "sender-secured" mode on the fax machine, enters their biometric-PIC followed by their title index code. The fax machine then connects to the DPC, and sends the biometric-PIC information. Once the DPC verifies the individual's identity, the individual then sends the fax by feeding the document into the fax scanner. In this case, the fax is actually sent to the DPC, which stores the fax digitally. Once the entire fax arrives at the DPC, the DPC commences sending the fax to each destination, labeling each page with the name, title, and company of the sender, along with the banner of "SENDER-SECURED" at the top of each page.

## III. Secured Fax

In a secured fax, the sender selects the "secured" mode on the fax machine, enters their biometric-PIC followed by their title index code, and then enters the phone numbers of the recipients. Once the system verifies the sender's identity and each of the recipients phone numbers, the individual then sends the fax by feeding the document into the fax scanner. The fax is then sent to the DPC, which stores the fax digitally. Once the entire fax arrives at the DPC, the DPC sends a small cover page to the destination indicating the pending secured fax, the sender's title and identity, as well as the number of pages waiting, along with a tracking code. This tracking code is automatically entered into the memory of the recipient's fax machine.

To retrieve the fax, any employee of the recipient company can select the "retrieve fax" button on his fax machine, select which pending fax to retrieve by using the tracking code, and then enter biometric-PIC. If the fax is unwanted, the individual may press the "reject fax" button, though he must still identify himself to the system in order to

do this. Once validated as a member of the company, the fax is then downloaded to the recipient's fax machine. Each page has "SECURED" on the top of each page, along with the sender's identity and title information.

#### IV. Secured Confidential Fax

In a secured-confidential fax, the sender selects the "secured-confidential" mode on the fax machine, enters his biometric-PIC followed by his title and index code, and then enters the phone number and system extension of each recipient. Once the DPC verifies the sender's identity and each of the recipients phone numbers and extensions, the individual then sends the fax by feeding the document into the fax scanner. The fax is sent to the DPC, which stores the fax digitally. Once the entire fax arrives at the DPC, the DPC sends a small cover page to each destination indicating the pending secured- confidential fax, the sender's title and identity, the recipient's title and identity, as well as the number of pages waiting, along with a tracking code. This tracking code is automatically entered into the memory of the recipient's fax. However, the only individual that can retrieve the fax is the individual whose extension code is indicated.

This individual selects the "retrieve fax" button, selects the pending fax to retrieve, and then enters his biometric-PIC. Once validated as the recipient, the fax is then downloaded to the recipient's fax machine. Each page has "SECURED-CONFIDENTIAL" on the top of each page, along with the sender's title and identity information.

#### V. Secured Confidential Contract Fax

This fax is processed identically to the secured- confidential fax in terms of the actual delivery of the fax to the recipients, except that the fax is titled "contract" instead of secured- confidential. In addition, the DPC automatically archives contract faxes. Any recipient may accept or reject the contract through the SFT subsequent to receiving the contract fax. Hence with the option, the DPC performs the role of an electronic notary.

5 Any fax that is sent to the system and then forwarded to the recipient may be sent to any number of recipients without tying up the sending fax machine. Additionally, the tracking number of any fax sent is entered into the memory of the fax machine; a status report on any ongoing fax can be generated at the sending machine by selecting the "status" button and then selecting the particular fax pending tracking code. The DPC issues a report that is immediately sent to the sending fax machine detailing the state of the sending for each recipient.

10 With any secured or secured-confidential fax, an option exists for either the sender or one of the recipients to archive the fax (along with the specifics as to who sent and received the fax) for future reference. To this end, any secured fax is retained for some time period (i.e., 24 hours) following successful delivery. An archival tracking code is returned to the individual whenever an archive is requested. This archival code is used to  
15 retrieve faxes and fax status reports archived with the system.

Archived faxes are placed on read-only secondary storage after some time period (i.e., 24 hours). Retrieving an archived fax requires human intervention, and may take up to 24 hours to perform.

#### 20 1.4.7.5. Security

The SFT system works hard to assure the recipient of the sender's identity, and it works just as hard to assure the sender that the recipient actually acknowledged receipt of the document.

25 In order to protect against interception of the communications between the sender and recipient, the fax terminal encrypts the fax using the Message Key facility provided by the BIA. Since the BIA takes responsibility for encrypting the Message Key as part of the biometric-PIC, the encryption key is securely sent to the DPC.

30 When an individual receives a secured fax of any type, the message key is sent encrypted along with the private code, to allow the recipient to decrypt the message. Note that it is fine to have all recipients have this message key, as they all receive the same message.

#### 1.4.7.6. Notes

5 Sending secured faxes is very similar to sending electronic mail, and reuses much of the same software.

It is possible to construct fax terminals that do not have integral BIA/fax devices but that have a port suitable for attaching an external BIA/pc and software appropriate for using the BIA.

#### 10 1.4.8. Terminal: Biometric Registration Terminal

##### 1.4.8.1. Purpose

15 The purpose of the Biometric Registration Terminal (BRT) is to register new individuals including their biometric-PIC, mailing address, private code, electronic mail addresses, a list of titles and title index codes used to send and receive electronic messages and faxes, and a list of financial asset accounts and account index codes that they can access, all using their biometric-PIC.

20 The objective of the enrollment process is to obtain personal information from an individual at the location of a responsible institution where that information can be validated. This includes, but is not limited to retail banking outlets, and corporate personnel departments. Each participating responsible institution has one BRT that is used by a group of employees who have been authorized to perform registrations. Each  
25 employee is accountable for each individual registered.

##### 1.4.8.2. Construction

- 30 • an microcomputer and screen, keyboard, mouse
- an BIA/Reg
- 9.6 kb modem/X.25 network connection (known in the industry)
- a biometric registration software application

35 The BRT uses an attached BIA/Reg for biometric entry, and is connected to the system by a 9.6kb modem or an X.25 network connection

(known in the industry). Biometric registration terminals are located in places that are physically secure such as retail banking outlets.

#### 1.4.8.3. Identification

5  
Three entities need to be identified for the DPC to respond positively to an BIA/Reg registration request: the registering employee, the institution, and the BIA/Reg. The employee must have been authorized to register individuals for that institution.

10  
The institution and the BIA are identified by cross-checking the owner of the BIA with the institution code set by the BRT. The employee identifies himself to the system by entering his biometric- PIC upon starting the registration application.

15  
The institution uses its standard customer identification procedure (signature cards, employee records, personal information, etc) before registering the individual on the system. It is important for the institution to verify individual identity as assiduously as possible, since the registering individual will be empowered to transfer money from those accounts at will, and/or send electronic messages using the name of the  
20  
company.

#### 1.4.8.4. Operation

25  
During registration, the individual enters both a primary and secondary biometric. The individual must use both index fingers; if the individual is missing index fingers, the next inner-most finger may be used. Requiring specific fingers to be used allows the prior fraud check to work.

30  
The individual is encouraged to select a primary and a secondary finger; the primary finger is given preference during the DPC identity check, so the individual should present the most-often used finger as the primary. Of course, the DPC could choose to alter the designation of primary and secondary biometrics based on operations if it turns out to be important to do so.

35  
As a part of the biometric encoding process, the BIA/R determines if the individual has entered "a good print." Note that there are some individuals whose jobs result in the accidental removal of their

fingerprints, such as individuals who work with abrasives or acids. Unfortunately, these individuals cannot use the system. They are detected at this stage in the process and informed that they cannot participate.

5 The individual selects a PIC of from four to twelve digits from a series of PIC options provided by the system's central database. However, the PIC must be validated by the system. This involves two checks: one, that the number of other individuals using the same PIC aren't too great (since the PIC is used to reduce the number of individuals checked by the biometric comparison algorithm) , and that the individual being registered  
10 isn't too "close", biometrically speaking, with other individuals within the same PIC group. If either happens, the enrollment is rejected, an error message is returned to the BRT, and the individual is instructed to request a different PIC. The system may optionally return with an "identical  
15 match" error condition, which indicates that the individual already has a record in the system under that PIC.

A PIC of 0 allows the system to assign a PIC to the individual.

The individual constructs a confidential private code consisting of a word or phrase. If the individual does not wish to construct one, a private code will be constructed randomly by the terminal.  
20

The individual may also arrange their financial asset code list. This list describes which account index code points at which account (i.e. 1 for debit, 2 for credit, 3 for emergency debit, etc). Note that this can only occur if the registering institution is a bank, and only if the accounts are owned by that particular banking institution.  
25

Even after registration, an individual is not actually able to perform operations using the system until a prior fraud check is completed. This generally takes a few minutes, but during times of high load, it takes up to several hours. Only if the system finds no instance of prior fraud is the individual's account activated.  
30

#### 1.4.8.5. Security

35 If an individual is found to have defrauded the system even once, the DPC institutes a database-wide involuntary biometric database search for the criminal. Several of these are performed each night, so individuals who are particularly wanted by the system are winnowed out of

the database by using a time consuming process during conditions of light activity.

5 The employees performing the registration operation identify themselves using biometric-PIC only when initially activating the registration system. This is a convenience for the employee, but a possible security problem for the system, as unattended or "temporarily borrowed" BRTs could be the source for fraud. As a result, the registration application exits after a predetermined period of no activity.

#### 10 **1.4.9. Terminal: Customer Service**

##### **1.4.9.1. Purpose**

15 The purpose of the customer service terminal (CST) is to provide internal DPC support personnel access to the various aspects of the system databases. Support people need to answer inquiries by individuals, issuers, institutions, and merchants that are having trouble with the system.

##### 20 **1.4.9.2. Construction**

The CST consists of:

- a microcomputer
- an BIA/Int
- 25 • ethernet/token ring/FDDI network interface
- a database examination and modification application

30 Each CST is connected to the system via a high speed local area network connection such as token ring, ethernet, fiber (FDDI), etc. Each CST has the capability to query each of the databases, and display the results of these queries. However, the CST only displays fields and records based on the privilege of the individual terminal user. For instance, a standard customer service employee won't be able to see the encryption code for a given BIA's VDB record, though they can see which merchant or individual currently owns that BIA.

35

#### 1.4.9.3. Identification

5 For the CST to allow access to the database, the individual and the BIA must be identified by the system. In addition, the individual's privilege level must also be determined, so that the database can restrict access appropriately.

#### 1.4.9.4. Operation

10 An individual using a CST starts a session by providing identification by entering their biometric-PIC. The BIA constructs an Identification Request message, and send it to the DPC for verification. Once the system verifies the individual, the CST application can operate normally, though limited by the individual's previously assigned DPC  
15 privilege level.

#### 1.4.9.5. Security

20 For security purposes, the DPC will terminate a connection to the CST application after a predetermined idle time period.

It is important that the database application cannot be modified in any manner; either deliberately, or through an unintentional introduction of a virus. To that end, individual CSTs do not have any floppy drives or other removable media. Furthermore, read access to the database  
25 application executable is strictly limited to those with a need to know.

In order to protect the communications between the CST and the database from surreptitious modification or disclosure, the CST encrypts all traffic between the CST and the database. To do this, the CST generates a session key that is sent to the server during the login session  
30 with the system. This session key is used to encrypt and decrypt all communications with the DPC that occur during the period.

Even assuming secure communications and no modified database applications, the DPC makes certain that DPC data fields that are not accessible to the individual operating the CST are not sent to the CST's  
35 database application. Likewise, at no time do any CST personnel have access to or permission to modify individual biometric information.

The DPC and the support center can be co-located, or because of the fairly tight security surrounding the CST itself, the support center can be split off on its own.

5

#### **1.4.10. Terminal: Issuer Terminal**

##### **1.4.10.1. Purpose**

10

The purpose of the issuer terminal is to allow employees at issuing banks to submit batch asset account modification operations to the DPC in a secure and identifiable manner.

##### **1.4.10.2. Construction**

15

The IT consists of:

- a microcomputer
- a modem, X.25 network, or Internet connection to the system
- an BIA/Iss
- a network connection to the bank's internal network

20

The Issuer Terminal uses an issuer BIA to authorize mass additions and deletions of financial asset information.

##### **1.4.10.3. Identification**

25

In this operation, the bank must be identified, a properly-authorized bank employee must be identified, and all of the individuals whose asset accounts are being added or removed must also be identified.

30

The bank is responsible for identifying the individuals who wish to add their accounts at that bank to their asset account list. As in biometric registration, this is done by the bank using signature cards and personal information. The DPC identifies the bank by cross-checking the issuer code submitted by the IT with the issuer code registered in the VAD record of the BIA/Iss. A biometric-PIC is used to identify the bank employee actually submitting the batch.

35

#### 1.4.10.4. Operation

5 In order to add a financial asset account, an individual gives his biometric identification number to the bank (the identification number is given to the individual during the initial biometric registration step) along with the accounts that are to be added. After the individual is properly identified, this identification code and account list are forwarded to the IT for subsequent batch submission to the system.

10 Whenever deemed appropriate by the bank, an authorized individual at the bank instructs the IT to upload the batched account additions/deletions to the DPC. To do this, the authorized individual enters his biometric-PIC, the IT adds a session key, adds the bank's issuer code, and from that the BIA/Iss constructs an Issuer Batch Request message that the IT then forwards to the DPC. The IT encrypts the batch using the message code, and then sends that as well.

15 When the system receives the Issuer Batch Request, it validates that the BIA is an BIA/Iss, that the BIA/Iss is registered to the bank claimed by the issuer code, and that the individual identified in the biometric-PIC is allowed to submit batch requests to the DPC for that bank. If so, the DPC processes all the requests, keeping track of errors as required. Once done, the DPC returns the individual's private code, along with an encrypted batch containing any errors that occurred during processing.

#### 25 1.4.10.5. Security

30 Securing this transaction is critical for the security of the system. A criminal intent on fraud need only find a way to add other people's accounts to his biometric identification code and can then commit fraud at will. Eventually the criminal is caught, and purged from the database, but only after other people's accounts are drained by the criminal.

Encryption guarantees that the transmission between bank and DPC cannot be intercepted, and thus account numbers are protected in transit.

35 Cross-checking the bank with the BIA/Iss means that both the IT and the BIA must be compromised to submit false add/delete messages

to the DPC. Thus, the bank must ensure that the IT is physically secure, and that only authorized individuals are allowed to access it.

Requiring an individual to submit the batch provides for a responsible human to be "in the loop" whose job it is to make sure that proper bank security measures have been followed in the construction and submission of the batch.

#### **1.4.11. Terminal: Automated Teller Machinery**

##### **1.4.11.1. Purpose**

The purpose of the biometric ATM is to provide individuals access to cash and other ATM functions without having to use an Interbank card. It does this by submitting a biometric-PIC and an account index code and retrieving a bank account number. For users of the system, this replaces the Interbank card (known in the industry) + PIC mechanism as a method for identifying the account and authorizing the individual. It is assumed that all ATMs still continue to accept Interbank cards.

##### **1.4.11.2. Construction**

- a standard ATM
- an integrated BIA/ATM (scanner only)
- a connection to the DPC

The biometric ATM uses an integrated BIA/ATM to identify individuals and allow them access to financial assets using a biometric-PIC and an account index. An BIA/ATM is installed into the ATM, making use of the ATM's current PIC pad for PIC and account index code entry. The ATM is connected to the system using X.25 or modem.

The BIA/ATM is structured in such a way as to make integration with an existing ATM network as simple as possible. This results in a compromise between security and ease of integration.

#### 1.4.11.3. Identification

5 Three entities need to be identified for the DPC to respond properly to an BIA/ATM account request: the individual, the bank, and the BIA/ATM.

10 The bank is identified by cross-checking the ATM's stored bank code with the BIA/ATM's bank code. The BIA/ATM is identified by successfully locating the BIA/ATM in the VAD, and the individual is identified through the standard biometric-PIC.

#### 1.4.11.4. Operation

15 To access an ATM, an individual enters their biometric-PIC into the BIA along with the account index code. The BIA forms an account access request message, which is then sent to the DPC by the ATM. The DPC validates the biometric-PIC as well as the emergency account index code, and then sends the resulting asset account number along with the private code back to the ATM.

20 The ATM asks the BIA to decrypt the response, and then displays the private code on the ATM's display screen. The ATM also examines the response to see whether or not the individual is performing a standard account access, or a "duress" account access. If a duress account access is indicated, the ATM may provide false or misleading information as to the amounts available to the individual; the specifics of this behavior will vary from ATM to ATM. However, no ATM will ever provide any indication to the individual that a duress transaction is in progress.

#### 1.4.11.5. Security

30 Messages between the ATM and the DPC are secured by encryption and MAC calculation from the BIA. The MAC means that the ATM cannot change the contents of the message without being detected, and encryption prevents the encrypted part of the message from being disclosed.

35 Because the BIA/ATM has no LCD or no PIC pad attached, it requires the ATM to provide all the text prompts and to gather all the input

from the individual. This is less secure than if the BIA were performing the operation, but as ATMs are generally physically robust, it can probably be called a wash.

5                   **1.4.11.6. Notes**

10                   It is between the bank and the individual to specify the behavior of an ATM when the individual indicates he is performing a transaction under duress. A particular bank may choose to limit access, or alter balance information, or a false screen may be displayed. A false screen is a display of data which has been intentionally pre-determined to be inaccurate such that a coercing party will not illegally obtain accurate data about an individual's financial assets. It is beyond the scope of the invention to specify the precise behavior of an ATM under these circumstances.

15

**1.4.12. Terminal: Phone Point of Sale Terminal**

**1.4.12.1. Purpose**

20                   The purpose of the phone point of sale terminal (PPT) is to authorize credit or debit financial transactions from an individual using a specially-equipped telephone to make a purchase from a merchant.

25                   **1.4.12.2. Construction**

The PPT consists of:

- an BIA/catv
  - a rapid-connect digital modem [see the VoiceView patent (known in the industry)]
  - a telephone (keypad, earpiece, microphone)
  - a microprocessor
  - a DSP (digital signal processor)
  - a standard telephone line
- 30

The PPT accepts biometric identification using an BIA/carv connected to and integrated with a cordless, cellular, or standard telephone.

#### 1.4.12.3. Identification

In order for the DPC to authorize a transaction, both the individual and the merchant must be identified.

To identify an individual, biometric-PIC identification is used.

To identify a phone-order merchant, the merchant and all his phone numbers that individuals will call are registered with the DPC. Thus when an individual submits an authorization, he also submits the phone number he called, which is then cross-checked with the merchant's listed phone numbers.

#### 1.4.12.4. Operation

Individuals call merchants that are selling their wares through paper catalogs, newspapers, magazines, or other basic print media mechanisms. The PPT uses a special modem that shares the telephone voice line to exchange digital information with the merchant.

Each time the individual makes a phone call, the PPT keeps track of the phone number that was typed by the user, in case the individual decides to make a purchase. A DSP is used to detect dialtone, ring, connection, and so on, in order to tell what the actual phone number entered was, as distinct from extensions, or the navigation of phone message systems, and so on.

Once a call is placed to a merchant, the salesman for the merchant digitally downloads all the relevant information to the PPT including product, price, and the merchant code. Note that when in operation, the modem disconnects the speaker.

When the product information is downloaded, the PPT then prompts the individual for the biometric-PIC, the account index code, and then asks the individual to validate the purchase amount. Then the phone number and the merchant code are added, and the message is encrypted.

The rapid-connect modem is again engaged to send the authorization information to the merchant.

5 When the merchant receives the authorization information, the merchant verifies that the price and product information are correct, and then forwards the transaction to the DPC using a secured communications channel using either the Internet or some other general purpose network. The connection to the DPC is secured using Public Key Encryption and a secret key exchange.

10 Upon receiving and decrypting a phone authorization, the DPC checks the phone number against the merchant code, validates the biometric-PIC, and then sends the transaction to the credit/debit network for authorization. If authorization succeeds, the DPC appends the buyer's address to the response message and sends the response to the merchant.

15 The merchant receives the response from the DPC, copies the mailing address, and forwards the message to the individual again via a brief session with the rapid-connect modem. When the transmission to the IPT is complete, a chime sounds, the modem disconnects, and the individual's private code (decrypted by the BIA) is displayed on the LCD screen. The merchant's sales rep confirms that the individual's mailing address is valid; if so, the call is terminated and the transaction is complete.

#### 1.4.12.5. Security

25 One of the security concerns about phone transactions is the security of the phone system itself. Apart from the biometric identification, the central problem is making sure that the number the individual called actually reaches the merchant in question.

30 Note that the communications link between the PPT and the merchant isn't secured, so a purchase authorization from an individual to a merchant could be intercepted. However, no financial benefit would result from this, so it is not deemed to be important.

35 The security of a PPT is relatively low by necessity of price, weight, and because of the problems inherent in splitting the responsibility of PIC entry and private code decryption and presentation.

### 1.4.13. Terminal: Cable-TV Point of Sale

#### 1.4.13.1. Purpose

5 The purpose of the CATV point of sale terminal (CPT) is to authorize credit or debit financial transactions from an individual in front of his television (or "TV") set to a merchant who is presenting objects for sale on television.

#### 10 1.4.13.2. Construction

The CPT consists of:

- a BIA/catv
- a television remote control with integrated BIA/catv
- a Cable-TV digital signal decoder
- a Cable-TV remote control reader
- an on-screen display mechanism
- access to a Cable-TV broadband two-way communications channel

15 20 The CPT accepts biometric identification using an BIA/catv that is integrated with the television's remote control device. The remote control communicates with a television top box that itself communicates with the broadband cable television network. The terminal consists of the television remote logic that communicates with the BIA, as well as the television top box that communicates over the cable broadband network.

#### 25 1.4.13.3. Identification

30 In this transaction, the merchant and the individual must both be identified to execute the transaction.

The individual is identified by the biometric-PIC.

35 The merchant is identified by a merchant credential, created by the CATV broadcaster at the time the product is shown on television. Each product broadcast has a merchant-product credential consisting of a merchant code, a time, a duration, and a price which is signed using Public

Key Encryption and the CATV network broadcaster's private key. This merchant-product credential can only be generated by the network broadcaster.

5                   **1.4.13.4. Operation**

As a television advertisement, an infomercial, or a home shopping channel displays a product, the Cable television network also broadcasts simultaneous digital information that describes a short  
10 description, price, as well as the merchant-product credential. This digital information is processed and temporarily stored by the CPT, ready to be accessed by the individual when a decision to purchase is made.

To buy something that is currently being displayed, the individual selects the on-screen display function of the special television  
15 Remote, which instructs the CPT to display text information on the screen regarding the currently viewed product.

The individual is first prompted for the number of the items he wishes to buy through the on-screen display. Then he is prompted to enter his Biometric-PIC, and his account index code. Once he verifies that the  
20 final purchase price is okay, the product, price, merchant code, merchant-product credential, and channel number along with the Biometric-PIC are used to construct a Remote Transaction Authorization request message. The request is sent to the merchant for authorization by way of the Cable-television broadband two-way communications channel.

25 Note that each merchant that desires to sell products in this manner must have the ability to receive order information using the broadband Cable television network.

Upon receipt of the authorization request, the merchant submits it to the DPC using a secured Internet connection or an X.25 connection.

30 If the DPC authorizes the transaction, it constructs an authorization response that includes the current mailing address of the individual in addition to the authorization code, and the encrypted private code. Once the merchant receives the authorization, he copies the authorization and the mailing address, and then forwards the authorization  
35 back to the CPT, who then displays the private code to the individual, terminating the transaction.

#### 1.4.13.5. Security

5 This architecture does not allow criminals to replay messages intercepted from the CableTV broadband, but they are able to read parts of them. If this is not desirable, then the messages may be encrypted using an optional CATV Center's public key, or other "link level" encryption between the CATV set-top box (known in the industry) and the CATV local office.

10 To secure a connection between a merchant and the DPC, the connection uses a session key changed daily that has been previously exchanged using a public key encryption key exchange system.

### 1.5. System Description: Data Processing Center

#### 1.5.1. Introduction

15 The Data Processing Center (DPC) handles financial transaction authorizations and individual registration as its main responsibilities. In addition, the DPC provides storage and retrieval for secure faxes, electronic documents, and electronic signatures.

20 Each DPC site is made up of a number of computers and databases connected together over a LAN (known in the industry) as illustrated in the DPC Overview Figure (number\*\*). Multiple identical DPC sites ensure reliable service in the face of disaster or serious hardware failure at any single DPC site. Furthermore, each DPC site has electrical power backup and multiple redundancy in all of its critical hardware and database systems.

25 DPC components fall into three categories: hardware, software, and databases. Below is a short description, by category, of each component. More detailed descriptions appear in the following sections.

**1.5.1.1. Hardware**

FW Firewall Machine: the entry point of the DPC site.

5 GM Gateway Machine: the system coordinator and message processor.

DPCLAN DPC Local Area Network: connects the DPC sites

10 **1.5.1.2. Databases**

IBD Individual Biometric Database: identifies individuals from their biometric and PIC code.

15 PFD Prior Fraud Database: lists individuals who have defrauded the system and can check if a biometric matches any of these individuals.

20 VAD Valid Apparatus Database: stores information required to validate and decrypt BIA messages.

AOD Apparatus Owner Database: stores information about the owners of BIA devices.

25 ID Issuer Database: identifies issuing banks that participate with the system.

30 AID Authorized Individual Database: stores the list of individuals allowed to use personal or issuer BIA devices.

35 RMD Remote Merchant Database: stores information necessary to process transactions with telephone and cable television merchants.

EDD Electronic Document Database: stores electronic documents, such as faxes and electronic mail, for retrieval by authorized individuals.

5 ESD Electronic Signature Database: stores electronic document signatures for verification by a third party.

### 1.5.1.3. Software

10 MPM Message Processing Module: handles the processing of each message by coordinating with the other software modules and databases required to perform the message's task.

15 SNM Sequence Number Module: handles DUKPT sequence number processing.

MACM Message Authentication Code Module: handles MAC validation and generation.

20 MDM Message Decrypt Module: handles encrypting and decrypting of BIA requests and responses.

25 PGL PIC Group List: handles the lookup of PIC groups by PIC and the configuration of database elements that depend on the list of PIC groups.

30 IML IBD Machine List: handles the lookup of the main and backup database machines dedicated to holding IBD records for a given PIC group.

**1.5.1.4. Terminology**

When defining database schema, the following terminology is used for describing field types:

int<X>	an integral type using <X> bytes of storage
char<X>	a character array of <X> bytes
text	a variable length character array
<type>[X]	a length <X> array of the specified type.
time	a type used for storing time and date
biometric	a binary data type used for storing the biometric
fax	a binary data type used for storing fax images

When describing database storage requirements, the term "expected" means the expected condition of a fully loaded system.

**1.5.2. Protocol Description**

Terminals accomplish their tasks by sending request packets to a DPC site. The DPC site sends back a reply packet containing the status on the success or failure of the request.

Communication is via a logical or a physical connection-oriented message delivery mechanism such as X.25 connections, TCP/IP connections, or a telephone call to a modem bank. Each session holds the connection to the terminal open until the DPC sends its response back to the terminal.

The request packet contains a BIA message part and a terminal message part:

- BIA message part
  - protocol version number
  - message type
    - 4-byte BIA Identification
    - 4-byte sequence number
    - <message specific data>
  - Message Authentication Code (MAC)

Terminal message part  
 <terminal specific data>

5 The BIA message part is constructed by an BIA device. It includes one or two biometrics, a PIC, authorization amounts, and the contents of the general registers which are set by the terminal. Note: the MAC in the BIA message part only applies to the BIA part and not to the terminal part.

10 A terminal may place additional data for the request message in the terminal message part. The BIA provides a message key to allow the terminal to secure the terminal part data. The BIA automatically includes the message key in the packet's encrypted biometric-PIC block when necessary. The terminal performs the message key encryption itself, however.

15 The response packet contains a standard header and two optional free-form message parts: one with a MAC and one without:

Standard Header

20 protocol version number  
 message type

Optional Free-form message part with MAC

<message specific data>  
 MAC

25 Optional Free-form message part without MAC

<additional message specific data>

30 The message part with a MAC is sent to the BIA so that it may validate that this part of the response has not been tampered with and to display the individual's private code. The message part without a MAC is used for transmitting large amounts of data, such as fax images, that are not sent to the BIA for MAC validation as the BIA to terminal connection may be of limited bandwidth.

### 1.5.3. Processing Packets

5 In an embodiment of the invention with multiple DPC sites, a terminal need only send its request to one of the DPC sites, typically the closest, because that site automatically handles updating the others by running distributed transactions as necessary.

10 When one of the DPC's Firewall Machines receives a packet, it forwards it to one of the GM Machines for the actual processing. Each GM has a Message Processing Module that handles the coordination between the DPC components required to process the request and sends the response back to the sender.

### 1.5.4. Validating and Decrypting Packets

15 All packets the DPC receives, with the exception of those not constructed by an BIA, contain an BIA hardware identification code (the BIA Identification of the packet), a sequence number, and a Message Authentication Code (MAC). The GM asks the MAC Module to validate the packet's MAC and then checks the sequence number with the Sequence  
20 Number Module. If both check out, the GM passes the packet to the Message Decrypt Module for decryption. If any one of the checks fail, the GM logs a warning, terminates processing for the packet, and returns an error message to the BIA device.

25 Currently, the only message types that are not constructed by an BIA is the Secure Fax Data request and Electronic Document Data request.

### 1.5.5. Reply Packets

30 Each packet the DPC receives may contain an optional response key stored in the encrypted biometric-PIC block of the packet. Before the DPC replies to a request that includes a response key, it encrypts the reply packet with the response key. It also generates a Message Authentication Code and appends it to the packet.

35 The only exception to encrypting response packets applies to error messages. Errors are never encrypted and never include confidential

information. However, most response packets include a status or reply code that can indicate whether the request succeeded or not. For example, when the DPC declines a credit authorization, it does not return an error packet, it returns a normal transaction response packet with a reply code set to "failed".

### 1.5.6. DPC Procedures

The DPC has two procedures commonly used while processing requests.

#### 1.5.6.1. Individual Identification Procedure

For requests that require the DPC to identify an individual, the DPC executes the following procedure: using the PIC code, the DPC searches the IBD Machine List for the main and backup IBD machines responsible for handling identifications for the given PIC code. Next, the DPC sends the identification request to either the main or backup machines depending on which is the least loaded. The IBD machine responds with the IBD record for the individual or an "individual not found" error.

The IBD machine retrieves all the IBD records for the given PIC. Using a proprietary biometric hardware device, the IBD machine compares each record's primary biometric with the individual's biometric arriving at a comparison score indicating the similarity of the two biometrics. If no biometric has a close enough comparison score, the comparisons are repeated using the secondary biometrics. If none of the secondary biometrics have a close enough comparison score, then the IBD machine returns an "individual not found" error. Otherwise, the IBD machine returns the full IBD record of the individual, from which such fields such as the private code, account numbers, titles, and so on may be obtained.

#### 1.5.6.2. Emergency Response Procedure

For requests that include an account index, the DPC handles the case where the individual chooses his or her emergency account index. The

GM processing the request immediately notifies the DPC customer support staff, logs a warning, and if the response packet has a reply code, sets it to "emergency". It is the responsibility of the owner of the BIA device that submitted the request to watch for an "emergency" reply code and provide further assistance, such as the false screen mechanism described in the ATM terminal section. The DPC also increments the emergency use count of the individual's IBD record whenever the emergency account index gets accessed.

### 1.5.7. Protocol Requests

The following sections describe each protocol request/response and the actions the DPC takes to perform them.

The list of protocol packets are:

- Individual Identification
- Transaction Authorization
- Registration
- Account Access
- Issuer Batch
- Secure Fax Submit
- Secure Fax Data
- Secure Fax Tracking
- Secure Fax Retrieve
- Secure Fax Reject
- Secure Fax Archive
- Secure Fax Contract Accept
- Secure Fax Contract Reject
- Secure Fax Organization Change
- Electronic Document Submit
- Electronic Document Data
- Electronic Document Tracking
- Electronic Document Retrieve
- Electronic Document Reject
- Electronic Document Archive

- Electronic Document Archive Retrieve
- Electronic Signature
- Electronic Signature Verify
- Network Credential

5

**1.5.7.1. Individual Identification**

**Individual Identification Request**

*BIA Part:*

10

- 4-byte BIA Identification
- 4-byte sequence number
- encrypted(DUKPT key) Biometric-PIC block:*
  - 300-byte authorization biometric
  - 4-12 digit PIC
  - 56-bit response key

15

MAC

*Terminal Part: (not used)*

**Individual Identification Response**

20

- encrypted(response key):*
  - private code text
  - individual name
  - biometric identification code
- MAC

25

The Individual Identification request includes a biometric-PIC block which the DPC uses with the individual identification procedure to identify the individual. If the individual is identified, then the DPC responds with the individual's name, biometric identification, and private code. Otherwise, the DPC responds with an "unknown individual" error.

30

**1.5.7.2. Transaction Authorization**

**Transaction Authorization Request**

*BIA Part:*

- 5                   4-byte BIA Identification
- 4-byte sequence number
- encrypted(DUKPT key) Biometric-PIC block:*
- 300-byte authorization biometric
- 4-12 digit PIC
- 10                  56-bit response key
- [optional 56-bit message key]
- account index
- price
- merchant Identification
- 15                  [optional free-format product information]
- [optional merchant code (phone#, channel# + time, hostname)]
- [optional send-address request]
- MAC

*Terminal Part: (not used)*

20

**Transaction Authorization Response**

*encrypted(response key):*

- private code text
- authorization response
- 25                  authorization detail (autho code, transaction identification, etc)
- [optional individual address information]
- reply code (fail, ok, emergency)
- MAC

30

There are two basic transaction authorization subtypes: retail and remote.

For retail authorizations, the DPC identifies the purchasing individual by the biometric-PIC block of the request. If the individual cannot be identified, the DPC replies with an "unknown individual" error.

35

Next, the DPC sends an external authorization request (crediting the asset account of the BIA device's owner and debiting the

individual's asset account) to one of several existing financial authorization services depending on the type of asset accounts involved (such as Visa™ or American Express™). If the external financial authorization service approves the transaction, the DPC returns the external authorization codes and an "ok" reply code to the BIA device. Otherwise, the DPC returns the reason why the authorization was denied and sets the reply code to "failed". In either case, the DPC includes the individual's private code in the response.

When the DPC looks up the individual's asset account using the account index of the request, the chosen account may be the "emergency" account. If this happens, the DPC follows the emergency response procedure. The external authorization still takes place, however.

Remote authorization are generated by telephone, mail-order, or cable television merchants. The DPC handles remote authorizations the same way it does a retail authorization but with the following exceptions:

i) Remote authorizations include a remote merchant code which the DPC checks against the Remote Merchant Database to validate whether the packet's merchant Identification matches the one stored in the database. Furthermore, the asset account credited is the remote merchant's account, not the account of the BIA device's owner.

ii) Additionally, BIA devices that generate the remote authorizations tend to be personal BIA devices. The DPC checks the biometric Identification of the identified individual against the Authorized Individual Database's list of individuals allowed to use the BIA device. If the individual is not authorized to use the device, then the DPC denies the authorization request.

iii) Finally, the authorization packet may contain a "send-address" indicator. This indicator informs the DPC to include the individual's address in the reply packet and is usually used only for mail order purchases.

### 1.5.7.3. Registration

#### Registration Request

##### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

1000-byte primary biometric  
 1000-byte secondary biometric  
 4-12 digit PIC

5 56-bit response key  
 56-bit message key  
 MAC

*Terminal Part:*

*encrypted(message key):*

10 name  
 address  
 zipcode  
 private code  
 asset account list (account index code, account #)  
 15 emergency account (account index code, account #)  
 title list (title index code, title name)

**Registration Response**

status code

20 *encrypted(response key):*

private code text  
 PIC  
 biometric Identification code  
 list of DPC chosen PICs (if original choice of PIC  
 25 is rejected)

status code (ok, rejected)

MAC

30 Individuals register with the DPC via a Biometric Registration Terminal (BRT). The BRT sends the DPC a registration packet containing primary and secondary biometrics and personal identification code, along with ancillary data such as the individual's name, address, a list of financial asset accounts, the private code, and the emergency account. Optionally, the individual may include an electronic mail address, and a title list  
 35 including titles and the title index code, as well as an Social Security Number (or "SSN"). The individual may choose his or her own PIC code

or allow the system to choose it. In a modification step any previously entered data can be modified or deleted.

At any given moment, only one DPC site acts as the registration site, for implementation simplicity. Registration request packets received by non-registration DPC sites are forwarded to the current registration site. The registration DPC site performs the entire registration check, assigning of IBD records to IBD machines, and the distributed transaction required to update all other DPC sites.

The registration DPC site selects the PIC code for registration requests that don't specify one, stores the IBD record on the main and backup IBD machines (as specified in the PIC Group List), and checks the PIC and biometric suitability of the registration packet before running the distributed transaction to update the other DPC sites.

The DPC runs a personal identification code and biometric sample duplication check step wherein the biometrics and personal identification code gathered during the registration step is checked against all previously registered biometrics currently associated with the identical personal identification code. The DPC may reject the registration for the following reasons: the PIC code is too popular, or the biometrics are too similar to other biometrics stored under the chosen PIC. To aid the individual in choosing an acceptable PIC, the DPC generates a short list of PIC codes for which the registration will be guaranteed that it reserves for a period of time. The BRT then prompts the individual for a new PIC which may be chosen from the good PIC list.

#### 1.5.7.4. Account Access

##### Account Access Request

###### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

###### *encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

[optional 56-bit message key]

account index

MAC

*Terminal Part: (not used)*

5

### **Account Access Response**

*encrypted(response key):*

private code text

[optional PIC]

asset account number

10

reply code (fail, ok, emergency)

MAC

15

The account access request allows BIA-equipped Automated Teller Machines to provide a safer and more convenient way for individuals to identify themselves to the ATM.

The GM identifies the individual by the packet's biometric-PIC and uses the specified account index to choose which asset account number to retrieve.

20

When the GM looks up the individual's asset account using the account index of the request, the chosen account may be the "emergency" account. If this happens, the GM follows the emergency response procedure.

25

### **1.5.7.5. Issuer Batch**

#### **Issuer Batch Request**

*BIA Part:*

4-byte BIA Identification

4-byte sequence number

30

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

56-bit message key

35

issuer code

MAC

*Terminal Part:**encrypted(message key) batch list:*

add <biometric Id> <account index> <asset account> [<emergency flag>]  
 remove <biometric Id> <account index> <asset account>

**Issuer Batch Response***encrypted(response key):*

private code text  
 reply code (fail, ok, emergency)  
 MAC

*encrypted(message key) failed list:*

failed <command> <code>

...

The Issuer Batch request allows an issuing bank or other authority to perform routine maintenance on the Individual Biometric Database. The DPC logs a security violation warning if it receives any Issuer Batch requests from non-issuer BIA devices, and it also refuses to process the request.

The DPC identifies the individual submitting the batch request by following the individual identification procedure. The DPC then checks that the individual is registered in the Authorized Individual Database to use the BIA device embedded in the sending Issuer Terminal.

The DPC also uses the issuer code in the request to look up the apparatus owner Identification in the Issuer Database and compare it against the apparatus owner Identification stored in the Valid Apparatus Database to ensure that the issuer code is not forged.

The DPC then executes the add and delete commands in the message-key encrypted batch list. The batch list is a newline separated list of commands. Valid commands are:

add <biometric Id> <account index> <asset account> [<emergency flag>]  
 remove <biometric Id> <account index> <asset account>

The add command adds the asset account to the account list at the specified account index. The optional emergency flag indicates whether the particular account index is treated as the individual's emergency account. If the

asset account currently stored in the account list does not belong to the issuer, the command fails. This feature prevents one bank from adding or removing asset accounts from other bank's customers without the individual's knowledge or authorization.

5           The remove command clears the individual's asset account stored at the specified account index in the account list. If the asset account currently stored in the account list does not match the account the issuer is attempting to remove, the command fails.

10           For each command in the batch that failed to execute correctly, the GM logs a security violation warning and appends an entry to the failed list of the response. The failed entry includes the text for the command and the error code.

#### 15           **1.5.7.6. Secure Fax Submit**

##### **Secure Fax Submit Request**

###### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

20           *encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

56-bit message key

25           security mode (unsecured, sender-secured, secured, secured-confidential)

sender title index code

sender fax number

sender fax extension

recipient list

30           [optional archive fax indicator]

[optional contract/agreement indicator]

*Terminal Part: (not used)*

**Secure Fax Submit Response***encrypted(response key):*

private code text

fax tracking number

MAC

When the DPC receives a Secure Fax Submit request, it identifies the individual from the request's biometric-PIC by following the individual identification procedure. This identification, along with the individual's title described by the title index code, is presented to the recipients so that the sender of the fax is always reliably identified.

The DPC generates a tracking number for tracking purposes and stores it, the sender's biometric Identification, the security mode, and the message key in a newly created EDD Document record. For each recipient in the recipient list, the DPC also creates a Recipient record. The DPC then waits for the sending fax machine to transmit the fax data encrypted under the message key.

If the request includes an "archive fax" or "contract/agreement" indicator, the EDD places a copy of the Document and Recipient records in the archive database. Any subsequent updates to these records are also made to the archived versions.

The fax data is sent in a separate step so that if the sender makes a mistake entering his biometric and PIC, the system notifies him before he wastes any time feeding the document into the fax machine.

**1.5.7.7. Secure Fax Data****Secure Fax Data Request***BIA Part: (not used)**Terminal Part:*

fax tracking number

*encrypted(message key):*

fax image data

**Secure Fax Data Response**

status (incomplete, ok)

The Secure Fax Data request allows a secure fax machine to send the fax image to the DPC for delivery to the previously specified recipient(s). This request does not involve any biometric identification and instead relies upon the secret message key to securely transmit the image.

5 The fax image data is encrypted by the message key registered by the Secure Fax Submit request. Once the DPC has received the entire fax, it sends a Secure Fax Arrival Notice message to each of the recipient's fax numbers. The DPC retrieves the list of recipients by querying the EDD for all Recipient records containing the fax tracking number. The Recipient record  
10 contains the destination fax number and optional extension. After sending the Arrival Notice, the DPC updates each Recipient record's delivery status field to "notified". Note: if the destination fax number is busy, the DPC marks the delivery status field to "busy" and retries sending the notice periodically (i.e., every 10 minutes) until successful and at that time, updates the status field to  
15 "notified".

The Arrival Notice is as follows:

Secure Fax Arrival Notice (Fax message)

20 sender name, company, title, and fax number  
fax tracking number  
instructions on how to download the fax

25 The DPC only sends the sender a Status Notice via fax after all recipients have either retrieved or rejected the fax. The sender may query the DPC using the Secure Fax Tracking request (see below) to get the current status of all recipients.

The Status Notice is as follows:

Secure Fax Status Notice (Fax message)

30 sender name, company, title, and fax number  
fax tracking number  
list of recipients showing:  
name, company, title, and fax number  
delivery date and status  
35 contract/agreement status

The DPC finds each individual's company and title information in the EDD Organization table.

For individuals who are not registered in the system and hence cannot receive secure faxes or for non-recipient secured modes, the DPC does not send them a Secure Fax Arrival Notice. Instead, the DPC sends them the fax directly. If the fax line is busy, the DPC retries every 10 minutes until it succeeds in delivering the fax.

**1.5.7.8. Secure Fax Tracking**

**Secure Fax Tracking Request**

*BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

MAC

*Terminal Part: (not used)*

**Secure Fax Tracking Response**

*encrypted(response key):*

private code text

message digest for tracking response fax image

status code (ok, failed)

MAC

fax image for recipient status list

The DPC handles the Secure Fax Tracking request by retrieving all EDD Recipient records for the fax and generating a fax message to display the records. If the individual making the tracking request is not the sender of the fax document, then the DPC sets the status code to failed and puts an empty fax in the response.

The tracking response fax contains information describing the status of the delivery of the fax to each recipient. This fax contains such status information as line busy, fax arrival notice sent, fax sent, fax rejected, contract accepted, and so on.

5

The Tracking Notice is as follows:

Secure Fax Tracking Notice (Fax message)

sender name, company, title, and fax number

fax tracking number

10

list of recipients showing:

name, company, title, and fax number

delivery date and status

contract status

message digest for fax image

35

MAC

*encrypted(message key):*

### fax image

5 The DPC uses the biometric-PIC to identify the individual making the retrieve request by following the individual identification procedure. If no EDD Recipient record exists for the individual and for the specified fax, then the DPC responds with an "invalid recipient" status.

The DPC retrieves the encrypted fax image from the EDD Document record with the correct fax tracking number and biometric Identification which it returns to the requester.

10 The fax image includes a cover page that displays whether the fax is a contract/agreement and the sender's name, company, title, fax number, and extension.

15 When the last recipient has either received or rejected the fax, the DPC sends a Status Notice via fax (see Secure Fax Data, above) to the fax's sender and then schedules to remove the Document and Recipient records from the EDD within a configurable time period. The time period is intended to allow the recipients sufficient time to decide whether or not to archive the fax.

### 20 1.5.7.10. Secure Fax Reject

#### Secure Fax Reject Request

MAC

###### *Terminal Part: (not used)*

##### Secure Fax Archive Response

30 *encrypted(response key):*  
private code  
status code (ok, invalid individual)  
MAC

35 The DPC uses the biometric-PIC to identify the individual making the secure fax archive request. The DPC finds the EDD Recipient record keyed

by the request's fax tracking number and the individual's biometric Identification. If the record cannot be found and the individual is not the sender or one of the recipients, then the request fails with an "invalid individual" status. Otherwise, the DPC copies the Document and Recipient records into the EDD archive database. Any subsequent changes to these records are also copied to the archived versions.

**1.5.7.12. Secure Fax Contract Accept**

**Secure Fax Contract Accept Request**

*BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

fax tracking number

MAC

*Terminal Part: (not used)*

**Secure Fax Contract Accept Response**

*encrypted(response key):*

private code

status code (ok, invalid recipient)

MAC

The DPC uses the biometric-PIC to identify the individual making the Contract Accept request. The DPC finds the EDD Recipient record keyed by the request's fax tracking number and the individual's biometric Identification. If the record cannot be found then the request fails with an "invalid recipient" status. Otherwise, the DPC updates the Recipient record's contract status field to "accepted" and generates a Status Notice to the fax's sender (see Fax Data, above).

**1.5.7.13. Secure Fax Contract Reject**

**Secure Fax Contract Reject Request**

*BIA Part:*

- 5                   4-byte BIA Identification
- 4-byte sequence number
- encrypted(DUKPT key) Biometric-PIC block:*
- 300-byte authorization biometric
- 4-12 digit PIC
- 10               56-bit response key
- fax tracking number
- MAC

*Terminal Part: (not used)*

**Secure Fax Contract Reject Response**

*encrypted(response key):*

- private code
- status code (ok, invalid individual)
- 20               MAC

The DPC uses the biometric-PIC to identify the individual making the Contract Reject request. The DPC finds the EDD Recipient record keyed by the request's fax tracking number and the individual's biometric Identification. If the record cannot be found then the request fails with an "invalid recipient" status. Otherwise, the DPC updates the Recipient record's contract status field to "rejected" and generates a Status Notice to the fax's sender (see Fax Data, above).

**1.5.7.14. Secure Fax Organization Change**

**Secure Fax Organization Change (Secure Fax message)**

- sender name, company, title, and fax number
- list of organizational changes

Organization changes are submitted to the DPC via a secure fax message. A customer support engineer enters the changes requested in the fax

message, verifying that the individual submitting the request is allowed to register individuals for that particular company. Since the fax is a secure fax, the sender's identity has already been ascertained, as has his title.

5                   **1.5.7.15. Electronic Document Submit**

**Electronic Document Submit Request**

*BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

56-bit message key

recipient list

MAC

*Terminal Part: (not used)*

20                   **Electronic Document Submit Response**

*encrypted(response key):*

private code text

tracking number

status code (ok, invalid recipient)

25                   MAC

When the DPC receives an Electronic Document Submit request, it identifies the individual by following the individual identification procedure.

The DPC then creates an EDD Document record and assigns it a unique tracking number. The DPC initializes the record's sender identification code to be the biometric identification code of the identified individual and the message key to be the message key in the request.

Next, the DPC searches the Individual Biometric Database for each recipient and creates an EDD Recipient record for each one. Each record is initialized with the tracking number, the recipient's biometric identification

code, and a delivery status of "incomplete". If any of the recipients cannot be found, the DPC replies with an "invalid recipient" status.

**1.5.7.16. Electronic Document Data**

**Electronic Document Data Request**

*BIA Part: (not used)*

*Terminal Part:*

- tracking number
- command (either abort or data)
- [optional message offset]
- completion indication
- encrypted(message key):*
- message body

**Electronic Document Data Response**

status (incomplete, ok)

The Electronic Document Data request allows an individual to send the document text (in one or more parts) to the EDD for delivery to the recipient(s). This request does not involve any biometric identification, instead, it relies upon the secret message key to securely transmit the document text.

The request text is assumed to be encrypted by the message key stored in the EDD document record and is appended to the document text already stored in the record.

When the EDD receives a packet with the "document complete" indicator, it knows that the sender has finished transmitting the document. The EDD now sends an Arrival Notice to all recipients of the document via Internet electronic mail informing them that they have a document waiting.

The Arrival Notice is as follows:

Electronic Document Arrival Notice (Internet E-mail message)

sender name, company, title, and e-mail address

tracking number

instructions on how to receive the electronic document

The EDD also updates the status of the EDD recipient record to "notified". When all recipients have either retrieved or rejected the electronic document, the DPC sends a Status Notice via Internet electronic mail to the document originator.

5

The Status Notice is as follows:

Electronic Document Status Notice (Internet E-mail message)

sender name, company, title, and e-mail address

tracking number

10

list of recipients showing for each

name, company, title, e-mail address

delivery date and status

The DPC finds each individual's company and title information in the EDD Organization table.

15

### 1.5.7.17. Electronic Document Retrieve

#### Electronic Document Retrieve Request

20

*BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

56-bit message key

status (incomplete, ok, invalid recipient)

MAC

*encrypted(message key):*

document text

The DPC uses the biometric-PIC to identify the individual making the electronic document retrieve request by following the individual identification procedure.

The DPC next finds the EDD Recipient record keyed by the tracking number and the individual's biometric Identification.

If the record cannot be found, then the request fails with an "invalid recipient" status. Otherwise, the DPC sends the document's message key and the document (still encrypted by the message key) to the requester.

The EDD then updates the status of the EDD recipient record to "retrieved". When all recipients have either retrieved or rejected the document, the DPC sends a Status Notice via Internet electronic mail to the document originator (see Electronic Document Data, above) and then schedules to remove the Document and Recipient records (see Secure Fax Retrieve, above).

**1.5.7.18. Electronic Document Reject****Electronic Document Reject Request***BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

message tracking number

MAC

*Terminal Part: (not used)*

**Electronic Document Reject Response***encrypted(response key):*

private code

status code (ok, invalid recipient)

MAC

The DPC uses the biometric-PIC to identify the individual making the electronic document reject request. The DPC next finds the EDD Recipient record keyed by the tracking number and the individual's biometric Identification. If the record cannot be found, then the request fails with an "invalid recipient" status.

The EDD updates the status of the EDD recipient record to "rejected". The DPC then follows the same notification and deletion procedure as described in Electronic Document Retrieve, above.

**1.5.7.19. Electronic Document Archive****Electronic Document Archive Request***BIA Part:*

4-byte BIA Identification

4-byte sequence number

*encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

tracking number

MAC

*Terminal Part: (not used)***Electronic Document Archive Response***encrypted(response key):*

private code

status code (ok, invalid individual)

MAC

The DPC uses the biometric-PIC to identify the individual making the electronic document archive request. The DPC finds the EDD Recipient record keyed by the request's tracking number and the individual's biometric Identification. If the record cannot be found and the individual is not the sender or one of the recipients, then the request fails with an "invalid individual" status. Otherwise, the DPC copies the Document and Recipient records into the EDD archive database. Any subsequent changes to these records are also copied to the archived versions.

#### 1.5.7.20. Electronic Document Archive Retrieve

##### Electronic Document Archive Retrieve Request

###### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

###### *encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

optional title index code, sending fax number, and extension tracking number

MAC

###### *Terminal Part: (not used)*

##### Electronic Document Archive Retrieve Response

###### *encrypted(response key):*

private code

status code (ok, invalid individual)

MAC

The DPC can receive an Electronic Document Archive Retrieve request from either a Secure Fax Terminal or a Certified Email Terminal. The DPC uses the individual identification procedure to determine the individual submitting the archive retrieve request. The individual must be either the sender or one of the recipients or else the DPC denies the request by setting the status code to "invalid individual". However, if the archived document was

a fax sent using a corporate title, the DPC allows additional individuals whose titles are higher in the corporate hierarchy to retrieve the archived document as well.

5 The EDD maintains an archive database, indexed by the document's original tracking number, stored on off-line media such as CD-ROMs and tape that can take considerable time to search for the archived document. As a result, the DPC does not return the archived document immediately, but instead informs the requesting individual that the DPC has begun the search. At 10 a later date when the DPC finishes the search, it notifies the requester that the archived document is ready to be retrieved through the standard document arrival notification mechanisms -- either via fax or email, depending on the format of the original document.

15 The DPC creates an EDD archive request record to store information about the requester so that when the search completes, the DPC remembers to whom to send the document.

#### 1.5.7.21. Electronic Signature

##### Electronic Signature Request

###### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

###### *encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

document name

document MD5 calculation

MAC

###### *Terminal Part: (not used)*

##### Electronic Signature Response

###### *encrypted(response key):*

private code text

signature string

MAC

To process the electronic signature request, the DPC first performs a biometric identification using the biometric-PIC. Then, the DPC creates an ESD record, assigns it a unique signature identification code, and sets the record's signature field to the electronic signature in the request. The DPC then returns a signature string that can be submitted for later verification:

"<Dr. Bunsen Honeydew> <Explosions in the Laboratory> 5/17/95 13:00  
PST 950517000102"

#### 1.5.7.22. Electronic Signature Verify

##### Electronic Signature Verification Request

###### *BIA Part:*

4-byte BIA Identification

4-byte sequence number

###### *encrypted(DUKPT key) Biometric-PIC block:*

300-byte authorization biometric

4-12 digit PIC

56-bit response key

signature string

MAC

###### *Terminal Part: (not used)*

##### Electronic Signature Verification Response

###### *encrypted(response key):*

private code text

signature string

status (verified, failed)

MAC

The DPC performs a biometric identification, extracts the signature tracking code from the signature string, retrieves the indicated ESD record, and verifies that it matches the signature string. The DPC returns the private code and the outcome of the signature comparison.

### 1.5.7.23 Network Credential

#### Network Credential Request

##### *BIA Part:*

5                   4-byte BIA Identification  
                   4-byte sequence number  
                   *encrypted(DUKPT key) Biometric-PIC block:*  
                   300-byte authorization biometric  
                   4-12 digit PIC  
 10                  56-bit response key  
                   account index  
                   bank code  
                   bank hostname  
                   terminal.port and bank.port (TCP/IP addresses)  
 15                  MAC

#### Network Credential Response

##### *encrypted(response key):*

                  private code  
 20                  *signed(DPC's private key):*  
                   credential(time, acct, terminal.port, bank.port)  
                   bank's public key  
                   status code (ok, failed)  
 25                  MAC

                  The DPC identifies the individual using the request's biometric-PIC and retrieves the individual's asset account stored at the specified index. If the account index is the emergency account, then the network credential response status code is set to "failed" and no credential is generated.

30                  The DPC constructs the credential using the current time, the retrieved asset account, and the TCP/IP addresses of the terminal and the bank. The DPC then uses public key encryption to sign the credential with its private key.

35                  The response also includes the bank's public key, which the DPC retrieves from the Remote Merchant Database.

### 1.5.8. Customer Support and System Administration Messages

5 The DPC handles additional message types classified as internal messages. The DPC generally does not accept these messages from non-DPC systems. The messages are database vendor specific. However, the internal network uses DES-encrypted packets to provide additional security.

10 The Customer Service and System Administration tasks are implemented using the database vendor's query language and application development tools.

#### 1.5.8.1. Customer Service tasks:

- IBD: find, activate, deactivate, remove, correct records.
- AID: add or remove authorized individuals.
- 15 • AOD: find, add, remove, correct records.
- VAD: find, activate, deactivate, remove, correct records.
- RMD: find, add, remove, correct records.
- PFD: add, remove, correct records.

#### 20 1.5.8.2. System Administration tasks:

- Run prior fraud checks.
- Modify the Valid Site List.
- Summarize log information (warnings, errors, etc.).
- 25 • Modify the PIC Group List.
- Performance monitoring.
- Run backups.
- Crash recovery procedures.
- Time synchronization for the DPC sites.
- 30 • Change the primary registration site.
- Change the secret DES encryption key.
- Clean up old document tracking numbers.
- Generate a list of BIA hardware identification code, MAC encryption key, and DUKPT Base Key triples. Store on an encrypted floppy  
35 for the Key Loading Device.

### **1.5.9. Firewall Machine**

#### **1.5.9.1. Purpose**

5           The FW Machines provide a first line of defense against network viruses and computer hackers. All communication links into or out of the DPC site first pass through a secure FW Machine.

#### **1.5.9.2. Usage**

10           The FW Machine, an internet-localnet router, only handles messages destined for the GM Machines.

15           BIA-equipped terminals send packets to a single DPC site via modem, X.25, or other communication medium. The DPC relies on a third party to supply the modem banks required to handle the volume of calls and feed the data onto the DPC backbone.

20           For DPC to DPC communication, primarily for distributed transactions and sequence number updates, the FW Machines send out double-length DES encrypted packets. The DPC LAN component handles the encryption and decryption: the FWs do not have the ability to decrypt the packets.

#### **1.5.9.3. Security**

25           A properly configured network sniffer acts as an intruder detector as backup for the FW. If an anomalous message is detected, the intruding messages are recorded in their entirety, an operator is alerted, and the FW is physically shut down by the sniffer.

30           The FW disallows any transmissions from the internal network to the rest of the Internet.

#### **1.5.9.4. Message Bandwidth**

35           A transaction authorization request requires about 400 bytes and registration packets require about 2 KB. To handle 1000 transaction authorizations per second and 1 registration packet per second, the FW

Machines are able to process about 400 KB per second (all known in the industry) .

Each DPC site requires an aggregate bandwidth of nearly three T1 connections to the third party modem bank and the other DPC sites.

#### **1.5.10. Gateway Machine**

##### **1.5.10.1. Purpose**

The GM Machine (GM), through the FW Machines, link the outside world (BIA-equipped terminals and other DPCs) to the internal components of the DPC. The DPC has multiple GMs, typically two.

##### **1.5.10.2. Usage**

The GM supervises the processing of each BIA request, communicates with the various DPC components as necessary, and sends the encrypted results of the request back to the sender. The software performing this task is called the Message Processing Module.

The GM logs all requests it receives and any warnings from components it communicates with. For example, the GM logs any emergency account accesses, sequence number gaps, and invalid packets.

Processing a request may require the GM to inform GMs at all other DPCs of a change in the DPC databases. When this happens, the GM runs a distributed transaction to update the remote databases.

Distributed transactions fall into two categories: synchronous and asynchronous. Synchronous distributed transactions require the GM to wait for the distributed transaction to commit before continuing to process the packet. Asynchronous distributed transactions do not require the GM to wait for the commit, and allow it to finish processing the request regardless of whether the distributed transaction commits or not. Asynchronous distributed transactions are only used to update data for which database consistency is not an absolute requirement: sequence numbers and biometric checksum recordings may be performed asynchronously, whereas creating database records, such as Individual Biometric records, may not.

When executing a synchronous distributed transaction, the requesting GM only considers the entire transaction successful if all sites can successfully commit the transaction locally. Otherwise, the GMs back out the changes locally and reject the request due to a transaction error.

The list of valid DPC sites is normally all of the sites. In the case of an extreme site failure, however, a system administrator may manually remove that site from the valid site list. The most likely cause of distributed transaction failures, however, are temporary network failures that are unrelated to any DPC equipment. Requests that require a synchronous distributed transaction cannot be performed until network connectivity is restored or the site is removed from the valid site list. Before a site can be added back to the valid site list, the system administrator brings the site's databases up to date with those of a currently active site.

### 1.5.10.3. Software Components

Each GM runs the following software components locally for performance reasons:

- Message Processing Module
- Message Authentication Code Module
- Message Decrypt Module
- Individual Biometric Database Machine List

### 1.5.10.4. Message Bandwidth

The message bandwidth required by the GMs is similar to that required by the FW Machines. A FDDI network interface provides 100 Mbits per second and easily covers any bandwidth requirements.

## 1.5.11 DPC LAN

### 1.5.11.1 Purpose

The DPC Local Area Network (LAN) links the machines of the DPC sites together using a fiber optic token ring. The fiber optic token ring provides both high bandwidth and good physical security.

### 1.5.11.2 Security

5 The network interfaces used by the machines on the DPC LAN include encryption hardware to make tapping or intercepting packets useless without the encryption key. The encryption key is the same for all machines on the LAN and is stored in the encryption hardware.

10 A properly configured network sniffer acts as an intruder detector as backup for the FW. If an anomalous message is detected, the intruding messages are recorded in their entirety, an operator is alerted, and the FW is physically shut down by the sniffer.

### 1.5.12 Message Processing Module

#### 1.5.12.1 Purpose

15 The Message Processing Module (MPM) handles the processing for a request packet. It communicates with other components of the DPC as necessary to perform its tasks. The presence of an MPM on a machine brands it as a GM.

#### 1.5.12.2 Usage

25 The MPM maintains a request context for each request it is currently processing. The request context includes the information necessary to maintain the network connection to the terminal making the request, the BIA device information, the response key, and the response packet.

### 1.5.13. Message Authentication Code Module

#### 1.5.13.1. Purpose

30 The Message Authentication Code Module's (MACM) tasks are to validate the Message Authentication Code on inbound packets and to add a Message Authentication Code to outbound packets.

### 1.5.13.2. Usage

The MACM maintains an in-memory hash table of 112-bit MAC encryption keys keyed by BIA hardware identification code.

5 When the MACM receives a request from the GM to validate a packet's MAC, it first looks up the packet's hardware identification code in the hash table. If no entry exists, then the MACM replies to the GM with an "invalid hardware identification code" error.

10 Otherwise, the MACM performs a MAC check on the BIA message part of the packet using the 112-bit MAC encryption key. If the MAC check fails, then the MACM replies to the GM with an "invalid MAC" error. Otherwise, the MACM replies with a "valid MAC" message.

15 If the packet contains a merchant code, the MACM also checks the merchant code against the owner identification code in the hash table. If the codes don't match, then the MACM replies with an "invalid owner" error.

20 When the MACM receives a request from the GM to generate a MAC for a packet, it looks up the MAC encryption key using the packet's hardware identification code. With the MAC encryption key, the MACM generates a MAC and adds it to the packet. If the MACM cannot find the hardware identification code in its hash table, it replies with an invalid hardware identification code error instead.

### 1.5.13.3. Database Schema

25 The MACM hash table entry contains:

MACM Entry:

hardwareId = int4

ownerId = int4

macEncryptionKey = int16

30 The table is hashed by hardware identification code.

#### 1.5.13.4. Database Size

5 Assuming 5 million BIA-equipped devices in service, the hash table requires about 120 MB of storage. For performance reasons, this hash table is cached completely in memory.

#### 1.5.13.5. Dependencies

10 The MACM only contains records referencing active BIA hardware identification codes and active apparatus owners. Whenever an apparatus or apparatus owner is suspended or deleted from the system, the MACM removes any entries that reference the identification code. When an apparatus is activated, the MACM then adds an entry for it.

15 The MACM also caches the MAC encryption key from the Valid Apparatus Database. Since the system does not allow the encryption key of an BIA to be changed, the MACM does not need to worry about receiving encryption key updates.

#### 1.5.14. Message Decrypt Module

##### 1.5.14.1. Purpose

20 The Message Decrypt Module's (MDM) task is to reconstruct the DUKPT transaction key and with it decrypt the biometric- PIC block of the packet. It maintains a list of the DUKPT Base Keys that are required to generate the transaction key.

##### 1.5.14.2. Usage

30 The MDM constructs the DUKPT transaction key using the packet's sequence number as the DUKPT transaction counter, the upper 22 bits of the BIA hardware identification code as the DUKPT tamper resistant security module (or "TRSM") Identification, and the low 10 bits of the BIA hardware identification code as the DUKPT Key Set Identification.

35 The DUKPT standard specifies how the transaction key is generated. The Key Set Identification is used to look up a Base Key from the

Base Key List. The Base Key is used to transform the TRSM Identification into the initial key via a DES encrypt/decrypt/encrypt cycle. The transaction counter is then applied to the initial key as a series of DES encrypt/decrypt/encrypt cycles to generate the transaction key.

For additional security, two Base Key Lists are maintained, one for low security BIA devices and one for high security devices. The MDM chooses which Base Key List to use depending on the security level of the device.

#### 1.5.14.3. Database Schema

The MDM Base Key List entry contains:

MDM Entry:

baseKey = int16

The Base Key List is indexed by Key Set Identification.

#### 1.5.14.4. Database Size

The MDM maintains an in-memory list of the DUKPT Base Keys. Each key requires 112-bits. The MDM maintains two sets of 1024 keys requiring 32 KB total.

#### 1.5.14.5. Dependencies

The MDM has no direct dependencies on any other DPC component.

### 1.5.15. PIC Group List

#### 1.5.15.1. Purpose

The PIC Group List (PGL), in conjunction with the Individual Biometric Database Machine List, defines the configuration of the IBD machines. The PGL stores a list of the PIC groups in the system which is used to simplify the management of the PICs. A PIC group is a set of consecutive PIC codes. A PGL exists on each GM Machine (GM).

### 1.5.15.2. Usage

5 The PGL, when given a PIC code, searches through its list of PIC groups for the group containing the PIC code. The PGL maintains the list of groups in order and uses a binary search to quickly find the correct group.

10 The initial configuration for the PGL is one giant PIC group containing all possible PICs. After a threshold number of PICs are assigned, the giant PIC group is split in two. Thereafter, this process is applied to all succeeding PIC groups.

15 When a PIC group splits, the PGL assigns a new main and backup IBD machine based on available storage on a first-come-first serve basis. The PGL coordinates with the IBD machines to first copy the affected records from the old main and backup machines to the new ones, update the IML record, and last remove the old main and backup copies. Splitting a PIC group is an involved task. The PGL batches split requests to be run when the DPC is lightly loaded, for instance, at night.

20 The system administrator may also change the main and backup IBD machines for a given PIC group if the machines' free storage falls below a level required for handling the expected amount of new registrations.

### 1.5.15.3. Database Schema

25 The schema for the PIC Group records are:

PICGroup:

lowPin = int8

highPin = int8

used = int4

30 Each PIC group is identified by a unique identifier. For convenience the PIC group identification code is the lowPin code for the group, however the system does not otherwise rely upon this fact.

35 The PGL is keyed by the lowPin field.

#### 1.5.15.4. Database Size

5 The PGL is expected to contain about 3000 groups (each PIC group contains about 1000 active PICs, but may span millions of actual PICs). The entire PGL requires about 72 KB of storage and is cached completely in memory.

#### 1.5.15.5. Dependencies

10 When PIC groups are added, merged, or split up, the PGL is responsible for informing the IBD Machine List of the changes and for directing the movement of IBD records from one IBD machine to another.

#### 1.5.16. Individual Biometric Database Machine List

##### 1.5.16.1. Purpose

15 The IBD Machine List (IML), in conjunction with the PIC Group List, codifies the configuration of the IBD machines. The IML maps a PIC code to the main and backup IBD machines storing IBD records for the PIC. The IML is actually keyed by PIC Group (a set of consecutive PIC codes) rather than by individual PICs because this greatly reduces the memory required to store the list. An IML exists on each GM Machine (GM).

##### 1.5.16.2. Usage

25 When a GM processes a request that requires a biometric identification, the GM finds the IML record keyed by the biometric's PIC group. The GM then knows the main and backup IBD machines to use for the biometric identification.

30

### 1.5.16.3. Database Schema

The schema for the IML list entries are:

MachinePair:

pinGroup = int8

main = int2,

backup = int2

The IML is keyed by pinGroup.

### 1.5.16.4. Database Size

The IML is expected to contain about 3000 entries (the number of PIC Groups). Each MachinePair record is 12 bytes requiring about 36 KB of storage and is cached completely in memory.

### 1.5.16.5. Dependencies

Any changes in the configuration of the IBD machines are be reflected in the IML. In addition, the IML uses PIC groups for its keys so when the PIC Group List gets modified, the IML are also updated.

## 1.5.17. Sequence Number Module

### 1.5.17.1. Purpose

The Sequence Number Module's (SNM) primary function is to prevent replay attacks by validating packet sequence numbers. Its secondary task is to minimize the effects of a resubmission attack by informing other SNMs in remote DPC sites of sequence number updates and to periodically update the sequence numbers in the Valid Apparatus Database.

The SNM maintains an in-memory hash table of sequence numbers keyed by BIA hardware identification code codes to allow quick validation of packet sequence numbers.

### 1.5.17.2. Usage

5 When the SNM receives a validate request from the GM for a given hardware identification code and sequence number, it looks up the hardware identification code in the hash table. If no entry exists, then the SNM replies to the GM with an "invalid hardware identification code" error.

10 Otherwise, the SNM checks the given sequence number against the sequence number stored in the hash table entry. If the sequence number is less than or equal to the stored sequence number, the SNM replies with an "invalid sequence number" error. Otherwise, the SNM sets the sequence number in the hash table entry to the given sequence number and replies with a "valid sequence number" message.

15 From time to time, the SNM may observe a sequence number gap. A sequence number gap occurs when the SNM receives a sequence number that is more than one greater than the sequence number stored in the hash table entry. In other words, a sequence number was skipped. When the SNM discovers a sequence number gap, it replies with a "sequence number gap" message to the GM instead of a "valid sequence number" message. The GM treats the packet as valid, but it also logs a "sequence number gap" warning.

20 Sequence number gaps usually occur when network connectivity is lost: packets are dropped or can't be sent until the network is restored to working order. However, sequence number gaps occur for fraudulent reasons as well: malicious parties could intercept packets preventing them from arriving at the DPC or they could even attempt to counterfeit packets (with a large sequence number so that it isn't immediately rejected).

25 The SNM's secondary function is to inform other DPCs of the updated sequence numbers. Quickly updating sequence numbers at all DPC sites thwarts resubmission attacks wherein a malicious entity monitors packets whose destination is for one DPC site and immediately sends a copy to a different DPC site in the hope of exploiting the transmission delay of sequence number updates from one DPC site to another resulting in both sites accepting the packet as valid, when only the first site should accept the packet.

30 The SNMs send update messages to each other whenever they receive a valid sequence number. If an SNM receives an update message for a sequence number that is less than or equal to the sequence number currently

stored in its hash table, that SNM logs a sequence number resubmission warning. All resubmission attacks are detected in this manner.

5 A simpler way to thwart resubmission attacks completely, is to have only one SNM validate packets. Under this scheme, there is no update transmission delay window to exploit with a resubmission attack. Alternately, multiple SNMs can be active at the same time provided none of them handle sequence number validation for the same BIA-equipped device.

### 10 1.5.17.3. Sequence Number Maintenance

When the SNM boots up, it loads the sequence number hash table from the sequence numbers for active BIA stored in the VAD.

Once per day, the SNM downloads the current sequence numbers to the local Valid Apparatus Database (VAD).

15 The VAD is responsible for sending add-entry and remove-entry messages to the SNMs for any BIA-equipped devices that are activated or deactivated to keep the SNM hash table up-to-date.

### 20 1.5.17.4. Database Schema

The SNM hash table entry contains:

SNM Entry:

hardwareId = int4

sequenceNumber = int4

25 The hash table is keyed by hardwareId.

### 30 1.5.17.5. Database Size

Assuming about 5 million BIA-equipped devices in service requires the hash table to be about 40 MB.

#### **1.5.17.6. Dependencies**

5 The SNM depends on the Valid Apparatus Database. When an apparatus is suspended or removed from the database, the SNM removes the corresponding entry. When an apparatus is activated, the SNM creates an entry for it.

#### **1.5.17.7. Message Bandwidth**

10 The SNMs require a transmission bandwidth of about 8 KB per second to handle 1000 update sequence number messages per second. The update sequence number messages is buffered and sent out once per second to minimize the number of actual messages sent.

#### **1.5.18. Apparatus Owner Database**

##### **1.5.18.1. Purpose**

20 The Apparatus Owner Database (AOD) stores information on individuals or organizations that own one or more BIA-equipped devices. This information is used to double check that the BIA devices are used only by their rightful owners, to provide asset account information for financial credit and debit transactions, and to allow identification of all BIAs owned by a specific individual or organization.

##### **1.5.18.2. Usage**

30 Each AOD record includes an asset account to credit or debit the owner when the DPC processes a financial transaction submitted by one of the owner's BIA-equipped devices. For instance, transactions submitted from BIA attached to a retail point of sale terminal involves credits to the asset account, while certified electronic mail transmissions results in debits to the asset account.

### 1.5.18.3. Database Schema

The schema for the Apparatus Owner record is:

ApparatusOwner:

ownerId = int4

name = char50

address = char50

zipCode = char9

assetAccount = char16

status = int 1

The status field is one of:

0: suspended

1: active

The Apparatus Owner Database is keyed by ownerId.

### 1.5.18.4. Database size

The AOD is expected to store about 2 million Apparatus Owner records. Each entry is 130 bytes requiring about 260 MB of storage. The AOD is stored as a hashed file keyed by owner identification code. A copy of the AOD is stored on each GM.

### 1.5.18.5. Dependencies

When entries are removed or suspended from the AOD, any Valid Apparatus Database records that reference those apparatus owners are marked as suspended. In addition, the MAC Module and the Sequence Number Module remove their entries for the suspended apparatuses.

## 1.5.19. Valid Apparatus Database

### 1.5.19.1. Purpose

The Valid Apparatus Database (VAD) is a collection of records representing all of the BIAs that have been manufactured to date. The VAD

record contains the Message Authentication Code encryption key for each BIA, as well as an indication of whether an BIA is active, awaiting shipment, or marked as destroyed. In order for a message from an BIA to be decrypted, the BIA must exist and have an active record in the VAD.

#### 1.5.19.2. Usage

When manufactured, each BIA has a unique public identification code and a unique MAC encryption key, both of which are entered into the VAD record prior to BIA deployment.

When an BIA is first constructed, it is given a unique hardware identification code. When an BIA is placed in service, its hardware identification code is registered with the system. First, the owner or responsible party of the BIA is entered into the Apparatus Owner Database (AOD). Then, the VAD record is pointed to the AOD record, and the BIA is then set active. Requests from that BIA are accepted by the DPC.

When an BIA is removed from service, it is marked as inactive, and the link to the AOD record is broken. No communications from that BIA are accepted.

Each BIA type and model has a security level assigned to it that indicates its level of physical security. When the DPC processes requests from that BIA, it uses the BIA's security level to gauge what kind of actions are allowed. The DPC also provides the security level to external financial transaction authorization services.

For example, a financial transaction authorization service can decide to deny any request for over \$300 from low security BIA, requiring individuals to use higher security BIA to authorize such sums. The authorization service can also use the security level as a guide on how much to charge for the transaction, based on risk.

The security levels and the actions that they allow are determined operationally. Basically, the cost to defraud the system must be higher than the potential gain, so the security level is related to the cost to compromise the device.

### 1.5.19.3. Database Schema

The schema for the Valid Apparatus record is:

Valid Apparatus:

5 hardwareId = int4  
macEncryptionKey = int16  
ownerId = int8  
mfgDate = time  
inServiceDate = time  
10 securityLevel = int2  
status = int1  
type = int1  
use = int1

15 Possible values for the status field are:

0: suspended  
1: active  
2: destroyed

20 Possible values for the type field are (one for each type of terminal):

0: ATM  
1: BRT  
2: CET  
3: CPT  
25 4: CST  
5: EST  
6: IPT  
7: IT  
8: ITT  
30 9: PPT  
10: RPT  
11: SFT

Possible values for the use field are:

- 0: retail
- 1: personal
- 2: issuer
- 3: remote

The Valid Apparatus Database is keyed by hardware identification code.

#### 1.5.19.4. Database Size

The VAD handles about 5 million retail, issuer, and remote Valid Apparatus entries. Each entry is 51 bytes requiring about 255 MB total. The VAD is stored as a hashed file keyed by hardware identification code. A copy of the VAD is stored on each GM.

The number of personal Valid Apparatus entries number in the range of 30 million requiring another 1.5 GB of storage.

#### 1.5.19.5. Dependencies

When a VAD record changes status, the MAC Modules and Sequence Number Modules are informed of its change in status. For instance, when an apparatus becomes active, the MACP and SNM adds an entry for the newly active apparatus. When an apparatus becomes inactive, the MACP and SNM remove their entry for the apparatus.

### 1.5.20. Individual Biometric Database

#### 1.5.20.1. Purpose

Individual Biometric Database (IBD) records store information on individuals, including their primary and secondary biometrics, PIC code, list of financial asset accounts, private code, emergency account, address, and phone number. The individual may optionally include their SSN and electronic mail address. This information is necessary for identifying an individual either by biometric or personal information, for accessing account information, or for

providing an address or phone number to remote merchants for additional verification.

### 1.5.20.2. Usage

5

Individuals are added to the system during the individual enrollment process at registered Biometric Registration Terminals located in retail banking establishments worldwide, or in local system offices. During enrollment, individuals select their personal identification numbers, and add financial asset accounts to their biometric and PIC combination.

10

Individuals may be removed from the database due to fraudulent activity reported by any issuing member. If this occurs, the individual's account information is moved from the IBD to the Prior Fraud Database (PFD) by an authorized internal systems representative. The biometric Ids for records in the PFD may not be used for records in the IBD.

15

The IBD exists on multiple machines, each of which is responsible for a subset of the IBD records with a copy of each record stored on two different machines, both for redundancy and for load-sharing. The IBD Machine List, stored on the GM, maintains which machines hold which PICs.

20

### 1.5.20.3. Database Schema

The schema for the Individual Biometric record is:

IndividualBiometric:

25

primaryBiometric = biometric

secondaryBiometric = biometric

biometricId = int4

PIC = char10

phoneNumber = char12

30

lastName = char24

firstName = char24

middleInitial = char2

SSN = char9

privateCode = char40

35

address = char50

zipCode = char9

publicKey = char64  
checksums = int4[10]  
accountLinks = char30[10]  
emergencyIndex = char1  
emergencyLink = char1  
privs = char10  
enroller = int8  
emergencyUseCount = int4  
status = int1

The status field is one of:

- 0: suspended
- 1: active
- 2: priorFraud

The IBD is keyed by PIC.

#### 1.5.20.4. Database Indexes

Each IBD machine has additional indexes on the individual's Social Security Number, biometric identification code, last name, first name, and phone number to facilitate access to the IBD database.

#### 1.5.20.5. Database Size

Each IBD machine has 40 GB of secondary storage provided by one or more RAID devices. Each IBD record is 2658 bytes (assuming the biometrics are 1K apiece) allowing up to 15 million records per machine. The IBD records are stored using a (perhaps clustered) secondary index on the PIC. The index is stored in memory and requires no more than 64 MB (a 64 MB index handles about 16 million entries). To store records for 300 million individuals, the DPC needs at least 40 IBD machines: 20 IBD machines for main storage and another 20 for backup. The number of IBD machines is easily scaled up or down depending on the number of registered individuals.

### 1.5.20.6. Dependencies

5 The IBD machines, PIC Group List, and the IBD Machine List remain up-to-date in terms of which PICs are on which machine. When a PIC group is reconfigured or main and backup machines for PIC groups are changed, the IBD machines update their databases and indexes appropriately.

### 1.5.21. Authorized Individual Database

#### 10 1.5.21.1. Purpose

For each issuer or personal BIA-equipped device, the Authorized Individual Database (AID) maintains a list of individuals who are authorized, by the owner of the device, to use it.

15 The AID exists for two reasons. The first is that it provides restricted access to a terminal. For example, the Issuer Terminal can only be used by an authorized bank representative. The second reason for the AID is to prevent criminals from secretly replacing the BIA in a retail point of sale terminal with that of a personal BIA from a phone Terminal and thus routing all purchases to a remote merchant account set up by the criminals.

#### 20 1.5.21.2. Database Schema

The schema for the Authorized Individual record is:

25 Authorized Individual:

hardwareId = int4

biometricId = int4

30 The hardwareId refers to a record in the Valid Apparatus Database and the biometricId refers to a record in the Individual Biometric Database. Whenever the DPC needs to check whether an individual is authorized to use a personal or issuer BIA device, the DPC checks for the existence of an Authorized Individual record with the correct hardwareId and biometricId.

35 Personal BIA devices are identified by a use field set to 1 (personal) in the Valid Apparatus Database. Issuer BIA devices are identified by a use field set to 2 (issuer) in the Valid Apparatus Database.

### 1.5.21.3. Database Size

5 Assuming each issuer terminal has 10 individuals authorized to use it and an each personal device has 2 additional authorized individuals with 1,000,000 personal devices in the server, the AID stores about:

$$10 * 100,000 + 2 * 1,000,000 = 3,000,000 \text{ entries}$$

10 The entire database requires about 24 MB of storage.

### 1.5.21.4. Dependencies

15 When Authorized Owner Database records or Valid Apparatus Database records are removed, all Authorized Individual records referencing them are removed.

## 1.5.22. Prior Fraud Database

### 1.5.22.1. Purpose

20 The Prior Fraud Database (PFD) is a collection of records representing individuals who have defrauded member issuers at some point in the past. The PFD also runs background transactions during periods of low system activity to weed out individuals in the IBD who have matching records in the PFD.

25 The system does not automatically put individuals in the PFD, unless it detects that they are attempting to register again. Placing an individual in the PFD is a sensitive policy matter which is outside the scope of this document.

### 1.5.22.2. Usage

30 Before a new IBD record is marked as active, the individual's primary and secondary biometrics are checked against each and every biometric in the PFD using the same biometric comparison techniques as those

used in the individual identification procedure.. If a match is found for the new IBD record, the IBD record's status is set to "prior fraud". If the prior fraud check was executed as part of a registration request, the GM logs a "registering individual with prior fraud" warning.

5 It is assumed that the PFD will remain relatively small. The cost to run the PFD is expensive, as it is an involuntary biometric search, so it is important to add only those individuals to the PFD who have imposed a significant cost to the system.

### 10 1.5.22.3. Database Schema

The schema for the Prior Fraud record is:

Prior Fraud:

15 primaryBiometric = biometric  
 secondaryBiometric = biometric  
 biometricId = int4  
 PIC = char10  
 phoneNumber = char12  
 lastName = char24  
 20 firstName = char24  
 middleInitial = char2  
 SSN = char9  
 privateSignal = char40  
 address = char50  
 25 zipCode = char9  
 publicKey = char64  
 checksums = int4[10]  
 accountLinks = char30[10]  
 emergencyIndex = char1  
 30 emergencyLink = char1  
 privs = char10  
 enroller = int8  
 emergencyUseCount = int4  
 35 status = int 1

The status field is one of:

0: suspended

1: active

2: prior fraud

5

The PFD is keyed by biometric identification code.

#### **1.5.22.4. Database Size**

10

The PFD record is the same as the IBD record. Fortunately, the DPC needs to store a lot less of them so only two database machines are required to store the entire database, of which one is the backup.

#### **1.5.22.5. Dependencies**

15

The PFD does not have any direct dependencies on any other DPC component.

#### **1.5.23. Issuer Database**

20

##### **1.5.23.1. Purpose**

25

The Issuer Database (ID) stores information on banks and other financial institutions that allow their asset accounts to be accessed through the system. The issuing institutions are the only entities that can add or remove their asset account numbers to a given individual's IBD record.

##### **1.5.23.2. Usage**

30

The DPC uses the ID to validate requests from Issuer Terminals by searching the ID for a record containing the Issuer Terminal's issuer code. The owner Identification stored in the record must match up with the owner stored in the Valid Apparatus Database for the BIA stored in the Issuer Terminal.

The schema for the Issuer record is:

Issuer Record:

issuerCode = int6

ownerId = int4

name = char50

phoneNumber = char12

address = char50

zipCode = char9

The Issuer Database is keyed by issuerCode.

#### 1.5.23.3. Database Size

The Issuer Database handles about 100,000 entries. Each entry is 127 bytes requiring less than 2 MB. A copy of the ID is stored on each GM.

#### 1.5.23.4. Dependencies

The Issuer Database does not have any direct dependencies on any other DPC component.

### 1.5.24. Electronic Document Database

#### 1.5.24.1. Purpose

The Electronic Document Database (EDD) stores and tracks electronic documents such as fax images and electronic mail messages destined for specified individuals. It also maintains corporate organizational charts to provide the official titles of both sender and receiver. The EDD also archives the documents at the sender or receiver's request and provides a neutral, third-party verification of contract agreements submitted through the system.

#### 1.5.24.2. Usage

When the DPC receives a fax or other electronic document from an individual, it creates an EDD Document record to store the document until it is picked up by the authorized recipients.

For fax documents, the recipients are specified by fax number and extension. For other electronic documents, the recipients are specified by electronic mail address. The DPC looks up an Organization record for each recipient by fax number and extension or e-mail address. If the record cannot be found, then the DPC looks in the Individual Biometric Database but only if the recipient is specified by e-mail address. For each recipient, the DPC creates a Recipient record that references both the Document and the recipient's biometric Identification specified by the Organization or IBD record if found. The DPC allows recipients who are not registered in the system, but it cannot then ensure delivery or confidentiality for those recipients.

The EDD is flexible enough to allow fax documents to be sent to an individual's e-mail address and e-mail messages sent to a fax machine.

While no electronic signature is placed on the document by the system, the system does guarantee through encryption that the message as received (and decrypted) by the Certified Email or Secure Fax terminal was sent by the individual.

Duly authorized officers of the organization can submit secure faxes or electronic messages to the DPC to assign title and fax extensions to new members, to update a member's title or fax extension, or to remove terminated members.

When an individual is removed from the organization tree, the DPC retires the extension number for a period of one year. This retirement period allows the individual sufficient time to inform confidants that he can no longer receive confidential faxes at that extension and so that the organization cannot mistakenly activate someone else at the extension who might then otherwise receive faxes not intended for him or her.

The EDD maintains an archive database which contains copies of Document and Recipient records when requested by the sender or one of the recipients of the document. The archive database is periodically moved onto CD-ROM.

### 1.5.24.3. Database Schema

The EDD has three record types:

**Document Record:**

documentNumber = int8  
senderId = int4  
documentFax = fax  
documentText = text  
messageKey = int8  
status = int 1

**Recipient Record:**

documentNumber = int8  
recipientId = int4  
recipientFaxNumber = char12  
recipientFaxExtension = char8  
recipientEmailAddr = text  
receivedBy = int4  
lastModified = time  
deliveryStatus = int 1  
contractStatus = int 1

**Archive Request Record:**

biometricId = int4  
documentNumber = int8  
requestorFaxNumber = char12  
requestorFaxExtension = char8  
requestorEmailAddr = text

**Organization Record:**

biometricId = int4  
registeredBy = int4  
company = text  
title = text  
faxNumber = char12  
faxExtension = char8  
emailAddr = text  
activeDate = time  
privs = int2  
status = int 1

The Document record status field is one of:

0: incomplete

1: ok

The Recipient record delivery status field is one of:

0: incomplete

1: notified

2: rejected

3: retrieved

4: retrieved unsecured

5: busy

The Recipient record contract status field is one of:

0: none

1: accepted

2: rejected

The Organization record status field is one of:

0: active

1: suspended

The Organization record privs\*\* field is used to indicate what privileges the DPC allows that individual:

0: registration

The Document, Recipient, and Archive Retrieve records are keyed by documentNumber. The Organization records are keyed by biometricId. The EDD maintains secondary indexes on the Document senderId field, the Recipient recipientId field, and the Organization company name and title fields.

#### 1.5.24.4. Database Size

The EDD's storage requirements depend primarily on the number of fax pages it will have to store since e-mail messages are relatively small compared to fax pages. Each fax page requires about 110 KB of storage.

Assuming 4 pages per fax, 2 faxes per person per day, and 30 million fax machines, the EDD requires 24 GB of storage to spool one day's worth of faxes.

5                   **1.5.24.5. Security**

Documents are sent to and from the system encrypted using the BIA encryption mechanism. However, the encryption key is stored in the same database as the document. The document is left in its encrypted form to prevent casual disclosure, but individuals concerned about security of documents stored on the system should make some arrangement for additional encryption themselves.

15                   **1.5.24.6. Message Bandwidth**

Each fax page requires about 110 KB which means that a T1 connection, with a throughput of 1.54 Mbits/second, can handle about 1.75 fax pages per second.

20                   **1.5.25. Electronic Signature Database**

**1.5.25.1. Purpose**

The Electronic Signature Database (ESD) authenticates and tracks all electronic signatures created by the system.

**1.5.25.2. Usage**

Individuals who are members of the system submit a 16-byte "message digest" for the document along with biometric-PICs and obtain a "digital signature" which remains on file with the system in perpetuity. This digital signature encodes the individual's name, biometric identification code, the authorized signature record number, document title, along with the timestamp at which the document was signed.

To verify a signature, a message digest for the document are first calculated (using RSA's MD5 for instance) and sent along with the document's signature tags. The ESD looks up the signature tags and validates the just recently calculated message digest against the message digest stored in the database.

#### 1.5.25.3. Database Schema

The schema for the Electronic Signature record is:

Electronic Signature:

signatureNumber = int8

signer = int4

documentName = text

checksum = int16

date = time

The signer is the biometric identification code for the individual signing the document. The electronic signature record is hashed by signatureNumber.

#### 1.5.25.4. Database Size

For each 1 GB of secondary storage, the Electronic Signature Database stores 27 million records (each record is about 32 bytes).

#### 1.5.25.5. Dependencies

The ESD has dependencies on the signer's biometric Identification. Since these signatures remain valid essentially forever, ESD records are not removed when the system deletes the signer's Individual Biometric Database record. Note that this requires the IBD to never reuse a biometric Identification.

### 1.5.26. Remote Merchant Database

#### 1.5.26.1. Purpose

5           The Remote Merchant Database (RMD) stores information on  
merchants that provide goods or services over telephones, cable television  
networks, or the Internet. Each order sent by an individual using a  
properly-equipped terminal is routed through the merchant's order terminal to  
10           the system.

#### 1.5.26.2. Usage

15           Once an individual's remote transaction authorization is received  
and the MAC validated by the DPC, the merchant code is compared against  
the merchant code in the RMD. The merchant code, be it phone number,  
merchant-product credential, or internet address, exists in the RMD record  
under the correct merchant identification code or the DPC terminates the  
request and returns an invalid merchant code error to the sending BIA terminal  
20           device.

#### 1.5.26.3. Database Schema

The schema for the Remote Merchant record is:

Remote Merchant:

25           merchantId = int4  
            merchantCode = char16  
            merchantType = int1  
            publicKey = int16

30           The Remote Merchant merchantType is one of:

0: telephone  
1: CATV  
2: Internet

35           The merchantId and merchantCode are both primary keys. No two  
RMD records have the same merchantId and merchantCode combination.

#### 1.5.26.4. Database Size

5 Assuming about 100,000 remote merchants, the RMD requires about 24 bytes per record for a total of about 2.4 MB storage required.

#### 1.5.26.5. Dependencies

10 The RMD does not have any direct dependencies on any other DPC components.

#### 1.5.27. System Performance

15 The key performance number is how many financial authorization transactions the DPC handles per second.

##### In GM:

- 20 1. MACM checks the MAC (local)
2. SNM checks the sequence number (network message)
3. MDM decrypts the biometric-PIC block (local)
4. Find IBD machine (local)
5. Send identify request to the IBD machine (network message)

##### In IBD machine:

- 25 6. Retrieve all IBD records for the PIC (x seeks and x reads, where x is the number of pages required to store the biometric records).
7. For each record, compare against its primary biometric ( $y / 2$  ms where y is the number of records retrieved).
- 30 8. If no reasonable match, repeat step 9 but compare against the secondary biometric ( $z * y / 2$  ms, where y is the number of records retrieved and z is the probability no match is found).
9. Update the best matching IBD record's checksum queue and check for possible replay attacks (1 seek, 1 read, and 1 write).
- 35

10. Return the best matching IBD record or an error if the match is not close enough (network message).

**In GM:**

5

- 11. Authorize request with an external processor (network message)
- 12. GM encrypts and MACs the response (local).
- 13. Sends response packet back (network message).

10

**Total Disk Costs:**

$$x * (s + r) + y / 2 * (1 + z) + s + r + w + 5 * n$$

$$= (x + 1) * (s + r) + y / 2 * (1 + z) + w + 5 * n$$

[assume x is 20, y is 30, z is 5%; s = 10ms, r = 0ms, w = 0ms, n = 0ms]

$$= 21 * 10 \text{ ms} + 15 * 1.05 \text{ ms}$$

15

$$= 226 \text{ ms}$$

$$= 4.4 \text{ TPS}$$

[assume x is 10, y is 15, z is 5%; s = 10ms, r = 0ms, w = 0ms, n = 0ms]

$$= 11 * 10 \text{ ms} + 7.5 * 1.05 \text{ ms}$$

$$= 118 \text{ ms}$$

20

$$= 8.4 \text{ TPS}$$

[assume x is 1, y is 1, z is 5%; s = 10ms, r = 0ms, w = 0ms, n = 0ms]

$$= 2 * 10 \text{ ms} + 1/2 * 1.05 \text{ ms}$$

$$= 21 \text{ ms}$$

25

$$= 47 \text{ TPS}$$

The backup IBD machine also processes requests doubling effective TPS.

**Worst case (with 2 machines in use):**

30

Individuals per PIC	TPS
30	8
15	16
1	94

Average case (with 20 machines in use):

Individuals per PIC	TPS
30	88
15	168
1	940

Best case (with 40 machines in use):

Individuals per PIC	TPS
30	176
15	336
1	1880

The above is just an example of one configuration of the system as it could be implemented in a commercially viable manner. However, it is anticipated that this invention can be configured in many other ways which could incorporate the use of faster computers, more computers and other such changes.

**1.6. Terminal Protocol Flowchart**

The following set of protocol flows describe interactions between specific terminals, the DPC, the attached BIA, and other parties such as the credit/debit processor, and so on.

**1.6.1. Retail Point of Sale Terminal**

In this case, an RPT communicates with a retail BIA and the DPC to authorize a transaction. The transaction amount is 452.33, the individual's account is 4024-2256-5521-1212 merchant code is 123456, and the individual's private code is "I am fully persuaded of it."

RPT → BIA Set Language <English>  
 BIA → RPT Ok  
 RPT → BIA Get Biometric <20>  
 BIA/LCD: <Please place finger on lighted panel>  
 Individual places finger on scanner

BIA → RPT Ok  
 RPT → BIA Get Pin <40>

     RPT: prints receipt with autho-code on it  
 30

### 1.6.2. Internet Point of Sale Terminal

In this case, an IPT communicates with a standard BIA and the  
 DPC to authorize a transaction. The transaction amount is 452.33, the  
 35 individual's account is 4024-2256-5521-1212, the internet merchant is located

at merchant.com, his merchant code is 123456, and the individual's private code is "I am fully persuaded of it."

5 IPT → merchant.com <send me merchant code if resources available>

merchant.com → IPT <ok 123456 merchant.com-public-key>

IPT generates session key, encrypted with merchant.com-public-key

IPT → merchant.com <session key>

All subsequent communications with merchant are encrypted with session key.

10 merchant.com → IPT <price and product information>

IPT/Screen: displays price and product information

Individual: selects item "fruitcake, price 45.33"

IPT → BIA Set Language <English>

BIA → IPT Ok

15 IPT → BIA Get Biometric <20>

BIA/LCD: <Please place finger on lighted panel>

 BIA/LCD: <Transaction ok: I am fully persuaded of it>  
 BIA → IPT <Transaction ok>

### 1.6.3. Internet Teller Terminal

20 In this case, an ITT communicates with a standard BIA, the DPC,  
 and a bank's internet server to perform routine and nonroutine home banking  
 operations. Note that the DPC isn't involved in actually validating any  
 transactions, but is only responsible for creating a valid set of network  
 25 credentials and securing the communications line to the bank.

ITT → bank.com <send me bank code if resources available>  
 bank.com → ITT <ok 1200>  
 ITT → BIA Set Language <English>  
 30 BIA → ITT Ok  
 ITT → BIA Get Biometric <20>  
 BIA/LCD: <Please place finger on lighted panel>  
 Individual places finger on scanner  
 BIA → ITT Ok  
 35 ITT → BIA Get Pin <40>  
 BIA/LCD: <Please enter your PIC, then press <enter>>

Individual enters PIC, then <enter>

BIA → ITT Ok

RPT → BIA Get Account Number <40>

BIA/LCD: <Now enter your account index code, then press <enter>>

Individual enters code, then <enter>

BIA → ITT Ok

ITT → BIA Assign Register <1> <1200> (bank code)

BIA → ITT Ok

ITT → BIA Assign Register <2> <bank.com>

BIA → ITT Ok

ITT → BIA Assign Register <3> <ITT.port, bank.com.port> (TCP/IP addresses)

BIA → ITT Ok

ITT → Form Message <net credential>

BIA → ITT <network credential Request>

BIA → ITT Ok

BIA/LCD: <I'm talking to DPC Central>

ITT → DPC <network credential Request>

DPC: validate biometric, create credential(time, acct, bank)

DPC: get private code

DPC → ITT <network credential Response>

ITT → BIA Show Response <network credential Response>

BIA decrypt response, check response

BIA/LCD: <Credential ok: I am fully persuaded of it>

BIA encrypt credential, session key, challenge key with bank's public key

BIA → ITT <Secure Connection Request Message>

BIA → ITT <Session Key>

BIA → ITT Ok

BIA/LCD: <Secure connection to bank.com in progress>

ITT → bank.com <Secure Connection Request Message>

bank.com decrypt with private key, validate credential, use shared key

bank.com → ITT <ok>

Further transactions over the ITT → bank.com connections are all encrypted by the ITT using the ITT/bank session key.

Any transactions that the bank determines are non-routine must be validated by the individual using the BIA's challenge-response mechanism.

The challenge-response mechanism is available only while the BIA remains in the "secure connection" state.

bank.com → ITT <validate <validation request>>

ITT → BIA Validate Private <encrypted validation request>

BIA decrypts challenge section, and displays it

BIA/LCD: <Please OK: transfer of 12,420.00 to 1023-3302- 2101-1100>

Individual enters Ok

BIA re-encrypts response using challenge key

BIA/LCD: <Secure connection to bank.com in progress>

BIA → ITT <Ok <encrypted validation response>>

ITT → bank.com <encrypted validation response>

#### 1.6.4. Electronic Signature Terminal

In this case, an EST communicates with a standard BIA and the DPC to construct digital signatures. The individual's private code is "I am fully persuaded of it" and the document to be signed is called "The Letter of Marque."

CET → BIA Set Language <English>

BIA → CET Ok

CET → BIA Get Biometric <20>

BIA/LCD: <Please place finger on lighted panel>

Individual places finger on scanner

BIA → CET Ok

CET → BIA Get Pin <40>

BIA/LCD: <Please enter your PIC, then press <enter>>

Individual enters PIC, then <enter>

BIA → CET Ok

CET → BIA Validate Document <Letter of Marque> <40>

BIA/LCD: <Document "Letter of Marque" OK?>

Individual enters OK

BIA → CET Ok

CET → BIA Assign Register <1> <document MD5 value>

BIA → CET Ok

CET → Form Message <signature submit>  
 BIA → CET <Electronic Signature Request>  
 BIA → CET OK  
 BIA/LCD: <I'm talking to DPC Central>  
 5 CET → DPC <Electronic Signature Request>  
 DPC: validate biometric, create signature, return sig text code  
 DPC: get private code  
 DPC → CET <Electronic Signature Response>  
 CET → BIA Show Response <Electronic Signature Response> <8>  
 10 BIA/LCD: <Document ok: I am fully persuaded of it>  
 BIA → CET <Ok <sig text code>>

#### 1.6.5. Certified Email Terminal

15 In this case, a CET communicates with a standard BIA and the DPC to transmit certified electronic mail. The individual's private code is "I am fully persuaded of it", and the document name is "Post Captain."

20 CET → BIA Set Language <English>  
 BIA → CET Ok  
 CET → BIA Get Biometric <20>  
 BIA/LCD: <Please place finger on lighted panel>  
 Individual places finger on scanner  
 BIA → CET Ok  
 25 CET → BIA Get Pin <40>  
 BIA/LCD: <Please enter your PIC, then press <enter>>  
 Individual enters PIC, then <enter>  
 BIA → CET Ok  
 30 CET → BIA Validate Document <Post Captain> <40>  
 BIA/LCD: <Document "Post Captain" OK?>  
 Individual enters OK  
 CET/Screen: <Recipient list? >  
 Individual enters <fred@telerate.com joe@reuters.com>  
 35 CET → BIA Assign Register <1> <fred@telerate.com joe@reuters.com>  
 BIA → CET Ok  
 CET → Form Message <document submit>

BIA → CET <Electronic Document Submit Request>

BIA → CET OK

BIA/LCD: <I'm talking to DPC Central>

CET → DPC <Electronic Document Submit Request>

5

DPC: validate biometric, create message, return message #001234

DPC: get private code

DPC → CET <Electronic Document Submit Response>

CET → BIA Show Response <Electronic Document Submit Response> <8>

BIA/LCD: <Document ok: I am fully persuaded of it>

10

BIA → CET <Document ok <1234>>

CET → DPC <Electronic Document Data Request, 1234, section 1, incomplete>

DPC → CET <Electronic Document Data Response, incomplete>

CET → DPC <Electronic Document Data Request, 1234, section 2, incomplete>

DPC → CET <Electronic Document Data Response, incomplete>

15

CET → DPC <Electronic Document Data Request, 1234, section 3, incomplete>

DPC → CET <Electronic Document Data Response, incomplete>

CET → DPC <Electronic Document Data Request, 1234, section 4, done>

DPC → CET <Electronic Document Data Response, track 1234.1 1234.2>

DPC → fred@telerate.com <email 1234.1 message arrived>

20

DPC → joe@reuters.com <email 1234.2 message arrived>

mailer@telerate.com → DPC <received notification email for 1234.1>

DPC → sender@company.com <email 1234.1 recipient notified>

mailer@reuters.com → DPC <received notification email for 1234.2>

DPC → sender@company.com <email 1234.2 recipient notified>

25

[At Fred's CET: Fred sees the "message arrived" electronic mail message, and decides to go pick up the message]

CET → BIA Set Language <English>

30

BIA → CET Ok

CET → BIA Get Biometric <20>

BIA/LCD: <Please place finger on lighted panel>

Individual places finger on scanner

BIA → CET Ok

35

CET → BIA Get Pin <40> BIA/LCD: <Please enter your PIC>

Individual enters PIC, then <enter>

BIA → CET Ok  
 CET → BIA Assign Register <1> <1234.1>  
 BIA → CET Ok  
 CET → Form Message <document retrieve>  
 5 BIA → CET <Electronic Document Retrieve Request>  
 BIA → CET OK  
 BIA/LCD: <I'm talking to DPC Central>  
 CET → DPC <Electronic Document Retrieve Request>  
 DPC: validate biometric, lookup 1234.1  
 10 DPC: get private code  
 DPC → CET <Electronic Document Retrieve Response>  
 CET → BIA Show Response <Electronic Document Retrieve Response> <8>  
 BIA/LCD: <Document ok: I am fully persuaded of it>  
 BIA → CET <Document ok <message key>>  
 15 CET/Screen: decrypt, then show document

#### 1.6.6. Secure Fax Terminal

20 In this case, a SFT communicates with an BIA/catv and the DPC to  
 transmit secure faxes.

SFT → BIA Get Biometric <20>  
 BIA/LCD: <Please place finger on lighted panel>  
 Individual places finger on scanner  
 25 BIA → SFT Ok  
 BIA/LCD: <Please enter your PIC, then press <enter>>  
 Individual enters PIC, then <enter>  
 SFT → BIA Set Pin <40>  
 BIA/LCD: <Please enter your Title Index, then press <enter>>  
 30 Individual enters title index, then <enter>  
 SFT → BIA Set Title Index Code <40>  
 BIA → SFT Ok  
 SFT/Screen: <Recipient? (add \* for ext, # at end)>  
 Individual enters <1 510 944-6300\*525#>  
 35 SFT/Screen: <Recipient? (add \* for ext, # at end)>  
 Individual enters <1 415-877-7770#>

SFT/Screen: <Recipient? (add \* for ext, # at end)>

Individual enters <#>

SFT → BIA Assign Register <1> <15109446300\*525 14158777770>

BIA → SFT Ok

5 SFT → Form Message <document submit>

BIA → SFT <Secure Fax Submit Request>

BIA → SFT OK

BIA/LCD: <I'm talking to DPC Central>

SFT → DPC <Secure Fax Submit Request>

10 DPC: validate biometric, create message, return message #001234

DPC: get private code

DPC → SFT <Secure Fax Submit Response>

SFT → BIA Show Response <Secure Fax Submit Response> <10>

BIA/LCD: <Document ok: I am fully persuaded of it>

15 BIA → SFT <Document ok <001234>>

SFT → DPC <Secure Fax Data Request, 1234, section 1, incomplete>

DPC → SFT <Secure Fax Data Response, incomplete>

SFT → DPC <Secure Fax Data Request, 1234, section 2, incomplete>

DPC → SFT <Secure Fax Data Response, incomplete>

20 SFT → DPC <Secure Fax Data Request, 1234, section 3, incomplete>

DPC → SFT <Secure Fax Data Response, incomplete>

SFT → DPC <Secure Fax Data Request, 1234, section 4, done>

DPC → SFT <Secure Fax Data Response>

DPC → connect-fax 15109446300

25 DPC → SFT6300 <fax-cover "Sam Spade" from "Fred Jones" 1234.1 4 pages waiting>

DPC → disconnect

DPC → connect-fax 14158777770

DPC → SFT7770 <fax-cover "John Jett" from "Fred Jones" 1234.2 4 pages waiting>

DPC → disconnect

30

[At Sam's SFT: Sam sees document fax cover arrive from Fred, initiates retrieval of document from DPC using tracking code 1234.1.]

SFT → BIA Get Biometric <20>

35 BIA/LCD: <Please place finger on lighted panel>

Individual (Sam) places finger on scanner

BIA → SFT Ok  
 SFT → BIA Get Pin <40>  
     BIA/LCD: <Please enter your PIC, then press <enter>>  
     Individual (Sam) enters PIC, then <enter>  
 5 BIA → SFT Ok  
 SFT → BIA Assign Register <1> <1234.1>  
 BIA → SFT Ok  
 SFT → Form Message <document retrieve>  
 BIA → SFT <Secure Fax Retrieve Request>  
 10 BIA → SFT OK  
     BIA/LCD: <I'm talking to DPC Central>  
 SFT → DPC <Secure Fax Retrieve Request>  
     DPC: validate biometric, lookup 1234.1, verify biometric-PIC = Sam Spade  
     DPC: lookup private code in database  
 15 DPC → SFT <Secure Fax Retrieve Response>  
 SFT → BIA Show Response <Secure Fax Retrieve Response> <8>  
 BIA → SFT <Document ok: I am fully persuaded of it <message key>>  
     SFT/Screen: <Document ok: I am fully persuaded of it>  
     SFT/Screen: print fax  
 20

### 1.6.7. Biometric Registration Terminal

In this case, a BRT communicates with a registration BIA and the DPC to register an individual with the system.

25 BRT → BIA Set Language <English>  
 BIA → BRT Ok  
 BRT → BIA Get Biometric <20> <primary>  
     BIA/LCD: <Please place PRIMARY finger on lighted panel>  
 30 Individual places primary finger on scanner  
 BIA → BRT Ok  
 BRT → BIA Get Biometric <20> <secondary>  
     BIA/LCD: <Please place SECONDARY finger on lighted panel>  
     Individual places secondary finger on scanner  
 35 BIA → BRT Ok  
 BRT → BIA Get Pin <40>

BIA/LCD: <Please enter your PIC, then press <enter>>  
Individual enters 123456, then <enter>  
BIA → BRT Ok  
BRT → BIA Get Message Key  
5 BIA → BRT <Ok <message key>>  
BIA → <Registration Request Message>  
BRT/Screen: <Name: >  
Representative enters <Fred G. Shultz>  
BRT/Screen: <Address: >  
10 Representative enters <1234 North Main>  
BRT/Screen: <Zipcode: >  
Representative enters <94042>  
BRT/Screen: <Private code: >  
Representative queries individual, then enters <I am fully persuaded of it.>  
15 BRT/Screen: <Asset account list: >  
Representative enters <2, 1001-2001-1020-2011> (credit card)  
Representative enters <3, 1001-1002-0039-2212> (checking account)  
BRT/Screen: <Emergency account: >  
20 Representative enters <1, 1001-1002-0039-2212> (emergency, checking  
account)  
BRT → Form Message <registration>  
BIA → BRT <Registration Request Message>  
BIA → BRT OK  
BIA/LCD: <I'm talking to DPC Central>  
25 BRT appends message-key-encrypted personal information to request  
BRT → DPC Registration Request Message> <encrypted personal information>  
DPC: verify PIC 123456  
DPC → BRT <Registration Response Message>  
BRT → BIA Show Response <Registration Response Message> <8>  
30 BIA/LCD: <Registration ok: I am fully persuaded of it, 123456>  
BIA → BRT <Ok>

### 1.6.8. Customer Service Terminal

In this case, a CST communicates with a standard BIA and the DPC to verify the identity and the credentials of an individual.

5

CST → BIA Set Language <English>

BIA → CST Ok

CST → BIA Get Biometric <20>

BIA/LCD: <Please place finger on lighted panel>

10

Individual places finger on scanner

BIA → CST Ok

CST → BIA Get Pin <40>

BIA/LCD: <Please enter your PIC, then press <enter>>

Individual enters PIC, then <enter>

15

BIA → CST Ok

CST → BIA Get Message Key

BIA → CST <Ok <message key>>

CST → Form Message <Individual Identity Request>

20

BIA → CST <Individual Identity Request>

BIA → CST OK

BIA/LCD: <I'm talking to DPC Central>

CST → DPC <Individual Identity Request>

DPC: get private code, individual's priv

25

DPC → CST <Individual Identity Reply>

CST → BIA Show Response <Individual Identity Reply> <8>

BIA/LCD: <Identity ok: I am fully persuaded of it>

BIA → CST <Ok <individual-name priv>>

CST: check priv to see if sufficient for CST use

30

### 1.6.9. Issuer Terminal

In this case, an IT communicates with a standard BIA and the DPC to authorize and send a batch of account addition and deletion requests to the DPC. The individual's private code is "I am fully persuaded of it", and the bank code is 1200.

35

IT → BIA Set Language <English>  
 BIA → IT Ok  
 IT → BIA Get Biometric <20>  
 5        BIA/LCD: <Please place finger on lighted panel>  
          Individual places finger on scanner  
 BIA → IT Ok  
 IT → BIA Get Pin <40>  
          BIA/LCD: <Please enter your PIC, then press <enter>>  
 10        Individual enters PIC, then <enter>  
 BIA → IT Ok  
 IT → BIA Assign Register <1> <1200>  
 BIA → IT Ok  
 IT → BIA Get Message Key  
 15        BIA → IT <message key>  
          BIA → IT Ok  
 IT → BIA Form Message <issuer request>  
 BIA → IT <Issuer Batch Request>  
 BIA → IT OK  
 20        BIA/LCD: <I'm talking to DPC Central>  
 IT → DPC <Issuer Batch Request> <message-key-encrypted issuer batch>  
          DPC: validate biometric, validate bank code 1200 vs. BIA identification  
          DPC: get private code  
          DPC: decrypt message using message key, execute issuer batch  
 25        DPC → IT <Issuer Batch Reply>  
 IT → BIA Show Response <Issuer Batch Reply> <8>  
          BIA/LCD: <Batch ok: I am fully persuaded of it>  
 BIA → IT <Ok>

### 30        1.6.10. Automated Teller Machinery

In this case, an ATM communicates with an integrated ATM BIA  
 and the DPC to identify an individual and obtain his bank account number.  
 The individual's account is 2100-0245-3778-1201, bank code is 2100, and the  
 35        individual's private code is "I am fully persuaded of it."

ATM → BIA Get Biometric <20>  
 ATM/LCD: <Please place finger on lighted panel>  
 Individual places finger on scanner  
 BIA → ATM Ok  
 5 ATM/LCD: <Please enter your PIC, then press <enter>>  
 Individual enters 123456 on ATM keyboard, then <enter>  
 ATM → BIA Set Pin <123456>  
 BIA → ATM Ok  
 10 ATM/LCD: <Now enter your account index code, then press <enter>>  
 Individual enters 2, then <enter>  
 ATM → BIA Set Account Index Code <2>  
 BIA → ATM Ok  
 ATM → BIA Assign Register <1> <2100>  
 BIA → ATM Ok  
 15 ATM → Form Message <account access>  
 BIA → ATM <Account Access Request Message>  
 BIA → ATM OK  
 ATM/LED: <I'm talking to DPC Central>  
 20 ATM → DPC <Account Access Request Message>  
 DPC: validate biometric, retrieve account number →2100-0245-3778-1201  
 DPC: get private code  
 DPC → ATM <Account Access Response Message>  
 ATM → BIA Decrypt Response <Account Access Response Message>  
 BIA → ATM <2100-0245-3778-1201> <no emergency> <I am fully persuaded of it>  
 25 ATM/LCD: <I am fully persuaded of it>

At this point, the ATM has the account number it needs to continue, so it then retrieves the information associated with the account number, and commences interacting with the individual.

### 1.6.11. Phone Point of sale Terminal

In this case, a PPT communicates with an integrated phone BIA and the telephone merchant to download information and purchase items securely using the telephone. The individual's PIC is 1234, the account index

code is 1, the merchant's phone number is 1 800 542-2231, merchant code 123456, and the actual account number is 4024-2256-5521- 1212.

Note that the telephone strips the area code (1-800) from the telephone number before handing it to the system.

Individual dials phone 18005422231

PPT → connect merchant 18005422231

PPT → BIA Assign Register 1 <5422231>

Sales rep answers. Individual selects item "fruitcake". Sales rep downloads info.  
merchant → PPT <123456 fruitcake 43.54>

PPT → BIA Get Biometric <20>

Phone/LCD: <Please place finger on lighted panel>

Individual places finger on scanner

BIA → PPT Ok

Phone/LCD: <Please enter your PIC, then press #>

Individual enters 1234 on keypad, then # or \* (enter)

PPT → BIA Set Pin <1234>

BIA → PPT Ok

Phone/LCD: <Now enter your account index code>

Individual enters 1, then <enter>

RPT → BIA Set Account index code <1>

BIA → PPT Ok

RPT → BIA Assign Register <2> <123456>

BIA → PPT Ok

Phone/LCD: <Press # if amount 45.54 is ok>

Individual enters # (yes)

PPT → BIA Set Amount <43.54>

BIA → PPT Ok

PPT → Form Message <remote transaction>

BIA → PPT <Remote Transaction Request>

BIA → PPT Ok

Phone/LCD: <I'm talking to DPC Central>

PPT → merchant <Phone Transaction Request>

merchant → DPC secure-connect to DPC using DPC-public-key

merchant → DPC <Phone Transaction Request>

DPC: validate biometric, retrieve account number → 4024- 2256-5521-1212

DPC: validate merchant 5422231 has code 123456

DPC → VISA <authorize 4024-2256-5521-1212 43.54 123456>

VISA → DPC <ok 4024-2256-5521-1212 43.54 123456 autho- code>

DPC: get private code

DPC → merchant <Transaction Response Message>

merchant examines response code

merchant → PPT <Transaction Response Message>

PPT → BIA Decrypt Message <Transaction Response Message>

BIA → PPT <Ok <I am fully persuaded of it> <autho-code>>

Phone/LCD: <chime> Transaction ok: I am fully persuaded of it

#### 1.6.12. Cable-TV Point of sale Terminal

In this case, a CPT communicates with an integrated cable-tv BIA and the Cable television merchant to download information and purchase items securely using the cable television broadband network. The individual's PIC is 1234, the account index code is 1, the channel is 5, the merchant code 123456, and the actual account number is 4024-2256-5521- 1212.

Individual turns the television to channel 5.

merchant → CPT <fruitcake 43.54 123456> (broadcast)

Individual hits "buy" on TV Remote

CPT/TV: <Buying fruitcake for \$43.54>

CPT → BIA Get Biometric <20>

CPT/TV: <Please place finger on lighted panel>

Individual places finger on scanner

BIA → CPT Ok

CPT/TV: <Please enter your PIC, then press <enter>>

Individual enters 1234 on keypad, then "buy"

CPT → BIA Set Pin <1234>

BIA → CPT Ok

CPT/TV: <Now enter your account index code>

Individual enters 1, then <enter>

RPT → BIA Set Account index code <1>

BIA → CPT Ok

RPT → BIA Assign Register <1> <channel 5, 15:30:20 PST>  
 BIA → RPT Ok  
 CPT → BIA Assign Register <2> <123456>  
 BIA → CPT Ok  
 5 CPT/TV: <Press "buy" if amount 45.54 is ok>  
 Individual enters "buy"  
 CPT → BIA Set Amount <43.54>  
 BIA → CPT Ok  
 CPT → Form Message <CableTV transaction>  
 10 BIA → CPT <CableTV Transaction Request>  
 BIA → CPT Ok  
 CPT/TV: <I'm talking to DPC Central>  
 CPT → CTV Center <CableTV Transaction Request>  
 CTV Center → merchant <CableTV Transaction Request>  
 15 merchant → DPC secure-connect to DPC using DPC-public-key  
 merchant → DPC <CableTV Transaction Request>  
 DPC: validate biometric, retrieve account number → 4024-2256- 5521-1212  
 DPC: validate merchant channel 5, current show has code 123456  
 DPC → VISA <authorize 4024-2256-5521-1212 43.54 123456>  
 20 VISA → DPC <ok 4024-2256-5521-1212 43.54 123456 autho- code>  
 DPC: get private code, mailing address  
 DPC → merchant <Transaction Response Message>  
 merchant examines response code, records mailing address  
 merchant → CTV Center <Transaction Response Message>  
 25 CTV Center → CPT <Transaction Response Message>  
 CPT → BIA Decrypt Message <Transaction Response Message>  
 BIA → CPT <Ok <I am fully persuaded of it> <autho-code>>  
 CPT/TV: <chime> Transaction ok: I am fully persuaded of it

30 From the foregoing, it will be appreciated how the objects and  
 features of the invention are met.

35 First, the invention provides a computer identification system that  
 eliminates the need for a user to possess and present a physical object, such as  
 a token, in order to initiate a system access request.

Second, the invention provides a computer identification system that is capable of verifying a user's identity, as opposed to verifying possession of proprietary objects and information.

5 Third, the invention verifies the user's identity based upon one or more unique characteristics physically personal to the user.

Fourth, the invention provides an identification system that is practical, convenient, and easy use.

10 Fifth, the invention provides a system of secured access to a computer system that is highly resistant to fraudulent access attempts by non-authorized users.

Sixth, the invention provides a computer identification system that enables a user to notify authorities that a particular access request is being coerced by a third party without giving notice to the third party of the notification.

15 Seventh, the invention provides an identification system that allows for identification of the sender and recipient of an electronic message and/or facsimile.

20 Although the invention has been described with respect to a particular tokenless identification system and method for its use, it will be appreciated that various modifications of the apparatus and method are possible without departing from the invention, which is defined by the claims set forth below.

25

## 5. GLOSSARY

### **ACCOUNT INDEX CODE:**

5 A digit or an alpha-numeric sequence that corresponds to a particular financial asset account

### **AID:**

10 Authorized Individual Database: contains the list of individuals authorized to use personal and issuer BIA devices.

### **AOD:**

Apparatus Owner Database: central repository containing the geographic and contact information on the owner of each BIA.

### **ASCII:**

15 American Standard Code for Information Interchange

### **ATM:**

20 Automated Teller Machinery; uses encoded biometric identity information to obtain access to a financial asset management system, including cash dispensing and account management.

### **BIA:**

25 Biometric input apparatus; collects biometric identity information, encodes and encrypts it, and makes it available for authorizations. Comes in different hardware models and software versions.

### **Biometric:**

30 A measurement taken by the system of some aspect of an individual's physical person.

### **Biometric ID:**

35 An identifier used by the system to uniquely identify an individual's biometric record (IRID – Individual Record ID)

**BIO-PIC GROUP:**

A collection of algorithmically dissimilar biometric samples linked to the same personal identification code

**BRT:**

Biometric Registration Terminal; located at retail banking outlets, BRTs combine biometric registration information with an individual-selected PIN and selected personal information to register individuals with the system.

**CBC:**

Cipher Block Chaining: an encryption mode for the DES.

**CCD:**

Charged-Coupled Device

**CET:**

Certified Email Terminal; uses BIA to identify sender, encrypts document, sends to system. System retains, notifies recipient of message arrival in-system. Recipient identifies self, and then document is transmitted to recipient. Notification to transmitter once document is sent. Document is verified sent, secured by BIA encryption. Transmitter may inquire as to delivery status. Both participants must be system members.

**COMMANDS:**

A program or subroutine residing in the DPC that performs a specific task, activated by a request message sent from a BIA-equipped terminal.

**CONTRACT ACCEPT/REJECT:**

The process by which an individual enters their BIO-PIC and instructs the DPC to register said individual's contractual acceptance or rejection of the terms contained within a document which had been sent by electronic facsimile to that individual.

**CPT:**

5 Cable-TV Point-of-Sale Terminal: combines an onscreen display simulcast digital signal informing TV-top cable box of product information with product video, and an BIA controller remote which performs the biometric-pin validation using the CATV communications network. Order/autho/mailling-address/item-id forwarded to merchant. Results of authorization are displayed on the TV.

**CST:**

10 Customer Service Terminals; provide system customer service personnel with varying degrees of access (based on access privilege) the ability to retrieve and modify information on individuals in order to help people with account problems.

**DATA SEALING STEP:**

15 The conversion of plain text to cipher text (known as "encryption") in combination with the encrypted checksumming of a message that allows information to remain in plain text while at the same time providing a means for detecting any subsequent modification of the message.

**DES:**

20 Digital Encryption Standard: a standard for the cryptographic protection of digital data. See standard ANSI X3.92-1981

**DETERMINATION:**

25 The status of the command processed during the execution step.

**DPC:**

30 A data processing center, namely, the place and the entity where the hardware, software, and personnel are located with the goal of supporting a multigigabyte biometric identity database. A DPC processes electronic messages, most of which involve performing biometric identity checks as a precursor to performing some action, such as a financial transfer, or sending a fax, or sending  
35 electronic mail, etc.

**DSP:**

Digital Signal Processor: a class of integrated circuits that specialize in the mathematical operations required by the signal processing applications.

5

**DUKPT:**

Derived Unique Key Per Transaction: See standard ANSI/ABA X9.24-1992

10

**EDD:**

Electronic Document Database: central repository containing all pending faxes and electronic messages awaiting pickup by individuals.

15

**EMERGENCY ACCOUNT INDEX:**

The alpha-numeric digit or sequence selected by an individual which, when accessed, will result in a transaction being labeled by the system as an emergency transaction, potentially causing the display of false screens and/or the notification of authorities that said individual has been coerced into performing a transmission or transaction.

20

**ESD:**

Electronic Signature Database: central repository containing all MD5 and electronic signatures of all documents signed by anybody, referenced by authorization number.

25

**EST:**

Electronic Signature Terminal; uses BIA to identify individual, computer calculates checksum on document, sends checksum to system, system validates, timestamps, saves checksum, and returns with sig code. Uses Internet as transport. EST also verifies signatures given a sig code and an MD5 calculation.

30

**FAR (False Accept Rate):**

The statistical likelihood that one individual's biometric will be incorrectly identified as the biometric of another individual.

35

**FALSE SCREENS:**

5 Displays of information which has been intentionally pre-determined to be subtly inaccurate such that a coercing party will not illegally obtain accurate data about an individual's financial assets, all the while remaining unaware of the alteration of the information.

**FDDI:**

10 Fiber Digital Device Interface: a networking device that utilizes a fiber optic token ring.

**FS:**

Field Separator

**FW:**

15 Firewall Machine: the internet-local net router that regulates traffic into and out of the DPC.

**GM:**

20 Gateway Machine: the main processing computers in the DPC; runs most of the software.

**IBD:**

25 Individual Biometric Database: central repository for biometric, financial asset, and other personal information. Queries against the biometric database are used to verify identity for transaction authorizations and transmissions.

**ID:**

30 Issuer Database: central repository containing the institutions that are allowed to add and delete financial asset account numbers with the system.

**IML:**

35 IBD Machine List: a software module in the DPC determines which IBD machines are responsible for which PIN codes.

**INTERNET MERCHANT:**

A retail account selling services or good to consumers by means of the Internet electronic network

5

**IPT:**

Internet Point-of-Sale Terminal: items and merchant code from the internet, BIA biometric-PIN for validation, sent to system using Internet, autho/order/PO # forwarded to merchant. System response using internet as well, displaying results on screen.

10

**ISSUER:**

A financial account issuer for financial assets to be registered with the DPC.

15

**ISSUER BATCH:**

A collection of "add" and "delete" instructions complete with biometric IDs, financial asset accounts, and account index codes verified and submitted by an issuer to the DPC.

20

**IT:**

Issuer Terminals; provides a batch connection to the system for issuers to add and remove (their own) financial asset account numbers from specific individual's IBD records.

25

**ITT:**

Internet Teller Terminal; authorizes network terminal session using encrypted credential obtained from DPC using biometric ID.

**LCD:**

Liquid Crystal Display: a technology used for displaying text.

30

**MAC:**

Message Authentication Code: an encrypted checksum algorithm, the MAC provides assurance that the contents of a message have not been altered subsequent to the MAC calculation. See standard ANSI X9.9-1986

5

**MACM:**

Message Authentication Code Module: a software module in the DPC that handles MAC validation and generation for inbound and outbound packets.

10

**MDM:**

Message Decrypt Module: a software module in the DPC that encrypts and decrypts packets from or destined to an BIA device.

15

**MPM:**

Message Processing Module: a software module in the DPC that performs the processing of request packets.

20

**NETWORK CREDENTIAL:**

Both the individual and the bank are identified by the DPC to create the network credential. The credential includes the individual's identification as well as the context of the connection (i.e., the TCP/IP source and destination ports). DPC creates a network credential using the individual's account id, the time of day, and the bank code. The DPC signs this credential using Public Key Encryption and the DPC's Private Key.

25

**PFD:**

Prior Fraud Database: central repository for IBD records which have had prior fraud associated with them. Every new customer's biometrics are checked against all PFD records with the intent of reducing recidivism.

30

**PGL:**

PIN Group List: a software module in the DPC that is responsible for maintaining the configuration of the IBD machines.

35

**PIN:**

Personal Identification Number; a method for protecting access to an individual's account through secret knowledge, formed from at least one number.

5

**PIC:**

Personal Identification Code; a PIN formed from either numbers, symbols, or alphabetic characters.

10

**POS:**

Point-Of-Sale; a place where goods are sold.

**PPT:**

Phone Point-of-Sale Terminal; combines phone number with merchant price and product information to authorize a transaction over a BIA-equipped telephone. Order/authorization/mailling-address/PO forwarded to merchant. Resulting authorization is displayed on phone LCD, or "spoken", along with the individual's private code.

15

20

**RAM:**

Random Access Memory

**RF:**

Radio Frequency: generally refers to radio frequency energy emitted during the normal operation of electrical devices.

25

**REGISTERS:**

Memory reserved for a specific purpose, data set aside on chips and stored operands to instructions

30

**REQUESTS:**

Electronic instructions from the BIA to DPC instructing the DPC to identify the individual and thereby process the individual's command in the event the identification is successful

35

**RMD:**

Remote Merchant Database: contains all merchant identification codes for merchant telephone and Cable TV order shops; indexed by merchant ID. Contains per-merchant system encryption codes as well.

5

**RPT:**

Retail Point-of-Sale Terminal; combines encoded biometric identity information with retail transaction information (possibly from an electronic cash register) and formulates authorization requests of the system using X.25 networks, modems, etc.

10

**SECURE TRANSMISSION:**

An electronic message or facsimile wherein at least one party has been identified by the DPC.

15

**SFT:**

Secured Fax Terminal; uses BIA to identify sender, sends fax either unsecured, sender-secured, secured, or secured-confidential. The latter two require recipients to identify themselves using biometric-PIN. Uses "titles" (specified using a title index digit) to label outbound faxes. Sender may inquire as to delivery status. Both participants must be system members. Either sender or recipient can request that the fax be archived.

20

25

**SNM:**

Sequence Number Module: a software module in the DPC that handles the DUKPT sequence number processing for inbound request packets. Sequence number processing protects against replay attacks.

30

**Terminal:**

A device that uses the BIA to collect biometric samples and form request messages that are subsequently sent to the DPC for authorization and execution. Terminals almost always append ancillary information to request messages, identifying counterparties and the like.

35

**TITLE INDEX CODE:**

Alpha-numeric sequence uniquely identifying an individual's authorized role or capacity within the context of his employment

5

**Token:**

An inanimate object conferring a capability.

**TRACKING CODE:**

An alpha-numeric sequence assigned to data stored in or transmitted by the DPC, such that said sequence may be used to recall the data or obtain a report on the status of the transmission of the data.

10

**TRANSACTION:**

An electronic financial exchange

15

**TRANSMISSION:**

An electronic message other than an electronic financial exchange

**VAD:**

Valid Apparatus Database: central repository in which each BIA (with associated unique encryption codes) is identified, along with the owner of the BIA.

20

25

I claim:

1. A voluntary tokenless identification computer system for determining an individual's identity from an examination of at least one biometric sample and a personal identification code gathered during a bid step, and comparison with previously recorded biometric sample and personal identification code gathered during a registration step, said system comprising:
  - a. at least one computer;
  - b. first gathering and display means for voluntary input of at least one biometric sample, personal identification code, and private code from an individual during the registration step, wherein the private code is selected by the individual;
  - c. second gathering and display means for voluntary input of at least one biometric sample and personal identification code, from an individual during a bid step;
  - d. first interconnecting means for interconnecting said first and second gathering and display means to said computer for transmitting the gathered biometric sample, personal identification code, and private code from said first and second gathering means to said computer;
  - e. means for comparison of biometric sample and personal identification code gathered during the bid step with the biometric sample and personal identification code gathered during the registration step, for producing an evaluation;
  - f. execution means within said computer for storage of data and processing and execution of commands for producing a determination; and
  - g. means for output of said evaluation, determination, or private code from said computer.
2. The apparatus of claim 1 wherein the computer comprises means for detecting and preventing electronic intrusion of the computer system.
3. The apparatus of claim 1 wherein the computer is placed remote from the gathering and display means.
4. The apparatus of claim 1, the first and second gathering and display means further comprising:
  - a. at least one biometric input means for gathering biometric samples further comprising a hardware and software component;
  - b. at least one terminal means that is functionally partially or fully integrated with the biometric input means for input of and appending additional data;

- c. at least one data entry means for input of a personal identification code where in said means is integrated either with the biometric input means or the terminal means; and
- d. second interconnecting means for interconnecting said biometric input means, data entry means and said terminal.
- 5
5. The apparatus of claim 4 wherein said terminal further comprises at least one display means for display of data.
6. The apparatus of claim 4 wherein the biometric input means has a hardware identification code previously registered with the computer, which makes the biometric input means uniquely identifiable to the computer.
- 10
7. The apparatus of claim 4 wherein the hardware component further comprises:
- a. at least one computing module for data processing;
- b. erasable and non-erasable memory modules for storage of data and software;
- 15
- c. biometric scanner device for input of biometrics data;
- d. data entry means for entering data;
- e. digital communication port; and
- f. means for prevention of electronic eavesdropping.
8. The apparatus of claim 7 wherein the computing modules are connected in a manner to prevent monitoring of communications between said computing modules.
- 20
9. The apparatus of claim 7 wherein the hardware component further comprises display means for display of data.
10. The apparatus of claim 7 wherein the hardware component further comprises RF shielding .
- 25
11. The apparatus of claim 4 wherein the hardware component further comprises a wireless communications means.
12. The apparatus of claim 7 wherein the biometric input means is secured from physical tampering.
13. The apparatus of claim 12 further comprising means for detection of physical penetration of the biometric input means.
- 30
14. The apparatus of claim 13 further comprising means for electronic self destruction whereby software and data stored within the memory module are erased.
15. The apparatus of claim 13 further comprising means for physical self destruction whereby the computing modules and memory modules are destroyed.
- 35
16. The apparatus of claim 4 wherein the hardware component further comprises means for reading magnetic strip cards.

17. The apparatus of claim 4 wherein the hardware component further comprises means for reading a smart card.
18. The apparatus of claim 4 wherein the software component resides in a computing module and further comprises;
- 5           a.       electronically erasable memory module wherein at least one command interface module, a first set of software and associated data specifically configured for the intended use of the biometric input device and data are stored; and
- b.       non-erasable memory module wherein a second set of software and
- 10           associated data are stored.
19. The apparatus of claim 18 said software component further comprising means for encryption of data from plaintext to ciphertext.
20. The apparatus of claim 18 said software component further comprising means to detect alteration of data further comprising;
- 15           a.       a secret key; and
- b.       an irreversible one way transformation of the data that cannot be reproduced without the secret key.
21. The apparatus of claim 18 wherein the first set of software and associated data further comprising:
- 20           a.       biometric encoding algorithm; and
- b.       encryption code.
22. The apparatus of claim 18 wherein the second set of software and associated data further comprising:
- 25           a.       an operating system; and
- b.       at least one device driver.
23. The apparatus of claim 4 wherein said terminal is any electronic device and which issues commands to and receives results from the biometric input means.
24. The apparatus of claim 23 wherein said terminal is selected from the group of facsimile machines, telephones, television remote control, personal computers, credit/debit card
- 30       processors, cash registers, automated teller machines, wireless personal computers.
25. The apparatus of claim 4 wherein said second interconnecting means is means for wireless communications.
26. The apparatus of claim 1 wherein said first interconnecting means is selected from the
- 35       group X.25, ATM network, Telephone network, Internet network, cable television network, cellular telephone network.

27. The apparatus of claim 1 wherein the comparison means further comprises means for encryption and decryption of data.
28. The apparatus of claim 1 wherein comparison means further comprises means for identifying the biometric input device.
- 5 29. The apparatus of claim 1 wherein the computer system further comprises:
- a. at least one independent computer network system; and
  - b. third interconnecting means for interconnecting said computer system with said counter party computer system.
- 10 30. The apparatus of claim 29 wherein the third interconnecting means comprises an X.25 network.
31. The apparatus of claim 1 wherein the execution means comprises at least one database for storage and retrieval of data.
32. The apparatus of claim 31 wherein the data base further comprises an individual biometric data base.
- 15 33. The apparatus of claim 31 wherein the data base further comprises a prior fraud check data base.
34. The apparatus of claim 31 wherein the data base further comprises an electronic document data base.
- 20 35. The apparatus of claim 31 wherein the data base further comprises an electronic signature data base.
36. The apparatus of claim 1 wherein said output means is selected from the group of an X.25 network, ATM network, Telephone network, Internet network, cable television network.
- 25 37. The apparatus of claim 1 wherein said private code is generated by the computer.
38. A method for voluntary and tokenless identification of individuals, and authentication of the identification, said method comprising the steps of:
- a. registration step wherein at least one biometric sample, personal identification code, and private code from an individual is gathered and stored;
  - 30 b. bid step wherein at least one biometric sample and personal identification code from an individual is gathered;
  - c. comparison step wherein the biometric sample and personal identification code gathered during the bid step is compared with the biometric sample and personal identification code gathered and stored during the registration step, for producing either a successful or failed identification result;
- 35

- d. execution step wherein a command is processed and executed to produce a determination;
- e. output step wherein said identification result or determination is externalized and displayed; and
- 5 f. presentation step wherein on successful identification of the individual, the private code is presented to the individual being identified.
39. The method of claim 38 wherein both the registration and bid steps further comprise a biometric sample check step wherein the quality of the biometric sample is verified.
- 10 40. The method of claim 38 wherein the registration step further comprises a personal identification code and biometric sample duplication check step wherein the biometrics and personal identification code gathered during the registration step is checked against all previously registered biometrics currently associated with the identical personal identification code.
- 15 41. The method of claim 38 wherein the registration step further comprises an ancillary data input step wherein ancillary data is collected.
42. The method of claim 41 wherein the ancillary data further comprises name and address of the individual.
43. The method of claim 41 wherein the ancillary data further comprises a title of an individual.
- 20 44. The method of claim 43 wherein the ancillary data input step further comprises a title index assignment step wherein each title of the individual is assigned a code.
45. The method of claim 41 wherein the ancillary data further comprises a financial asset account number.
- 25 46. The method of claim 45 wherein the ancillary data input step further comprises an account index assignment step wherein each financial asset account number is assigned an index code.
47. The method of claim 38 wherein the registration step further comprises a prior fraud check step wherein the biometric sample gathered during registration is compared to a subset of previously registered biometric samples.
- 30 48. The method of claim 38 wherein the registration step further comprises an emergency mechanism setup step.
49. The method of claim 48 further comprising an emergency account index assignment step wherein an account index is labeled as an emergency account where in the event the account is accessed appropriate authorities are notified of the emergency.
- 35 50. The method of claim 49 further comprising a false screen display setup step wherein there is assignment of false screen data.

51. The method of claim 49 wherein access to various financial asset accounts is limited.
52. The method of claim 38 wherein the registration step further comprises a modification step wherein any previously entered ancillary data can be modified or deleted.
53. The method of claim 38 wherein both the registration and bid steps further comprise a data sealing step to provide the ability to detect alteration of the data further comprising;
- a. a secret key; and
  - b. an irreversible one way transformation of the data that cannot be reproduced without the secret key.
54. The method of claim 38, wherein the registration and bid steps further comprise an encryption step to convert the data from plaintext to ciphertext.
55. The method of claim 38 wherein the bid or registration steps further comprise a transmission step wherein the data is transmitted.
56. The method of claim 38 wherein the bid or registration steps is further provided with a unique transmission code having a unique hardware identification code and incrementing sequence number which increases by one for each transmission.
57. The method of claim 38 wherein the registration step further comprises choosing a language for communication in a set language step.
58. The method of claim 38 wherein the bid step further comprises choosing a title in a set title number step.
59. The method of claim 38 wherein the bid step further comprises choosing an account number in a set account number step.
60. The method of claim 38 wherein the bid step further comprises validating an amount in a validate amount step.
61. The method of claim 38 wherein the bid step further comprises entering an amount in an enter amount step.
62. The method of claim 38 wherein the bid step further comprises validating a document in a validate document step.
63. The method of claim 38 wherein the bid step further comprises appending ancillary data in an assign register step.
64. The method of claim 63 the ancillary data further comprising a counter party identification code.
65. The method of claim 38 wherein the bid or registration step further comprise aborting or canceling said step in a reset step.
66. The method of claim 38 wherein the bid step further comprises transmission of data in a transmission step.

- 5
67. The method of claim 38 wherein the bid step further comprises choosing a language for communication in a set language step.
68. The method of claim 38 wherein the comparison step further comprises use of the unique transmission codes to detect repeat transmissions.
69. The method of claim 38 wherein the comparison step further comprises a counter party identification step using the counter party identification and unique transmission codes.
- 10
70. The method of claim 38 wherein the comparison step comprises matching the individual's personal identification code and biometric gathered during the bid step, with the personal identification code and biometric gathered during the registration step for positive identification of the individual.
71. The method of claim 70 wherein if there is no match of the personal identification code and biometric gathered during the registration step and the personal identification code and biometric gathered during the bid step, there is no recognition of the individual.
- 15
72. The method of claim 38 wherein the execution step further comprises a debit/credit transaction step.
73. The method of claim 72 wherein the debit/credit transaction step further comprises an address collection step.
- 20
74. The method of claim 38 wherein the execution step further comprises an archiving step and a tracking code assignment step for archival of data.
75. The method of claim 74 wherein the data is sent through a message digest encoding algorithm step to produce an electronically signed document.
76. The method of claim 38 wherein the execution step further comprises the retrieval of archived data using said tracking code.
- 25
77. The method of claim 38 wherein the execution step further comprises a modification step wherein the title index code, account numbers and account index codes are added, deleted or modified.
78. The method of claim 38 wherein the execution step further comprises an account number retrieval step where the account index code is used to retrieve an account number.
- 30
79. The method of claim 38 wherein the execution step further comprises an emergency activation step.
80. The method of claim 79 wherein the emergency activation step further comprises recognition of the emergency code and identifying the entire transaction as an emergency and notification of authorities.
- 35

81. The method of claim 79 wherein the execution step further comprises a false display step wherein previously designated, false accounts or false limitations on accounts are accessible.
82. The method of claim 38 wherein the output step further comprises an identification result notification step.
83. The method of claim 38 wherein the output step further comprises a determination notification step.
84. The method of claim 38 wherein the output step further comprises an emergency code step wherein authorities are notified.
85. The method of claim 38 wherein the output step further comprises display of false screens.
86. The method of claim 38 wherein the presentation step further comprises encryption, externalization, and decryption of the private code.
87. A method for rapid search of at least one first previously stored biometric sample from a first individual, using a personal identification code-basket that is capable of containing at least one algorithmically unique second biometric sample from at least one second individual, and which is identified by said personal identification code-basket, comprising:
- a. a storage step further comprising:
    - i. selection of a personal identification code by said first individual;
    - ii. entering a biometric sample from said first individual;
    - iii. locating the personal identification code-basket identified by the personal identification code selected by said first individual;
    - iv. comparison of the biometric sample taken from said first individual, with any previously stored biometric samples in said selected personal identification code-basket, to make sure that the biometric sample entered by said first individual is algorithmically unique from the previously stored at least one biometric sample provided by at least one second individual; and
    - v. storage of the entered biometric sample from said first individual in the selected personal identification code-basket if said sample is algorithmically unique from the at least one previously stored biometric sample from said at least one second individual; and
  - b. a bid step further comprising:
    - i. entering said selected personal identification code by said first individual; and

- ii. entering a biometric sample by said first individual; and
- c. a comparison step further comprising:
  - i. finding the personal identification code-basket that is identified by said personal identification code entered by said first individual; and
  - ii. comparison of the entered biometric sample from said first individual with said at least one stored biometric sample from said at least one second individual in said entered personal identification code-basket for producing either a successful or failed identification result.

(54) Title: AUTOMATED PAYMENT SYSTEM

(57) Abstract: An automated payment system, such as for credit cards, is provided which compiles customer financial account information from a plurality of financial institutions. The system receives account information from the financial institutions, and compiles the information in central location. The system presents financial account information to the customer. The system then receives and stores a selection of at least one of the financial accounts of the customer and provides the selected financial account information to a merchant, biller or payment processor.

10

**AUTOMATED PAYMENT SYSTEM**

15

**FIELD OF THE INVENTION**

The present invention relates to computerized billing and payment systems. In particular, the invention relates to an automated credit card payment system that matches a customer's information, fingerprint, retina scan voice, or other biometric measurement and/or a unique personal identifier ("UPI") with financial account information consolidated from multiple financial institutions and selects, or allows customers to select, a financial account for use in paying bills, invoices and other obligations.

25

**BACKGROUND OF THE INVENTION**

Most companies that provide continual services can automatically bill their customers on a regular basis. To increase customer retention, as well as reliability in payments, and also to avoid the need for repeated billings of past due accounts, companies

increasingly offer customers the option of making payments through the customer's credit card. However, the need for customers to retrieve the credit card they wish to use, coupled with the customer's perception that writing their credit card account number on a bill and mailing it is not secure, hinders many customers from taking advantage of this convenient payment method.

5           Second, when a customer desires to purchase goods or services on the Internet, they usually give the merchant their credit card information as a form of payment. Since there are millions of merchants on the Internet, it is becoming increasingly difficult for the consumer and for credit card organizations to control fraud. From the moment the consumer presses "send" on the merchant's website, their credit card is exposed. Their card number can be  
10 intercepted by perpetrators en route to the merchant, or it can be "hacked" from the merchant's database once it is received. In addition, the fact that there are millions of merchants and that that number is growing exponentially, makes it virtually impossible to ensure that the merchant is a legitimate company and not merely in existence to perpetrate credit card fraud.

Third, when a customer purchases goods or services with a traditional bricks-  
15 and-mortar merchant, they must have their credit card with them, and they must give it to the merchant so that the credit card can be processed. Given this conventional scenario, the consumer is vulnerable when the credit card is lost or stolen. They are also vulnerable if the merchant or any employee decides to use the credit card number in a fraudulent manner.

Thus, there is a need for a system that provides customers the ability to  
20 efficiently match their financial account information with their UPI, allowing them to purchase goods or services with their credit card or other financial account, without presenting the actual card. The aim of this system is to optimize customer security and privacy interests.

#### SUMMARY OF THE INVENTION

25           The present invention is for a system and related method for payment of bills, purchases, or other payments which compares a UPI or a merchant/biller's database of subscribers, customers, potential customers, prospects, or accounts receivables, sometimes referred to herein collectively as "customers", either with a consolidated database of financial account information such as credit card account information, or with a plurality of non-  
30 consolidated databases of financial account information, or with a combination of the two types. Many types of financial account information may be used to make the payments,

including, but not limited to, credit cards, charge cards, debit cards, smart cards, bank cards, demand deposit accounts such as checking accounts, virtual payment accounts, virtual cash account numbers such as those provided for commercial transactions over the Internet, wire transfer networks, financial electronic data interchange (FEDI), E-check, Automated Clearing House (ACH), payment products from third party, non-bank financial institutions such as CyberCash and TransPoint (MSFDC), stored value tools such as VisaCash and Mondex, and the like.

The system matches the customer's UPI or the customer identification data contained in a merchant, biller or payment processor's database with the financial account information contained in the one or more financial account databases and selects which one or more financial accounts to present when the customer is a holder of more than one financial account.

The financial account or accounts selected are provided to the merchant or biller for inclusion on a commercial communication, such as a payment stub, renewal form, invoice, or other marketing material soliciting payment or subscription. Optionally, the merchant/biller need not know the particular financial account or number being used. For example, a commercial communication may indicate the issuer of the financial account, such as a credit card, and a particular financial account, such as a particular credit card account, for the customer to charge the purchase to, but include the account number only in encrypted form, thus offering security and privacy to the consumer. Many forms of securing information are known and may be used, including but not limited to the use of encryption techniques and record locator techniques.

For example, in a transaction where the financial account utilized is a credit card account, the customer can indicate his approval to use the credit card number provided in encrypted form and thus does not have to provide the information himself when paying by credit card. The merchant/biller collects the invoices or other offers with the customer's indication or authorization of payment from the credit card account and, optionally, submits it to a service bureau which decrypts the credit card account number and processes billing to the selected credit card account. This helps preserve the customer's privacy in his or her credit card and related information.

As shown in Fig. 2, the system of the present invention serves as an

intermediary between a large number of issuers and a large number of merchants. As shown in Fig. 2, issuers provide their account information lists to the central account management and consolidation system of the present invention, which in turn receives customer identification data from merchants, and matches and selects financial account information to provide to merchants, as described above.

In some embodiments, the system includes a memory device which stores consolidated multiple financial account information, such as a master financial account list, which includes, for example, credit card account information from multiple credit card issuers. A computer system or other processing unit matches customer identification data from the stored consolidated financial account information to a UPI or to a database of a merchant/biller's customer identification data in order to associate a financial account number with a selected member of the customer database. The computer system or processing unit selects one or more specific associated financial account numbers when more than one financial account number matches the selected member of the merchant/biller's customer database. If not previously encrypted, the associated financial account number is encrypted and provided to the merchant/biller for inclusion on the customer's commercial communication, such as a bill, payment stub, renewal form or invoice, which is then sent to the customer. After selection and authorization by the customer, the system may also decrypt the encrypted financial account number for processing payment to the merchant/biller from the selected financial account of the customer.

Alternatively, in lieu of including a master consolidated database of financial account information, the system may be comprised of a plurality of databases of financial account information either internal or remote, and a mechanism for searching the various databases to locate a customer's financial account information. The various financial account information databases may include databases of individual issuers and/or partially consolidated databases containing information from a number of financial account issuers.

A method in accordance with one embodiment of the invention includes the steps of consolidating multiple financial account information lists from multiple financial account issuers into a master financial account list, receiving a UPI or a merchant/biller's customer database, and matching information from the master financial account list to the customer's UPI or to the merchant/biller's database to associate at least one financial account number for

each customer. In accordance with desired selection rules, one or more of the matching financial account number(s) is selected, if more than one financial account number is found for a particular customer. The selected financial account number is encrypted, or may be provided already encrypted in the financial account databases. The encrypted financial account number or numbers are provided to the merchant/biller for inclusion on the merchant/biller's commercial communication to the customer, thus providing the customer with a means for authorizing payment for purchase to the associated financial account number, such as a particular credit card. Payment for the purchase is processed and made to the merchant/biller from the financial account of the authorizing member. Of course, a financial account number can be any unique encrypted identifier, even those including letters as well as numbers.

Alternatively, instead of consolidating multiple financial account information from a number of financial account issuers into a single master financial account database or list, the method may include consolidating some subset of financial account lists and searching a plurality of such lists as well as lists from individual financial account issuers in order to associate at least one financial account number for each customer in the merchant/biller's customer database, or searching a plurality of individual financial account lists made available by different issuers.

In another embodiment, the present invention is directed to a system and method for providing automated payments over a computer network, for example, over the Internet. The system includes an automated payment server which is connected to various financial institutions and which receives and compiles data from those institutions to create files of account information for various customers. When a customer desires to purchase goods from a merchant's web site, or to pay bills, the customer is routed to the payment server, and is presented with the account information as compiled by the payment server. The customer selects one or more of the financial accounts, and the payment server transmits the appropriate financial information to the merchant's payment processor to complete the transaction. In this manner, credit card numbers are not transmitted over the Internet or stored on a merchant's site, but are only transmitted between the payment server and the payment processor, preferably over a secure line.

#### BRIEF DESCRIPTION OF THE DRAWINGS

15 For a fuller understanding of the invention, reference is made to the following description taken in connection with the accompanying drawings, in which:

Fig. 1 is a block diagram illustrating the problems encountered in matching a large number of financial account issuers to a large number of merchants/billers in an automated payment system;

20 Fig. 2 is a block diagram illustrating the use of the present invention in efficiently matching a large number of financial account issuers to a large number of merchants/billers in an automated payment system;

Fig. 3 is a block diagram of a preferred embodiment of an apparatus for carrying out the automated credit card payment method and system of the present invention;

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

Preferred embodiments of the invention are now described with reference to the drawings. Although many of the drawings and descriptions illustrate the use of the invention with credit card accounts for the sake of simplicity, the invention is in no way meant to be limited to credit card accounts.

Referring to Fig. 3, an automatic payment system 50 according to one embodiment of the present invention is shown. The system 50 may utilize any combination of many types of financial accounts and is described with reference to credit card accounts for simplicity. The system 50 may be operated by a company, such as a service bureau, and includes a database consolidation and sorting subsystem 55, a master credit card database 57, an identifier matching and selecting subsystem 59, and an optional credit card account number encryption subsystem 53.

The automatic payment system 50 is used in conjunction with  $n$  number of credit card issuers  $60_0$  to  $60_n$ . Each of the  $n$  credit card issuers 60 maintains on a computer system its own credit card information list  $66_0$  to  $66_n$  in accordance with one of a number of conventional format types known to those of skill in the art. These credit card information lists 66 typically contain account holder identification data, such as the name and address of each account holder, as well as the associated credit card number, name of financial institution, account information and demographic information pertaining to each card holder. One skilled in the art will recognize that although the preferred embodiments are described with reference to the use of credit cards, other financial account information or devices, including but not limited to smart cards, bank cards, checking accounts, and virtual payment accounts used for Internet and other on-line commercial transactions, may be used instead of or in any combination with credit card accounts.

The automated payment system 50 receives credit card information lists 66 over

a transmission medium 68 from the  $n$  credit card issuers 60. This transfer of information over medium 68 may be achieved by many communications methods, including but not limited to modem connections, high speed data lines, the Internet, or the physical transfer of storage media, such as tapes or disks. This transfer is authorized by contractual relationships and may include financial incentives. In order to increase the likelihood of locating customer credit card information, it is preferable to include the credit card account information from as many credit card issuers as possible. The database consolidation and sorting subsystem 55, which may be in the form of a programmed computer system, sorts and consolidates the credit card information 66<sub>o</sub> to 66<sub>n</sub> provided by the credit card issuers 60<sub>o</sub> to 60<sub>n</sub>, and the sorted and consolidated data is then stored in the master credit card information database 57. This database may reside on a mass storage unit of the computer system. Of course, the processing elements and information storage elements may reside on multiple computing devices to provide for contingencies such as fault tolerance and load balancing.

The automated payment system 50 is used to provide credit card account information to one or more of  $m$  number of merchants/billers 70<sub>o</sub> to 70<sub>m</sub>. Each of the  $m$  merchants/billers may maintain on a computer its own list 76 of customer identification data. These lists 76<sub>o</sub> to 76<sub>m</sub> include customer identification data such as names and addresses of customers or additional information, such as social security numbers and demographic information. The automatic payment system 50 receives the customer identification data from a given merchant/biller 70<sub>x</sub>, and the matching and selecting subsystem 59 compares the customer identification data supplied by merchants/billers 70<sub>x</sub> with the records in the master credit card information database 57 to locate matching credit card holder identification data. The matching and selecting subsystem 59 may be in the form of a preprogrammed computer system which is either the same as the one used for the database consolidation and sorting subsystem 55, or separate therefrom. The process of matching customers from a merchant/biller database to credit card account holders in the matching and selecting subsystem 59 may be performed using conventional matching algorithms as known to those of skill in the art.

If more than one credit card holder identifier matches a given customer (i.e., the customer has more than one credit card), one or more of the matching credit card identifiers is selected or featured by the matching and selecting subsystem 59. This selection

proceeds in accordance with certain selection and presentation rules. As an illustrative example, a simple selection rule is used wherein the selected credit card is the one issued by the issuer having the most credit cards in the database, i.e., the most “popular” or predominant credit card. Alternatively, in one embodiment, the selection is made on a pro rata basis or other algorithm based on the total number of credit card accounts for each issuer in relation to the number of credit card accounts for the other issuers and the total number of credit card accounts in the master credit card database 57. Thus, for example, a credit card issuer which accounts, for example, for 25% of the total number of credit card accounts in the consolidated database, will have its associated credit card account selected 25% of the time for customers 10 who have multiple credit card number accounts including that issuer. Another method of selecting one associated credit card account number from more than one matching associated credit card account is to compare the selected associated credit card account numbers with credit card usage information to determine the customer’s primary credit card, based on amount of use, and selecting the customer’s most often used credit card. Yet another method 15 of selecting an account may take into consideration the fees associated with financial transactions and select the financial institution that charges the lowest fees. Alternatively, the selection process may take into account historical data and select the financial institution that yields the best results or success for a particular merchant/biller. Finally, the selection may be made as a result of fees paid by the credit card issuer to receive priority in the selection 20 process.

In alternative embodiments, more than one credit card, or all of the credit cards, may be selected for inclusion, and the customer is given the option of selecting which one of the cards is to be used for making payment. In this embodiment, all matching credit card account numbers may be selected and presented to the customer. The selected credit card 25 accounts may be presented to the customer in a list with a check box, such as in the following form:

Choose the card(s) with which you wish to pay:

\_\_\_\_\_ CITIBANK VISA

\_\_\_\_\_ DISCOVER

30 \_\_\_\_\_ AMERICAN EXPRESS

In a more preferred embodiment of the present invention, the selected credit card accounts can also be ordered and presented to the user, based on similar criteria as that used by the system to determine the selection of credit cards, *e.g.*, the most popular card in the database, the customer's most often used credit card, the card that charges the lowest fees, or the card whose issuer has paid the highest fee, can be presented above or ahead of other credit cards.

The selected credit card account number or numbers which are to be included on a commercial communication are encrypted by a credit card account number encryption subsystem 53. The particular method of encryption may include a finder number, record locator, some form of high level encryption, or any other encryption technique. While encryption is an element of the preferred embodiment, the method of encryption may be any method which achieves adequate security and the specific method of encryption does not constitute a material element of the system and method set forth herein. Moreover, credit card information may be encrypted and provided in encrypted form from the credit card issuers 60 before being stored in the master credit card information database.

15 Fig. 4 illustrates the use of encrypted account information of the present invention, and specifically, encrypted credit card information for the sake of simplicity. In one embodiment, for each customer in a merchant/biller's customer identification data database 76, the encrypted credit card account number associated with the customer is provided by merchant/biller 70<sub>x</sub> to the customer (step 80) as part of the communication to the customer 20 from merchant/biller 70<sub>x</sub>. Alternatively, in a bricks-and-mortar embodiment of the present invention where the bricks-and-mortar merchant does not have a "customer information database," the customer communicates directly to the central database 57 via a payment process interface, *e.g.*, a terminal or computer. At step 90, the customer decides whether to authorize payment by credit card. This authorization step may also include selecting which 25 credit card(s) to use if the customer is presented with more than one. If the customer authorizes such payment and returns the commercial communication to the merchant/biller or other payment processing entity, the encrypted credit card account number is decrypted at step 100. The encrypted number may be sent by the system 50 to the credit card issuer, a payment processor or merchant for decryption and/or payment processing. After decryption the credit 30 card account number is used to process payment to merchant/biller (step 110) and payment is made to the particular merchant/biller, along with any required payments for use of the system

in handling the transaction. If the customer 90 does not authorize payment, steps 100 and 110 are simply not performed.

It should be understood that elements of the system and method of the present invention described herein, such as in Figures 3 and 4, may be modified in keeping with the intended scope of the invention. For example, the consolidated credit card account database has been described as containing account information from multiple credit card account issuers. However, the merchant/biller's customer identification data may alternatively be matched serially against multiple databases, including individual credit card issuers' credit card account databases and/or one or more consolidated database. Each individual or consolidated database represents some number of credit card issuers which is a subset of all the issuers.

Fig. 5 shows an alternative embodiment of an automated payment system 50' according to the present invention. The system 50' of this alternative embodiment includes a serial matching subsystem 59' and a selection/presentation subsystem 59''. The serial matching subsystem compares customer identification data, received over transmission medium 1569 from a merchant or one or more customer databases 76 of a given merchant/biller 70, to a number of credit card databases 66 of a number of issuers 60. The serial matching subsystem may also compare the customer identification data with a consolidated database 58 containing information consolidated from a limited number of issuers 60, in this case, issuers 3 and 4. The serial matching subsystem locates matches of the merchant/biller's customer identification data with account holder identification data contained in the individual and partially consolidated databases 66 and 58, as discussed above. Once a set of matching credit card account numbers is located, the selection subsystem 59'' selects one or more of the account numbers, in accordance with the selection rules discussed above.

Referring now to Fig. 6, therein is shown a block diagram of an embodiment of the automated credit card payment system of the present invention as applied to merchant/billers. In this arrangement, multiple merchant/billers 150 use a fulfillment house 152 and a service bureau 154 employing the system of the present invention to deal with multiple credit card account databases 156, one or more of which may be partially consolidated databases as explained above. More than one fulfillment house 152 may be utilized to serve the various merchant/billers and/or groups of merchant/billers, or one fulfillment house 152 may be used for each biller 150. Merchant/billers 150 provide the fulfillment house 152 with

each of their customer files 158 and outside lists 160 (e.g., lists of prospective customers). The service bureau 154 uses the system of the present invention to match the names on the merchant/billers' customer files 158 with associated financial account information. This information, including credit card information, is consolidated by the service bureau 154 from multiple credit card issuers 156 and is stored in a master credit card file. Alternatively, this credit card information can be accessed serially from databases of the multiple credit card issuers.

After matching the merchant/billers' customer files 158 and outside lists 160 with associated financial account information, the service bureau encrypts the matching credit card account numbers (block 162) and provides them to the fulfillment house 152. The use of the located credit card information is shown in the flow chart of Fig. 7, where fulfillment house 152 uses the encrypted credit card account information in marketing, billing and/or renewal efforts (step 164), such as by placing encrypted credit card account numbers on commercial communications. At step 165, customers authorize the use of their credit card, and optionally select which credit card to use if more than one is presented to the customer.

When customers place orders using the encrypted credit card account information on the commercial communication, the orders are collected and the encrypted number entered and consolidated into a consolidated order file (step 166). The encrypted account numbers in the consolidated order file are then decrypted (step 170) and payments are processed (step 172).

Referring now to Figs. 8 and 9, there is shown another embodiment of the present invention. In this embodiment, the system 200 is designed for use over a computer network, for example, over the Internet, a LAN, WAN, or the like. The system 200 includes an automated payment server 202 that includes a processing unit 204 and a customer database 206 maintained by the processing unit, and is similar in many respects to the automated payment system 50 described above. The database combines account information from various financial institutions, as well as bill information from various billers.

The automated payment server 202 connects to a plurality of customers at respective terminals 208, and interacts with those customers via a suitable customer interface 210 (only one terminal is shown schematically in FIG. 8). The customer interface can be a basic application used to select payment options, a method of viewing bills from various

billers, and/or a full-service interface that combines those functions and allows the customer to re-configure the account. It will be apparent to those skilled in the art that various forms of interface may be employed.

The automated payment server 202 further connects to one or more merchant sites 212 over one or more communication lines 214. Preferably, at least one of the lines 214 is a secure line for transmission of payment information, as is described in greater detail below.

The automated payment server 202 is connected to various financial institutions 220 and to various billers 222. The automated payment system 202 receives account information, including updated account information, over a transmission medium from the financial institutions, and receives billing information from the various billers, as described above in connection with the automated payment server 50. For example, various utilities may transmit bills electronically to their customers via the payment server 202. An automated account information merge/purge subsystem 224 and an automated bill information merge/purge subsystem 226, which may be in the form of programmed computer systems, sort and consolidate the account and bill information provided by the financial institutions and billers, and the sorted and consolidated data is then stored in the customer database 206 for subsequent access, as is described in greater detail below.

The customer terminals 208 can take many different forms, and can access the automated payment server 202 in many different ways. For example, the customer may transmit purchase requests via a brick-and-mortar terminal, E-mail, or over the Internet by clicking on a banner on a web site, through interactive television, WebTV®, over the telephone, by direct mail, or in any other suitable manner. In one embodiment, the merchant site 212 may post a banner indicating that payment for a transaction may be conducted through the automated payment server 202. The customer can then click on the banner and be directed to the automated payment server, as is described in greater detail below.

The customer interface 210 is preferably a suitable interface that allows the automated payment server 202 to simultaneously communicate with multiple customers over the Internet or other computer network.

Referring now to Fig. 9, the operation of the automated payment server 202 is described in more detail. Operation begins at step 300, with a customer beginning the

transaction by communicating with a merchant 212 and either placing an order or requesting to pay a bill for goods or services. In one embodiment, the merchant site presents the customer with a banner having an embedded URL of the automated payment server 202, or alternatively the merchant site can automatically direct the customer to the automated payment server when the customer places an order. At step 302, the customer is linked to the automated payment server 202, and at step 303 the server determines whether the customer is registered with the server. If the customer is not registered, operation proceeds to step 304, and the customer registers with the payment server. Registration can be conducted over the computer network, over the telephone, through the mail, or in any other suitable manner, and involves receiving identifying information from the customer to verify the identity of the customer for all subsequent transactions. For example, the customer may provide their name, address, etc., along with their mother's maiden name, a social security number, or the like. The customer may also provide biometric information, *e.g.*, fingerprint sample, handwriting sample, retina scan, or voice recording/pattern. Once the customer's identity has been verified, a password is selected for the customer (either chosen by the customer or randomly assigned by the payment server), as is well known in the art.

If the customer is already registered with the payment server 202, the customer inputs his or her user name and password at step 303, and after authentication or verification, the customer is allowed to continue with the payment transaction.

The merchant 212 transmits order and/or payment data to the payment server 202, either automatically or after being prompted by the payment server, at step 305. The data preferably identifies the customer, for example by including order ID data and/or a customer UPI, which is also transmitted to the payment server when the customer accesses the payment server. Alternatively, the merchant site may transmit the customer's name or any other identifying data to allow the payment server to associate the customer with the particular order or payment request.

The customer's UPI or other identifying information is associated with the customer's financial account(s). The UPI can be in the form of a name, password, PIN, ID number, or other unique identifier. Alternatively, the UPI can take the form of a fingerprint, retina scan, voice pattern, handwriting sample, or other unique "biometric" identifier. These biometric identifiers, in some cases, can be used in conjunction with a password or PIN. The

recording, capturing, and storing of unique biometric identifiers such as retina scans, iris scans, voice patterns, digital handwriting samples or digitally scanned fingerprints are described in U.S. Patent Nos. 6,047,281; 6,038,334 and 5,991,408, the disclosures of which are incorporated herein by reference. In one possible embodiment of the invention, the customer's UPI is recorded and/or authenticated using prior art devices, such as digital scanners, cameras or recorders, attached to the consumer's computer or located at a bricks-and-mortar or other merchant terminal as exemplified in Fig. 12.

Once the payment server has associated the customer with the order or payment request, operation proceeds to step 306, and the payment server accesses the customer database 10 to retrieve the customer's account information, which as described above is in the form of various credit cards, debit cards, smart cards, bank cards, demand deposit accounts such as checking accounts, virtual payment accounts, wire transfer networks, financial electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), payment products from third party, non-bank financial institutions such as CyberCash and TransPoint (MSFDC), stored 15 value tools such as VisaCash and Mondex, and the like. Then, at step 308, the payment server 202 presents the customer account information to the customer (Fig. 10). The account information identifies the various financial to the customer, without transmitting entire account numbers to the customer. For example, some identifying information is transmitted, such as the name of the credit card, the last several digits of a credit card, or the like (e.g., "AmEx 206543"). The account information may include, in addition to identifying the various credit cards and the like, available balance information, date of the last update to that account, date of last payment, credit limit, transaction detail, and the like.

At step 310, the customer selects one or more payment options, and that selection (or selections) is transmitted to the payment server via the interface 210. Thus, the 25 actual account numbers are not transmitted between the payment server and the customer.

The customer may choose to split a payment between two or more financial accounts, for example, two or more credit cards. In addition, the payment server can present the accounts to the customer in some specific order, as defined by the customer, the financial institutions, particular merchants, account usage, available balances, interest rates, and the 30 like.

In one embodiment, the payment server 202 presents the customer only with

appropriate payment options. For example, if the purchase amount is \$100, and the customer's checking account has a balance less than \$100, the payment server preferably does not provide that as an option to the customer. Alternatively, the checking account may be presented to the customer, but in a different color or font to indicate to the customer that such account is not suitable for the particular transaction, but can be used in connection with another payment option to complete the transaction.

At step 312, the payment server 202 transmits a request for authorization to the payment processor of the merchant site 212, which includes the payment option selected by the customer. At step 314, the customer interface determines whether the payment option is acceptable. For example, the customer may have selected a credit card that is not accepted by the particular merchant. If so, operation proceeds to step 316, and the customer is informed that the authorization failed. Operation then flows back to step 308, to allow the customer to select another payment option.

If the payment option is acceptable at step 314, operation proceeds to step 318, and the customer is notified that the transaction has been approved. Then, at step 320, the payment server 202 transmits the approved order or Approval to the merchant site or to the merchant's payment processor 212, preferably over a secure line, and the merchant fills the order by interacting with the customer 208. For example, the merchant site may request shipping information if they do not already have it or other required information to complete the transaction. Then, at step 322, the payment processor accesses the appropriate financial institution and transmits the payment information, so that the customer's account is debited and the merchant's account is credited.

It will be apparent to those skilled in the art that the above steps may also be carried out over a telephone network that allows for interactivity, such as those systems offering voice recognition and/or dual tone multi-frequency (DTMF) tones. As is well known in the art, the customer may enter a user ID and password by pressing the appropriate keys on the telephone, with the payment server including the appropriate, well-known hardware to interpret the DTMF tones to determine the corresponding numbers entered by the customer. Thus, a customer may dial a telephone number, listen to a list of available goods, services and/or bills, and select one or more of the goods, services and/or bills by pressing appropriate keys on the telephone. The payment server, through a well-known interactive system such as

interactive voice response (IVR) or the like, then prompts the customer to enter identification data, such as a user name and PIN number, or the like. Once the identity of the customer is verified, the payment server may then present the customer with a list of credit cards that may be used to complete a transaction. For example, the IVR software may read "Press 1 to select your Visa account, press 2 to select American Express," or the like. The customer may simply press the corresponding key on the telephone to signal the payment server of the customer's choice. The remainder of the process is the same as the computer network version described above. Thus, in this manner the payment server 202 is available to customers over a telephone network.

10           Alternatively, the present invention may be implemented through the mail, by the customer returning an order form sent through regular mail and/or electronic mail. In this manner, the payment server sends a preprinted order form to potential customers, listing various goods, services and/or bills available, and also listing that particular customer's financial accounts as compiled by the customer database 206. The customer selects one or  
15 more of the goods, services and/or bills, selects a financial account for payment from the customer-specific list printed on the form, and returns the order form to the payment server 202. An operator at the payment server then enters the data, or in the case of electronic transfer such as email, the data is uploaded. The payment server forwards the data to the appropriate merchant. If the payment option selected by the customer is not appropriate (e.g.,  
20 the merchant does not accept that type of payment or the available balance is too low), the customer is notified, either through the mail (electronic or regular) or via telephone, and may select another payment option. Once a suitable payment option is selected, the remainder of the transaction is completed along the lines of the computer network version described above.

In an alternative embodiment, the customer who receives the order form or bill  
25 may call a telephone number provided on the form and complete the transaction over the telephone, in the same manner as described above.

In another embodiment, the customer at terminal 208 may access the payment server 202 directly without initially accessing a merchant's site. The customer then may be presented with outstanding bills, as compiled by the automated bill information merge/purge  
30 subsystem 226 (Fig. 11). The customer may select one or more of the bills to be paid, and is then presented with the account information, similar to the process described above with

respect to Fig. 9.

It will be apparent that the system and method of the present invention allow payment transactions to be performed over a computer network without requiring any credit card numbers or the like to be transmitted directly between the customer 208 and merchant 5212, or between the customer 208 and the payment server 202. Thus, no account information passes over a public network such as the Internet. The account information is transmitted over secure lines between the financial institutions and the payment server 202, and between the payment server and the merchant's payment processor or the merchant's site. In addition, multiple merchants do not need to maintain a database of account numbers, as such information is maintained at the payment server 202. Maintaining the database at one location rather than at each individual merchant further reduces the likelihood of fraud.

Referring to Fig. 12, an automatic payment system 50 is shown according to an embodiment that implements use of biometric identifiers and/or PINs. A biometric identifier and/or PIN is collected at a bricks-and-mortar terminal. A bricks-and-mortar terminal may include a computer, digital camera, scanner, recorder or other device capable of capturing such information. The automatic payment system 50 receives the biometric identifier and/or PIN from the bricks-and-mortar terminals 84<sub>x</sub>, and the matching and selecting subsystem 59 compares the biometric identifier and/or PIN 88<sub>x</sub> with the records in the master credit card information database 57 to locate matching credit card holder identification data. The matching and selecting subsystem 59 may be in the form of a preprogrammed computer system which is either the same as the one used for the database consolidation and sorting subsystem 55, or separate therefrom. The process of matching customers from a merchant/biller database to credit card account holders in the matching and selecting subsystem 59 may be performed using conventional matching algorithms as known to those of skill in the art. If a match is found in the master credit card database 57, then the PIN is validated.

As can be understood from the above description of the present invention, the present invention provides a number of benefits to customers (such as credit card users), financial institutions, merchants and billers. Benefits for the financial institutions include reduced fraud, more credit card usage, higher retention rates, and increased fee income. Benefits for the customer include convenience, privacy, and efficiency. Benefits to the merchant/billers are reduced fraud and theft, higher retention rates, less bad debt, savings on

mailing expense, and better customer relationships.

The system and method of the present invention may also be used in conjunction with a targeted marketing or coupon plan in which purchasing behavior can be identified and recorded by the payment server. In one possible embodiment, consumers with financial accounts (including credit card accounts) on the payment server can acquiesce in having their purchasing behavior tracked and provided to a wide variety of businesses and industries. These business and industries can then preferentially target various consumers for discounts, coupons, or other marketing deals based on their past purchases.

Another benefit provided by the present invention is the security and privacy for consumers. Therefore, in accordance with the preferred embodiment of the invention herein, a centralized organization or company is the only party, aside from the financial institutions with relationships with the consumers, as well as the consumers themselves, that has access to the specific financial account information. It should be understood that the functions performed by the central organization may actually be divided between separate entities. For example, one entity may perform processing, while another entity performs encryption/decryption. As described above, only encrypted account information is provided to the merchants/billers; however, it is within the scope of the present invention to provide a system in which accounts are provided to merchants/billers directly, and the merchant/biller or other company encrypts such account information for use in its billing materials. In such a case, once the merchant/biller receives the customer's approval for charging a particular account, it can proceed to decrypt and process the payment from the financial institution directly.

Many other user functions known in the art can be implemented such as the ability to allow a user to modify his user registration information.

While several forms of the invention have been described, it will be apparent to those skilled in the art that various modifications and improvements may be made without departing from the spirit and scope of the invention.

## WHAT IS CLAIMED IS:

1. A method for facilitating payment from a customer's financial account to a merchant/biller or a payment processor associated with a merchant/biller, comprising the steps of:

compiling in a memory financial account information for at least one customer from a plurality of financial institutions;

receiving and storing transaction information relating to a particular customer;

retrieving from the memory the financial account information for the customer;

presenting the financial account information to the customer;

receiving and storing a selection by the customer of at least one of the financial accounts; and

providing the selected financial account(s) information either to the merchant/biller or to a payment processor associated with the merchant/biller.

1           2. The method of claim 1, wherein said financial account corresponds to at  
2 least one of a credit card, charge card, debit card, smart card, bank card, demand deposit account,  
3 checking account, virtual payment account, virtual cash account, wire transfer networks, financial  
4 electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and stored value  
5 tools.

1           3. The method of claim 1, further comprising the step of consolidating at  
2 least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database and wherein said retrieving step includes the step of  
4 searching said consolidated database.

1           4.       The method of claim 1, further comprising the steps of selecting a subset  
2 of one or more financial accounts from among a plurality of customer financial accounts, and  
3 presenting the subset to the customer.

1           5.       The method of claim 4, wherein the subset of accounts includes financial  
2 accounts acceptable to the merchant/biller.

1           6.       The method of claim 1, further comprising the step of dividing payment  
2 for a single transaction among more than one financial account if more than one financial account  
3 is selected.

1           7.       The method of claim 1, further comprising the step of selecting the order  
2 in which one or more financial accounts are presented to the customer before presenting the  
3 financial account information to the customer.

1           8.       The method of claim 1, further comprising the steps of encrypting said  
2 selected customer financial account information prior to providing it to said merchant/biller, or  
3 payment processor, and encrypting or truncating the financial account information before it is  
4 presented to the customer.

1           9.       The method of claim 1, further comprising the step of updating said  
2 financial account information from at least one of said plurality of financial institutions.

1           10.      The method of claim 1, further comprising the steps of determining  
2 whether a customer is a registered customer; and  
3 registering a customer if the customer is not yet registered.

1           11.      The method of claim 10, wherein the step of registering a customer further  
2 includes capturing a PIN and a biometric measurement of the customer.

1           12.    The method of claim 11, wherein the biometric measurement includes  
2 voice patterns, fingerprints, retina scans, or handwriting samples.

1           13.    The method of claim 11, further comprising the step of comparing the PIN,  
2 biometric measurement, or both, against a respective stored database of PINs or biometric  
3 measurements.

1           14.    The method of claim 1, further comprising the step of comparing a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           15.    The method of claim 14, further comprising the step of presenting to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           16.    A method for facilitating payment from a customer's financial account for  
2 a bill selected from a plurality of bills presented to the customer, the method comprising the  
3 following steps:

4                    compiling in a memory financial account information for at least one  
5 customer from a plurality of financial institutions;

6                    presenting the customer with bill information for each of a plurality of  
7 bills;

8                    receiving selection information from the customer specifying a particular  
9 selected bill which is to be paid;

10                   retrieving from the memory the financial account information for the  
11 customer;

12                   presenting the financial account information to the customer; and

13                   receiving selection information from the customer specifying a particular  
14 account to be used to pay the selected bill.

1           17.     The method of claim 16, wherein said financial account corresponds to  
2 at least one of a credit card, charge card, debit card, smart card, bank card, demand deposit  
3 account, checking account, virtual payment account, virtual cash account, wire transfer networks,  
4 financial electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and  
5 stored value tools.

1           18.     The method of claim 16, further comprising the step of consolidating at  
2 least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database and wherein said retrieving step includes the step of  
4 searching said consolidated database.

1           19.     The method of claim 16, further comprising the steps of selecting a subset  
2 of one or more financial accounts from among a plurality of customer financial accounts, and  
3 presenting the subset to the customer.

1           20.     The method of claim 19, wherein the subset of accounts includes financial  
2 accounts acceptable to the merchant/biller.

1           21.     The method of claim 16, further comprising the step of dividing payment  
2 for a single transaction among more than one financial account if more than one financial account  
3 is selected.

1           22.     The method of claim 16, further comprising the step of selecting the order  
2 in which one or more financial accounts are presented to the customer before presenting the  
3 financial account information to the customer.

1           23.     The method of claim 16, further comprising the steps of encrypting said  
2 selected customer financial account information prior to providing it to said merchant/biller, or  
3 payment processor, and encrypting or truncating the financial account information before it is  
4 presented to the customer.

1           24.    The method of claim 16, further comprising the step of updating said  
2 financial account information from at least one of said plurality of financial institutions.

1           25.    The method of claim 16, further comprising the steps of determining  
2 whether a customer is a registered customer; and  
3           registering a customer if the customer is not yet registered.

1           26.    The method of claim 25, wherein the step of registering a customer further  
2 includes capturing a PIN, an IP address or a biometric measurement of the customer.

1           27.    The method of claim 26, wherein the biometric measurement includes  
2 voice patterns, fingerprints, retina scans, or handwriting samples.

1           28.    The method of claim 26, further comprising the step of comparing at least  
2 one of the PIN, IP address, biometric measurement, against a respective stored database of PINs,  
3 IP addresses or biometric measurements.

1           29.    The method of claim 16, further comprising the step of comparing a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           30.    The method of claim 29, further comprising the step of presenting to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           31.    A method for facilitating payment from a customer's financial account to  
2 a merchant/biller or a payment processor associated with a merchant biller over a computer  
3 network, comprising the steps of:

4                    compiling in a memory at a payment server financial account information  
5 for at least one customer, said information being received from a plurality of financial  
6 institutions;

7                    receiving over the computer network transaction information at the  
8 payment server relating to a particular customer and storing the transaction information;

9                    retrieving from the memory the financial account information for the  
10 customer;

11                   transmitting the financial account information over the computer network  
12 to the customer;

13                   receiving over the computer network a selection by the customer of one  
14 or more of the financial accounts and storing the selection; and

15                   transmitting the selected financial account information over the computer  
16 network to said merchant/biller or a payment processor associated with the merchant/biller.

1           32.    The method of claim 31, wherein said financial account corresponds to  
2 at least one of a credit card, charge card, debit card, smart card, bank card, demand deposit  
3 account, checking account, virtual payment account, virtual cash account, wire transfer networks,  
4 financial electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and  
5 stored value tools.

1           33.    The method of claim 31, further comprising the step of consolidating at  
2 least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database and wherein said retrieving step includes the step of  
4 searching said consolidated database.

1           34.     The method of claim 31, further comprising the steps of selecting a subset  
2 of one or more financial accounts from among a plurality of customer financial accounts, and  
3 presenting the subset to the customer.

1           35.     The method of claim 34, wherein the subset of accounts includes financial  
2 accounts acceptable to the merchant/biller.

1           36.     The method of claim 31, further comprising the step of dividing payment  
2 for a single transaction among more than one financial account if more than one financial account  
3 is selected.

1           37.     The method of claim 31, further comprising the step of selecting the order  
2 in which one or more financial accounts are presented to the customer before presenting the  
3 financial account information to the customer.

1           38.     The method of claim 31, further comprising the steps of encrypting said  
2 selected customer financial account information prior to providing it to said merchant/biller, or  
3 payment processor, and encrypting or truncating the financial account information before it is  
4 presented to the customer.

1           39.     The method of claim 31, further comprising the step of updating said  
2 financial account information from at least one of said plurality of financial institutions.

1           40.     The method of claim 31, further comprising the steps of determining  
2 whether a customer is a registered customer; and  
3 registering a customer if the customer is not yet registered.

1           41.     The method of claim 40, wherein the step of registering a customer further  
2 includes capturing a PIN, IP address or a biometric measurement of the customer.

1           42.    The method of claim 41, wherein the biometric measurement includes  
2 voice patterns, fingerprints, retina scans, or handwriting samples.

1           43.    The method of claim 41, further comprising the step of comparing at least  
2 one of the PIN, IP address, and biometric measurement, against a respective stored database of  
3 PINs, IP addresses or biometric measurements.

1           44.    The method of claim 31, further comprising the step of comparing a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           45.    The method of claim 44, further comprising the step of presenting to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           46.     A method for facilitating payment from a customer's financial account to  
2 a merchant/biller or a payment processor associated with a merchant biller, comprising the steps  
3 of:

4                     compiling in a memory at a payment server financial account information  
5 for at least one customer, said information being received from a plurality of financial  
6 institutions;

7                     receiving transaction information relating to a particular customer;

8                     transmitting said transaction information to the payment server and storing  
9 the transaction information;

10                    retrieving from the memory the financial account information for the  
11 customer;

12                    displaying the financial account information on an interface;

13                    receiving a selection by the customer of at least one of the financial  
14 accounts and storing the selection; and

15                    transmitting the selected financial account(s) information either to the  
16 merchant/biller or to a payment processor associated with the merchant/biller.

1           47.     The method of claim 46, wherein said financial account corresponds to  
2 at least one of a credit card, charge card, debit card, smart card, bank card, demand deposit  
3 account, checking account, virtual payment account, virtual cash account, wire transfer networks,  
4 financial electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and  
5 stored value tools.

1           48.     The method of claim 46, further comprising the step of consolidating at  
2 least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database and wherein said retrieving step includes the step of  
4 searching said consolidated database.

1           49.     The method of claim 46, further comprising the steps of selecting a subset  
2 of one or more financial accounts from among a plurality of customer financial accounts, and  
3 presenting the subset to the customer.

1           50.     The method of claim 49, wherein the subset of accounts includes financial  
2 accounts acceptable to the merchant/biller.

1           51.     The method of claim 46, further comprising the step of dividing payment  
2 for a single transaction among more than one financial account if more than one financial account  
3 is selected.

1           52.     The method of claim 46, further comprising the step of selecting the order  
2 in which one or more financial accounts are presented to the customer before presenting the  
3 financial account information to the customer.

1           53.     The method of claim 46, further comprising the steps of encrypting said  
2 selected customer financial account information prior to providing it to said merchant/biller, or  
3 payment processor, and encrypting or truncating the financial account information before it is  
4 presented to the customer.

1           54.     The method of claim 46, further comprising the step of updating said  
2 financial account information from at least one of said plurality of financial institutions.

1           55.     The method of claim 46, further comprising the steps of determining  
2 whether a customer is a registered customer; and  
3 registering a customer if the customer is not yet registered.

1           56.     The method of claim 55, wherein the step of registering a customer further  
2 includes capturing a PIN, IP address or a biometric measurement of the customer.

1           57.    The method of claim 56, wherein the biometric measurement includes  
2 voice patterns, fingerprints, retina scans, or handwriting samples.

1           58.    The method of claim 56, further comprising the step of comparing at least  
2 one of the PIN, IP address and biometric measurement, against a respective stored database of  
3 PINs, IP addresses or biometric measurements.

1           59.    The method of claim 46, further comprising the step of comparing a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           60.    The method of claim 59, further comprising the step of presenting to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           61.    The method of claim 46, wherein the interface includes a terminal, smart  
2 terminal, smart box, keypad, LCD display, cardswipe device or touchpad.

1           62.    The method of claim 46, wherein only those financial accounts acceptable  
2 to the merchant/biller are displayed on the interface.

1           63.    A method for facilitating direct bill payment by a customer, comprising  
2 the steps of:

3                    receiving and storing billing information from a merchant/biller or  
4 merchant payment processor relating to a particular customer;

5                    retrieving from a customer database financial account information for the  
6 customer compiled from a plurality of financial institutions;

7                    presenting to the customer a bill payment interface with one or more of  
8 the customer's financial accounts;

9                    receiving and storing a selection by the customer of at least one of the  
10 financial accounts for payment of the bill; and

11                   providing the selected financial account(s) information either to the  
12 merchant/biller or to a payment processor associated with the merchant/biller.

1           64.    The method of claim 63, wherein said financial account corresponds to  
2 at least one of a credit card, charge card, debit card, smart card, bank card, demand deposit  
3 account, checking account, virtual payment account, virtual cash account, wire transfer networks,  
4 financial electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and  
5 stored value tools.

1           65.    The method of claim 63, further comprising the step of consolidating at  
2 least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database and wherein said retrieving step includes the step of  
4 searching said consolidated database.

1           66.    The method of claim 63, further comprising the steps of selecting a subset  
2 of one or more financial accounts from among a plurality of customer financial accounts, and  
3 presenting the subset to the customer.

1           67.    The method of claim 66, wherein the subset of accounts includes financial  
2 accounts acceptable to the merchant/biller.

1           68.     The method of claim 63, further comprising the step of dividing payment  
2 for a single transaction among more than one financial account if more than one financial account  
3 is selected.

4           69.     The method of claim 63, further comprising the step of selecting the order  
5 in which one or more financial accounts are presented to the customer before presenting the  
6 financial account information to the customer.

1           70.     The method of claim 63, further comprising the steps of encrypting said  
2 selected customer financial account information prior to providing it to said merchant/biller, or  
3 payment processor, and encrypting or truncating the financial account information before it is  
4 presented to the customer.

1           71.     The method of claim 63, further comprising the step of updating said  
2 financial account information from at least one of said plurality of financial institutions.

1           72.     The method of claim 63, further comprising the steps of determining  
2 whether a customer is a registered customer; and  
3           registering a customer if the customer is not yet registered.

1           73.     The method of claim 72, wherein the step of registering a customer further  
2 includes capturing a PIN, IP address or a biometric measurement of the customer.

3           74.     The method of claim 73, wherein the biometric measurement includes  
4 voice patterns, fingerprints, retina scans, or handwriting samples.

1           75.     The method of claim 73, further comprising the step of comparing at least  
2 one of the PIN, IP address or biometric measurement, against a respective stored database of  
3 PINs, IP addresses or biometric measurements.

1           76.    The method of claim 63, further comprising the step of comparing a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           77.    The method of claim 76, further comprising the step of presenting to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           78.    An apparatus for facilitating payment from a customer's financial account  
2 to a merchant/biller or a payment processor associated with a merchant/biller, comprising:

3                   a processor; and

4                   a memory storing processing instructions for controlling the processor, the  
5 processor operative with the processing instructions to:

6                   compile in a memory financial account information for at least one  
7 customer from a plurality of financial institutions;

8                   receive and storing transaction information relating to a particular  
9 customer;

10                  retrieve from the memory the financial account information for the  
11 customer;

12                   present the financial account information to the customer;

13                   receive and store a selection by the customer of at least one of the financial  
14 accounts; and

15                   provide the selected financial account(s) information either to the  
16 merchant/biller or to a payment processor associated with the merchant/biller.

1           79.    The system of claim 78, wherein said financial account corresponds to at  
2 least one of a credit card, charge card, debit card, smart card, bank card, demand deposit account,  
3 checking account, virtual payment account, virtual cash account, wire transfer networks, financial  
4 electronic data interchange (FEDI), Echeck, Automated Clearing House (ACH), and stored value  
5 tools.

1           80.     The system of claim 78, wherein the processor is operative to consolidate  
2 at least two of said plurality of financial account information databases into a single consolidated  
3 financial account information database.

1           81.     The system of claim 78, wherein the processor is operative to select a  
2 subset of one or more financial accounts from among a plurality of customer financial accounts,  
3 and to present the subset to the customer.

1           82.     The system of claim 78, wherein the processor is operative to select a  
2 subset of accounts that includes financial accounts acceptable to the merchant/biller.

1           83.     The system of claim 78, wherein the processor is operative to divide a  
2 payment for a single transaction among more than one financial account if more than one  
3 financial account is selected.

1           84.     The system of claim 78, wherein the processor is operative to select the  
2 order in which one or more financial accounts are presented to the customer before presenting  
3 the financial account information to the customer.

1           85.     The system of claim 78, wherein the processor is operative to encrypt said  
2 selected customer financial account information prior to providing it to said merchant/biller or  
3 to said payment processor, and to encrypt or truncate the financial account information before  
4 it is presented to the customer.

1           86.     The system of claim 78, wherein the processor is operative to update said  
2 financial account information from at least one of said plurality of financial institutions.

1           87.     The system of claim 78, wherein the processor is operative to determine  
2 whether a customer is a registered customer, and to register the customer if the customer is not  
3 yet registered.

1           88.    The system of claim 87, wherein the processor is operative to capture a  
2 PIN, IP address or a biometric measurement of the customer as part of the registration.

1           89.    The system of claim 88, wherein the biometric information includes voice  
2 patterns, fingerprints, retina scans, or handwriting samples.

1           90.    The system of claim 88, wherein the processor is operative to compare at  
2 least one of the PIN, IP address and biometric measurement, against a respective stored database  
3 of PINs, IP addresses or biometric measurements.

1           91.    The system of claim 78, wherein the processor is operative to compare a  
2 transaction value from the transaction information to an available balance value from the  
3 financial account information.

1           92.    The system of claim 91, wherein the processor is operative to present to  
2 customers only those financial accounts with an individual or combined available fund balance  
3 equal to or greater than the transaction value.

1           93.    An apparatus for facilitating payment from a customer's financial account  
2 for a bill selected from a plurality of bills presented to the customer, comprising:  
3           a processor; and  
4           a memory storing processing instructions for controlling the processor, the  
5 processor operative with the processing instructions to:

6                    compile in a memory financial account information for at least one  
7 customer from a plurality of financial institutions;  
8                    present the customer with bill information for each of a plurality of bills;  
9                    receive selection information from the customer specifying a particular  
10 selected bill which is to be paid;  
11                   retrieve from the memory the financial account information for the  
12 customer;  
13                   present the financial account information to the customer; and  
14                   receive selection information from the customer specifying a particular  
15 account to be used to pay the selected bill.

1           94.    An apparatus for facilitating payment from a customer's financial account  
2 to a merchant/biller or a payment processor associated with a merchant/biller over a computer  
3 network, comprising:

4           a processor; and

5           a memory storing processing instructions for controlling the processor, the  
6 processor operative with the processing instructions to:

7                   compile in a memory at a payment server financial account information  
8 for at least one customer, said information being received from a plurality of financial  
9 institutions;

10                   receive over the computer network transaction information at the payment  
11 server relating to a particular customer and storing the transaction information;

12                   retrieve from the memory the financial account information for the  
13 customer;

14                   transmit the financial account information over the computer network to  
15 the customer;

16                   receive over the computer network a selection by the customer of one or  
17 more of the financial accounts and storing the selection; and

18                   transmit the selected financial account information over the computer  
19 network to said merchant/biller or a payment processor associated with the merchant/biller.

1           95.    An apparatus for facilitating payment from a customer's financial account  
2 to a merchant/biller or a payment processor associated with a merchant biller, comprising:

3                   a processor; and

4                   a memory storing processing instructions for controlling the processor, the  
5 processor operative with the processing instructions to:

6                         compile in a memory at a payment server financial account information  
7 for at least one customer, said information being received from a plurality of financial  
8 institutions;

9                         receive transaction information relating to a particular customer;

10                        transmit said transaction information to the payment server and storing the  
11 transaction information;

12                        retrieve from the memory the financial account information for the  
13 customer;

14                        display the financial account information on an interface;

15                        receive a selection by the customer of at least one of the financial accounts  
16 and storing the selection; and

17                        transmit the selected financial account(s) information either to the  
18 merchant/biller or to a payment processor associated with the merchant/biller.

1           96.    An apparatus for facilitating direct bill payment by a customer,  
2 comprising:

3                   a processor; and

4                   a memory storing processing instructions for controlling the processor, the  
5 processor operative with the processing instructions to:

6                         receive and store billing information from a merchant/biller or merchant  
7 payment processor relating to a particular customer;

8                         retrieve from a customer database financial account information for the  
9 customer compiled from a plurality of financial institutions;

10                        present to the customer a bill payment interface with one or more of the  
11 customer's financial accounts;

12                                    receive and store a selection by the customer of at least one of the financial  
13 accounts for payment of the bill; and  
14                                    provide the selected financial account(s) information either to the  
15 merchant/biller or to a payment processor associated with the merchant/biller. --.

(54) Title: APPARATUS, SYSTEM AND METHOD EMPLOYING A WIRELESS USER-DEVICE

FIG. 12

(57) Abstract: Embodiments of the invention generally relate to apparatus, systems and methods for authentication, in particular, apparatus, systems and methods for authenticating an entity for computer and/or network security, secure authorization of a payment or for funds transfer and for selectively granting privileges and providing other services in response to such authentications. In addition, embodiments of the invention relate generally to apparatus, systems and methods for the communication of information between a mobile user-device and a point-of-sale device to securely provide authorization for a financial transaction.

## APPARATUS, SYSTEM AND METHOD EMPLOYING A WIRELESS USER-DEVICE

### 5 RELATED APPLICATIONS

This application claims priority under 35 U.S.C. § 119(e) to each of the following co-  
pending U.S. Provisional Applications: Serial No. 61/384,146, entitled "APPARATUS,  
SYSTEM AND METHOD FOR SECURE PAYMENT," filed on September 17, 2010; U.S.  
Provisional Application Serial No. 61/447,497, entitled "APPARATUS, SYSTEM AND  
10 METHOD EMPLOYING A WIRELESS USER-DEVICE," filed on February 28, 2011 and  
U.S. Provisional Application Serial No. 61/499,961, entitled "APPARATUS, SYSTEM AND  
METHOD FOR EMPLOYING A WIRELESS USER-DEVICE," filed on June 22, 2011, each  
of which are incorporated herein by reference in their entirety.

### 15 BACKGROUND

#### 1. Field of Invention

Embodiments of the invention generally relate to apparatus, systems and methods for  
identification, in particular, apparatus, systems and methods for identifying an entity for  
20 computer and/or network security, secure authorization of a payment or for funds transfer and  
for selectively granting privileges and providing other services in response to such  
identifications. In addition, embodiments of the invention relate generally to apparatus,  
systems and methods for the communication of information between a mobile user-device and  
a point-of-sale device to securely provide authorization for a financial transaction.

25

#### 2. Discussion of Related Art

Millions of financial transactions are conducted daily using electronic systems. Many  
of these are conducted using traditional magnetic stripe readers while others are conducted

- 2 -

using smart-cards, mobile phones or other handheld electronic devices. However, these prior approaches all require that an account number (bank account number, credit card account number, debit card account number, etc.) be provided to authorize the transaction. Because a thief with access to an account number poses a significant financial risk and risk of identity theft, financial service providers go to great efforts to try to communicate the account numbers securely when conducting these transactions.

In addition, electronic transactions often require that a user provide information that uniquely identifies the user to allow financial information or other personal information to be used in completing the transaction. This user-identification is generally static-information, that is, the information does not change over time, for example, user names and/or passwords. In addition, the user-identification information uniquely identifies the user. As a result of the well documented risk posed by identity theft, business entities spend enormous amounts of time, effort and money to protect this static user-identity information. The approaches implemented by business entities include using secure networks to transmit the user-identity information, and alternatively or in combination with the preceding, using various forms of encryption to protect the user-identity information from electronic-eavesdroppers. Regardless, each of these prior approach results in the transmission of the highly-sensitive user-identity information.

Further, traditional approaches to identity authentication rely on a verification process. That is, the authenticator receives static user-identity information along with other information such as a time(or event)-varying code. The authenticator employs the user-identity information to establish the user that the entity purports to be. The authenticator then employs the other information to determine whether that information authenticates that the entity is who they purport to be. Such approaches can include multi-factor authentication in which the entity provides the authenticator with information including evidence of one or more of something the user is (for example, a biometric), something the user knows (for example, a PIN); or something the user possesses (for example, a token). In this example, static information (for example, a user name or password) is used to verify the identity of the user to locate the other information (for example, any of biometric data, the user's PIN and/or a seed associated with

- 3 -

the token) concerning the user which is stored by the authenticator. With a proprietary algorithm and the current time, the authenticator generates a non-predictable code using the other information that is associated with the user. The authenticator then determines whether the time-varying code received from the user is the same as that generated by the authenticator.

5           That is, some existing token technologies use a verification process that requires the user to supply a remote authentication system with a unique static index such as a user name or email address. This static information is used to retrieve the user's file, including a secret seed. With a proprietary algorithm and current time, that seed generates the expected unpredictable code. If the user sends the same code, the possession of the token is "VERIFIED." With  
10       today's powerful computers, it is possible to electronically eavesdrop or otherwise obtain a series of a particular user's codes at different times, and then reverse engineer the algorithm, and unique seed to counterfeit a token.

As mentioned above, however, the preceding approaches must begin with the entity providing the authenticator with the user-identity of the user that the entity purports to be. The  
15       security of these approaches can be breached because each requires the communication of the static identifying information. For example, today's powerful computers can be used by an electronic eavesdropper to reverse engineer the algorithm and the seed based on a series of intercepted time-varying codes generated for a particular user. Such an attack would then allow the eavesdropper to counterfeit the user's token.

20           Because of the previously described shortcomings of current approaches, improved identity-authentication is needed to provide sufficient security in view of the processing power of today's computers and the sophistication of today's eavesdroppers.

#### SUMMARY OF INVENTION

25           According to some embodiments, apparatus, systems and methods employ tokens that never send or transmit any abusable or exploitable static information. For example in one embodiment, an unpredictable number, representing the satisfaction of all three identity factors, is transmitted by radio frequency (RF) to a remote, secure server. In the background, the

- 4 -

remote-server has been generating all non-predictable codes that are being generated on all or a group of authorized tokens. If the transmitted code is matched against the constantly changing database included in the remote server, the user is "IDENTIFIED."

According to various embodiments, identity-authentication is achieved without  
5 transmitting any exploitable static information. In one aspect, a system includes a processor configured to generate a non-predictable code using multiple authentication factors for a user in possession of a token. The system includes a secure authentication system (for example, including a database and associated server) that stores multiple authentication factors for a plurality of users, respectively. In one embodiment, the secure system periodically (for  
10 example, every minute) generates the non-predictable code associated with each of the plurality of users. When a non-predictable code alone without any static index is transmitted from a user token and received at the secure system, the system operates to compare the received code to all non-predictable codes valid at that time. When a match is found, the user is identified. This approach is in contrast to prior approaches in which the user's identity is  
15 "verified."

According to various embodiments, the token includes a mobile phone, a tablet or iPad device or other wireless user-device and the token wirelessly transmits the non-predictable code.

Additional features can be included in combination with the preceding. For example,  
20 in some embodiments, a PIN is not stored in the token. Instead, according to this embodiment, the PIN is entered by the user and immediately integrated in an algorithm such that it is not stored, transmitted or otherwise exposed. According to one embodiment, the algorithm includes an exclusive-or operation performed on the PIN. Further, the non-predictable code is generated without being exposed to the user and is transmitted from the token via radio  
25 frequency (RF) so that it remains unknown to the user. These approaches increase security, speed and convenience.

For example, according to some embodiments, the generation and transmission of the non-predictable code in the preceding approach avoids constraints on the size of data that is

- 5 -

transmitted from the token because the transmitted value is not manually entered by the user. In addition, the potentially large size of the non-predictable value (for example, 20 digits or more) can exponentially increase security while RF transmission dramatically increases speed and convenience.

5           According to some embodiments, the non-predictable value provides evidence of three factors including something the user is (for example, the biometric), something the user knows (for example, the PIN); and something the user possesses (for example, the token with the associated secret seed). Thus, in one embodiment, successful authentication of identity is only achieved where each of the three factors is valid for generation of a non-predictable value  
10           corresponding to the user.

          The robustness of the system can be enhanced in some embodiments by addressing the unlikely circumstance where the same non-predictable code is generated for more than one user for a given time period. According to one embodiment, when the preceding occurs the secure system delays the authentication until the occurrence of immediately subsequent non-  
15           predictable code from the next time period to insure that the authentication proceeds based on a unique identification. In some embodiments, the current code and several future codes may be generated at either or both USR and the token for computational efficiency and instant comparisons. According to one embodiment, the codes are generated at USR on a  
          substantially real-time basis.

20           To reduce the risk of a man-in-the-middle attack, embodiments can operate to have the secure system confirm its identity to the token. In one embodiment, the token generates and transmits a first non-predictable code (or portion thereof) to the secure system. This first non-predictable code is not used to execute the authentication used to approve the requested action. Instead, according to this embodiment, the secure system identifies the user based on the first  
25           non-predictable code (for example, using a code matching algorithm as described herein) and replies by generating a second non-predictable code (or portion thereof) that corresponds to the code that would be generated by the token during the immediately subsequent time period. The token receives the second non-predictable code and determines whether it is correct by

- 6 -

comparing the code to that which it generates. If so, the remote secure system has proven its identity and the token then generates a third non-predictable value that is transmitted to the secure system where it is employed to authenticate the identity of the user.

According to some embodiments, the systems and methods described herein provide  
5 approaches in which the user device (for example, smart phone, tablet, or other form of token) do not store information that can be exploited by a hacker to impersonate the user. In one embodiment, the PIN entered by the user is not authenticated locally at the token. Instead, the PIN is either immediately employed in the generation of a non-predictable value used by a  
10 secure registry to authenticate an identity of the user or is transmitted in a protected manner to the secure registry as part of an authentication process, for example, by XORing the PIN with the non-predictable value. Because the PIN is not authenticated locally, the PIN need not be stored by the token. In one embodiment, the user device does not store information that can be exploited by a hacker to impersonate the user.

Unlike prior approaches in which a non-predictable value is encrypted (either in a  
15 consistent manner or a varying manner), embodiments described herein do not require encryption of the transmitted non-predictable value because the non-predictable value is transmitted without static identifying information. As a result, an eavesdropper gains no knowledge of the identity of the user even where the eavesdropper intercepts the non-predictable value.

20 In accordance with one aspect, a system for authenticating identities of a plurality of users includes a network having at least a portion that includes a wireless network, a computer coupled to the network, a handheld device configured to communicate with the computer over the wireless network and a secure registry system including a communication interface coupled to the network. In some embodiments, the handheld device includes a user interface  
25 programmed to receive user input including secret information known to the user of the handheld device. In addition, the handheld device can include a processor coupled to the user interface where the processor is programmed to authenticate the user of the handheld device and generate a time varying non-predictable value following a successful authentication of the

- 7 -

user by the processor based on the user successfully providing the secret information to the handheld device. Further, the handheld can include a wireless transceiver coupled to the processor and configured to transmit via the network a wireless signal including the time-varying non-predictable value. According to further embodiments, the secure register system includes a communication interface coupled to the network where the secure registry system is configured to receive the time-varying non-predictable value and successfully authenticate the user where the time-varying non-predictable value is matched to the user by the secure registry system. Further, in accordance with some embodiments, a user of the handheld device is permitted to operate the computer to access resources with the computer so long as the computer periodically receives subsequent authentication information that results in a continued successful authentication of the user for time periods subsequent to a time at which the time-varying non-predictable value is generated.

In accordance with some embodiments the handheld device includes a biometric sensor coupled to the processor where the biometric sensor is programmed to receive a biometric input provided by the user and where the processor is programmed to authenticate the user of the handheld device and can generate a time varying non-predictable value following a successful authentication of the user by the processor. In one embodiment, the biometric sensor includes a microphone configured to receive a spoken input provided by the user and the user interface is programmed to display a multicharacter string including at least one of a plurality of alpha-characters and a plurality of numeric-characters, and further where the processor is programmed to authenticate the user based on the spoken input of the multicharacter string by the user. In accordance with some embodiments, the secure registry system is programmed to randomly generate the multicharacter string and communicate the multicharacter string by the network to the handheld device for display.

In accordance with another aspect, a method of authenticating identity using a secure registry system is provided where the secure registry system includes a processor, a communication interface coupled to the processor and database coupled to the processor where the database is configured to store seed for each of the plurality of user respectively and the

- 8 -

processor is configured to generate time-varying non-predictable values using the respective seeds. In accordance with some embodiments, the method includes receiving at the secure registry system a first time-varying non-predictable value generated by a first handheld device in possession of the user the first time-varying non-predictable value generated using a seed  
5 associated with the first handheld device and a first time. Further, the method can include identifying, by the secure registry, the user based on the first time-varying non-predictable value and generating a second time-varying non-predictable value with the secure registry. In one embodiment, the second time-varying non-predictable value is generated using the seed associated with the first handheld device and a second time where the second time is  
10 subsequent to the first time.

In addition, in accordance with some embodiments, the method may also include communicating at least a portion of the second time-varying non-predictable value to the first handheld device. In these embodiments, the second time-varying non-predictable value is employed by the first handheld device to communicate the identity of the secure registry  
15 system by confirming that the second time-varying non-predictable value is valid when generated using the seed at the second time. Further, the method may include authenticating an identity of the user by the secure registry system using the third time-varying non-predictable value generated by the first handheld device and received by the secure registry system. In accordance with these embodiments, the third time-varying non-predictable value is  
20 generated using the seed associated with the first handheld device and a third time subsequent to the second time.

In some embodiments, a method of securing a computing device can include receiving at the computing device a first wireless signal including first authentication information wirelessly transmitted from a mobile device proximate to the computing device, processing,  
25 the first authentication information to initially authenticate a user in possession of the mobile device, the user, attempting to access resources with a computing device. The method can also include temporarily allowing the user to employ the computing device to access the resources when the initial authentication is successful and continuing to allow the user to employ the

- 9 -

computing device to access the resources upon a continued receipt of authentication information from a mobile device that is successfully authenticated. Still further, the method can include automatically terminating use of the computing device by the user based on at least one of: authentication information no longer being received from the mobile device and  
5 authentication information received from mobile device no longer being successfully authenticated.

#### BRIEF DESCRIPTION OF DRAWINGS

The accompanying drawings are not intended to be drawn to scale. In the drawings,  
10 each identical or nearly identical component that is illustrated in various figures is represented by a like numeral. For purposes of clarity, not every component may be labeled in every drawing. In the drawings:

FIG. 1 is a functional block diagram of a computer system configured to implement the universal secure registry (“USR”), including a USR database, according to one embodiment of  
15 the invention;

FIG. 2 is a functional block diagram of a first embodiment of a networked environment including the computer system of FIG. 1;

FIG. 3 is a functional block diagram of an entry of a database forming the USR database of FIG. 1 in accordance with one embodiment;

20 FIG. 4 is a flow chart in accordance with one embodiment;

FIG. 5 is a flow chart in accordance with another embodiment;

FIG. 6 is a flow chart in accordance with still another embodiment;

FIG. 7 is a functional block diagram of a system in accordance with some  
embodiments;

25 FIG. 8 is a functional block diagram of a system in accordance with some further  
embodiments;

FIG. 9 is a flow chart in accordance with one embodiment;

FIG. 10 is a flow chart in accordance with one embodiment;

- 10 -

FIG. 11 is a system block diagram in accordance with one embodiment; and  
FIG. 12 is a system block diagram in accordance with one embodiment.

#### DETAILED DESCRIPTION

5           This invention is not limited in its application to the details of construction and the arrangement of components set forth in the following description or illustrated in the drawings. The invention is capable of other embodiments and of being practiced or of being carried out in various ways. Also, the phraseology and terminology used herein is for the purpose of description and should not be regarded as limiting. The use of “including,” “comprising,”  
10 “having,” “containing,” “involving,” and variations thereof herein is meant to encompass the items listed thereafter and equivalents thereof as well as additional items.

          As used herein, “USR” generally refers to a secure registry, for example, a remote secure registry. In some embodiments, USR is employed as a secure, central repository for a variety of confidential personal information. In various embodiments, this personal  
15 information can be used to authenticate an identity in support of any of the following activities: Credit/Debit Card Purchases; Check Purchases; Wiring Funds; Accessing bank and other financial records; transferring funds between individuals; transferring funds between an individual and vendor and vending machine; providing a form of identification; unlocking and starting a vehicle; unlocking and entering a home, office, hotel room or other secure physical  
20 space; accessing secure physical facilities such as a military base or nuclear reactor; completing applications for loans, mortgages, credit or jobs; accessing and/or logging into a computer, a computer network or a secure server; and completing medical (or other types of) forms.

          In some embodiments, an information system is formed as a computer program running  
25 on a computer or group of computers configured to provide a universal secure registry (USR) system. The computer, in this instance, may be configured to run autonomously (without the intervention of a human operator), or may require intervention or approval for all, a selected subset, or particular classes of transactions. The invention is not limited to the disclosed

- 11 -

embodiments, and may take on many different forms depending on the particular requirements of the information system, the type of information being exchanged, and the type of computer equipment employed. An information system according to this invention, may optionally, but need not necessarily, perform functions additional to those described herein, and the invention  
5 is not limited to a computer system performing solely the described functions.

In the embodiment shown in FIG. 1, a computer system 10 for implementing a USR system according to the invention includes at least one main unit 12 connected to a wide area network, such as the Internet, via a communications port 14. The main unit 12 may include one or more processors (CPU 16) running USR software 18 configured to implement the USR  
10 system functionality discussed in greater detail below. The CPU 16 may be connected to a memory system including one or more memory devices, such as a random access memory system RAM 20, a read only memory system ROM 22, and one or more databases 24. In the illustrated embodiment, the database 24 contains a universal secure registry database. The invention is not limited to this particular manner of storing the USR database. Rather, the USR  
15 database may be included in any aspect of the memory system, such as in RAM 20, ROM 22 or disc, and may also be separately stored on one or more dedicated data servers. According to some embodiments, cloud computing is employed such that access to the USR and associated features and elements is remotely available to users and/or administrators.

The computer system may be a general purpose computer system which is  
20 programmable using a computer programming language, such as C, C++, Java, or other language, such as a scripting language or even assembly language. The computer system may also be specially programmed, special purpose hardware, an application specific integrated circuit (ASIC) or a hybrid system including both special purpose components and programmed general purpose components.

25 In a general purpose computer system, the processor is typically a commercially available microprocessor, such as Pentium series processor available from Intel, or other similar commercially available device. Such a microprocessor executes a program called an operating system, such as UNIX, Linux, Windows NT, Windows 95, 98, or 2000, or any other

- 12 -

commercially available operating system, which controls the execution of other computer programs and provides scheduling, debugging, input/output control, accounting, compilation, storage assignment, data management, memory management, communication control and related services, and many other functions. The processor and operating system defines a  
5 computer platform for which application programs in high-level programming languages are written.

The database 24 may be any kind of database, including a relational database, object-oriented database, unstructured database, or other database. Example relational databases include Oracle 81 from Oracle Corporation of Redwood City, California; Informix Dynamic  
10 Server from Informix Software, Inc. of Menlo Park, California; DB2 from International Business Machines of Armonk, New York; and Access from Microsoft Corporation of Redmond, Washington. An example object-oriented database is ObjectStore from Object Design of Burlington, Massachusetts. An example of an unstructured database is Notes from the Lotus Corporation, of Cambridge, Massachusetts. A database also may be constructed  
15 using a flat file system, for example by using files with character-delimited fields, such as in early versions of dBASE, now known as Visual dBASE from Inprise Corp. of Scotts Valley, California, formerly Borland International Corp.

The main unit 12 may optionally include or be connected to an user interface 26 containing, for example, one or more input and output devices to enable an operator to  
20 interface with the USR system 10. Illustrative input devices include a keyboard, keypad, track ball, mouse, pen and tablet, communication device, and data input devices such as voice and other audio and video capture devices. Illustrative output devices include cathode ray tube (CRT) displays, liquid crystal displays (LCD) and other video output devices, printers, communication devices such as modems, storage devices such as a disk or tape, and audio or  
25 video output devices. Optionally, the user interface 26 may be omitted, in which case the operator may communicate with the USR system 10 in a networked fashion via the communication port 14. It should be understood that the invention is not limited to any particular manner of interfacing an operator with the USR system.

- 13 -

It also should be understood that the invention is not limited to a particular computer platform, particular processor, or particular high-level programming language. Additionally, the computer system may be a multiprocessor computer system or may include multiple computers connected over a computer network. It further should be understood that each  
5 module or step shown in the accompanying figures and the substeps or subparts shown in the remaining figures may correspond to separate modules of a computer program, or may be separate computer programs. Such modules may be operable on separate computers. The data produced by these components may be stored in a memory system or transmitted between computer systems.

10 Such a system may be implemented in software, hardware, or firmware, or any combination thereof. The various elements of the information system disclosed herein, either individually or in combination, may be implemented as a computer program product, such as  
15 USR software 18, tangibly embodied in a machine-readable storage device for execution by the computer processor 16. Various steps of the process may be performed by the computer processor 16 executing the program 18 tangibly embodied on a computer-readable medium to perform functions by operating on input and generating output. Computer programming languages suitable for implementing such a system include procedural programming languages, object-oriented programming languages, and combinations of the two.

As shown in FIG. 2, the computer system 10 may be connected to a plurality of  
20 interface centers 27 over a wide area network 28. The wide area network 28 may be formed from a plurality of dedicated connections between the interface centers 27 and the computer system 10, or may take place, in whole or in part, over a public network such as the Internet. Communication between the interface centers 27 and the computer system 10 may take place according to any protocol, such as TCP/IP, ftp, OFX, or XML, and may include any desired  
25 level of interaction between the interface centers 27 and the computer system 10. To enhance security, especially where communication takes place over a publicly accessible network such as the Internet, communications facilitating or relating to transmission of data from/to the USR

- 14 -

database 24 or the computer system 10 may be encrypted using an encryption algorithm, such as PGP, DES, or other conventional symmetric or asymmetric encryption algorithm.

In one embodiment, the USR system 10 or USR database 24 may be able to authenticate its identity to a user or other entity accessing the system by providing an appropriate code which may be displayed on the user's smart card, mobile device such as a mobile phone, ipad, tablet, laptop, netbook, or on a desktop computer as some examples. A comparison by the user or the code generator between the provided number and an expected number can validate, to the user (or other entity) or a code generator included in the user-device, that communication is with the database and not an imposter. In another embodiment, a challenge-response protocol is employed to authenticate the identity of the USR system and/or the user to the other.

The database 24 shown in FIG. 1 has a USR database containing entries related to persons 1-n. The data in the USR database may also be segregated, according to data type to enable individual computer modules to handle discrete applications on discrete data types. Segregating the data in modules may make access to the database more robust by enabling portions of the data in the USR database 24 to be accessible even when it is necessary to perform maintenance on a portion of the database. However, storing the data in the USR database 24 according to the scheme illustrated in FIG. 1 may make it easier for a user of the database to make changes to multiple types of data simultaneously or in a single session. There are advantages and disadvantages to each data structure, and the invention is not limited to a particular manner of organizing the data within the database 24, data structures other than the two shown also being possible.

As shown in FIG. 3, each entry 30 in the database 24 may contain multiple types of information. For example, in the embodiment shown in FIG. 3, the entry contains authentication information 32, access information 34, publicly available information 36, address information 38, credit card and other financial information 40, medical information 42, job application information 44, and tax information 46. The invention is not limited to a USR containing entries with all of this information or only this particular information, as any

- 15 -

information on a person or other entity such as a company, institution, etc. may be stored in  
USR database 24.

If the database information is split between multiple databases, each database will  
typically include at least the authentication and access information to enable the USR software  
5 to correlate an authentication attempt with a valid authentication, and to enable the USR  
software to determine access privileges to the requested data. Alternatively, databases may be  
linked to permit information not in a main USR database to be retrieved, with successful  
authentication for all databases accessed being done at the USR system.

In FIG. 3, the authentication information is information about the user of the database  
10 to whom the data pertains and is to be used by the USR software 18 to validate that the person  
attempting to access the information is the person to whom the data pertains or is otherwise  
authorized to receive it. The authentication information may be any type of information that  
will reliably authenticate the identity of the individual. For example, in some embodiments,  
the information may include any of a secret known by the user (e.g., a pin, a phrase, a  
15 password, etc.), a token possessed by the user that is difficult to counterfeit (e.g., a secure  
discrete microchip), and/or a biometric information concerning a biometric, for example, a  
voiceprint, a fingerprint, DNA, a retinal image, a photograph, etc.

The user's authentication information may be manually entered or scanned at the  
interface center. However, a variety of types of communication may be employed to  
20 communicate the user's identifying information from the user-device to the computer system.  
For example, near field signal may be employed to communicate information between the  
user-device and the computer system 10. According to one embodiment, the user's  
authentication information is included in (or entered via) the user's cell phone where it is then  
communicated to the computer system 10. In one embodiment, the cell phone is also  
25 configured to receive information from the computer system 10 at the interface center 27.

In one embodiment, the user of the database will carry a user-device that allows for  
secure access to the USR database without requiring the user to transmit any personal  
information. In one embodiment, to access the USR database, the user-device retrieves a

- 16 -

secret seed associated with the device and/or time varying value from memory and obtains from the user a secret personal identification code. The user-device mathematically combines these three numbers using a predetermined algorithm to generate a one-time non-predictable code which is transmitted to the computer system 10. The computer system, specifically USR  
5 software 18, utilizes the received one-time non-predictable code to determine whether the user is authorized access the USR database and grants access to the USR database if the user is determined to be authorized. The authentication information 32 in the database entry in the embodiment of the invention illustrated in FIG. 3 contains information to enable the USR software 18 to validate the user using such a card in this manner.

10 Alternative types of identification cards or tokens may likewise be used. For example, other smart cards may be used which generate non-predictable single use codes, which may or may not be time varying, or other access code generators may be used. An algorithm generating such non-predictable codes may also be programmed onto a processor on user-  
15 devices such as smart cards or other computing devices, such as a cell phone, pager, ID badge, wrist watch, computer (for example, desktop, laptop, netbook, tablet), personal digital assistant, key fob, or other commonly available electronic device. For convenience, the term “electronic ID device” will be used generically to refer to any type of electronic device that may be used to obtain access to the USR database.

Likewise, various types of biometric information may be stored in the authentication  
20 area of the database entry to enable the identity of the user possessing the identifying device to be authenticated at the point of use. Examples of the type of biometric information that may be used in this situation includes a personal identification number (PIN), fingerprint, voice print, signature, iris or facial scan, or DNA analysis. If desired, the verifying section of the database may contain a picture to be transmitted back to the person seeking to validate the device to  
25 ensure the person using the device is the correct person. Optionally, the identifying device itself may also be provided with a picture of the person authorized to use the card to provide a facial confirmation of the person’s right to use the card.

- 17 -

Further, a challenge-response protocol may be employed in combination with or as an alternative to the preceding to validate the person attempting to access the information. Various embodiments may employ a challenge-response protocol with or without an identification card.

5 In FIG. 3, the Access information 34 is provided to enable different levels of security to attach to different types of information stored in the entry 30 in the USR database 14. For example, the person may desire that their address information be made available only to certain classes of people, for example colleagues, friends, family, Federal Express, U.P.S., and the U.S. mail service. The names or universal identifiers for those selected individuals,  
10 companies, organizations and/or agencies may be entered into appropriate fields in the Access information to specify to the USR software 18 those individuals to whom the address information may be released. Likewise, access fields may be specified for the other types of information. For example, the individual may specify that only particular individuals and/or  
15 companies have access to the credit card and other financial information 40, medical information 42, job application information 44 and tax information 46. Additionally, the individual may specify that no one have access to that information unless the individual participates in the transaction (see FIG. 6).

As shown in FIG. 1, the USR software 18 contains algorithms for execution by the CPU 16 that enables the CPU 16 to perform the methods and functions of the USR software  
20 described herein. The USR software 18, in this embodiment, performs all functions associated with validating an electronic ID card. If desired, a separate authentication software module may be provided to validate electronic ID devices outside of a firewall segregating the authentication information from other user information.

This algorithm comprising the USR software 18 may be used to implement, in one  
25 exemplary embodiment, a USR system configured to enable selected information to be disseminated to selected individuals in a secure and dynamic fashion. This information may be used for numerous purposes, several of which are set forth below and discussed in greater detail below.

- 18 -

For example, the USR system may be used to identify the person, enable the person to be contacted by telephone or mail anonymously, enable the person to be contacted by telephone or by mail without revealing the person's telephone number or present location, enable the person to purchase items over the Internet or in a store without revealing to the merchant any personal identification information or credit card information, enable the person to complete a job application without completing a job application form, enable the police to discern the person's identity and any outstanding warrants on the individual, and numerous other uses. The invention is not limited to these several enumerated uses, but rather extends to any use of the USR database.

FIG. 4 illustrates a flow chart of a process 420 for identification of an entity employing the USR. In the illustrated embodiment, the process 420 begins at act 422 where a user registers with the USR. In various embodiments, the registration process can be accomplished remotely over any one of or any combination of wide area networks, local area networks including GSM, Bluetooth, near field communication and Wi-Fi, as some examples. The registration process can include the communication of the user's image, for example, a digital photograph of the user's face that is stored at the USR for use in authenticating the identity of the user in various situations. Further, in various embodiments, the process can require that the user's image be periodically updated to make sure that the image remains current. Other biometric information can also be provided by the user during the registration process, for example, the user can speak the numbers 0-9 for later use in activation of a mobile device as described further herein. This information can be stored with the authentication information 32 as illustrated in FIG. 3.

At act 424, an application, for example, a software application is communicated from the USR to the user's mobile device when the registration is complete. The application can include any of a variety of software programs configured to operate on the user's mobile device, for example, applications programmed for, or using, any of the Java® Platform, Micro Edition (ME), the Android® platform, Linux®, .NET Compact Framework, BREW (Binary Runtime Environment for Wireless), the Symbian platform, the Qt framework, Windows

- 19 -

Mobile®, Palm® OS, as well as applications developed for proprietary operating systems such as Blackberry® by Research In Motion of Waterloo, Ontario, Canada, and iOS by Apple Inc. of Cupertino, Calif.

At act 426, a digital seed which may be encrypted is communicated from the USR to the user's mobile device. In general, the seed is employed to generate a random number, for example, a time varying random number that can be used to identify the user. In some embodiments, the seed is combined with an electronic serial number (ESN) of the token and a digital representation of the time interval. Thus, in accordance with some embodiments, the seed itself is generated in a random fashion at the USR and then stored such that it is associated with the user and can later be used to derive random or pseudo-random one-time codes that are generated at the user device and also at the USR, as is explained further herein.

In accordance with some embodiments, the seed is generated in a random, relatively non-deterministic fashion by the USR using one or a combination of the following non-limiting examples: a real time clock; a counter included in the USR that measures an unstable property of an element (for example, the settling time of an unstable phased locked loop circuit) or the characteristics of a random external event; an analog signal (for example, a voltage produced by noise or data) which is generated by or received by the USR; a random number generator or cryptofunction included in the USR (for example, a multi-stage random number generator; an xorshift random number generator; a linear congruential generator algorithm), the elapsed time of an external function (for example, a wireless message transfer time), or a random number generator provided by an application programming interface (API) included in the USR.

Communication of the seed can be completed over any of a wide area network or a local area network or a combination of both wide area networks and local area networks. For example, the seed can be communicated through a cellular network to a mobile device such as a smart phone. In accordance with other embodiments, the seed can be communicated to the mobile device via a wide area network such as the Internet to a user's personal computer from which it can be communicated to the mobile device via a hardwire USB connection or any

- 20 -

manner of wireless connections such as Bluetooth communication. According to one embodiment, the seed is communicated to the mobile device along with the application. In addition, the seed can thereafter be updated as described below.

5 In accordance with some embodiments, for example, where USR is employed in a system for proximity-based computer security using a wireless user-device (for example, as described in association with FIG. 12) the computer can have a USR element that includes a seed associated with each user authorized to unlock the computer to access resources. In these embodiments, updates to the seed or seeds included in the USR element at the computers can be updated as described above to maintain current information in the computer for the user(s).

10 At act 428, the user requests authorization from the USR for any of a secure payment, authorization for other types of financial transactions, authorization for access to a secure network or physical space, or authorization for any of the activities described previously for which the USR can be employed to authorize the user's action to a third party. That is, once the mobile device is provided with the application and the seed is communicated to the mobile  
15 device, the user has the elements in place with which they can employ the process 420 as generally shown in FIG. 4 to identify themselves in a secure manner to a USR. Accordingly, in some embodiments, the process 420 ends at act 426 for user registration and system activation. Thereafter, the process 420 later begins at act 428, when the user requests authorization to take one or a plurality of the listed actions.

20 Beginning at act 430, the process 420 illustrates a general approach employing the USR to identify the user to authorize an action requested by the user either directly by the user or via an intermediary, for example, a third party conducting a transaction with the user. At act 430, the user employs the mobile device to generate a one-time code, for example, a one-time non-predictable pseudo random code. According to one embodiment, the random code is generated  
25 by employing a combination of time and the seed that was previously assigned to the user and communicated to the mobile device. In some embodiments, the ESN is employed with the preceding. As described further herein, embodiments can allow the time to be substantially synchronized between the USR and the mobile device to provide a highly secure manner of

- 21 -

identifying the user. Further, the seed that is assigned by the USR is stored and maintained by the USR such that the USR has all the information required by which it can generate the random one-time code that corresponds to the random one-time code generated using the mobile device.

5           In accordance to some embodiments, the USR maintains a database for a plurality of user's where the database includes a random seed that is unique to each user where the seeds are assigned by the USR server. As used herein, the term unique indicates that there is no probability that the USR will assign an identical seed (that is, a seed having an identical value) to more than one user for example, pseudo-random seed generation with the result compared to  
10 all previously generated seeds and rejected if there is a match.

          According to various embodiments, the random one-time code is a discrete value that is generated by an algorithm that employs a combination of the seed assigned to the user via the USR and at least one of time (for example, Coordinated Universal Time), an electronic serial number of the mobile device, a SIM card number of the SIM card included in the device and a  
15 PIN number provided by the user. According to some embodiments, any of the seed, the electronic serial number, the SIM card number and the PIN can be stored in a secure element provided with the mobile device. In various embodiments, the secure element can include a microcontroller, memory or other electronic components that can be provided in the mobile device. Further, in various embodiments, the random one-time code is generated by  
20 employing a PIN in combination with any one of or any combination of an electronic serial number of the user-device, a SIM number of the user-device and a seed associated with the device.

          In accordance with one embodiment, at act 434, the USR employs a code-matching algorithm to locate a match between the random one-time code communicated from the mobile  
25 device and the random one-time codes that are calculated for each of a plurality of registered users as provided by the USR. That is, because the USR can host tens of millions or more registered users, the USR is programmed to conduct code-matching searches by first determining a current code associated with each user and then comparing the random one-time

- 22 -

code received from the user by the mobile device with all the codes calculated for that moment in-time by the USR. At act 436, the user is identified if a match is found. The USR then reviews the authorization request to determine whether the identified-user has the permission required to take the requested action, i.e., the USR determines whether the requested action is  
5 consistent with those associated with the user.

According to some embodiments, registered users are organized into groups, for example, based on the geography, to reduce the plurality of users that are processed with the code-matching algorithm on receipt of a random one-time code. In one embodiment, location information can be transmitted with the random one-time code from a user's mobile device.

10 According to some embodiments, the approach illustrated in FIG. 4 can be employed over periods of time for a variety of authorized activities requested by the user. Thus, at act 438, the mobile device and the USR are available for identification to support the user's subsequent activities as needed. In accordance with the illustrated embodiment, the process begins again for a subsequent act at act 426, however, in some embodiments, the process can  
15 begin at act 428. Where, for example, the same seed is to be employed in the subsequent authorization request made relatively close in time to the first request.

FIG. 4 also illustrates an embodiment in which there are a plurality of ongoing actions that can take place in the process 420. For example, at act 440, an updated seed is assigned to the user by the USR and communicated to the mobile device. The preceding can be conducted  
20 at a known interval (i.e., periodically) or in a more random nature that is sufficient to maintain the level of security required of the process 420. Thus, in various embodiments, the updated seed can be provided at act 440 on the frequency of less than one minute, between one and fifteen minutes, hourly, daily, weekly, or at some other interval that is either a known frequency or a variable frequency. In some embodiments, the interval can be established to  
25 achieve a desired level of security, for example, where the more frequently the seed is updated the greater the security.

As also illustrated in FIG. 4, according to some embodiments, the process 420 can be used to assist a user in making payments and/or fund transfers from the user's account which is

- 23 -

maintained with the USR. As is described in greater detail herein, such an approach can provide the user with a means by which the mobile device can be employed to transfer funds between their account and the account of another authorized user after the parties have agreed to the transfer and after the USR has been employed to identify the parties to the transaction.

5 In addition, the USR can be employed to maintain the accounts such that the transfer of funds occurs within the USR from an account of a USR-account of the payer to a USR-account of the payee.

According to one embodiment, the user can establish a fund's transfer account with the USR during the act of registration 422 or sometime thereafter. In the illustrated embodiment, 10 the user establishes the funds-transfer account at Act 442. Further, the user can activate the account by transferring funds to the USR, for example, such as electronically transferring the funds, wiring the funds, charging the funds to an account or mailing a check to the USR administrators. Once populated with funds, the account can be employed to make or receive payments or otherwise transfer funds between their accounts and the accounts of other 15 authorized, registered USR users.

In some embodiments, authorized users (that is, payors or payees) are established on temporary, real-time basis to conduct a one-time transaction. In further embodiments, registered USR users are authorized by a payor for an anticipated series of transactions over a longer period of time in the future.

20 Further, one of the ongoing actions illustrated in 420 includes the act 444 at which automatic replenishment of funds can be applied to the user's account. Such an approach can rely on preauthorized transfers or debits from the user's existing bank accounts or other forms of electronic transfer funds such as a transfer of funds from a credit card or debit account. The acts 442 and 444 are illustrated in phantom because they are optional in accordance with some 25 embodiments.

Referring now to FIG. 5, a process 460 is illustrated by which a user can employ a mobile device to receive an authorization for one or more of the user's activities. Some embodiments include a process by which a user activates a mobile device for use in having

- 24 -

their identification confirmed. According to one embodiment, the process 460 includes act 462 in which a user enters a PIN number in their mobile device and at Act 464, the PIN number is communicated to the USR, for example, in an encrypted form. According to some embodiments, at Act 466, the USR compares the PIN to PINs associated with a plurality of users all stored at the USR, and where the PIN matches the identity of a user, communicates the multi-character numeric value to the user's mobile device. According to this embodiment, the user's spoken input of the numeric value is employed to authenticate the user to activate the mobile device for use in an identification process with the USR. Thus, in accordance with one embodiment, the user's spoken input is communicated to the USR for authentication in order to activate the mobile device. According to another embodiment, at Act 466, the authentication of the user's spoken input is accomplished at the mobile device. In other embodiments, the mobile device can have limited functionality (for example, allowing a user to make phone calls or browse the Internet) prior to device activation while preventing the mobile device from being employed to execute secure transactions or take other actions that require interaction with USR based-authentication until a device activation process is complete (for example, acts 462, 464 and 466 of the process 460).

In some embodiments, entry of a PIN is not required. Instead, a selection of the USR application results in the multi-character value being presented to the user in a display of their mobile device. The user's spoken input of the multi-character value is then authenticated at act 466.

According to various embodiments, the device activation portion of the process 460 (the acts 462, 464, and 466) can differ from that described above, for example, the PIN may be used to derive a non-predictable value that is used to identify the user prior to communication of the multi-character numeric value. In still further embodiments, the process 460 does not include the acts 462, 464 and 466.

Although the process 460 is described as employing a multi-character numeric value, other embodiments can employ a multi-character string that includes either or both alpha or numeric characters. In some embodiments, the user interface of the mobile device (for

- 25 -

example, the wireless user device 652, 735) is configured to display a multi-character string including at least one of a plurality of alpha-characters and a plurality of numeric-characters where a processor included in the mobile device is programmed to authenticate the user based on the spoken input of the multi-character string by the user. In a further embodiment, the processor included in the mobile device is programmed to authenticate the spoken input on a character-by-character basis.

According to various embodiments, the device activation portion of the process 460 (the acts 462, 464, and 466) can be employed by a user to allow their identity to be confirmed and their actions authorized in any of a wide variety of environments and situations. For example, at act 468, the activated mobile device can be employed with the mobile device to make a financial payment or credit/debit card payment or funds transfer using the USR. At act 470, the mobile device can be activated to make a direct personal payment and/or funds transfer between accounts within the USR, including third-party accounts. In accordance with a further embodiment, at act 472, the device can be activated to allow the user's identity to be determined and their actions authorized in a number of other situations, for example, to gain access to a secure computer network, to perform other types of commercial transactions, to proceed through security checkpoints, access physical facilities, etc.

Returning again to act 468 and the use of the mobile device with USR based identification system, the process 460 can be employed at a point-of-sale. For example, a user located in a store or other commercial environment at the point-of-sale. The transaction details are communicated from the point-of-sale to the mobile device for review by the user. Such transaction details can include information, for example, the purchase amount, the name of the vendor, time and date, and even a list of the individual item or items that are being purchased. This provides the user with an opportunity to review and approve the transaction on their mobile device. At act 474, the user can elect to accept the transaction by, for example, selecting an element in the user interface of the mobile device or cancel the transaction. Where, for example, the user elects to cancel the transaction, the process 460 ends at act 476. Alternatively, should the user accept the transaction, the process moves to act 478. At act 478,

- 26 -

the mobile device generates a random one-time code as described, for example, in the embodiments of FIG. 4. At act 480, the one-time code is communicated to the USR along with the transactions details. In some embodiments, the transaction details can include a code representing one of a plurality of accounts.

5           The communication with the USR can occur via the POS or independent of the POS, depending on the embodiment. At act 482, the USR receives the random one-time code and employs the code-matching search to identify the user. The user is identified when a match is found between the random one-time code communicated to the USR and the USR-calculated codes determined for the registered group or groups of users. This registered group or groups  
10 of users can be those other registered users who also employ the identification approach described herein. Alternatively, the various group or groups can be divided into subgroups of users who may have some common association or identifying feature that USR can employ in organizing and segmenting the data in the database to increase the processing speed of the code-matching algorithm. Regardless of the size of the group, however, the USR employs a  
15 code-matching search and identifies the user when a match is found between a USR-calculated code included among a plurality of codes calculated for the plurality of users, respectively, and the code generated with the mobile device.

At act 484, the USR determines whether the identified-user is authorized to complete the transaction, for example, does the identified-user have a financial account with USR and if  
20 so are they credit-worthy. At act 488, the USR communicates a denial of a transaction if the identified user is not authorized to complete such a transaction. At act 486, the USR communicates an authorization, for example, communicates the authorization to the point-of-sale along with a digital image of the user if the identified user is authorized to complete the transaction. The digital image may come directly from USR or partially from USR and  
25 partially from the mobile device.

According to some embodiments, the random one-time code generated at act 478 is communicated along with static identifying information at act 480, for example, where a verification process is employed to authenticate the identity of the user of the mobile device.

- 27 -

According to other embodiments, static identifying information is not communicated to USR with the random one-time code generated at act 478, for example, where an identification process is employed to authenticate the identity of the user of the mobile device.

In addition, a device activation process (for example, the device activation provided in 5 by acts 462, 464, 466) can be employed without the remaining acts included in the process 460 illustrated in FIG. 5. For example, the acts 462, 464, 466 can be employed independently in a process that may not include any communication with the USR and/or may not include generation of a one-time code using the mobile device.

Referring now to FIG. 7, a functional block diagram of the USR is illustrated in 10 accordance with one embodiment. According to some embodiments, the USR 640 is employed to identify a user from among a plurality of users based on the receipt of a random one-time code from a remote system element. According to various embodiments, the remote system element can include any of: an electronic device such as a handheld electronic device; a point-of-sale device; a computer, server or other network device, for example, wireless user 15 devices 652 and 735 described herein. Accordingly, in some embodiments the remote system element includes a mobile phone such as a smart phone. Further, in some embodiments, any of the elements illustrated in FIG. 7 can be included in the USR systems or portions thereof illustrated in FIGS. 1-3 either alone or in any combination with other elements described herein.

20 In the embodiment illustrated in FIG. 7, the USR 640 includes a seed generation module 642, a database of assigned seeds 644, a generation module 646, a time reference 648, a comparison module 645, a first communication module 647 and a second communication module 649. Other arrangements and system configurations are possible depending upon the desired functionality. For example, the embodiment illustrated in FIG. 7 can be employed with 25 the USR system configurations illustrated herein. Accordingly, in some embodiments system elements that communicate with the USR to execute the processes illustrated in Figs. 32, 33 and 34 can include any of the mobile device 674, the POS terminal 676, the interface device 682, the mobile device 652, the network access device 658, the wireless user-device 735 and

- 28 -

the computer 736 as some examples. In some embodiments, one or more of the preceding system elements can communicate with the system 640 via the second communication module 649. Further, functionality other than that illustrated in FIG. 7 can also be provided with the USR. In particular, the USR illustrated in FIG. 7 can include functionality such as any or  
5 select portions of the functionality described herein concerning other embodiments of the USR. Further, any of the illustrated modules can be configured in hardware, software or a combination of hardware and software depending upon the embodiment.

Accordingly, it should be appreciated that embodiments can include other modules and/or modules configured differently than those illustrated. For example, the first  
10 communication module 647 and the second communication module 649 can be included in the same module; the comparison module 645 can include a database, data-table or data-tree to store the current random one-time codes for comparison, or alternatively, a separate database, data-table or data-tree can be included to store the current random one-time codes which are provided to the comparison module 645 for comparison. In various embodiment s, each of the  
15 modules included in the USR 640 is coupled to others of the modules.

According to one embodiment, the seed generation module 642 is in communication with at least the database module 644 and the second communication module 649. The database module 644 is in communication with at least with the generation module 646. Further, in the illustrated embodiment, the time reference 648 is in communication with the  
20 generation module 646. In addition, the generation module 646 is in communication with the comparison module 645, while the comparison module 645 is also in communication with each of the first communication module 647 and the second communication module 649.

In accordance with one embodiment, the seed generation module 642 operates to randomly generate (for example, without replacement) and assign seeds for a plurality of users  
25 registered with the USR, for example, users 1-N. Further, the generation module 642 communicates the seeds and their assignments to the database module 644 where the assigned seed associated with each user for a given time period are stored in association with one another such that they can be searched and retrieved. According to a further embodiment, a

- 29 -

separate assignment module is included in the USR and operates to receive the seeds from the seed generation module 642 and assign the seeds to the plurality of users. In accordance with various embodiments, the database module 644 can include a relational database such as relational database such as Oracle® Database by Oracle Corp. of Redwood Shores, Calif.,  
5 Advantage Database Server or SQL Anywhere, each by Sybase of Dublin, Calif., MySQL™ by Sun Microsystems of Santa Clara, Calif., DB2® by IBM Corp. of Armonk, N.Y., or InterBase by Embarcadero Technologies of San Francisco, Calif. In other embodiments, the database module can include an object-oriented database such as InterSystems CACHÉ by InterSystems Corp. of Cambridge, Mass., JADE by Jade Software Corp. of Christchurch, New  
10 Zealand, or FastObjects by Versant Corp. of Redwood City, Calif.

In accordance with some embodiments, the second communication module 649, communicates seeds to the system elements including user-devices, secured computers and other elements included in the USR system. In one embodiment, seed updates are performed without requiring any user interaction. For example, in one embodiment, a seed in a user  
15 device or remote USR element (for example, the USR element 768 illustrated in FIG. 12) is updated in the background at a time when the device or registry element are in communication. In a further embodiment, the update occurs without knowledge of the user. Thus, the systems described herein can include automatic reseeding of remote end user devices and USR systems elements.

20 In accordance with the illustrated embodiment, the generation module 646 receives a time reference from the time reference module 648 and receives the assigned seeds and users from which it generates random one-time code at the time T for the users 1-N and communicates that information to the comparison module 645.

25 According to some embodiments, the comparison module 645 receives, via communication module 647, a random one-time code from a remote system element such as mobile device, POS device or the like and compares, using a code-matching search, the received random one-time code with those generated by the generation module 646 to determine whether a match exists. Depending on the embodiment, the communication of the

- 30 -

random one-time code can be over a network such as the networks 28, 656 and 738 as illustrated and described herein. According to some embodiments, the current codes of a plurality of users are organized in a table, for example, a table that is organized numerically. In one embodiment, the table can be searched using a search algorithm such as a binary search.

5 In a further embodiment, the search begins by comparing the value that is sought to the middle item of the table. If the value matches the middle item, the search is successful. If the value is less than the middle item, then the higher half of the table is eliminated from the search. If the value is greater than the middle item, then the lower half of the table is eliminated. The process is then repeated, for example, depending on the embodiment either iteratively or

10 recursively, within each remaining half of the table until a match is identified. According to various embodiments, other search techniques may be used to search the table.

In other embodiments, the current codes of the plurality of users are organized in a tree data structure. According to one embodiment, the tree can be searched using a search algorithm, such as a binary search tree. For example, a tree can include a plurality of nodes

15 connected in a hierarchical tree structure, where each node to the left of a root node only contains a value less than the value that is contained in the root node, and where each node to the right of the root node only contains a value greater than contained in the root node. Using a binary search tree, the search begins by comparing the value that is sought to a value stored in the root node of the tree. If the value matches, the search is successful. If the value is less than

20 the value of the root node, for example, then the nodes of the left subtree are searched iteratively or recursively. If the value is greater than the value of the root node, then the nodes of the right subtree are searched. This process is repeated, descending the nodes of each subtree, until a match is identified. According to various embodiments, other search techniques may be used to search the tree data structure.

25 As should be appreciated, the USR 640 illustrated in FIG. 7 can be employed in embodiments that use an identification process and embodiments that use a verification process. Where an identification process is used, the random one-time codes received by the first communication module 647 are received without any static identifying information. The

- 31 -

comparison module 645 compares the received code with the current codes for a plurality of users to authenticate an identity of the user. Where a verification process is employed, a static nominal constant is included with the random one-time code, for example, appended to the random one-time code as a suffix or prefix. Here, the comparison module 645 indexes the  
5 database by the static number to verify an identity of the user by determining whether the current random one-time code is associated with the user who is identified by the static number. In some embodiments, the random one-time code is discrete and constantly changing with each change from one period of time to the next.

It should also be appreciated that the system illustrated in and described with reference  
10 to FIG. 7 can be employed with any embodiment described herein in which the USR is employed to authenticate identity (using either an identification process or a verification process) based on receipt of a random (or pseudo random) one-time code.

Referring now to FIG. 8 a system 670 includes a POS system 672 and a mobile device  
15 674. According to some embodiments the mobile device 674 can include a wireless device, for example, a tablet computer, netbook computer, laptop computer, a mobile phone, a PDA, a smart card, electronic passport and the like.

In accordance with some embodiments, the POS system 672 includes a POS terminal  
20 676, a credit/debit card interface 678, and a barcode reader 680. Further, according to some embodiments, the POS system 672 includes a communication interface 681 which can include a wireless communication device and/or a hardwired communication device. In accordance with various embodiments, the system element of the POS system 672 can include conventional system elements such as a conventional POS terminal, conventional credit/debit card interface and a conventional barcode reader. In various embodiments, the system 670 can include more or fewer elements than those illustrated in FIG. 8. However, in addition to any of  
25 the preceding, the POS system 672 includes an interface device 682 which is integrated with the POS system 672. In accordance with some embodiments, the interface device 682 includes a processor 684, a memory 686, a display 688, a user interface 690, a wireless interface 692 and a hardwired communication interface 694.

- 32 -

In accordance with some embodiments, the interface device 682 operates to allow a registered user of the USR in possession of the mobile device 674 to conduct transactions using the USR and the conventional POS system elements. For example, the mobile device 674 can be used by the user to conduct a transaction in the manner illustrated and described with reference to FIG. 4.

In accordance with some embodiments, the interface device 682 is employed by an operator of the POS terminal of the POS system 672, for example, a cashier or service person. Further, in some embodiments the POS terminal 676 includes a cash register as is traditionally found in a retail establishment.

In accordance with various embodiments, the credit/debit card interface 678 can include a magnetic stripe card reader or other means by which account information is traditionally provided by the credit/debit card holder to the point-of-sale system. Thus, in some embodiments the credit/debit card interface can include a wireless interface that can, for example, communicate wirelessly with a smart card. However, as indicated here, these traditional credit/debit card interfaces may not always be configured to allow a user of a mobile device 674 to take advantage of the functionality and greater security provided by the USR for financial transactions even where the mobile device 674 includes a smart card. Thus, the interface device 682 provides transitional hardware and software to allow the user of the mobile device 674 to take advantage of the functionality and increased security provided by the USR. These advantages are also beneficial to the operator of the POS system 672 because they provide a higher degree of security for financial transactions that are conducted using the POS system 672. The increased security can be provided as described herein by using the USR and the mobile device in an identification process rather than a verification process to authenticate the user of the mobile device 674 and to confirm their credit worthiness.

In accordance with one embodiment, the processor 684 includes a memory 686 while in accordance with other embodiments at least some of the memory 686 is external to the processor. In accordance with some embodiments, a microcontroller is included in the

- 33 -

interface device 682 where the microcontroller includes the processor 684 and at least some of the memory 686.

Further, in accordance with some embodiments, the display 688 includes an LCD display that can be employed by either or both of the operator of the POS system 672 and the user of the mobile device 674 to display information. The user interface 690 can include a touch screen integrated in the display 688 that employs icons or other graphical symbols to allow operation of the interface device 682 to facilitate processing of the financial transaction.

In accordance with various embodiments, the interface device 682 includes any one or any combination of wireless communication protocols and associated hardware including any of Wi-Fi communication 695, near field communication (NFC) 696, GSM (or other cellular communication protocols) 697 and Bluetooth communication 698. In accordance with various embodiments, one or more of these wireless communication protocols can be employed to communicate between the interface device 682 and the mobile device 674 as well to communicate between the interface device 682 and the USB. In other embodiments, alternate forms of wireless communication protocols and/or hardware can be employed in the system 670. According to some embodiments a first wireless network included in the wireless interface 692 is employed to communicate locally between the mobile device 674 and the interface device 682 while a second of the wireless networks 692 is employed to communicate between the interface device 682 and the USB. In further embodiments, a wired communication network is connected to the communication interface 681.

In general, the interface device 682 operates to receive and display transaction information concerning the transaction being conducted between the user of the mobile device 674 and the operator of the POS terminal 676 by, for example, displaying transaction details, authentication requests, approvals, and the like to either or both of the user of the mobile device 674 and the operator of the POS system 672 on the display 688. Thus, in some embodiments the interface device 682 receives the information that is generally provided to the credit/debit card interface 678 concerning the transaction such as the total transaction amount, the cost of individual items being purchased, account information concerning an account of the

- 34 -

user of the mobile device, merchant identification and current time and date. In some embodiments, this information is received and displayed at the interface device 682 and also at the credit/debit card interface 678 in the traditional manner, however, where the USR is employed the interface device 682 can operate to take the place of the credit/debit card interface 678. For example, the interface device can receive the information necessary to  
5 authorize and complete the transaction from the mobile device 674. In one embodiment, the electrical connection of the interface device 682 to the POS terminal 676 can be completed by connecting the interface device 682 in series between the POS terminal 676 and the credit/debit card interface 678. According to this embodiment, signals are transmitted from the POS  
10 terminal 676 to the interface device 682 and are then communicated to the credit/debit card interface 678. According to another embodiment, the interface device 682 is connected in parallel with the credit/debit card interface 678 such that communication of data from the POS terminal 676 occurs with the direct receipt of the information by each of the credit/debit card interface 678 and the interface device 682.

15 In operation, and in accordance with one embodiment, a user of the mobile device 674 activates the mobile device 674 for conducting a financial transaction such as a purchase of an item at a retail or other commercial establishment. In accordance with one embodiment, the device is activated in the manner illustrated and described at acts 462 to 466 of FIG. 5. That is, the user first enters a PIN in the mobile device and communicates it to the USR. Following a  
20 receipt of the PIN by the USR a multi character numeric value is communicated to the mobile device and the user's spoken input of the numeric value is employed to authenticate the user and activate the device for the transaction. In accordance with one embodiment, the communication between the mobile device 674 and the USR to activate the mobile device 674 is conducted without employing the interface device 682. Thus, in accordance with one  
25 embodiment, the communication is over cellular network or other wide area network between the mobile device 674 and the USR.

Once the mobile device 674 is activated, the communication link can be established between the mobile device 674 and the POS system 672. In general in these embodiments, a

- 35 -

wireless communication link is established between the mobile device 674 and the POS system 672 via the interface device 682. The user or an operator of the POS terminal 676 can employ a barcode reader 680 or other conventional means to enter information that identifies the item or items being purchased into the POS system 672. The POS terminal 676 receives the  
5 information concerning the selected item or items and processes it in a conventional manner to provide a total transaction amount.

In accordance with one embodiment a transaction summary is communicated to the user's mobile device for display, review and approval. In some embodiments, the transaction summary is communicated via the interface device where it may it also be displayed using the  
10 display 688. This provides the user with an opportunity to review and if agreed, accept the transaction and request authorization from the USR to execute the transaction. In accordance with one embodiment, the USR application provided on the mobile device 674 allows the user to select an acceptance key or icon to indicate their agreement with the transaction, see for example, act 474 in FIG. 5. In accordance with further embodiments, the mobile device 674  
15 using the USR application operates to generate a random one-time code and communicate the random one-time code to the USR along with all or some of the transaction details. As is described with reference to FIG. 5, the USR performs a code matching algorithm to identify the user by locating a match between the USR calculated code included among a plurality of codes calculated for a plurality of users, respectively, and the code generated by and  
20 communicated from the mobile 674. According to some embodiments, the communication between the mobile device 674 and the POS and the USR can be completed at this stage using the information provided from the POS system 672 but without the need to communicate directly between the POS terminal 676 and the USR. However, successful completion of the code matching algorithm and check for the credit worthiness of the user of the mobile device  
25 674 results in the USR communicating an approval back to the merchant and/or operator of the POS system 672. In a further embodiment, an acknowledgement of the transaction-approval is also provided to the mobile device from the USR. According to some embodiments, the receipt of this information occurs at the interface device 682 where it is displayed to the

- 36 -

operator of the POS terminal 676. According to another embodiment, the communication from the USR of the acceptance or denial of the transaction is communicated to one of the conventional elements included in the POS system 672, for example, the POS terminal 676.

In some embodiments, the mobile device 674 communicates the random one-time code to the POS system 672. According to these embodiments, the POS system 672 combines the code with information concerning any or all of the selected products and prices and a merchant account code. The combined information is communicated from the POS system 672 to the USR. Here too, a successful completion of the code matching algorithm and check for the credit worthiness of the user of the mobile device 674 results in the USR communicating an approval back to the merchant and/or operator of the POS system 672.

According to further embodiments, the USR can be employed to provide apparatus, systems and methods to conduct financial transactions between parties directly, securely and with greater convenience than current approaches. Further, in various embodiments, these approaches provide increased security relative to known approaches by eliminating the necessity to communicate any of, or at least any one of, account numbers, user names, PIN numbers or passwords. In addition, some embodiments are employed in mobile devices that allow flexibility in where and how these approaches are employed. For example, in various embodiments the secure financial transactions can be conducted with a user's mobile device at vending machines, parking meters and at a variety of other locations. Further, the approaches described herein can be employed even in situations in which the parties to the transaction (for example, two users employing mobile devices) are not in communication with the USR at the time of the transaction and/or not in close proximity to one another.

According to one embodiment, two users, each registered with the USR and each having a funds transfer account, in close proximity to one another, intend to conduct a transaction that will result in a transfer funds between their accounts. Each user independently activates their respective mobile device, for example, using the approach illustrated and described concerning acts 462-466 of FIG. 5. According to some embodiments, the device activation includes multifactor authentication in which a biometric is employed. Further, in

- 37 -

some embodiments, the current seed provided from the USR is used in combination with the biometric to activate the device. In some embodiments, the activation of the two mobile devices can include separate authentication protocols such that the user of a first mobile device is identified in a multi-factor authentication process that does not employ a biometric and the user of a second mobile device is identified in a multi-factor authentication process that does include a biometric.

According to a further embodiment, the mobile devices can store default values which can be employed in a financial transaction. The default values can be used to allow a more rapid completion of the transaction by reducing the amount of data that must be entered by the user of the mobile device.

In some embodiments, the two users select the "Funds Transfer" application via the user interface of the respective mobile devices, for example, by using a keypad (a soft keypad, a pushbutton-style keypad, etc.) or an icon located in a graphical user interface displayed at the mobile device. Once the two users have opened the applications, the payer-user enters the amount of the transfer. According to some embodiments, the payee-user then presses a "receive" control element (GUI icon, pushbutton etc.) which is available at the payee's mobile device via operation of the funds-transfer application. According to some embodiments, the payer-user presses a "send" control element (either alone or in combination with the payee-user pressing the "receive" control element) which is available on their mobile device via operation of the funds-transfer application.

Communication is opened between the two mobile devices and data is exchanged. According to the embodiment, a selected one of a variety of wireless communication protocols can be employed. These may include Bluetooth, NFC, or infrared or other optical or RF signals depending on the embodiment.

According to another embodiment, the mobile devices each include an accelerometer, shock switch or other shock sensor such that communication between the two devices can be initiated when the two users bring the two mobile devices into contact with one another. For example, the two mobile devices can be "bumped" into one another (directly or indirectly, for

- 38 -

example, via contact between the users' hands) so that the transmitted shock/vibration acts on each to open communication via the funds-transfer application. In addition, the preceding can be employed in combination with other user acts such as a selection of an icon in the display of the user's mobile device.

5           In some embodiments, the two devices can remain in communication for completion of the funds-transfer authorization via the USR. According to one approach, the user-payer employs the mobile device to generate and communicate to the USR a first random one-time code that is employed by the USR to identify the payer. Further, the user-payee employs their mobile device to generate and communicate to the USR a second random code that is  
10 employed by the USR to identify the payee. The USR can separately employ a code-matching algorithm, as described herein, to perform the identification of the parties to the transaction.

In general, at least the payer includes the transaction amount in the communication with the USR while in a further embodiment, each of the payer and the payee communicate the agreed upon transaction amount to the USR. According to this later embodiment, the  
15 transaction amounts must agree for the transaction to proceed.

According to some further embodiments, the USR separately authenticates itself to the two mobile devices employed in the transaction by generating a subsequent random one time code based on a seed associated with the respective mobile device and the current time. The one time random code generated by the USR for the user-payer is communicated to the payer's  
20 mobile device and the one time random code generated by the USR for the user-payee is communicated to the payee's mobile device. The two mobile devices each employ their respective seed with the time that the USR generated the random one-time code to confirm the identity of the USR.

The USR can communicate (subsequent to or along with the communication of the  
25 respective random codes) a digital image of the payer to the payee and a digital image of the payee to the payer. Further, for added security, the USR can transmit multiple images (for example, a "line-up" of images) of a plurality of individuals to the two parties and the funds transfer is not finalized until the payer accurately selects the image of the payee and the payee

- 39 -

accurately selects the image of the payer from among the respective plurality of images which are received. Security of such an approach can be increased by allowing each of the parties only one or some other limited number of selections in which to accurately identify the correct image.

5           The parties communicate via the respective mobile devices the confirmation of the visual identity of the other party to the USR which then operates to transfer (for example, electronically transfer) the requested amount of funds from the payer's account to the payee's account.

10           According to some embodiments, a funds transfer can also be completed between a payer and payee even where the two parties are not in proximity with one another. According to these embodiments, the payer activates their mobile device and selects the funds transfer application. The payer then enters an identifier that identifies the payee such as the payee's mobile phone number, the payee's email, etc. along with the amount of the transfer. The payer communicates with the USR and transmits a one-time random code that the USR employs to  
15 identify the user. The USR identifies itself to the payer by transmitting a subsequent random one-time code based on the seed associated with the payer's mobile device and the current time. According to this embodiment, the payer confirms the identity of the USR based on the received one-time random code. In some embodiments, the payee is identified by the USR and the payee confirms the identity of the USR in a similar manner. Here too, the USR can  
20 communicate a digital image of the payee to the payer and an image of the payer to the payee for increased security. Provided that the preceding identity-process is successfully completed, in some embodiments, the payer can then select the "pay" soft-key provided by the funds transfer application.

25           According to another embodiment, the USR and a mobile device of a registered user with a funds transfer account can be employed by the user to conduct transactions (for example, make purchases) at a vending machine, self service check out, unmanned-kiosk and the like. According to these embodiments, the owner or proprietor of the unmanned system is also registered with the USR and has an account that includes the funds transfer option.

- 40 -

According to this embodiment, the payer opens the funds transfer application as previously described and communicates with the unmanned system to conduct a transaction. Information concerning the transaction such as the selected item, the cost, sales tax (if any), the identity of the parties and the like can be communicated. According to one embodiment, the owner or  
5 proprietor is a corporation or other business entity. According to this embodiment, the logo of the business entity is communicated to the mobile device for display to the user. The user can visually confirm that they are dealing with the correct business entity and then enter the amount of the transaction and accept the purchase by selecting the appropriate soft-key generated by the funds transfer application.

10 According to some embodiments, the funds transfer described in the preceding paragraph is completed using an authentication process with the USR on a substantially real-time basis. For example, the identity of the payer can be performed as described above prior to the payer receipt of the item. Where real-time communication between the mobile device and the USR is unavailable for the transaction, the actual funds transfer is completed at a later point  
15 in time as described below.

According to any of the preceding embodiments, execution of financial transactions (including purchases, etc.) approved and authorized by a payer and a payee can be deferred if the two parties are not in communication with the USR at the time the parties agree to the transaction. The completion of the transaction including the communication of the random  
20 one-time codes, successful identification of the USR and cross-identification by the parties can be separately completed by the payer and the payee when they are next in communication with the USR. The USR can defer the transaction until each of the two parties completes the parts of the transaction for which they are responsible. According to some embodiments, the communication between the users' mobile devices and the USR is automatically established  
25 when such communication is next available.

Referring now to FIG. 6, a process 500 is illustrated by which users can employ their mobile devices for use in a personal payment transaction, or other types of interactions during periods where the user devices are in communication with USR. The process generally

- 41 -

includes the authentication of the users by their respective devices, for example, by their mobile devices. The process 500 may, in some embodiments, also include communication between the two devices, for example, wireless communication between the two devices. However, in other embodiments, communication between the two devices is not employed. In  
5 some embodiments, identities of each of the two users are authenticated by USR. In other embodiments, USR authenticates an identity of only one of the two users, for example, the payor. Further, in some embodiments, USR authenticates itself to either or both of the devices via a “handshake” process as described below.

The approaches described herein generally employ multi-factor authentication.  
10 According to some embodiments, the approaches employ 3+ factor security. As referred to herein 3+ factor security employs each of something the user knows, something the user has, and something the user is, and in addition, employs one of the preceding three factors more than once. Such approaches are described in greater detail herein.

Referring to the process 500, at Act 502, user #1 is authenticated by their mobile device  
15 (Device 1). Similarly, at Act 504, user #2 is authenticated by their mobile device (Device 2). According to some embodiments, the process 500 includes Act 506 in which Device 1 and Device 2 establish a communication protocol with one another. The communication protocol may allow the wireless exchange of identifying information (for example, public identifying information) for each of user #1 and user #2. For example, Device 1 can transmit a public ID  
20 of user #1 to Device 2 while Device 2 transmits a public ID of user #2 to Device 1. Act 506 is identified as optional because, according to some embodiments, the process 500 is completed without any direct communication between Device #1 and Device #2.

Although the current embodiment is described with reference to a financial transaction that involves user #1 and user #2, the approaches described herein may be employed by two or  
25 more parties to authorize (and/or agree to) a variety of actions. According to these embodiments, the user selects an identity of the other party(ies), the agreed upon act, and if necessary, any other details, constraints or qualifiers. As will be apparent to those of ordinary skill in the art, the party identification is in the form of something other than a “payee” or

- 42 -

“payor” where the action does not involve a payment. Further, regardless of the form of transaction the identification of the parties to the transaction can include the identification of an entity such as a company or other organization rather than an individual.

According to one embodiment, at Act 508 user #1 selects each of the payee and an amount of a financial transaction. Further, user #1 can also select, at Act 508 an amount of the transaction and/or an account type (or other identifier) suitable with the selected transaction.

According to this embodiment, user #1 can select/enter the payee identification using data stored in the mobile device or by manually entering the ID information in the device. According to one embodiment, the identifying information of user #2 is located in the contact or address book in Device 1. Therefore, depending on the embodiment, the identifying information of user #2 can be provided by user #1 in the form of any of a name, a shorthand identification, an email address or phone number of user #2 which is selected from the contacts stored in Device 1. Alternatively, where the process 500 includes the Act 506 the payee identification can be provided to user #1 by transmission from Device 2 to Device 1. Similarly, at Act 510 user #2 selects each of a payer (user #1) and an amount of the financial transaction.

In some embodiments, the information selected by user #1 is communicated to USR at Act 512 (for example, wirelessly transmitted). In addition, Device 1 can be employed to generate a non-predictable value, as described elsewhere herein, that is used to authenticate the identity of user #1 at USR. In the illustrated embodiment, the transmission of the non-predictable value is included in Act 512. According to other embodiments, the non-predictable value is transmitted in a separate act that precedes Act 512. In addition, Act 512 can be preceded with a step or series of steps included in the process 500 in which USR authenticates itself to the device. For example, as illustrated in the process 580 of FIG. 10.

At Act 514, user #2 employs Device 2 to generate and communicate a transaction request/authorization to USR in a similar manner to that described with reference to Act 512. Here too, a non-predictable value can be communicated from the user’s device (Device 2) to USR along with the payer ID and the dollar amount of the transaction. Further, according to

- 43 -

some embodiments, Device 2 can be employed to generate a non-predictable value, as described elsewhere herein, that is used to authenticate the identity of user #2 at USR. In addition, Act 514 can be preceded with a step or series of steps in which USR authenticates itself to the device. For example, as illustrated in the process 580 of FIG. 10.

5           At Act 516, USR authenticates identities of user #1 and user #2, respectively. According to various embodiments, Act 516 can include one or more additional acts. For example, provided that the authentication of user #1 is successful, USR can also check the availability funds for the requested transaction.

          At Act 517, where the authentication of either or both of user #1 and user #2 is  
10 unsuccessful or the necessary funds are unavailable USR can communicate the fact to either or both of user#1 and user #2. According to some embodiments, the process 500 ends where at least one of the authentications is unsuccessful. In some embodiments, following act 517, the process 500 can include a subsequent attempt to complete the transaction by either or both of user #1 and user #2.

15           According to further embodiments, execution of the transaction can also require confirmation by the respective users of the identity of the others. For example, as illustrated in FIG. 6, at Act 518 USR transmits an image of the payer (user #1) to the payee (user #2) and an image of the payee to the payer for local authentication of identity by the parties to the  
20 transaction. According to this embodiment, an image of the payer (user #1) appears on display of Device 2 and an image of the payee (user #2) appears on a display included in Device 1.

          According to this embodiment, USR defers executing the transaction until the users accept the identity of one another based on the image, see Act 520. For example, where user #1 accepts the identity of the displayed image of user #2 and communicates acceptance to USR (for example, by selecting a key or icon included in the display of Device 1) and user #2  
25 confirms the identity of user #1 in the same manner using Device 2. In accordance with some embodiments, only one of the two parties to the transaction receives an image of the other. In accordance with still other embodiments, neither party receives an image of the other, for

- 44 -

example, the process 500 does not include Act 518. Here too, the process can terminate where  
USR does not receive either or both of the acceptances.

According to some embodiments, the process 500 does not include Act 506. Instead,  
the mobile devices of the two users do not directly share any information with one another.

5 According to this embodiment, Device 1 communicates identification of the payee in the form  
of the identification selected from data included in the mobile device or manually entered by  
user #1. User #2 can employ the same approach using Device 2 to identify the payor.

Referring now to FIG. 9, a process 540 is illustrated where a transaction is initiated by  
two users in situations in which either or both of the associated devices is not in  
10 communication with USR. This is sometimes referred to as an out-of-band transaction. At Act  
542, Device 1 authenticates user #1 and at Act 544, Device 2 authenticates user #2. Either of  
Act 542 and Act 544 can be accomplished as described elsewhere herein by local  
authentication of the user, respectively (for example, by the user's mobile device).

At Act 546, the devices open a communication protocol with one another to initiate the  
15 transaction by, for example, exchanging public ID information as described concerning Act  
506 illustrated in FIG. 6. According to other embodiments, the process 500 does not include a  
direct communication between the two devices and the mobile devices of the two users do not  
directly share any information with one another. Instead, the public ID info is provided to the  
USR by the respective user as described with reference to the process 500.

20 At Act 548, user #1 selects each of a payee and an amount of the desired financial  
transaction. Similarly, at Act 550, user #2 selects each of the payer and an amount of the  
financial transaction.

Although the current embodiment is described with reference to a financial transaction  
that involves user #1 and user #2, the approaches described herein may be employed by two or  
25 more parties to authorize (and/or agree to) a variety of actions. According to these  
embodiments, the user selects an identity of the other party(ies), the agreed upon act, and if  
necessary, any other details, constraints or qualifiers. As will be apparent to those of ordinary  
skill in the art, the party identification is in the form of something other than a "payee" or

- 45 -

“payor” where the action does not involve a payment. Further, regardless of the form of transaction the identification of the parties to the transaction can include the identification of an entity such as a company or other organization rather than an individual. As will also be apparent, where the action/permission to be agreed upon does not include a payment, the  
5 respective parties can provide USR with a description concerning the requested action, for example, access to a particular physical space or secure electronic system during a specific time-period and/or for an agreed upon cumulative amount of time.

In the illustrated embodiment, where Device 1 is not in communication with USR, the authentication of user #1 and processing of the payment request is delayed until such time that  
10 Device 1 can communicate with USR. Similarly, where Device 2 is not in communication with USR, the authentication of the identity of user #2 and the processing of the payment is deferred until such time that Device 2 is in communication with the USR. Accordingly, the transaction is not completed until each of Device 1 and Device 2 are in communication with USR, subsequent to acts 548 and 550, such that remaining acts included in the process 540 can  
15 be completed.

For example, where Device 1 is not in communication with USR at the time user #1 requests the transaction then the non-predictable value associated with user #1 is transmitted to USR along with a payee ID and the dollar amount of the transaction when Device 1 is next in communication with USR. Similarly, at Act 554, where Device 2 is not in communication  
20 with USR at the time user #2 requests the transaction then the non-predictable value associated with user #2 is transmitted to USR along with the payer ID and the dollar amount when Device 2 is next in communication with USR. As described with reference to the process 500 of FIG. 6, either or both of the acts 552 and 554 can be preceded by an authentication of USR to the respective mobile devices, for example, as illustrated in acts 586 to 590 of the process 580 in  
25 FIG. 10.

At Act 556, USR authenticates the identity of the payer (user #1) using the non-predictable value received from Device 1 while at Act 558 USR authenticates the identity of the payee (user #2) using the non-predictable value communicated from Device 2.

- 46 -

At Act 560, where USR successfully authenticates the identities of both payer and payee, the request is processed. Alternatively, should authentication of at least one of the parties to the transaction fail USR will not complete the transaction but will instead notify the parties that the request cannot be processed, at Act 561. Where the transaction is completed  
5 successfully, USR transmits confirmation to the payee and payer at Act 562.

Referring now to FIG. 10, a process 580 is illustrated including multi-factor security where the factors include each of something the user knows, something the user has, and something the user is. The use of one of the preceding factors more than once in an authentication process (in the same or different form) adds an additional level of security that  
10 provides 3+ security. For example, in some embodiments, a first form of biometric is included in the original three factors that are authenticated (for example, voice recognition) and a second form of biometric (for example, an image) must also be authenticated to allow the action (for example, a financial transaction) to proceed. According to some embodiments, the respective factors may be authenticated by the same elements or different elements included in  
15 the process. For example, one or more factor can be authenticated for device activation, while the same or different factor(s) are authenticated by USR. In a further embodiment, the same or different factors for the same user or entity are authenticated by a third party, for example, an operator of a POS or a party to a personal payment.

At Act 582, a user's device authenticates the user based on a biometric input. The  
20 biometric input can be any of the variety of biometric inputs described herein including voice, fingerprint, handwriting, retinal scan or any other form of biometric that can be sensed and processed by the device. Although illustrated as authentication using a biometric, other forms of device-based user authentication can be used in accordance with various embodiments.

At Act 584, the user enters a PIN in the device. Further, the PIN is employed along  
25 with the time and the seed which was previously provided to the device by USR to provide a non-predictable value, NPV #1. As will be recognized, the non-predictable value includes a time-varying value where time is employed in the derivation of the NPV #1. At Act 586, the process continues with all or a portion of NPV #1 being transmitted to USR for an initial

- 47 -

identification of the user in possession of the device. According to one embodiment, the non-predictable values generated in the process 580 are 20 digits or more. However, the number of digits (either generated or transmitted) can be adjusted in advance to achieve a desired level of security.

5 For example, Act 586 can include a transmission of a complete 20+ digit non-predictable value. Alternatively, only a portion of the 20+ digit non-predictable value can be transmitted from the device to USR for an initial identification (that is only a subset of digits generated are submitted). In some embodiments, a generation and/or transmission of a non-predictable value having a smaller size can increase the efficiency and speed at which the  
10 process 580 is completed. Then, at Act 587, USR employs the transmitted non-predictable value to determine an identity of the user associated with the device. In various embodiments, one or more of the code matching approaches described herein can be employed at USR in Act 587.

Should the initial identification using NPV #1 fail, the process can also include an Act  
15 589 in which the USR notifies the user that the identification failed. According to some embodiments, the user may get an opportunity to provide another NPV #1 to USR to initially establish their identity.

At Act 588, USR, using the time and the seed associated with the device, determines the next non-predictable value in sequence that would be generated by the device. The USR  
20 generates this next-in-sequence non-predictable value (NPV #2) and transmits it to the user device. Here too, can include a transmission of a complete 20+ digit non-predictable value. Alternatively, transmission of the non-predictable value can include all or only a portion of a 20+ digit non-predictable value (again, only a subset of digits generated are transmitted). Considerations here include the desired level of security, the processing power included in the  
25 user's device and the associated amount of time required for the device to perform the comparison required to authenticate USR.

Should the validation of the USR fail, the process can also include an Act 591 in which the USR receives notification that the validation at the user device was unsuccessful.

- 48 -

According to some embodiments, the USR the same or a different NPV#2 subsequent to Act 591.

At Act 590, the user device validates USR based on NPV #2. For example, user device can employ the seed and the time of the time increment at which NPV#2 was generated to  
5 determine the value that is generated by an authentic USR. The user device compares NPV#2 to this value to determine whether the device is in communication with USR rather than an imposter (to detect man-in-the-middle attacks). Provided that USR is successfully authenticated by the device, the process 580 proceeds to Act 592.

At Act 592, the user device generates NPV #3 using at least the time and the seed  
10 associated with the device and transmits NPV #3 to USR. In this instance, the full 20+ digit non-predictable value is transmitted in its entirety to provide a high level of security. In addition, as illustrated at Act 594, NPV #3 can be combined with information identifying the recipient of funds involved in the transaction as well as an amount of the transaction before being transmitted. In one example, NPV #3 is XORed with the information regarding the  
15 recipient of the funds and the amount. Further, in some embodiments where lower security is acceptable, act 592 includes transmission of fewer than 20 digits to increase the speed of the process 580.

At Act 596, USR authenticates the identity of the user based on the non-predictable value transmitted from the user device (NPV #3). In addition, USR can check for the  
20 availability of funds in the user's account.

Should the authentication fail, the process can also include an Act 597 in which the USR notifies the user that the authentication failed. According to some embodiments, the user may get an opportunity to try a subsequent authentication attempt with USR at Act 597.

At Act 598, USR processes the transaction provided that the identity of the user is  
25 properly authenticated and that the available funds are sufficient to cover the requested transaction. USR can notify a selected party or party to the transaction should the authentication and/or financial check fail.

- 49 -

According to alternate embodiments, the USR acts as an intermediary to banks, credit card companies or other financial service entities. According to these embodiments, the USR communicates the transaction details to the financial services company. The approval or denial of the transaction is then communicated to the user either directly from the financial services  
5 company or via USR, depending on the embodiment.

In addition, in some embodiments, an image of the user can be transmitted to either the user's device (to allow the user to display the image to another party to the transaction) or directly to the device of the other party for display. According to these embodiments, USR defers the processing described at Act 598 until receipt of an acknowledgement by the party  
10 who has responsibility for review of the image authenticating the identity of the user.

In this or any other embodiment in which an image of a first party to a transaction request is displayed for review by a second party, the selection of the image that authenticates the identity of the first party can be a pre-requisite to the completion of the transaction. For example, as described herein with reference to Act 518 and 520 of FIG. 6 or Act 486 of FIG. 5.  
15 Further where embodiments include such an act at a point-of-sale, a clerk or other staff-member can select the image from among a plurality of images that are displayed at the POS terminal (for example, the POS terminal 676 or the interface device 682 illustrated in FIG. 8). In one approach, each of a plurality of customers has established wireless communication with the POS terminal or interface device and an image of each is displayed to the clerk. The clerk  
20 selects the image of the customer who is currently conducting the sales transaction. For example, the clerk can select the image of the user with a touch-screen included for the POS (either a fixed location POS or a portable tablet-type POS).

Further, where the close proximity of multiple individuals/parties requires a selection of a unique party to the transaction from among a plurality of possible parties, a customer can  
25 enter a unique POS identifier to either initiate or complete a selected transaction. For example, the user enter the number associated with a particular check out station/line, gas pump, etc. According to some embodiments, a proximity signal is employed to restrict transactions to

- 50 -

only those wireless user-devices that are located immediately adjacent to the POS, or the wireless user device of the other party.

According to various embodiments, the non-predictable values employed in the process 580 are random one-time numbers, for example, pseudo random numbers. Further, according to some embodiments, the non-predictable values used to identify the user to USR (for example, at act 586) and to identify the USR to the user (for example, at act 588) are a partial (or subset of digits) from a non-predictable value generated for a previous time period for the user that were not employed for authentication. For example, the NPV #1 and the NPV #2 are previously generated but unused random one-time numbers, or portions thereof. Further, the preceding embodiments can be used where the USR is a "cloud" resource available to the user. According to some embodiments, the USR receives a first portion of NPV#1 from the wireless user-device where the first portion is employed by the USR to identify the wireless user-device to the USR. Prior to authenticating the identity of the user but with a high degree of certainty that it is communicating with an authorized user-device, the USR transmits a second portion of the NPV#1 to the user-device. Thus, the second portion of NPV#1 is employed as NPV#2 in the process 580. Where the second portion matches the value expected (generated as a portion of NPV#1) by the user-device, the user-device has a high degree of certainty that user-device is communicating with the USR rather than an imposter to complete the authentication process (for example, the authentication process 580 beginning at 592).

According to some embodiments, an untransmitted portion of a previously generated non-predictable value may be employed as an exclusive-or (XOR) checksum to insure the integrity and authenticity of the information being transmitted. Similarly, previously generated but unused non-predictable values can be used to encrypt (for example, using an exclusive-or operation) data communicated from either the user-device or the USR.

Further, in various embodiments, the random one-time code (for example, any of NPV#1, NPV#2 and NPV #3) is generated by employing a PIN in combination with any one of or any combination of an electronic serial number of the user-device, a SIM number of the user-device and a seed associated with the device. According to one embodiment, the PIN is

- 51 -

stored in the user-device while in an alternate embodiment the PIN is not stored in the user-device.

Referring now to FIG. 11, a system 650 including a USR 654 and a plurality of wireless user devices 652 (for example, wireless tokens 1-N) is illustrated in accordance with one  
5 embodiment. As used herein, the term “token” refers to a device that represents at least one factor employed in authenticating an identity of a user or entity. As should be apparent, in some embodiments, a token can include a mobile user device such as a mobile phone where the token represents something the user has. For example, the token can include a seed that must be employed to generate authentication information that can be successfully processed by  
10 the USR 654. In the illustrated embodiment, the system 650 can also include one or more network access devices 658, depending upon the embodiment, and a network 656. In general, the system 650 can be employed by a user in possession of a wireless token such as a smart phone, tablet or other form of wireless electronic device. According to various embodiments, the network 656 provides users with access to the cloud where a variety of remote resources  
15 (for example, the USR 654) can be accessed.

In the illustrated embodiment, each of the wireless user devices 652 include a biometric sensor 602, a user interface 604, a wireless transceiver 606, a processor 608, a display 610, a memory 612 and a power source 614. According to one embodiment, the display 610 is  
20 included in the user interface 604. In various embodiments, the biometric sensor 602 can detect at least one of a voiceprint, a fingerprint, a signature and a retinal scan. Further, one or more communication busses can be included in the wireless user device 652 to a communication of electronic signals within the user device such as the communication of data and/or instructions. The processor 608 can, for example, control communication within the user device 652. According to some embodiments, the processor is included in a  
25 microcontroller.

In some embodiments, the system 650 includes all or some of the features and functionality described with reference to the system 730 illustrated in Fig. 12. For example, the wireless networks and wireless communication protocols employed for communication

- 52 -

between the wireless user devices 652 and/or between the user devices and the network access device 658 can include any of those identified with reference to the system 730. As another example, the wireless device 652 can include all or some of the features and functionality described with reference to the wireless user device 735 of the system 730 illustrated in FIG.

5 12. For example, the wireless user device 652 can include any of the seed 757, the SIM 758 and the ESN 759 illustrated in FIG. 12. Further, in some embodiments, the USR 654 includes all or some of the features and functionality of the USR 734 of the 730 illustrated in FIG. 12.

In various embodiments, the system 650 can also be employed as a peer-to-peer secure identification system. According to one embodiment, biometric information for a pre-defined affinity group (for example: U.S. air marshals; FBI, CIA, Secret Service, Homeland Security or 10 TSA personnel; airline employees, members and/or employees of Congress, the White House, the Pentagon, Fortune 500 companies, private organizations or the armed services) is maintained by the system. The system 650 allows members of the affinity group to challenge and/or identify themselves to one another in a highly secure manner with a high degree of 15 certainty that the authentication information that is presented is legitimate. According to some embodiments, the wireless user-device 652, for example, the wireless user-device 652 of a challenger is stationary rather than a mobile device.

In general, authorized individuals register and establish their secure account at the USR 654 (see, for example, approaches described with reference to FIGS. 1-3, herein). In some 20 embodiments, their digital photograph or other biometric information is obtained and stored in the database included in the USR 654. Other members of the affinity group register similarly and an affinity group manager establishes the members of the group. In one embodiment, the affinity group manager directly manages the membership on the USR server(s). According to another embodiment, the manager contacts the business entity that operates the USR 654 and 25 that organization implements the necessary change(s) in membership status. In some embodiments, a different type of biometric is employed either alone or in combination with the image in an authentication process.

- 53 -

The stored biometrics and/or images are used as described below to authenticate identity. According to these embodiment, each of the user devices 652 stores a first portion (the A portion) of the biometric, respectively, of all members of the affinity group (with the possible exception of themselves). The user device 652 stores a second portion (a B portion) of the biometric of the user associated with the user device 652.

In a further embodiment, when two members of an affinity group meet they employ their respective user devices 652 and stored biometric information to authenticate one another. In one embodiment, a first user wirelessly transmits the B-portion of their biometric to the user device 652 of a second user. The user device 652 of the second user receives the B-portion for the first user and combines it with the previously stored A-portion for the first user to provide the full biometric for the first user. The second user then reviews this “full” biometric of the first user to authenticate the first user. According to one embodiment, the biometric includes an image where the A-portion and the B-portion are different portions of the image, for example, they may be different halves. The “full” biometric of the first user can be displayed in a display included in the user device of the second user. Similarly, in some embodiments, the second user also wirelessly transmits the B-portion of their biometric to the user device 652 of first user. The user device 652 of first user receives the B-portion for second user and combines it with the previously stored A-portion for the second user to provide the full biometric for the second user. The first user then reviews this “full” biometric of the second user to authenticate the second user.

In some embodiments, the biometric is split in half and the first portion and the second portion are halves. However, the biometric need not be split in half. Accordingly, in some embodiments, the percentage of the biometric of other members of the affinity group stored on a user device can be either a higher or lower percentage of the full biometric. Regardless of the split, the combination of the two biometrics need only provide a full biometric in combination with the corresponding portion.

According to some embodiments, the biometric (for example, an image) is divided in a manner that further increases the security of these approaches. For example, an algorithm can

- 54 -

be employed at each of the USR 654 and the user devices 652 to divide the stored images for a particular affinity group in a varying and irregular manner. According to one embodiment, the division is latitudinally (horizontally) so that the first and second portions are upper and lower regions of the image, respectively. According to another embodiment, the division is occurs  
5 longitudinally (vertically) so that the first and second portions are left and right regions of the image, respectively. Employing such an algorithm, the two portions of the images provide the A and B portions, respectively, as a ratio of the percentage of the image included in portion A to the percentage of the image included in portion B varies.

In some embodiments, the parties in an affinity group can, using their wireless user  
10 devices 652 challenge one another when they meet. In one embodiment, a soft key is selected in a user interface of the mobile device 652. The selection of the identity-application on the user device initiates a Bluetooth handshake in which authentication information is communicated from one device to another. In general, the communication serves to establish to each user that the other user appears to be a registered member of the affinity group, and  
15 following that, authenticates their identity. In some embodiments, a proprietary protocol is employed by the devices 652. In one embodiment, such a protocol utilizes asymmetric encryption. A high resolution image of the challenged individual and relevant identifying information (for example, identifying who they purport to be) is displayed on the user device of the challenger. The image is a full image including the A-portion and the B-portion of the  
20 image which are assembled by the wireless user device 652 of the challenger.

An approach in which the user devices store the various portions of the biometrics is advantageous because the user devices need not be in communication with USR 654 to perform an authentication. According to these embodiments, access to the network 656 or other network for communication with the USR 654 is not required. Thus, the authentication  
25 process can be completed in locations where external network access is unavailable such as, for example, underground locations, "black" facilities, in a plane at 30,000 feet of altitude, on land, sea, or space. However, in other embodiments, the A-halves are not stored on the user

- 55 -

devices 652 but are instead stored at USR 654. According to this embodiment, USR 654 communicates the A-half of a user on request from a member of the affinity group.

Advantages of these approaches include the fact that the approach is rapid. Simple and convenient to use, provides increased security relative to other approaches, is incorporated in an existing item carried by the great majority of people, does not draw attention to the participants when in use, can be field upgradeable with affinity group additions and deletions in substantially real-time where communication with the USR 654 is available, and cannot be used by a third party if lost or stolen.

Further embodiments can also provide any of: control of secure access to classified computers and/or networks; provide secure access to physical facilities, supplement or replace existing less-secure personal ID approaches such as conventional ID badges, ID documentation, drivers licenses, and passports); replace credit cards, toll payment devices, activate/deactivate security alarm systems at home or office; and provide audit trails via, for example, the use of GPS integrated in the wireless user devices 652.

In addition, the system 650 can include the following features in the wireless user device 652: a duress alarm whereby a user can employ the user device 652 to signal the USR 654 that they are under duress without detection by others (for example, where the user adds a known value (+1) to the PIN at the time of entry); and a self destruct mode in which either or both of hardware or software/stored data of the user device 652 is destroyed or rendered inoperable when tampering or abuse of the device is detected. In some embodiments, "self-destruct" can also be triggered based on a passage of time without receiving and/or being able to communicate a reset signal; based on targeted events; or when a location of the user device 652 is out of a pre-defined geographic area. To further increase security, the user device 652 can cryptographically hash data files when not in use.

In some embodiments, the user is challenged by other than an individual with another wireless user device 652. For example, the preceding approaches can be applied to point-of-sale transactions or an access control point. Also, although the above-described approach

- 56 -

describes use of an image as the shared biometric, further approaches can employ any of a fingerprint, a signature, a voiceprint and DNA codes as the shared biometric.

Referring now to FIG. 12, a system 730 employing a Universal Secure Registry (USR) is illustrated in accordance with one embodiment. In the illustrated embodiment, the system  
5 730 includes a USR 734, a wireless user device 735, at least one computer 736 and a network 738. In accordance with various embodiments, the wireless user device 735 can include any of a mobile phone, a tablet computer and a personal digital assistant or other type of computing device.

In the illustrated embodiment, the USR 734 includes a user interface 740, a processor  
10 742, a communication interface 744 and a database 746. The USR 734 can also be configured with fewer than all of the preceding elements or additional elements alone or in combination with the preceding. For example, the USR 734 can include any of the elements and/or functionality concerning the USR embodiments described herein. Further, the USR 734 can include one or a plurality of servers co-located or in configurations in which one or more of the  
15 servers is geographically remote from others of the servers. According to one embodiment, the USR 734 provides a secure centralized registry that can be employed to facilitate a variety of activities, for example, activities in which authentication of identity is required.

In the illustrated embodiment, the wireless user device 735 includes a user interface  
20 750, a secure element 751, a memory 753, a processor 752, a wireless transceiver 754, a display 755, a biometric sensor 756, a seed 757, a Subscriber Identity Module (“SIM”) 758 and an electronic serial number 759.

In accordance with various embodiments, the user interface 750 can include any of a keypad, a camera, a microphone and the display 755. In one embodiment, the user interface includes a touch screen graphical user interface.

25 In accordance with various embodiments, the memory 753 can include a plurality of memory devices, for example, RAM, ROM, flash memory, SRAM memory or other memory devices. In one embodiment, the processor 752 is included in a microcontroller that includes the processor and memory. Further, the memory can be a discrete memory component,

- 57 -

integral to the microcontroller or include both a discrete component and memory included in the microcontroller.

In accordance with some embodiments, the wireless transceiver 754 provides a communication interface in which the wireless user device 735 transmits information including authentication information from the device 735. The wireless user device 735 can also include one or more hardwired communication interfaces. As should be apparent, the wireless transceiver 754 can also be configured to receive information transmitted to the wireless user device 735.

According to some embodiments, the seed 757 is distributed in a manner as described herein concerning the embodiments associated with FIG. 7. In some embodiments, either or both of the seed 757 and the electronic serial number 759 are stored in the memory 753. In further embodiments, the seed 757 and the electronic serial number are stored in a region of the memory 753 that is secured in a manner that makes it more difficult to access by unauthorized parties (which may, for example, include the user). According to some embodiments, the secure element includes an electronic component such as one or a combination of a processor, a microcontroller and a memory. In accordance with some embodiments, the USR seed 757 and/or the electronic serial number 759 are stored in the secure element 751.

In accordance with one embodiment, the computer 736 includes a wireless transceiver 760, a user interface 762, a processor 764, a memory 766 and a USR element 768. Further, the system 730 can include one or a plurality of computers, such as the computers 1-N. For example, a single wireless user device may be employed to access each of the plurality of computers. In one embodiment, the plurality of computers can include an office computer, home computer and any number of computers that can communicate with USR and are secured using the system illustrated in FIG. 12. The computer 736 can include a plurality of computers that are geographically remote from one another. In accordance with various embodiments, the computer can include anyone of a desktop computer, a notebook computer, a laptop computer, a netbook computer and a tablet computer. As will be apparent, other styles and types of computers can be employed in the system 730. In accordance with some

- 58 -

embodiments, the computer is a “dumb” terminal that provides access to a network such as a wide area network (the Internet, an intranet or both) that allows an authorized user to access resources (for example, using a web browser) via the computer terminal.

In accordance with various embodiments, the network 738 can include a wide area  
5 network, a local area network or a combination of wide area network and a local area network. Further, the network 738 can include wired or wireless networks or combinations of both. Further, according to some embodiment the wireless user device 735 can also communicate over the network 738. In still other embodiments, the wireless user device 735 can  
10 communicate with the USR 734 over one or more additional networks that are not employed for communication between the computer 736 and the USR 734.

According to some embodiments, the system 730 is employed as proximity-based computer security system using the wireless user device 735 to generate authentication information to allow a user in possession of the device 735 to unlock the computer 736. According to some embodiments, the wireless user device 735 is employed to provide  
15 authentication information wirelessly to the computer when the wireless user device 735 is in proximity of the computer, for example, where proximity is determined by a range of the wireless network. According to these embodiments, the wireless network allows the wireless transceiver 754 of the device 735 to communicate with the wireless transceiver 760 of the computer 736.

20 In various embodiments the wireless network over which the device 735 and the computer 736 can communicate can include any one of Wi-Fi communication, near field communication (NFC) and Bluetooth communication. For the preceding examples, each type of wireless communication has limited range where Wi-Fi communication has the greatest range, NFC has the most limited range and Bluetooth has a range greater than NFC but less  
25 than Wi-Fi. Thus, for each of the preceding types of wireless communication the wireless user device 735 and the computer can remain in wireless communication only so long as the device 735 and the computer 736 are in proximity of one another. In further embodiments, other forms of wireless communication can be employed. Further, where the inherent maximum

- 59 -

communication distance is greater than desired, security can be increased by modifying the wireless network hardware or software such that the range is further limited, for example, to a few feet.

According to one embodiment, a user can unlock the computer 736 to access computer  
5 resources by successfully authenticating their identity with the USR 734 and then keeping their wireless user device 735 proximate to the computer 736.

In accordance with some embodiments, at least a portion of USR is included in the computer 736. In the illustrated embodiment, the USR element 768 is deployed in the computer 736. The USR element 768 can take various forms depending upon the embodiment.  
10 According to one embodiment, the USR element 768 is a software module that performs local authentication of authentication information received from the wireless user device 735. In some embodiments, the USR element 768 includes a combination of hardware and software. Further, where the USR element 768 includes software, the USR element can be electronically-distributed to the computer 736, for example, via the network 738 or via a different network.

15 In accordance with other embodiments, the USR element 768 only provides an interface between the computer 736 and the USR 734. In accordance with this latter embodiment, communication from the wireless user device 735 is relayed or can be relayed to the USR 734 via the computer 736 using the USR element 768. In still other embodiments, the computer 736 can relay authentication information or other communication from the wireless  
20 user device 735 over the network 738 without need for the USR element 768.

In embodiments where USR elements 768 can locally authenticate the user of the wireless user device 735, the USR element can provide it in software such that element 768 can be distributed, for example, securely distributed to a variety of computers 736 that are remote from the USR 734. In accordance with one embodiment, the USR element 768  
25 includes a seed for each user authorized to unlock the computer, respectively. According to this embodiment, the complete authentication of non-predictable values provided by users can be accomplished locally by the computer 736. Thus, in some embodiments, authentication, including bilateral authentication, can be accomplished by the computer 736 without any real-

- 60 -

time interaction by the computer with the USR 734. These authentication protocols can include all or some of the acts illustrated in Figs. 33 and 38, where the protocols are employed to allow access to the computer 736 (for example, rather than authorize a financial transaction). Further, automatic seed updates for both the wireless user device 735 and the computer 736  
5 can occur as described above with reference to FIG. 7. These seed updates can occur with or without knowledge and/or interaction with the user, for example, they may occur randomly.

According to some embodiments, the proximity-based security provided with the wireless user device 735 in combination with the USR 734 is achieved where a USR element is not included in the computer 736.

10 The overall operation of the system 730 allows the user to operate the computer 736 to access resources using the computer so long as the computer periodically receives authentication information from the wireless user device 735 where that authentication information is successfully authenticated by the USR system either at the USR 734, at the USR element 768, or employing each of the USR 734 and the USR element 768. In some  
15 embodiments, a portion of the authentication protocol is performed by each of the USR elements 768 and the USR 734.

Various authentication information can be communicated from the wireless device 735 to the USR to authenticate the user of the device 735 depending on the embodiment. For example, the information transmitted from the wireless user device 735 to the computer 736  
20 can include a time-varying non-predictable value. Multi-factor communication protocols described herein can be employed including protocols in which a time-varying non-predictable value is generated as a result of 2, 3 or 3+ factors.

In some embodiments, the protocol includes the generation of an initial time-varying non-predictable value by the device 734. This value is wirelessly communicated to the  
25 computer 736 for authentication with the USR. In one embodiment, the USR element 768 authenticates the user based on the value that is communicated from the device 735. Successful authentication allows the user of the device 735 to unlock the computer to access local or remote resources. The resources can include any of files, images, forms, e-mail,

- 61 -

document management systems, catalogs or other information whether located locally on the computer 736 or accessible over a network such as the Internet or an intranet. Thereafter, the device 735 and the computer 736 can periodically communicate where the device 735 communicates subsequent time-varying non-predictable values to the computer for ongoing authentication. According to this embodiment, the computer remains operable to the user (for example, unlocked) so long as the computer continues to receive subsequent authentication values. In accordance with one embodiment, the subsequent authentication values also include a time-varying non-predictable value.

In one embodiment, the initial time-varying non-predictable value used to authenticate the user and unlock the computer includes only a portion of a larger time-varying non-predictable value. In this example, subsequent time-varying non-predictable values can include additional portions of the same time-varying non-predictable value, or a portion of or all of a newly-generated time-varying non-predictable value. In alternate embodiments, a complete time-varying non-predictable value (for example, a 20+ character value with the full set of characters as generated) is employed for the initial authentication and newly-generated time-varying non-predictable values are employed for each of the subsequent authentications, respectively, to maintain the computer 736 in an unlocked state. Depending upon the embodiment, these subsequent authentications can employ a time-varying non-predictable value including a 20+ character value with the full set of characters as generated or a time-varying non-predictable value that includes a subset of the full set of characters. According to some embodiments, the time-varying non-predictable value only includes numeric characters and the subset is a subset of digits. According to other embodiments, the time-varying non-predictable value includes both alpha and numeric characters (for example, a value represented in hexadecimal notation).

In one embodiment, static identifying information is not included and the system 730 employs an identification process as described elsewhere herein. In accordance with an alternate embodiment, at least some form of static identifying information concerning the user is communicated with the non-predictable value in a verification process that is employed

- 62 -

either locally at the computer 736, with the USR element 768, or remotely at the USR 734 to authenticate the user.

As mentioned above, the system 730 can maintain the computer 736 in the unlocked state so long as time-varying non-predictable values are received subsequent to the initial authentication, and provided that these later received values are successfully authenticated.  
5 Thus, where the user moves with the wireless user device out of the proximity of the computer (for example, out of wireless range) the computer 736 can go into a locked state that will prevent its further use until an authentication protocol is successfully initiated by the same or a different user.

10 In some embodiments, the system 730 employs an initial user authentication process such as the process 580 described in association with embodiments of FIG. 10, for example, a “handshake” or bilateral authentication must be completed at a start of the process to unlock the computer. However, in one embodiment, the computer can temporarily lock-up for a permissible time period following the initial successful user authentication. Provided that the  
15 user returns within the permissible time-period, the computer will unlock (provided that a subsequent time-varying non-predictable values is received and successfully authenticated) without need for the user to repeat the initial user authentication process.

In this example, the computer 736 is unlocked with an initial authentication and remains in the unlocked state so long as the subsequent time-varying non-predictable values is  
20 received and successfully authenticated. Where a subsequent time-varying non-predictable value is received and not successfully authenticated, the computer 736 will return to a locked state that requires a user to complete the initial user authentication process to unlock the computer 734. However, where the computer stops receiving subsequent time-varying non-predictable values for less than a predetermined period of time (for example, a matter of  
25 minutes when the user has momentarily left the immediate vicinity of the computer) that user can return and unlock the computer with the successful authentication of subsequent time-varying non-predictable values generated with the wireless user device without beginning the authentication process anew.

- 63 -

The computer 736 can be configured to authenticate one or more users to employ one or more wireless user devices 735. For example, computer 736 can be accessible to a plurality of users where each of the users employs a different wireless device 735, respectively.

According to these embodiments, the computer can maintain (or access via USR 734)

5 authentication information such as seeds for each of the plurality of authorized users. Further, each of the plurality of wireless user devices generates time-varying non-predictable values independently of others of the plurality of wireless user devices.

Further, activation of the wireless user device 735 can employ approaches described herein using multiple factors including something the user knows, something the user has,

10 something the user is alone or in combination with each other or with additional factors. Thus, in accordance with one embodiment the wireless user device 735 includes a seed that is used to generate a time-varying non-predictable value. In accordance with some embodiments, the seed 757 is provided by the USR 734 in the manner described else where herein. In

accordance with a further embodiment, the electronic serial number of the wireless user device

15 735 can also be employed as a seed either alone or in combination with the USR seed 757.

Similarly, the subscriber identity module can include information that is employed alone or in combination with the USR seed 757 and/or the electronic serial number 759 as a seed that is used to generate a time-varying non-predictable value. As should be apparent, the approach

then employs the seed to generate the time-varying non-predictable value and also employs a

20 temporal element such as the current time, for example, a time at which the code or the value is generated. According to some embodiments, the processor of the wireless user device 735 is

configured to employ time, secret information known to the user and a seed to generate the

time-varying non-predictable value. In accordance with further embodiments the processor is configured to generate the non-predictable value at least in part by combining the secret

25 information and the seed and in an exclusive-or operation. Either or both of the electronic

serial number 759 and the SIM number 758 may be employed in any combination with the

preceding to further increase security of the multi-factor authentication process.

- 64 -

According to some embodiments, the subsequent time-varying non-predictable values are generated for subsequent time periods, respectively. The selection of the increment of time that provides the subsequent time periods can be selected based on the embodiment such that a new period of time occurs with a relatively high frequency in high security applications or at a lower frequency for lower security applications. Accordingly, depending upon the embodiment, the subsequent time-varying non-predictable value used in an authentication process can refer to a time-varying non-predictable value that is generated for a time period that is immediately subsequent to the preceding time-period or a later occurring time-period. For example, the NPV #1, the NPV #2 and the NPV #3 can be generated for three consecutive time periods or in sequence for time periods that include one or more time periods for which a NPV is not generated and transmitted. The approach can vary depending upon a length established for the time periods and the time required for a transmission and/or processing of the time-varying non-predictable value. In one embodiment, the USR system operates to vary the length of the time periods to increase security.

The preceding embodiments can be employed to provide an uncounterfeitable token that may be used in processes that have increased security relative to prior approaches.

According to some embodiments, an electronic wallet included in a mobile phone allows one to use any number of credit or debit cards at the point-of-sale where no private, sensitive, or secret information or account numbers are stored in the device or transmitted by near field communication ("NFC"). In further embodiments, the electronic wallet, in addition to NFC, can also communicate in Bluetooth and Wi-Fi and can be used for interpersonal funds transfer, computer network access, access to physical facilities and to otherwise authenticate one's identity and act as an individual's trusted agent.

In some embodiments, a user must satisfy 3 factor security to make a transaction, for example, by using a discreet token (the mobile phone), a secret (the users PIN), and a voice print (a biometric). In these embodiments, the biometric can not be recorded and replayed because the biometric required for authentication and/or device activation is a new code that must be spoken digit-by-digit with each authentication. In embodiments where a digital

- 65 -

picture of the identified user is sent to POS from USR the requirements of; 3+ factor security™ are met.

Embodiments of the system and method described herein can employ identification technology to increase security because no static abusable or exploitable static identifier is used. The preceding feature distinguishes these embodiments from verification technology  
5 where some form of static identifier is required. Further, where static identifying information is not employed, the generated, successful, unpredictable code transmitted from the mobile user device represents satisfaction of all three security factors and identifies, rather than verifies, the identification of the user.

10 Further, the various embodiments described herein can be employed in an identification process or a verification process depending on the specific embodiment. For example, in one approach (identification) static identifying information that identifies the user is not included with the transmitted random one-time code. Because an identification process provides increased security, in this embodiment, the USR employs a code matching algorithm to  
15 authenticate the user's identity without benefit of any static identifying information. In contrast, in another approach for the embodiments described herein the USR employs the static identifying information in combination with a code matching algorithm to authenticate the user's identity.

In some embodiments, no PIN is stored in the token. In some of these embodiments, the  
20 PIN is integrated with the algorithm and never stored, transmitted, or exposed.

In the improbable circumstance where at a particular time period more than one unpredictable code is generated for more than one user at USR, USR can in some embodiments wait for the next (immediately subsequent in time) code to authenticate based on a user's unique identity.

25 Further, in some embodiments, a "token" can first send a non-transactional subset non-predictable code to the USR server. The server then sends a subset of the next code that the USR token would generate to the token. Thus, the server has demonstrated its authenticity to the token and then the token can send the actual, active, non-predictable code to the now

- 66 -

trusted, authenticated secure USR server.

Still further, in various embodiments, some of the preceding can employ, or be employed in, apparatus, systems and methods where a verification process is used. For example, the non-predictable value can be communicated along with static identifying information. Where even greater security is required an identification process can be employed. For example, with the identification process, the non-predictable value can be communicated without any static identifying information.

According to any of the preceding embodiments, the mobile devices each include a GPS. According to these embodiments, the GPS capabilities can be used to track user activities and apply security criteria that can act to limit transaction activity based on the location of the mobile device and/or the relative change in position of the mobile device.

According to each of the preceding embodiments in which a PIN is employed to generate a non-predictable value communicated for authentication, the PIN need not be stored in the wireless user-device. According to these embodiments, the PIN can be supplied by the user and immediately employed in an algorithm used to generate the non-predictable value (for example, a time-varying non-predictable value).

It should also be appreciated that any of the apparatus, systems and methods described herein can be used with, or in the manner described in U.S. Patent Nos. 7,237,117; 7,809,651; 7,805,372; 8,001,055; and U.S. Patent Application No. 12/393,586 each of which is herein incorporated by reference in its entirety for all purposes. For example, in various embodiments, the systems 650 and 730 disclosed herein can operate in the manner of any one of the systems described in the previously-identified U.S. Patents and Application and provide any of the functionality of the systems described therein. Similarly, in various embodiments, the USRs 10, 640, 654 and 734 disclosed herein can operate in the manner of any one of the secure registries described in the previously-identified U.S. Patents and Applications and provide the functionality of any of the secure registries described therein. Further, the wireless user devices and/or tokens 674, 652 and 734 can take the form of any one of the user devices

- 67 -

and/or tokens that are described in the previously-identified U.S. Patents and Applications and provide the functionality of any of the user devices and/or tokens described therein.

As used herein, the terms “wireless device” and “wireless user device” describe apparatus that can wirelessly communicate. These terms encompass devices that can include  
5 both wireless communication and wired communication depending upon the manner in which the apparatus is used. For example, as used herein, a “wireless device” can include a USB or other hardwired communication port for temporary or permanent connection to another device and/or network. As will be apparent, a “wireless device” can also include a port for connection to a power source for operating power and/or battery recharging. Further, the embodiments of  
10 the wireless user devices described herein can each include a clock (such as an oscillator) used as a time-reference. In some embodiments, the clock is a discrete element while in other embodiments the clock can be included in another element, for example, a microcontroller of the wireless user device. Wireless user devices can also include any of electronic ID devices, mobile phones, PDAs, personal computers, fobs, wristwatches, passports, pens, credit cards  
15 and dongles as some examples.

Having thus described several aspects of at least one embodiment of this invention, it is to be appreciated various alterations, modifications, and improvements will readily occur to those skilled in the art. Such alterations, modifications, and improvements are intended to be part of this disclosure, and are intended to be within the spirit and scope of the invention.  
20 Accordingly, the foregoing description and drawings are by way of example only.

What is claimed is:

- 68 -

## CLAIMS

1. A system for controlling access to at least one computer, the system comprising:  
a network having at least a portion that includes a wireless network;  
5 at least one computer coupled to the network;  
a handheld device configured to communicate with the at least one computer over the  
wireless network, the handheld device including:  
a user interface programmed to receive a user input including secret information  
known to a user of the handheld device;  
10 a processor coupled to the user interface, the processor programmed to  
authenticate the user of the handheld device and to generate a first time-varying non-  
predictable value following a successful authentication, by the handheld device, of the  
secret information received via the user interface; and  
a wireless transceiver coupled to the processor and configured to transmit via  
15 the network a wireless signal including the first time-varying non-predictable value;  
and  
a secure registry system including a communication interface coupled to the network,  
the secure registry system configured to receive the first time-varying non-predictable value  
and successfully authenticate the user where the first time-varying non-predictable value is  
20 matched to the user by the secure registry system,  
wherein the user of the handheld device is permitted to operate the at least one  
computer to access resources with the at least one computer so long as the at least one  
computer periodically receives subsequent authentication information from the handheld  
device that results in a continued successful authentication of the user for time periods  
25 subsequent to a time at which the first time-varying non-predictable value is generated.

- 69 -

2. The system of claim 1, wherein the secure registry system is configured to lock the computer to prevent the user from operating the computer to access resources when the computer fails to periodically receive the subsequent authentication information.
- 5 3. The system of claim 2, wherein the secure registry system is configured to lock the computer to prevent the user from operating the computer to access resources when the computer fails to periodically receive the subsequent authentication information because the handheld device is no longer within proximity of the computer.
- 10 4. The system of claim 3, wherein the wireless network includes any one of a Wi-fi communication, near field communication and Bluetooth communication employed for communication between the computer and the handheld device, and  
wherein the proximity is determined by a range of the wireless network local to the computer.
- 15 5. The system of claim 4, wherein the handheld device includes any of a mobile phone, a tablet computer and a personal digital assistant, and  
wherein the computer includes any one of a desktop computer, a notebook computer, a laptop computer, a netbook computer and a tablet computer.
- 20 6. The system of claim 3, wherein the secure registry system is coupled to a plurality of computers, the computers each associated with a plurality of users, respectively, and  
wherein the secure registry system is configured to authenticate each of the plurality of users to provide access for each user to at least one computer associated with the user,  
25 respectively.
7. The system of claim 6, wherein the plurality of users includes a second user associated with a second computer,

- 70 -

wherein the second user is in possession of a second handheld device including a second processor, and

wherein the processor is configured to generate a second time-varying non-predictable value following a successful authentication of the second user by the second device.

5

8. The system of claim 7, wherein the second handheld device includes a second wireless transceiver coupled to the second processor and configured to transmit via a second network a second wireless signal including the second time-varying value,

wherein the communication interface of the secure registry is configured to receive the second time-varying non-predictable value and successfully authenticate the second user where the second time-varying non-predictable value is matched to the second user by the secure registry system, and

wherein the second user is permitted to operate the second computer to access resources so long as subsequent authentication information from the second handheld device of the second user results in a continued successful authentication of the second user for time periods subsequent to a time at which the second time-varying non-predictable value is generated.

9. The system of claim 8, wherein the secure registry is configured to lock the first computer to prevent access to resources using the first computer when the first computer fails to periodically receive authentication information subsequent to the time at which the first time-varying non-predictable value is generated because the first handheld device is no longer within proximity of the first computer, and

wherein the secure registry is configured to lock the second computer to prevent access to resources using the second computer when the second computer fails to periodically receive authentication information subsequent to the time at which the second time-varying non-predictable value is generated because the second handheld device is no longer within proximity of the second computer.

- 71 -

10. The system of claim 1, wherein the secure registry system is located remote from the computer, and  
wherein the authentication of the first time-varying non-predictable value and any  
5 subsequent time-varying non-predictable values occur at the secure registry system.
11. The system of claim 1, wherein at least a portion of the secure registry system is located at the computer, and  
wherein the authentication of the first time-varying non-predictable value and any  
10 subsequent time-varying non-predictable values occur at the computer.
12. The system of claim 1, wherein the handheld device includes a memory coupled to the processor, the memory configured to store a seed employed by the processor to generate the first time-varying non-predictable value; and  
15 wherein the processor is configured to employ time, the secret information and the seed to generate the first time-varying non-predictable value.
13. The system of claim 12, wherein the secure registry is configured to distribute seed-updates to the handheld device via the network without requiring any interaction on the part of  
20 the user, and  
wherein the seed-updates are communicated at random intervals to provide a new seed value to the handheld device.
14. The system of claim 13, wherein at least a portion of the secure registry system is  
25 located in a computer, the computer proximate the handheld device when the wireless signal is transmitted,  
wherein the computer includes a memory configured to store the seed, and  
wherein the seed is employed by the computer to authenticate the user.

- 72 -

15. The system of claim 14, wherein the processor is configured to combine the secret information with the seed to generate the first time-varying non-predictable value.
- 5 16. The system of claim 15, wherein the processor is configured to generate the first time-varying non-predictable value, at least in part, by combining the secret information and the seed in an exclusive-or operation, and  
wherein the secret information is not stored in the handheld device.
- 10 17. The system of claim 14, wherein the memory is configured to store at least one of an electronic serial number and a SIM code, and  
wherein the processor is configured to generate the first time-varying non-predictable value, at least in part, by combining the seed with at least one of the electronic serial number and the SIM code in an exclusive-or operation.
- 15 18. The system of claim 17, wherein the secret information is not stored in the handheld device.
19. The system of claim 17, wherein the handheld device includes a secure element, and  
20 wherein the secure element is configured to store at least one of the seed and the electronic serial number.
20. The system of claim 14, wherein the handheld device includes a biometric sensor comprising a microphone configured to receive a spoken input provided by the user,  
25 wherein the user interface is programmed to display a multi-character string including at least one of a plurality of alpha-characters and a plurality of numeric-characters, and  
wherein the processor is programmed to authenticate the user based on the spoken input of the multi-character string by the user.

- 73 -

21. The system of claim 21, wherein the secure registry system is programmed to randomly generate the multi-character string and communicate the multi-character string via the network to the handheld device for display,
- 5 wherein at least a portion of the secure registry system is located in a computer, the computer proximate the handheld device when the wireless signal is transmitted, and wherein the at least the portion of the secure registry located in the computer is configured to generate the multi-character string.
- 10 22. The system of claim 11, wherein the secure registry system includes a database configured to store the seed, wherein, following a successful authentication of the user, the secure registry system is configured to generate a second time-varying non-predictable value using time, the secret information and the seed,
- 15 wherein the communication interface is configured to transmit the second time-varying non-predictable value to the handheld device via the network, and wherein the processor is configured to authenticate the secure registry system using the second time-varying non-predictable value.
- 20 23. The system of claim 22, wherein the processor is configured to, following a successful authentication of the secure registry system, generate a third time-varying non-predictable value, wherein the wireless signal is a first wireless signal, wherein the wireless transceiver is configured to transmit via the network a second
- 25 wireless signal including the third time-varying non-predictable value, and wherein the secure registry system is configured to authenticate the user using the third time-varying non-predictable signal.

- 74 -

24. A method of securing a computing device, the method comprising:  
receiving, at the computing device, a first wireless signal including first authentication information wirelessly transmitted from a mobile device proximate to the computing device;  
processing the first authentication information to initially authenticate a user in  
5 possession of the mobile device, the user attempting to access resources with the computing device;  
temporarily allowing the user to employ the computing device to access the resources when the initial authentication is successful;  
continuing to allow the user to employ the computing device to access the resources  
10 upon a subsequent receipt of authentication information from the mobile device that is successfully authenticated; and  
automatically terminating use of the computing device by the user based on at least one of authentication information no longer being received from the mobile device and authentication information received from the mobile device no longer being successfully  
15 authenticated.
25. The method of securing a computing device of claim 24, further comprising:  
receiving, at the computing device, subsequent wireless signals from the first wireless device on a periodic basis, the periodic basis including a predetermined period during which  
20 the computing device must receive authentication information;  
continuing to allow the user to employ the computing device to access the resources where the subsequent wireless signals include authentication information that is successfully authenticated; and  
terminating use of the computing device when at least one of the subsequent wireless  
25 signals is not received during a respective predetermined period.

- 75 -

26. The method of claim 24, further comprising:  
including at least a first time-varying non-predictable value generated by the mobile device in the first authentication information; and  
including in the authentication information included in each of the subsequent wireless  
5 signals a respective time-varying non-predictable value generated by the mobile device.
27. The method of claim 26, further comprising initially authenticating the user of the mobile device when the first time-varying non-predictable value is matched to the user by a secure registry system geographically remote from the computing device.  
10
28. The method of claim 27, further comprising subsequently authenticating the user of the mobile device at each occurrence where the respective time-varying non-predictable value is matched to the user by the secure registry.
- 15 29. The method of claim 27, further comprising:  
including at least a portion of the secure registry system in the computing device; and  
locally authenticating the user with the computing device.
30. The method of claim 29, further comprising:  
20 including public identifying information of the user in the authentication information;  
and  
authenticating the user by comparing the time-varying non-predictable value received in the wireless signal with verification information for the user based on an identity provided by the public identifying information.  
25
31. The method of claim 24, further comprising:  
locating at least a portion of the secure registry system remote from the computing device;

- 76 -

communicating the first time-varying non-predictable value to the remote portion of the secure registry system for an initial authentication; and

locally authenticating the respective time-varying non-predictable values with the computing device.

5

32. The method of claim 25, further comprising maintaining an ability for the mobile device to wirelessly communicate with the computing device so long as the mobile device is located within a pre-determined distance of the computing device.

10 33. The method of claim 24, wherein the mobile device includes any of a personal digital assistant, mobile phone and a tablet computer, and

wherein the method further comprises communicating the wireless signal by one of Bluetooth, near field communication and Wi-Fi.

**AMENDED CLAIMS**  
received by the International Bureau on 20 March 2012 (20.03.2012)

1. A system for controlling access to at least one computer, the system comprising:
    - a network having at least a portion that includes a wireless network;
    - at least one computer coupled to the network;
    - a handheld device configured to communicate with the at least one computer over the wireless network, the handheld device including:
      - a user interface programmed to receive a user input including secret information known to a user of the handheld device;
      - a processor coupled to the user interface, the processor programmed to authenticate the user of the handheld device and to generate a first time-varying non-predictable value following a successful authentication, by the handheld device, of the secret information received via the user interface; and
      - a wireless transceiver coupled to the processor and configured to transmit via the network a wireless signal including the first time-varying non-predictable value; and
      - a secure registry system including a communication interface coupled to the network, the secure registry system configured to receive the first time-varying non-predictable value and successfully authenticate the user where the first time-varying non-predictable value is matched to the user by the secure registry system,
- wherein the user of the handheld device is permitted to operate the at least one computer to access resources with the at least one computer so long as the at least one computer periodically receives subsequent authentication information from the handheld device that results in a continued successful authentication of the user for time periods subsequent to a time at which the first time-varying non-predictable value is generated.

2. The system of claim 1, wherein the secure registry system is configured to lock the computer to prevent the user from operating the computer to access resources when the computer fails to periodically receive the subsequent authentication information.
3. The system of claim 2, wherein the secure registry system is configured to lock the computer to prevent the user from operating the computer to access resources when the computer fails to periodically receive the subsequent authentication information because the handheld device is no longer within proximity of the computer.
4. The system of claim 3, wherein the wireless network includes any one of a Wi-fi communication, near field communication and Bluetooth communication employed for communication between the computer and the handheld device, and  
wherein the proximity is determined by a range of the wireless network local to the computer.
5. The system of claim 4, wherein the handheld device includes any of a mobile phone, a tablet computer and a personal digital assistant, and  
wherein the computer includes any one of a desktop computer, a notebook computer, a laptop computer, a netbook computer and a tablet computer.
6. The system of claim 3, wherein the secure registry system is coupled to a plurality of computers, the computers each associated with a plurality of users, respectively, and  
wherein the secure registry system is configured to authenticate each of the plurality of users to provide access for each user to at least one computer associated with the user, respectively.

7. The system of claim 6, wherein the plurality of users includes a second user associated with a second computer,  
wherein the second user is in possession of a second handheld device including a second processor, and  
wherein the processor is configured to generate a second time-varying non-predictable value following a successful authentication of the second user by the second device.
8. The system of claim 7, wherein the second handheld device includes a second wireless transceiver coupled to the second processor and configured to transmit via a second network a second wireless signal including the second time-varying value,  
wherein the communication interface of the secure registry is configured to receive the second time-varying non-predictable value and successfully authenticate the second user where the second time-varying non-predictable value is matched to the second user by the secure registry system, and  
wherein the second user is permitted to operate the second computer to access resources so long as subsequent authentication information from the second handheld device of the second user results in a continued successful authentication of the second user for time periods subsequent to a time at which the second time-varying non-predictable value is generated.
9. The system of claim 8, wherein the secure registry is configured to lock the first computer to prevent access to resources using the first computer when the first computer fails to periodically receive authentication information subsequent to the time at which the first time-varying non-predictable value is generated because the first handheld device is no longer within proximity of the first computer, and  
wherein the secure registry is configured to lock the second computer to prevent access to resources using the second computer when the second computer fails to periodically receive authentication information subsequent to the time at which the second time-varying non-

predictable value is generated because the second handheld device is no longer within proximity of the second computer.

10. The system of claim 1, wherein the secure registry system is located remote from the computer, and

wherein the authentication of the first time-varying non-predictable value and any subsequent time-varying non-predictable values occur at the secure registry system.

11. The system of claim 1, wherein at least a portion of the secure registry system is located at the computer, and

wherein the authentication of the first time-varying non-predictable value and any subsequent time-varying non-predictable values occur at the computer.

12. The system of claim 1, wherein the handheld device includes a memory coupled to the processor, the memory configured to store a seed employed by the processor to generate the first time-varying non-predictable value; and

wherein the processor is configured to employ time, the secret information and the seed to generate the first time-varying non-predictable value.

13. The system of claim 12, wherein the secure registry is configured to distribute seed-updates to the handheld device via the network without requiring any interaction on the part of the user, and

wherein the seed-updates are communicated at random intervals to provide a new seed value to the handheld device.

14. The system of claim 13, wherein at least a portion of the secure registry system is located in a computer, the computer proximate the handheld device when the wireless signal is transmitted,  
wherein the computer includes a memory configured to store the seed, and  
wherein the seed is employed by the computer to authenticate the user.
15. The system of claim 14, wherein the processor is configured to combine the secret information with the seed to generate the first time-varying non-predictable value.
16. The system of claim 15, wherein the processor is configured to generate the first time-varying non-predictable value, at least in part, by combining the secret information and the seed in an exclusive-or operation, and  
wherein the secret information is not stored in the handheld device.
17. The system of claim 14, wherein the memory is configured to store at least one of an electronic serial number and a SIM code, and  
wherein the processor is configured to generate the first time-varying non-predictable value, at least in part, by combining the seed with at least one of the electronic serial number and the SIM code in an exclusive-or operation.
18. The system of claim 17, wherein the secret information is not stored in the handheld device.
19. The system of claim 17, wherein the handheld device includes a secure element, and  
wherein the secure element is configured to store at least one of the seed and the electronic serial number.

20. The system of claim 14, wherein the handheld device includes a biometric sensor comprising a microphone configured to receive a spoken input provided by the user,  
wherein the user interface is programmed to display a multi-character string including at least one of a plurality of alpha-characters and a plurality of numeric-characters, and  
wherein the processor is programmed to authenticate the user based on the spoken input of the multi-character string by the user.
21. The system of claim 20, wherein the secure registry system is programmed to randomly generate the multi-character string and communicate the multi-character string via the network to the handheld device for display,  
wherein at least a portion of the secure registry system is located in a computer, the computer proximate the handheld device when the wireless signal is transmitted, and  
wherein the at least the portion of the secure registry located in the computer is configured to generate the multi-character string.
22. The system of claim 11, wherein the secure registry system includes a database configured to store the seed,  
wherein, following a successful authentication of the user, the secure registry system is configured to generate a second time-varying non-predictable value using time, the secret information and the seed,  
wherein the communication interface is configured to transmit the second time-varying non-predictable value to the handheld device via the network, and  
wherein the processor is configured to authenticate the secure registry system using the second time-varying non-predictable value.
23. The system of claim 22, wherein the processor is configured to, following a successful authentication of the secure registry system, generate a third time-varying non-predictable value,

wherein the wireless signal is a first wireless signal,  
wherein the wireless transceiver is configured to transmit via the network a second wireless signal including the third time-varying non-predictable value, and  
wherein the secure registry system is configured to authenticate the user using the third time-varying non-predictable signal.

24. A method of securing a computing device, the method comprising:  
receiving, at the computing device, a first wireless signal including first authentication information wirelessly transmitted from a mobile device proximate to the computing device;  
processing the first authentication information to initially authenticate a user in possession of the mobile device, the user attempting to access resources with the computing device;  
temporarily allowing the user to employ the computing device to access the resources when the initial authentication is successful;  
continuing to allow the user to employ the computing device to access the resources upon a subsequent receipt of authentication information from the mobile device that is successfully authenticated; and  
automatically terminating use of the computing device by the user based on at least one of authentication information no longer being received from the mobile device and authentication information received from the mobile device no longer being successfully authenticated.

25. The method of securing a computing device of claim 24, further comprising:  
receiving, at the computing device, subsequent wireless signals from the first wireless device on a periodic basis, the periodic basis including a predetermined period during which the computing device must receive authentication information;  
continuing to allow the user to employ the computing device to access the resources where the subsequent wireless signals include authentication information that is successfully authenticated; and

terminating use of the computing device when at least one of the subsequent wireless signals is not received during a respective predetermined period.

26. The method of claim 24, further comprising:  
including at least a first time-varying non-predictable value generated by the mobile device in the first authentication information; and  
including in the authentication information included in each of the subsequent wireless signals a respective time-varying non-predictable value generated by the mobile device.
27. The method of claim 26, further comprising initially authenticating the user of the mobile device when the first time-varying non-predictable value is matched to the user by a secure registry system geographically remote from the computing device.
28. The method of claim 27, further comprising subsequently authenticating the user of the mobile device at each occurrence where the respective time-varying non-predictable value is matched to the user by the secure registry.
29. The method of claim 27, further comprising:  
including at least a portion of the secure registry system in the computing device; and  
locally authenticating the user with the computing device.
30. The method of claim 29, further comprising:  
including public identifying information of the user in the authentication information; and  
authenticating the user by comparing the time-varying non-predictable value received in the wireless signal with verification information for the user based on an identity provided by the public identifying information.

31. The method of claim 24, further comprising:  
locating at least a portion of the secure registry system remote from the computing device;  
communicating the first time-varying non-predictable value to the remote portion of the secure registry system for an initial authentication; and  
locally authenticating the respective time-varying non-predictable values with the computing device.
32. The method of claim 25, further comprising maintaining an ability for the mobile device to wirelessly communicate with the computing device so long as the mobile device is located within a pre-determined distance of the computing device.
33. The method of claim 24, wherein the mobile device includes any of a personal digital assistant, mobile phone and a tablet computer, and  
wherein the method further comprises communicating the wireless signal by one of Bluetooth, near field communication and Wi-Fi.

NOTICE OF ALLOWANCE AND FEE(S) DUE

37462 7590 03/19/2013
LANDO & ANASTASI, LLP
ONE MAIN STREET, SUITE 1100
CAMBRIDGE, MA 02142

EXAMINER
CHEUNG, CALVIN K
ART UNIT PAPER NUMBER

3662
DATE MAILED: 03/19/2013

Table with 5 columns: APPLICATION NO., FILING DATE, FIRST NAMED INVENTOR, ATTORNEY DOCKET NO., CONFIRMATION NO.

TITLE OF INVENTION: UNIVERSAL SECURE REGISTRY

Table with 7 columns: APPLN. TYPE, SMALL ENTITY, ISSUE FEE DUE, PUBLICATION FEE DUE, PREV. PAID ISSUE FEE, TOTAL FEE(S) DUE, DATE DUE

THE APPLICATION IDENTIFIED ABOVE HAS BEEN EXAMINED AND IS ALLOWED FOR ISSUANCE AS A PATENT. PROSECUTION ON THE MERITS IS CLOSED. THIS NOTICE OF ALLOWANCE IS NOT A GRANT OF PATENT RIGHTS. THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. THIS STATUTORY PERIOD CANNOT BE EXTENDED. SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

B. If the status above is to be removed, check box 5b on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and twice the amount of the ISSUE FEE shown above, or

If the SMALL ENTITY is shown as NO:

A. Pay TOTAL FEE(S) DUE shown above, or

B. If applicant claimed SMALL ENTITY status before, or is now claiming SMALL ENTITY status, check box 5a on Part B - Fee(s) Transmittal and pay the PUBLICATION FEE (if required) and 1/2 the ISSUE FEE shown above.

II. PART B - FEE(S) TRANSMITTAL, or its equivalent, must be completed and returned to the United States Patent and Trademark Office (USPTO) with your ISSUE FEE and PUBLICATION FEE (if required). If you are charging the fee(s) to your deposit account, section "4b" of Part B - Fee(s) Transmittal should be completed and an extra copy of the form should be submitted. If an equivalent of Part B is filed, a request to reapply a previously paid issue fee must be clearly made, and delays in processing may occur due to the difficulty in recognizing the paper as an equivalent of Part B.

III. All communications regarding this application must give the application number. Please direct all communications prior to issuance to Mail Stop ISSUE FEE unless advised to the contrary.

IMPORTANT REMINDER: Utility patents issuing on applications filed on or after Dec. 12, 1980 may require payment of maintenance fees. It is patentee's responsibility to ensure timely payment of maintenance fees when due.

**PART B - FEE(S) TRANSMITTAL**

**Complete and send this form, together with applicable fee(s), to: Mail Mail Stop ISSUE FEE  
 Commissioner for Patents  
 P.O. Box 1450  
 Alexandria, Virginia 22313-1450  
 or Fax (571)-273-2885**

**INSTRUCTIONS:** This form should be used for transmitting the ISSUE FEE and PUBLICATION FEE (if required). Blocks 1 through 5 should be completed where appropriate. All further correspondence including the Patent, advance orders and notification of maintenance fees will be mailed to the current correspondence address as indicated unless corrected below or directed otherwise in Block 1, by (a) specifying a new correspondence address; and/or (b) indicating a separate "FEE ADDRESS" for maintenance fee notifications.

CURRENT CORRESPONDENCE ADDRESS (Note: Use Block 1 for any change of address)

Note: A certificate of mailing can only be used for domestic mailings of the Fee(s) Transmittal. This certificate cannot be used for any other accompanying papers. Each additional paper, such as an assignment or formal drawing, must have its own certificate of mailing or transmission.

Determination of Patent Term Adjustment under 35 U.S.C. 154 (b)

(application filed on or after May 29, 2000)

The Patent Term Adjustment to date is 0 day(s). If the issue fee is paid on the date that is three months after the mailing date of this notice and the patent issues on the Tuesday before the date that is 28 weeks (six and a half months) after the mailing date of this notice, the Patent Term Adjustment will be 0 day(s).

If a Continued Prosecution Application (CPA) was filed in the above-identified application, the filing date that determines Patent Term Adjustment is the filing date of the most recent CPA.

Applicant will be able to obtain more detailed information by accessing the Patent Application Information Retrieval (PAIR) WEB site (http://pair.uspto.gov).

Any questions regarding the Patent Term Extension or Adjustment determination should be directed to the Office of Patent Legal Administration at (571)-272-7702. Questions relating to issue and publication fee payments should be directed to the Customer Service Center of the Office of Patent Publication at 1-(888)-786-0101 or (571)-272-4200.

## Privacy Act Statement

**The Privacy Act of 1974 (P.L. 93-579)** requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether disclosure of these records is required by the Freedom of Information Act.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspection or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

<b>Applicant-Initiated Interview Summary</b>	<b>Application No.</b> 13/237,184	<b>Applicant(s)</b> WEISS, KENNETH P.	
	<b>Examiner</b> CALVIN CHEUNG	<b>Art Unit</b> 3662	

All participants (applicant, applicant's representative, PTO personnel):

- (1) CALVIN CHEUNG. (3) John Anastasi (Reg# 37765).  
(2) Matthew Grady (Reg# 52957). (4) \_\_\_\_\_.

Date of Interview: 07 March 2013.

Type:  Telephonic  Video Conference  
 Personal [copy given to:  applicant  applicant's representative]

Exhibit shown or demonstration conducted:  Yes  No.  
If Yes, brief description: \_\_\_\_\_.

Issues Discussed 101 112 102 103 Others  
(For each of the checked box(es) above, please describe below the issue and detailed description of the discussion)

Claim(s) discussed: 1, 15 and 20.

Identification of prior art discussed: prior art of record.

**Substance of Interview**

(For each issue discussed, provide a detailed description and indicate if agreement was reached. Some topics may include: identification or clarification of a reference or a portion thereof, claim interpretation, proposed amendments, arguments of any applied references etc...)

Main discussion objective was to provide greater clarification of invention as it relates to claim language. It was pointed out to the Examiner that the pending application contains an additional step that is not found in the prior art Weiss. After further discussion, review, and consideration; the Examiner agreed. To further clarify the invention as a whole, claim 2 will be rolled into claim 1 and subject matter related with claim 2 will be added to the other independent claims.

**Applicant recordation instructions:** The formal written reply to the last Office action must include the substance of the interview. (See MPEP section 713.04). If a reply to the last Office action has already been filed, applicant is given a non-extendable period of the longer of one month or thirty days from this interview date, or the mailing date of this interview summary form, whichever is later, to file a statement of the substance of the interview

**Examiner recordation instructions:** Examiners must summarize the substance of any interview of record. A complete and proper recordation of the substance of an interview should include the items listed in MPEP 713.04 for complete and proper recordation including the identification of the general thrust of each argument or issue discussed, a general indication of any other pertinent matters discussed regarding patentability and the general results or outcome of the interview, to include an indication as to whether or not agreement was reached on the issues raised.

Attachment

/CALVIN CHEUNG/  
Examiner, Art Unit 3662

## Summary of Record of Interview Requirements

### Manual of Patent Examining Procedure (MPEP), Section 713.04, Substance of Interview Must be Made of Record

A complete written statement as to the substance of any face-to-face, video conference, or telephone interview with regard to an application must be made of record in the application whether or not an agreement with the examiner was reached at the interview.

### Title 37 Code of Federal Regulations (CFR) § 1.133 Interviews

Paragraph (b)

In every instance where reconsideration is requested in view of an interview with an examiner, a complete written statement of the reasons presented at the interview as warranting favorable action must be filed by the applicant. An interview does not remove the necessity for reply to Office action as specified in §§ 1.111, 1.135. (35 U.S.C. 132)

37 CFR §1.2 Business to be transacted in writing.

All business with the Patent or Trademark Office should be transacted in writing. The personal attendance of applicants or their attorneys or agents at the Patent and Trademark Office is unnecessary. The action of the Patent and Trademark Office will be based exclusively on the written record in the Office. No attention will be paid to any alleged oral promise, stipulation, or understanding in relation to which there is disagreement or doubt.

The action of the Patent and Trademark Office cannot be based exclusively on the written record in the Office if that record is itself incomplete through the failure to record the substance of interviews.

It is the responsibility of the applicant or the attorney or agent to make the substance of an interview of record in the application file, unless the examiner indicates he or she will do so. It is the examiner's responsibility to see that such a record is made and to correct material inaccuracies which bear directly on the question of patentability.

Examiners must complete an Interview Summary Form for each interview held where a matter of substance has been discussed during the interview by checking the appropriate boxes and filling in the blanks. Discussions regarding only procedural matters, directed solely to restriction requirements for which interview recordation is otherwise provided for in Section 812.01 of the Manual of Patent Examining Procedure, or pointing out typographical errors or unreadable script in Office actions or the like, are excluded from the interview recordation procedures below. Where the substance of an interview is completely recorded in an Examiners Amendment, no separate Interview Summary Record is required.

The Interview Summary Form shall be given an appropriate Paper No., placed in the right hand portion of the file, and listed on the "Contents" section of the file wrapper. In a personal interview, a duplicate of the Form is given to the applicant (or attorney or agent) at the conclusion of the interview. In the case of a telephone or video-conference interview, the copy is mailed to the applicant's correspondence address either with or prior to the next official communication. If additional correspondence from the examiner is not likely before an allowance or if other circumstances dictate, the Form should be mailed promptly after the interview rather than with the next official communication.

The Form provides for recordation of the following information:

- Application Number (Series Code and Serial Number)
- Name of applicant
- Name of examiner
- Date of interview
- Type of interview (telephonic, video-conference, or personal)
- Name of participant(s) (applicant, attorney or agent, examiner, other PTO personnel, etc.)
- An indication whether or not an exhibit was shown or a demonstration conducted
- An identification of the specific prior art discussed
- An indication whether an agreement was reached and if so, a description of the general nature of the agreement (may be by attachment of a copy of amendments or claims agreed as being allowable). Note: Agreement as to allowability is tentative and does not restrict further action by the examiner to the contrary.
- The signature of the examiner who conducted the interview (if Form is not an attachment to a signed Office action)

It is desirable that the examiner orally remind the applicant of his or her obligation to record the substance of the interview of each case. It should be noted, however, that the Interview Summary Form will not normally be considered a complete and proper recordation of the interview unless it includes, or is supplemented by the applicant or the examiner to include, all of the applicable items required below concerning the substance of the interview.

A complete and proper recordation of the substance of any interview should include at least the following applicable items:

- 1) A brief description of the nature of any exhibit shown or any demonstration conducted,
- 2) an identification of the claims discussed,
- 3) an identification of the specific prior art discussed,
- 4) an identification of the principal proposed amendments of a substantive nature discussed, unless these are already described on the Interview Summary Form completed by the Examiner,
- 5) a brief identification of the general thrust of the principal arguments presented to the examiner,  
(The identification of arguments need not be lengthy or elaborate. A verbatim or highly detailed description of the arguments is not required. The identification of the arguments is sufficient if the general nature or thrust of the principal arguments made to the examiner can be understood in the context of the application file. Of course, the applicant may desire to emphasize and fully describe those arguments which he or she feels were or might be persuasive to the examiner.)
- 6) a general indication of any other pertinent matters discussed, and
- 7) if appropriate, the general results or outcome of the interview unless already described in the Interview Summary Form completed by the examiner.

Examiners are expected to carefully review the applicant's record of the substance of an interview. If the record is not complete and accurate, the examiner will give the applicant an extendable one month time period to correct the record.

### Examiner to Check for Accuracy

If the claims are allowable for other reasons of record, the examiner should send a letter setting forth the examiner's version of the statement attributed to him or her. If the record is complete and accurate, the examiner should place the indication, "Interview Record OK" on the paper recording the substance of the interview along with the date and the examiner's initials.

**Notice of Allowability**

<b>Application No.</b>	<b>Applicant(s)</b>	
13/237,184	WEISS, KENNETH P.	
<b>Examiner</b>	<b>Art Unit</b>

/CALVIN CHEUNG/  
Examiner, Art Unit 3662

### **DETAILED ACTION**

1. This office action is given an identifier, Paper No. 20130308, for reference purposes only.

#### *Status of Claims*

2. Claims 2-3 are cancelled by claim amendments filed 7 March 2013. Therefore, claims 1 and 4-28 are allowed in this office action.

#### *Reason for Allowance*

3. The following is an examiner's statement of reasons for allowance:

Regarding the claimed terms, the Examiner notes that a "general term must be understood in the context in which the inventor presents it." *In re Glaug* 283 F.3d 1335, 1340, 62 USPQ2d 1151, 1154 (Fed. Cir. 2002). Therefore the Examiner must interpret the claimed terms as found within the Original Specification. Clearly almost all the general terms in the claims may have multiple meanings. So where a claim term "is susceptible to various meanings, ... the inventor's lexicography must prevail ...." *Id.* Using these definitions for the claims, the claimed invention was not reasonably found in the prior art.

The primary prior art reference, US 20020178364 A1 ("Weiss"), discloses a secure registry system and method for the use thereof are provided which permits secure access to a database containing selected data on a plurality of entities, at least portions of which database has restricted access. Mechanisms are provided for controlling access to restricted access portions of the database are provided, such access being determined by at least one of the identity of the

requesting entity and the entity's status. A multicharacter public code may be provided which the system can map to provide permit delivery of items, complete telephone calls and perform other functions for entities. The system may also be utilized to locate an individual based on limited biological data. Organizations utilizing the system may have custom software facilitating their access and use of the system.

The second reference, US 6819219 (“Bolle”), teaches an invention to wirelessly authenticate a user using a combination of biometrics (e.g., fingerprint) and a locally stored biometric template.

In regards to claim 1, the prior art taken either individually or in combination with other prior art of record fails to disclose, suggest, teach, or render obvious the invention as a whole an electronic ID device comprising: a biometric sensor configured to receive a biometric input provided by the user; a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts; a communication interface configured to communicate with a secure registry; a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication interface, the processor being programmed to activate the electronic ID device based on successful authentication by the electronic ID device of at least one of the biometric input and the secret information, the processor also being programmed such that once the electronic ID device is activated the processor is configured to generate a non- predictable value and to generate encrypted authentication information from the non-predictable value, information associated with at least a portion of the biometric input, and the secret information, and to communicate the encrypted

authentication information via the communication interface to the secure registry; and wherein the communication interface is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device, and wherein the secure registry is configured to receive at least a portion of the encrypted authentication information from the POS device.

In regards to claim 15, the prior art taken either individually or in combination with other prior art of record fails to disclose, suggest, teach, or render obvious the invention as a whole a method comprising: authenticating an identity of a user to an electronic ID device based on at least one of biometric data received by the electronic ID device from the user and secret information known to the user and provided to the electronic ID device; activating the electronic ID device based on successful authentication; generating, responsive to activating, a non-predictable value with the electronic ID device; receiving, in a user interface, identifying information from the user concerning a selected one of a plurality of user accounts; generating encrypted authentication information from the non-predictable value, information associated with at least a portion of the biometric data, and the secret information; and communicating, by a communication interface, the encrypted authentication information from the electronic ID device to a secure registry via a point-of-sale (POS) device to authenticate the electronic ID device with the secure registry.

In regards to claim 20, the prior art taken either individually or in combination with other prior art of record fails to disclose, suggest, teach, or render obvious the invention as a whole a method comprising: generating, with an electronic ID device, a non-predictable value; generating, with the electronic ID device, encrypted authentication information from the non-predictable value generated by the electronic ID device, information associated with at least a

portion of a biometric of the user received by the electronic ID device, and secret information provided to the electronic ID device by the user; communicating the encrypted authentication information from the electronic ID device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the electronic ID device with the secure registry; authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated; and denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

**AMENDMENT AFTER FINAL ACTION UNDER 37 C.F.R. 1.116**

Commissioner for Patents

Dear Madam:

**INTRODUCTORY COMMENTS**

In response to the Office Action dated January 17, 2013, finally rejecting claims 1, 2 and 4-28, please amend the above-identified U.S. patent application as follows:

**Amendments to the Claims** are reflected in the listing of claims which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 8 of this paper.

**AMENDMENT AFTER FINAL ACTION UNDER 37 C.F.R. 1.116**

Commissioner for Patents

Dear Madam:

**INTRODUCTORY COMMENTS**

In response to the Office Action dated January 17, 2013, finally rejecting claims 1, 2 and 4-28, please amend the above-identified U.S. patent application as follows:

**Amendments to the Claims** are reflected in the listing of claims which begins on page 2 of this paper.

**Remarks/Arguments** begin on page 8 of this paper.

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

#### Listing of Claims:

1. (Currently Amended) An electronic ID device configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction, comprising:
  - a biometric sensor configured to receive a biometric input provided by the user;
  - a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts;
  - a communication interface configured to communicate with a secure registry; ~~and~~
  - a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication interface, the processor being programmed to activate the electronic ID device based on successful authentication by the electronic ID device of at least one of the biometric input and the secret information, the processor also being programmed such that once the electronic ID device is activated the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, information associated with ~~derived from~~ at least a portion of the biometric input, and the secret information, and to communicate the encrypted authentication information via the communication interface to the secure registry; and  
wherein the communication interface is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device, and wherein the secure registry is configured to receive at least a portion of the encrypted authentication information from the POS device.
2. (Cancelled)

3. (Cancelled)

4. (Currently Amended) The electronic ID device of claim [[2]] 1, wherein the electronic ID device comprises a discrete code associated with the electronic ID device.

5. (Currently Amended) The electronic ID device of claim 1, wherein at least a portion of the biometric input received by the biometric sensor is communicated to the secure registry for authentication prior to generation of the encrypted authentication information.

6. (Currently Amended) The electronic ID device of claim 1, wherein the secret information includes the identifying information.

7. (Currently Amended) The electronic ID device of claim 1, further comprising a memory coupled to the processor, wherein the memory stores information employed by the electronic ID device to authenticate the biometric received by the biometric sensor.

8. (Currently Amended) The electronic ID device of claim 7, wherein the electronic ID device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the electronic ID device.

9. (Currently Amended) The electronic ID device of claim 8, wherein the secret information known to the user includes a PIN, and wherein the authentication of both the secret information and the biometric input activate the electronic ID device for a financial transaction.

10. (Currently Amended) The electronic ID device of claim 9, further comprising a memory coupled to the processor, wherein data stored in the memory is unavailable to an individual in possession of the electronic ID device until the electronic ID device is activated.

11. (Currently Amended) The electronic ID device of claim 10, wherein the data is subject to a mathematical operation that acts to modify the data such that it is unintelligible until the electronic ID device is activated.
  
12. (Currently Amended) The electronic ID device of claim 9, further comprising a memory coupled to the processor and configured to store an electronic serial number of the electronic ID device, wherein the processor is configured to generate a seed using at least two of the electronic serial number, a discrete code associated with the electronic ID device, the PIN, a time value, and the biometric input to generate the encrypted authentication information, and wherein the seed is employed by the processor to generate the non-predictable value.
  
13. (Currently Amended) The electronic ID device of claim 1, wherein the biometric sensor is configured to receive and process at least one of a fingerprint, a speech/voice input, an iris scan, a retina scan, a facial scan, written information and a DNA input.
  
14. (Currently Amended) The electronic ID device of claim 13, wherein the processor is configured to generate account identifying information for the respective one of the plurality of accounts, wherein the account identifying information does not identify an account number of the respective one of the plurality of accounts.
  
15. (Currently Amended) A method of generating authentication information comprising acts of:
  - authenticating an identity of a user to an electronic ID device based on at least one of biometric data received by the electronic ID device from the user and secret information known to the user and provided to the electronic ID device;
  - activating the electronic ID device based on successful authentication;
  - generating, responsive to activating, a non-predictable value with the electronic ID device;
  - receiving, in a user interface, identifying information from the user concerning a selected one of a plurality of user accounts;

generating encrypted authentication information from the non-predictable value, information associated with ~~derived from~~ at least a portion of the biometric data, and the secret information; and communicating, by a communication interface, the encrypted authentication information from the electronic ID device to a secure registry via a point-of-sale (POS) device to authenticate the electronic ID device with the secure registry.

16. (Currently Amended) The method of claim 15, further comprising an act of displaying, on the user interface indicators for the plurality of user accounts stored in a memory of the electronic ID device.

17. (Currently Amended) The method of claim 15, further comprising an act of de-activating the electronic ID device without generating the encrypted authentication information if the identity of the user is not successfully authenticated to the electronic ID device.

18. (Currently Amended) The method of claim 15, further comprising an act of generating a seed from which the authentication information is generated by employing at least two of the biometric data, the secret information known to the user, and an electronic serial number of the electronic ID device.

19. (Original) The method of claim 15, further comprising an act of generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry.

20. (Currently Amended) A method of controlling access to a plurality of accounts, the method comprising acts of:  
generating, with an electronic ID device, a non-predictable value;  
generating, with a the electronic ID device, encrypted authentication information from a the non-predictable value generated by the electronic ID device, information associated with ~~derived~~

~~from~~ at least a portion of a biometric of the user received by the electronic ID device, and secret information provided to the electronic ID device by the user;

communicating the encrypted authentication information from the electronic ID device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the electronic ID device with the secure registry;

authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated; and

denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

21. (Currently Amended) The method of claim 15, further comprising an act of generating an account identifier for the selected one of the plurality of user accounts that does not include an account number, and wherein the act of generating encrypted authentication information includes using the account identifier for the identifying information.

22. (Currently Amended) The electronic ID device of claim 1, wherein the processor is configured to display indicators for the plurality of accounts in the user interface, and the user interface is configured to accept user selection of a respective one of the plurality of accounts.

23. (Currently Amended) The electronic ID device of claim 1, wherein the user interface is configured to display options for purchase.

24. (Currently Amended) The electronic ID device of claim 23, wherein the user interface is configured to accept selection of at least one product or service.

25. (Previously Presented) The method of claim 15, further comprising displaying options for purchase on the user interface.

26. (Previously Presented) The method claim 25, further comprising selecting with the user interface at least one product or service for purchase.

27. (Previously Presented) The method of claim 20, further comprising displaying options for purchase on the user interface.

28. (Previously Presented) The method claim 27, further comprising selecting with the user interface at least one product or service for purchase.

### **REMARKS**

Claims 1, 2 and 4-28 were previously pending in this application. By this amendment, Applicant is canceling claim 2 without prejudice or disclaimer. Claims 1, 4-18, and 20-24 have been amended. As a result, claims 1, 4-28 are pending for examination with claims 1, 15, and 20 being independent claims. No new matter has been added.

#### **Summary of Telephone Conference with Examiner**

Applicant wishes to thank Examiner Cheung for the courtesies extended to Applicant's Representative during the Interview of March 7, 2013. During the course of the Interview, the participants discussed the present rejection of record and proposed amendments. Applicant's Representative and Examiner Cheung agreed that incorporation of dependent claim 2 into independent claim 1 results in allowable subject matter. Likewise, the remaining independent claims have been amended to recite similar limitations, as necessary.

Accordingly, presented are the amendments to the claims as discussed. Favorable consideration is respectfully requested.

#### **Claim Objection**

The Office Action objected claim 21 as being allegedly grammatically incorrect. Applicant has amended claim 21 to recite "where the act of." Accordingly, withdrawal of the object to claim 21 is respectfully requested.

#### **Rejection under 35 U.S.C. §112**

The Office Action rejected claims 1-2 and 4-28 under 35 U.S.C. §112, second paragraph, as being allegedly indefinite. Claim 2 has been canceled without prejudice or disclaimer making the rejection of claim 2 under 35 U.S.C. §112, second paragraph moot. Claims 1, 4-18, and 20-24 have been amended to overcome this rejection.

As discussed in the interview, claims 1, 15 and 20 have been amended to recite “information associated with at least a portion of the biometric input.” Accordingly, withdrawal of the rejection of claims 1, 15 and 20 under 35 U.S.C. §112, second paragraph, is respectfully requested.

Claims 4-14, 16-19, and 21-28 depend from claims 1, 15 and 20 respectively. Accordingly, withdrawal of the rejection of claims 4-14, 16-19 and 21-28 under 35 U.S.C. §112, second paragraph, is respectfully requested.

Claims 4-18, 20 and 22-24 have been amended to recite “The electronic ID device.” Accordingly, withdrawal of the rejection of claims 4-18, 20 and 22-24 under 35 U.S.C. §112, second paragraph, is respectfully requested.

#### Rejections Under 35 U.S.C. §102

The Office Action rejected claims 1-2, 4-6 and 13-28 under 35 U.S.C. §102(b) as being anticipated by U.S. Patent Publication No. 2002/0178364 to Weiss (hereinafter *Weiss*). As discussed and agreed during the Interview, *Weiss* does not teach or suggest claim 1, as amended.

In particular, claim 1, as amended, recites “the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, information associated with at least a portion of the biometric input, and the secret information, and to communicate the encrypted authentication information via the communication interface to the secure registry.” *Weiss* does not teach or suggest the generation of authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information.

Independent claims 15 and 20, as amended, likewise recite: “generating encrypted authentication information from the non-predictable value, information associated with at least a portion of the biometric data, and the secret information” (Claim 15); and “generating, with a device, encrypted authentication information from a non-predictable value generated by the device, information associated with at least a portion of a biometric of the user received by the device, and secret information provided to the device by the user” (Claim 20). As discussed above, *Weiss* does not teach or suggest generating authentication information as recited in claims 15 and 20, as amended.

Additionally, as agreed in the Interview, Applicant has amended the independent claims, as necessary, to recite a point-of-sale (POS) system. Accordingly, withdrawal of the rejection of claims 1, 15, and 20 under 35 U.S.C. §102(b) is respectfully requested.

Claims 4-6, 13-15, 16-19, and 21-28 depend from claims 1, 15 and 20 respectively, and are therefore, allowable for at least the same reasons. Accordingly, withdrawal of the rejection of claims 4-6, 13-15, 16-19, and 21-28 under 35 U.S.C. §102(b) is respectfully requested.

### Rejections Under 35 U.S.C. §103

The Office Action rejected claim 7 under 35 U.S.C. §103(a) as being unpatentable over *Weiss* in view of U.S. Patent No. 6,819,219 to Bolle (hereinafter *Bolle*). Applicant respectfully asserts that *Weiss* either alone or in proper combination *Bolle* does not teach or suggest claim 7, because *Weiss* does not teach or suggest a processor configured to “generate encrypted authentication information from the non-predictable value, information associated with at least a portion of the biometric input, and the secret information,” as recited in claim 1 as amended. As discussed above with respect to claim 1, *Weiss* does not teach or suggest generation of authentication information using the non-predictable value, information associated with at least a portion of the biometric input, and the secret information. *Bolle* does not cure this deficiency. Accordingly, withdrawal of the rejections of claim 7 under 35 U.S.C. §103 is respectfully requested.

The Office Action rejected claims 8-12 under 35 U.S.C. §103(a) as being unpatentable over *Weiss* in view of *Bolle* and further in view of Official Notice (as evidence by prior art references listed in PTO-892). Each of claims 8-12 directly or indirectly depends from allowable claim 1. Accordingly each of claims 8-12 are allowable for at least the same reasons as claim 1. Accordingly, withdrawal of the rejection of claims 8-12 under 35 U.S.C. §103 is respectfully requested.

### CONCLUSION

In view of the foregoing amendments and remarks, reconsideration is respectfully requested. This application should now be in condition for allowance; a notice to this effect is respectfully requested. If the Examiner believes, after this amendment, that the application is not in condition

for allowance, the Examiner is requested to call the Applicant's attorney at the telephone number listed below.

If this response is not considered timely filed and if a request for an extension of time is otherwise absent, Applicant hereby requests any necessary extension of time. If there is a fee occasioned by this response, including an extension fee that is not covered by an accompanying payment, please charge any deficiency to Deposit Account No. 50/2762 (Ref. No. W0537-701320).

Dated: March 7, 2013

**Information:**

<b>Total Files Size (in bytes):</b>	49822
-------------------------------------	-------

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it displays a valid OMB control number.

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

docketing@LALaw.com  
gengelso@LALaw.com

<b>Office Action Summary</b>	<b>Application No.</b> 13/237,184	<b>Applicant(s)</b> WEISS, KENNETH P.	
	<b>Examiner</b> CALVIN CHEUNG	<b>Art Unit</b> 3662	

**-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --**

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1)  Responsive to communication(s) filed on 17 December 2012.
- 2a)  This action is **FINAL**.
- 2b)  This action is non-final.
- 3)  An election was made by the applicant in response to a restriction requirement set forth during the interview on \_\_\_\_; the restriction requirement and election have been incorporated into this action.
- 4)  Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 5)  Claim(s) 1,2 and 4-28 is/are pending in the application.
- 5a) Of the above claim(s) \_\_\_\_ is/are withdrawn from consideration.
- 6)  Claim(s) \_\_\_\_ is/are allowed.
- 7)  Claim(s) 1,2 and 4-28 is/are rejected.
- 8)  Claim(s) \_\_\_\_ is/are objected to.
- 9)  Claim(s) \_\_\_\_ are subject to restriction and/or election requirement.

\* If any claims have been determined allowable, you may be eligible to benefit from the **Patent Prosecution Highway** program at a participating intellectual property office for the corresponding application. For more information, please see [http://www.uspto.gov/patents/init\\_events/pph/index.jsp](http://www.uspto.gov/patents/init_events/pph/index.jsp) or send an inquiry to [PPHfeedback@uspto.gov](mailto:PPHfeedback@uspto.gov).

**Application Papers**

- 10)  The specification is objected to by the Examiner.
- 11)  The drawing(s) filed on \_\_\_\_ is/are: a)  accepted or b)  objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).

**Priority under 35 U.S.C. § 119**

- 12)  Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
  - a)  All   b)  Some \*   c)  None of:
    - 1.  Certified copies of the priority documents have been received.
    - 2.  Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
    - 3.  Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

- 1)  Notice of References Cited (PTO-892)
- 2)  Information Disclosure Statement(s) (PTO/SB/08)  
Paper No(s)/Mail Date \_\_\_\_\_.
- 3)  Interview Summary (PTO-413)  
Paper No(s)/Mail Date. \_\_\_\_\_.
- 4)  Other: \_\_\_\_\_.

### **DETAILED ACTION**

1. This office action is given an identifier, Paper No. 20130103, for reference purposes only.

#### *Status of Claims*

2. Claim 3 is cancelled; claims 21-28 are newly added by claim amendments filed 17 December 2012. Therefore, claims 1-2 and 4-28 are examined in this office action.

#### *Response to Arguments*

3. Applicant's arguments filed 17 December 2012 have been fully considered but they are not persuasive.

#### **Specification Objection**

This objection is withdrawn.

#### **Claim Objection**

This objection is withdrawn.

#### **§ 102 Rejection**

Applicant argues the Weiss reference "does not teach or suggest the generation of authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information." The Examiner respectfully disagrees.

Art Unit: 3662

Weiss discloses “In one embodiment, ...to access the USR database, ... retrieves a **secret user code and/or time-varying value**...obtains from the user a **secret personal identification code**. ... **mathematically combines these three numbers** using a predetermined algorithm to **generate** a one-time **nonpredictable code**...” from ¶ 51. This passage clearly shows that Weiss discloses generating a non-predictable value, information derived from at least a portion of the biometric input, and the secret information. Weiss then discusses about generating authentication information from the nonpredictable value by transmitting the nonpredictable value to another computer, where the nonpredictable code is utilized as authentication information to determine whether a user is granted access (¶ 51).

Applicant repeats the arguments above for claims 15 and 20 and the Examiner traverses these repeated arguments with the same rationale.

### § 103 Rejection

With respect to claim 3, arguments are moot because Applicant has cancelled this claim.

Applicant argues the Weiss reference “does not teach or suggest the generation of authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information” and includes “Neither Weichert nor Bolle cure this deficiency.” In response, Applicant repeats the arguments above for claim 1 and the Examiner traverses these repeated arguments with the same rationale.

Applicant argues the Official Notice used in the rejection of claims 8-12 and requests for documentation to support what is well-known in the art. As requested, the Examiner is now providing the Drexler reference as evidence to support his position for rejecting claims 8 and 9; the Flitcroft reference as evidence to support his position for rejecting claims 10 and 11; and the Krasinski reference as evidence to support his position for rejecting claim 12.

### **Double Patenting Rejection**

This rejection is withdrawn because The Office has approved the Terminal Disclaimer on 21 December 2012.

### ***Claim Objections***

4. Claim 21 is objected to because of the following informalities:

Regarding Claim 21, line 3 recites “wherein the of” which is grammatically incorrect.

Appropriate correction is required.

### ***Claim Rejections - 35 USC § 112***

5. The following is a quotation of 35 U.S.C. 112(b):

(B) CONCLUSION.—The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the inventor or a joint inventor regards as the invention.

The following is a quotation of 35 U.S.C. 112 (pre-AIA), second paragraph:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

6. Claims 1-2 and 4-28 are rejected under 35 U.S.C. 112(b) or 35 U.S.C. 112 (pre-AIA), second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which the inventor or a joint inventor, or for pre-AIA the applicant regards as the invention.

Claim 1 recites an indefinite limitation, “information derived from at least a portion of the biometric input” from lines 14-15. It is unclear whether this limitation is (1) a **new** limitation or (2) making reference to the existing “encrypted authentication information” in line 13. Furthermore, claims 2, 4-14 and 22-24 are rejected based on dependency.

Claims 2, 4-6, 13-14 and 22-24 recite the limitation “The device” in line 1 only. There is insufficient antecedent basis for this limitation in the claim.

Claim 7 recites the limitation “The device” in lines 1 and “the device” in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 8 recites the limitation “The device” and “the device” in line 1 and “the device” in line 3. There is insufficient antecedent basis for this limitation in the claim.

Claim 9 recites the limitation “The device” in line 1 and “the device” in line 3. There is insufficient antecedent basis for this limitation in the claim.

Claim 10 recites the limitation “the device” in lines 1 and 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 11 recites the limitation “The device” in lines 1 and “the device” in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 12 recites the limitation “The device” in lines 1 and “the device” in line 2. There is insufficient antecedent basis for this limitation in the claim.

Claim 15 recites an indefinite limitation, “information derived from at least a portion of a biometric data” from lines 10-11. It is unclear whether this limitation is (1) a **new** limitation or (2) making reference to the existing “encrypted authentication information” in line 9. Furthermore, claims 16-19, 21 and 25-26 are rejected based on dependency.

Claim 15 recites the limitation “the device” in lines 3 and 4. There is insufficient antecedent basis for this limitation in the claim.

Claim 16 recites the limitation “the device” in line 4. There is insufficient antecedent basis for this limitation in the claim.

Claim 17 recites the limitation “the device” in lines 1 and 3. There is insufficient antecedent basis for this limitation in the claim.

Claim 18 recites the limitation “the device” in line 3. There is insufficient antecedent basis for this limitation in the claim.

Claim 20 recites an indefinite limitation, “information derived from at least a portion of a biometric of the user received by the device” from lines 5-6. It is unclear whether this limitation is (1) a new limitation or (2) making reference to the existing “encrypted authentication information” in line 3. Furthermore, claims 27 and 28 are rejected based on dependency.

***Claim Rejections - 35 USC § 102***

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 1-2, 4-6 and 13-28 are rejected under 35 U.S.C. 102(b) as being anticipated by US 20020178364 A1 (“Weiss”) from IDS.

Regarding Claim 1, Weiss discloses an electronic ID device (e.g., electronic ID device, ¶ 52) configured to allow a user (e.g., person) to select any one of a plurality of accounts (e.g., “Credit Card and other financial information” in FIG. 1) associated with the user to employ in a financial transaction, comprising (Abstract, ¶ 17, 52, FIG. 1, 3-4 with associated text):

Art Unit: 3662

- a biometric sensor (e.g., data input devices, such as voice and other audio and video capture devices) configured to receive a biometric input provided by the user (§§ 17, 42);
- a user interface (e.g., user interface **26**) configured to receive:
  - a user input including secret information (e.g., personal identification number) known to the user (§§ 42, 53) and
  - identifying information (e.g., biometric information) concerning an account selected by the user from the plurality of accounts (Abstract, §§ 43, 47, 57, FIG. 1, 3-4 with associated text);
- a communication interface (e.g., Internet) configured to communicate with a secure registry (e.g., database **24**) (§§ 38, 41); and
- a processor (e.g., CPU **16**) coupled to the biometric sensor to receive information concerning the biometric input (§§ 38-42, 48-53, FIG. 1, 3 with associated text), the user interface and the communication interface,
- the processor being programmed to activate (e.g., obtain access) based on successful authentication by the electronic ID device of at least one of the biometric input and the secret information, the processor also being programmed such that once the electronic ID device is activated the processor is configured (§§ 38-42, 51-53; 58-59. From ¶ 52, “the term, ‘electronic ID device’ will be used generically to refer to any of electronic device that may be used to obtain access to the USR database.”):
  - to generate a non-predictable value (e.g., non-predictable single use codes, ¶ 52) and

Art Unit: 3662

- to generate encrypted authentication information from the non-predictable value, information derived from at least at a portion the biometric input and the secret information (§§ 12, 45, 51-53, 74, 98, 100. Weiss discloses (1) “transactions to and from the database may take place using a public key/private key security system” from ¶ 12 and (2) “a secret user code and/or time varying value...and personal identification code... combines these three numbers using a predetermined algorithm to generate a one-time nonpredictable code” from ¶ 51 is used to authenticate the user.), and
- to communicate the encrypted authentication information via the communication interface to the secure registry (§§ 12, 45, 51, 100).

Regarding Claim 2, Weiss discloses:

- wherein the communication interface is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device (§§ 17, 51-52, 74 and FIG. 10, 17 with associated text), and
- wherein the secure registry is configured to receive at least a portion of the encrypted authentication information from the POS device (FIG. 8-10 with associated text, see Elements **804, 904, 1002**. Observe information flows according to “Merchant transmits to USR”).

Regarding Claim 4, Weiss discloses wherein the device comprises a discrete code associated with the electronic ID device (§ 74).

Regarding Claim 5, Weiss discloses wherein at least a portion of the biometric received by the biometric sensor is communicated to the secure registry for authentication prior to generation of the encrypted authentication information (§§ 12-13, 16-17, 41-42, 47-48).

Regarding Claim 6, Weiss discloses wherein the secret information includes the identifying Information (§§ 53).

Regarding Claim 13, Weiss discloses wherein the biometric sensor is configured to receive and process *at least one* (Only one option is required to satisfy the claimed limitation of ‘at least one’) of a fingerprint (e.g., fingerprint), a speech/voice input (e.g., voice print), an iris scan (e.g., iris), a retina scan, a facial scan (e.g., facial), written information (e.g., signature) and a DNA input (e.g., DNA analysis) (§§ 17).

Regarding Claim 14, Weiss discloses:

- wherein the processor is configured to generate account identifying information for the respective one of the plurality of accounts (§§ 51-53),
- wherein the account identifying information does not identify an account number of the respective one of the plurality of accounts (§§ 67-68, 87).

Regarding Claim 15, Weiss discloses a method of generating authentication information comprising acts of (Abstract, §§ 17, 47-48, 54):

Art Unit: 3662

- authenticating an identity of a user to an electronic ID device (e.g., electronic ID device, ¶ 52) based on *at least one* (Only one option is required to satisfy the ‘at least one’ limitation) of biometric data received by the device from the user and secret information known to the user and provided to the device (¶ 17, 51-53);
- activating (e.g., obtain access) the electronic ID device based on successful authentication (¶ 51-53, 58-59; in particular ¶ 52);
- generating, responsive to activating, a non-predictable value with the device (¶ 51-53, 58, 74);
- receiving, in a user interface (e.g., user interface **26** from FIG. 1), identifying information from the user concerning a selected one of a plurality of user accounts (Abstract, ¶ 74, FIG. 1 with associated text);
- generating encrypted authentication information from the non-predictable value, information derived from at least a portion of the biometric data, and the secret information (¶ 12, 45, 51-53, 74, 98, 100. Weiss discloses (1) “transactions to and from the database may take place using a public key/private key security system” from ¶ 12 and (2) “a secret user code and/or time varying value...and personal identification code... combines these three numbers using a predetermined algorithm to generate a one-time nonpredictable code” from ¶ 51 is used to authenticate the user.); and
- communicating, by a communication interface (e.g., Internet), the encrypted authentication information to a secure registry (e.g., database **24**) (¶ 12, 34, 41, 45, 51, 100).

Regarding Claim 16, Weiss discloses an act of displaying, on the user interface indicators for the plurality of user accounts stored in a memory of the device (“...the verifying section of the database may contain a picture to be transmitted back to the person seeking to validate the device to ensure the person using the device is the correct person. Optionally, the identifying device itself may also be provided with a picture of the person authorized to use the card to provide facial confirmation of the person’s right to use the card”, ¶ 53).

Regarding Claim 17, Weiss discloses de-activating the device without generating the encrypted authentication information if the identity of the user is not successfully authenticated to the device (¶ 108).

Regarding Claim 18, Weiss discloses generating a seed from which the authentication information is generated by employing the biometric data and the secret information known to the user (¶ 17, 51-53, 74. Two options satisfy the ‘at least two’ limitation which are listed by Weiss).

Regarding Claim 19, Weiss discloses generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry (FIG. 3, 6-10, 13 with associated text).

Art Unit: 3662

Regarding Claim 20, Weiss discloses a method of controlling access to a plurality of accounts, the method comprising acts of (Abstract, ¶ 17, 47-48, 54):

- generating, with a device, encrypted authentication information (¶ 12, 45, 98) from a non-predictable value generated by the device (¶ 51-53),
  - information derived from at least a portion of a biometric of the user received by the device (¶ 17, 51-53) and
  - secret information provided to the device by the user (¶ 17, 53);
- communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry (¶ 12, 45, 51-53, 74, 100);
- authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated (¶ 74-76. ¶ 76 provides the results of a transaction.); and
- denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated (¶ 74-76. ¶ 76 provides the results of a transaction.).

Regarding Claim 21, Weiss discloses:

- an act of generating an account identifier (e.g., user's private key) for the selected one of the plurality of user accounts that does not include an account number (¶ 12), and

- wherein the of generating encrypted authentication information includes using the account identifier for the identifying information (§ 12-13).

Regarding Claim 22, Weiss discloses wherein (from FIG. 1):

- the processor (e.g., CPU **16** from FIG. 1) is configured to display indicators (e.g., person, financial or other information) for the plurality of accounts in the user interface (FIG. 1 with associated text), and
- the user interface (e.g., user interface **26** from FIG. 1) is configured to accept user selection of a respective one of the plurality of accounts (Weiss discloses his invention may be “used to selectively provide personal, financial or other information about a person”, ¶ 12 and handles unlimited amount of accounts according to FIG. 1).

Regarding Claim 23, Weiss discloses wherein the user interface is configured to display options for purchase (§ 53, 99-100. Buyer must authenticate age and identity before purchasing alcohol because alcohol is an age-restricted product. Weiss’ invention transmits back “user’s photograph, age information” of buyer to merchant’s user interface.).

Regarding Claim 24, Weiss discloses wherein the user interface is configured to accept selection of at least one product or service (§ 53, 99-100. Weiss’ invention demonstrates a buyer of legal age will be accepted to buy alcohol.).

Regarding Claim 25, Weiss discloses displaying options for purchase on the user interface (§§ 53, 99-100. Buyer must authenticate age and identity before purchasing alcohol because alcohol is an age-restricted product. Weiss' invention transmits back "user's photograph, age information" of buyer to merchant's user interface.).

Regarding Claim 26, Weiss discloses selecting with the user interface at least one product or service for purchase (§§ 53, 99-100. Weiss' invention demonstrates a buyer of legal age will be accepted to buy alcohol.).

Regarding Claim 27, Weiss discloses displaying options for purchase on the user interface (§§ 53, 99-100. Buyer must authenticate age and identity before purchasing alcohol because alcohol is an age-restricted product. Weiss' invention transmits back "user's photograph, age information" of buyer to merchant's user interface.).

Regarding Claim 28, Weiss discloses selecting with the user interface at least one product or service for purchase (§§ 53, 99-100. Weiss' invention demonstrates a buyer of legal age will be accepted to buy alcohol.).

8. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Weiss and further in view of US 6819219 ("Bolle") from IDS.

Regarding Claim 7, Weiss discloses a memory coupled to the processor (§§ 17, 52, FIG. 1 with associated text.).

Weiss does not directly disclose wherein the memory stores information employed by the device to authenticate the biometric received by the biometric sensor (§§ 17, 52, FIG. 1 with associated text).

However, Bolle teaches a memory stores information employed by the device to authenticate the biometric received by the biometric sensor (Figure 1, 7 and 10 with associated text. Observe Figure 10, Element 1004). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss by incorporating biometric readers on portable devices as taught by Bolle in order to capture biometric information on a portable device.

9. Claims 8-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Weiss in view of Bolle and further in view of Official Notice (as evidenced by prior art references listed in PTO-892).

Regarding Claim 8, Weiss/Bolle Combination does not directly disclose wherein the device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the device.

The Examiner takes Official Notice it is well known in the art a mismatch or non-matched biometric reading not belonging to the rightful user provides a negative result which prevents access (As evidenced by Drexler (US 5457747), C7:64-C8:27 and FIG. 3 with

associated text.). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle Combination by incorporating a measure which prevents access when biometric readings do not match as taught by Official Notice (as evidenced by Drexler) in order to increase security to personal equipment and information.

Regarding Claim 9, Weiss discloses:

- wherein the secret information known to the user includes a PIN (§ 17, 53), and
- wherein the authentication of both the secret information and the biometric input activate the device for a financial transaction (“The identity of the user possessing the identifying device may be verified at the point of use via *any combination...*”, ¶ 17, 73, 100).

Regarding Claim 10, Weiss discloses a memory coupled to the processor (§ 17, 52, FIG. 1 with associated text.).

Weiss/Bolle Combination does not directly disclose wherein data stored in the memory is unavailable to an individual in possession of the device until the device is activated.

The Examiner takes Official Notice it is well known in the art credit card holders call a telephone number associated with the credit card number to activate their credit cards before they are allowed to make purchases (As evidenced by Flitcroft (US 20030028481) which states, “...when a new credit card is presently issued, it is commonly required that the card holder activate the card. Specifically, the card holder may be required to communicate with the credit

card issuer to activate the card before it can be used”, ¶ 200). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle Combination by incorporating an activation step as taught by Official Notice (as evidenced by Flitcroft) in order to verify the rightful credit card holder has obtained their card.

Regarding Claim 11, Weiss/Bolle Combination does not directly disclose wherein the data is subject to a mathematical operation that acts to modify the data such that it is unintelligible until the device is activated.

The Examiner takes Official Notice it is well known in the art the credit card data is blocked from making purchases until activated (As evidenced by Flitcroft (US 20030028481) which states, “when a new credit card is presently issued, *it is commonly required that the card holder activate the card*” ¶ 200. Thus the card is not yet active to make any purchase.). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the electronic ID devices as disclosed by Weiss/Bolle Combination by incorporating a protection step of preventing access to credit card usage as taught by Official Notice (as evidenced by Flitcroft) in order to protect the credit card holder in the event the card is obtained by someone other than the intended credit card holder.

Regarding Claim 12, Weiss discloses

- a memory:
  - coupled to the processor (¶ 17, 52, FIG. 1 with associated text) and

- configured to the device (§ 17, 52, FIG. 1 with associated text),
- wherein the processor is configured to generate a seed using *at least two* (Only two options are required to satisfy the ‘at least two’ limitation) of the electronic serial number, a discrete code associated with the device (§ 74), the PIN (§ 17, 53), a time value (§ 51), and the biometric input (§ 17) to generate the encrypted authentication information (§ 51-53, 74), and
- wherein the seed is employed by the processor to generate the non-predictable value (§ 51-53, 74).

Weiss/Bolle Combination does not directly disclose store an electronic serial number.

The Examiner takes Official Notice it is well known in the art electronic devices that operate an operating system have unique registration number (As evidenced by Krasinski (US 20030084332 ) which states, “several unique or distinct identifiers exists” one of which is an “operating system registration number”, ¶ 17.). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle combination by incorporating a unique digital number as taught by Official Notice (as evidenced by Krasinski) in order to identify the device.

### *Conclusion*

10. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO

MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

***Contact Information***

11. Examiner Calvin Cheung's direct telephone number is (571) 270-7041 and direct fax is (571) 270-8041 and can normally be reached Monday - Friday, 8:00a.m. - 5:00p.m., EST.

If attempts to reach the Examiner are unsuccessful, Primary Patent Examiner Tuan To's telephone number is (571) 272-6985. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

**AMENDMENT IN RESPONSE TO NON-FINAL OFFICE ACTION UNDER 37 C.F.R. 1.111**

Commissioner for Patents  
Alexandria, VA 22313-1450

Dear Madam:

**INTRODUCTORY COMMENTS**

In response to the Office Action dated August 15, 2012, please amend the above-identified U.S. patent application as follows:

**Amendments to the Specification** begin on page 2 of this paper.

**Amendments to the Claims** are reflected in the listing of claims which begins on page 3 of this paper.

**Remarks/Arguments** begin on page 9 of this paper.

**AMENDMENTS TO THE SPECIFICATION**

Please replace the paragraph beginning at page 1, line 4 with the following:

**CROSS REFERENCE TO RELATED APPLICATIONS**

This application claims the benefit under 35 U.S.C. § 120 as a continuation of U.S. patent application No. 12/393,586 filed February 26, 2009, now U.S. Patent No. 8,234,220 which is a continuation-in-part of each of U.S. patent application serial no. 11/760,732 filed June 8, 2007, now U.S. Patent No. 7,809,651; U.S. patent application serial no. 11/760,729 filed June 8, 2007, now U.S. Patent No. 7,805,372; and U.S. patent application serial no. 11/677,490 filed February 21, 2007, now U.S. Patent No. 8,001,055. This application also claims the benefit under 35 U.S.C. § 120 as a continuation-in-part of U.S. patent application no. 13/168,556 filed on June 24, 2011, which claims the benefit under 35 U.S.C. § 120 as a continuation of U.S. application no. 11/677,490. Each of U.S. application nos. 11/760,732, 11/760,729 and 11/677,490 claim priority under 35 U.S.C. § 119 (e) to U.S. Provisional Application Nos. 60/812,279 filed on June 9, 2006, and 60/859,235 filed on November 15, 2006. U.S. application no. 11/677,490 also claims priority under 35 U.S.C. § 119 (e) to U.S. Provisional Application No. 60/775,046 filed on February 21, 2006. Each of the above-identified applications is hereby incorporated herein by reference in its entirety.

### AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application.

#### Listing of Claims:

1. (Currently Amended) An electronic ID device configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction, comprising:
  - a biometric sensor configured to receive a biometric input provided by the user;
  - a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts;
  - a communication interface link configured to communicate with a secure registry; and
  - a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication interface link, the processor being programmed to activate the electronic ID device based on successful authentication by the electronic ID device of at least one of the biometric input and the secret information, the processor also being programmed such that once the electronic ID device is activated the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of information derived from at least a portion of the biometric input, and the secret information, and to communicate the encrypted authentication information via the communication interface link to the secure registry.
  
2. (Currently Amended) The device of claim 1, wherein the communication interface link is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device, and wherein the secure registry POS device is configured to receive ~~transmit~~ at least a portion of the encrypted authentication information from the POS device to the secure registry.
  
3. (Cancelled)

4. (Currently Amended) The device of claim 2, wherein the device comprises the processor is configured to generate the encrypted authentication information from each of the non-predictable value, the identifying information, the information concerning the biometric input and the secret information a discrete code associated with the electronic ID device.

5. (Currently Amended) The device of claim 1, wherein at least a portion of the biometric received by the biometric sensor is communicated to the secure registry for authentication prior to generation of the encrypted authentication information.

6. (Original) The device of claim 1, wherein the secret information includes the identifying information.

7. (Original) The device of claim 1, further comprising a memory coupled to the processor, wherein the memory stores information employed by the device to authenticate the biometric received by the biometric sensor.

8. (Original) The device of claim 7, wherein the device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the device.

9. (Currently Amended) The device of claim 8, wherein the secret information known to the user includes a PIN, and wherein the authentication of both the secret information and the biometric input activate the device for ~~the~~ a financial transaction.

10. (Original) The device of claim 9, further comprising a memory coupled to the processor, wherein data stored in the memory is unavailable to an individual in possession of the device until the device is activated.

11. (Original) The device of claim 10, wherein the data is subject to a mathematical operation that acts to modify the data such that it is unintelligible until the device is activated.

12. (Currently Amended) The device of claim 9, further comprising a memory coupled to the processor and configured to store an electronic serial number of the device, wherein the processor is configured to generate a seed using at least two of the electronic serial number, a discrete code associated with the device, the PIN, a time value, and the biometric input to generate the encrypted authentication information, and wherein the seed is employed by the processor to generate the non-predictable value.

13. (Currently Amended) The device of claim 1, wherein the biometric sensor is configured to receive and process at least one of a fingerprint, a speech/voice input, an iris scan, a retina scan, a facial scan, ~~a fingerprint~~, written information and a DNA input.

14. (Currently Amended) The device of claim 13, ~~further comprising wherein the processor is configured to generate account identifying information for the respective one of the plurality of accounts, wherein the account identifying information does not identify an account number of the respective one of the plurality of accounts a handheld device including each of the biometric sensor, the user interface, the communication link and the processor.~~

15. (Currently Amended) A method of generating authentication information comprising acts of:  
authenticating an identity of a user to an electronic ID device based on at least one of biometric data received by the device from the user and secret information known to the user and provided to the device;  
activating the electronic ID device based on successful authentication;  
generating, responsive to activating, a non-predictable value with the device;  
receiving, in a user interface, identifying information from the user concerning a selected one of a plurality of user accounts; ~~and~~

generating encrypted authentication information from the non-predictable value, ~~the identifying information, and at least one of~~ information derived from at least a portion of the biometric data, and the secret information; and

communicating, by a communication interface, the encrypted authentication information to a secure registry.

16. (Currently Amended) The method of claim 15, further comprising an act of ~~generating encrypted authentication information from each of the non-predictable value, the biometric data, the secret information, and the identifying information~~ displaying, on the user interface indicators for the plurality of user accounts stored in a memory of the device.

17. (Original) The method of claim 15, further comprising an act of de-activating the device without generating the encrypted authentication information if the identity of the user is not successfully authenticated to the device.

18. (Original) The method of claim 15, further comprising an act of generating a seed from which the authentication information is generated by employing at least two of the biometric data, the secret information known to the user, and an electronic serial number of the device.

19. (Original) The method of claim 15, further comprising an act of generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry.

20. (Currently Amended) A method of controlling access to a plurality of accounts, the method comprising acts of:

generating, with a device, encrypted authentication information from a non-predictable value generated by the device, ~~identifying information concerning an account selected by a user of the device from among a plurality of accounts associated with the user, and at least one of~~ information

derived from at least a portion of a biometric of the user received by the device, and secret information provided to the device by the user;

communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry;

authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated; and

denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

21. (New) The method of claim 15, further comprising an act of generating an account identifier for the selected one of the plurality of user accounts that does not include an account number, and wherein the of generating encrypted authentication information includes using the account identifier for the identifying information.

22. (New) The device of claim 1, wherein the processor is configured to display indicators for the plurality of accounts in the user interface, and the user interface is configured to accept user selection of a respective one of the plurality of accounts.

23. (New) The device of claim 1, wherein the user interface is configured to display options for purchase.

24. (New) The device of claim 23, wherein the user interface is configured to accept selection of at least one product or service.

25. (New) The method of claim 15, further comprising displaying options for purchase on the user interface.

26. (New) The method claim 25, further comprising selecting with the user interface at least one product or service for purchase.
  
27. (New) The method of claim 20, further comprising displaying options for purchase on the user interface.
  
28. (New) The method claim 27, further comprising selecting with the user interface at least one product or service for purchase.

### **REMARKS**

Claims 1-20 were originally filed in this application. Claim 3 has been cancelled without prejudice or disclaimer. Claims 1, 2, 4-5, 9, 12-16, and 20 have been amended. Claims 21-28 have been added. As a result, claims 1-28 are pending for examination, with claim 1, 15, and 20 being independent claims. No new matter has been added.

#### Specification

The original specification was objected to for failing to identify application No. 12/393,586 as U.S. Patent Number 8,234,220. The appropriate correction has been made. Accordingly, withdrawal of the objection of the specification is respectfully requested.

#### Claim Objections

The Office Action objected to claim 13, as “a fingerprint” is recited twice. Applicant has amended claim 13 as suggested. Applicant respectfully requests withdrawal of the objection.

#### Rejections Under 35 U.S.C. §102

The Office Action rejected claims 1-2, 4-6, and 13-20 under 35 U.S.C. §102(b) as being anticipated by U.S. Patent Publication No. 2002/0178364 A1 to Weiss (hereinafter *Weiss*). In response, Applicant has amended the claims and presents the following remarks in support of patentability.

Claim 1, as amended, recites “the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information, and to communicate the encrypted authentication information via the communication interface to the secure registry.” *Weiss* does not teach or suggest the generation of authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information.

Independent claims 15 and 20 have been amended to recite: “generating encrypted authentication information from the non-predictable value, information derived from at least a

portion of the biometric data, and the secret information” (Claim 15); and “generating, with a device, encrypted authentication information from a non-predictable value generated by the device, information derived from at least a portion of a biometric of the user received by the device, and secret information provided to the device by the user.” As discussed above, Weiss does not teach or suggest generating authentication information as recited in claims 15 and 20, as amended.

Claims 2, 4-6, and 13-14, and 16-19 depend from claims 1 and 15 respectively, and are therefore, allowable for at least the same reasons.

Accordingly, withdrawal of the rejection of claims 1-2, 4-6, and 13-20 are respectfully requested.

#### Rejections Under 35 U.S.C. §103

The Office Action rejected claim 3 under 35 U.S.C. §103(a) as being unpatentable over *Weiss* in view of U.S. Patent Publication No. 2004/0117302 A1 to Weichert (hereinafter *Weichert*). The Office Action rejected claim 7 under 35 U.S.C. §103(a) as being unpatentable over *Weiss* and further in view of U.S. Patent No. 6,819,219 to Bolle (hereinafter *Bolle*). Applicant respectfully asserts that Weiss either alone or in proper combination with Weichert and Bolle does not teach or suggest claims 3 and 7, because Weiss does not teach or suggest a processor configured to “generate encrypted authentication information from the non-predictable value, information derived from at least a portion of the biometric input, and the secret information,” as recited in claim 1 as amended. As discussed above with respect to claim 1, Weiss does not teach or suggest generation of authentication information using the non-predictable value, information derived from at least a portion of the biometric input, and the secret information. Neither Weichert nor Bolle cure this deficiency.

Accordingly, withdrawal of the rejections of claims 3 and 7 are respectfully requested.

The Office Action rejected claims 8-12 under 35 U.S.C. §103(a) as being unpatentable over *Weiss* in view of *Bolle* and further in view of Official Notice. Each of claims 8-12 directly or indirectly depends from allowable claim 1. Accordingly each of claims 8-12 are allowable for at

least the same reasons as claim 1. In addition, Applicant respectfully asserts that the Official Notice fails to support a prima facie case of obviousness at least because:

- 1) the Official Notice does not cure the deficiencies of Weiss and Bolle alone or in proper combination; and
- 2) the Examiner has not supported the Official Notice of specific knowledge of the prior art with a “citation to some reference work recognized as standard in the pertinent art” where such is required because the recited feature is not capable of instant and unquestionable demonstration as being well-known.
- 3) it is unclear from the record that the alleged knowledge was known at the time of the invention. Applicant respectfully requests that the Examiner provide a reference teaching what is alleged to be well-known or withdraw the rejection.

Accordingly, reconsideration and withdrawal of the rejection of claims 8-12 under 35 U.S.C. §103(a) is respectfully requested.

#### New Claims

Claims 21-28 depend directly or indirectly from allowable independent claims 1, 15, and 20, and are likewise allowable for at least the same reasons.

#### Double Patenting Rejection

In paragraph 10 of the Office Action, claims 1-20 were rejected under the judicially created doctrine of double-patenting over claims 1-54 of U.S. Patent No. 8,234,220. However, the Office Action stated that a timely filed Terminal Disclaimer in compliance with 37 C.F.R. 1.321(c) may be used to overcome this rejection. Without acceding to the correctness of this rejection, enclosed herewith is a Terminal Disclaimer with respect to U.S. Patent No. 8,234,220 in compliance with 37 C.F.R. 1.321(c) to overcome this rejection. In view of this Terminal Disclaimer, claims 1-20 are believed to be in allowable condition.

Claims 15-19 were rejected under the judicially created doctrine of double-patenting over claims 1-3, 5-8 and 43 of U.S. Patent No. 7,809,651. However, the Office Action stated that a timely filed Terminal Disclaimer in compliance with 37 C.F.R. 1.321(c) may be used to overcome

this rejection. Without acceding to the correctness of this rejection, enclosed herewith is a Terminal Disclaimer with respect to U.S. Patent No. 7,809,651 in compliance with 37 C.F.R. 1.321(c) to overcome this rejection. In view of this Terminal Disclaimer, claims 15-19 are believed to be in allowable condition.

### **CONCLUSION**

In view of the foregoing amendments and remarks, reconsideration is respectfully requested. This application should now be in condition for allowance; a notice to this effect is respectfully requested. If the Examiner believes, after this amendment, that the application is not in condition for allowance, the Examiner is requested to call the Applicant's attorney at the telephone number listed below.

If this response is not considered timely filed and if a request for an extension of time is otherwise absent, Applicant hereby requests any necessary extension of time. If there is a fee occasioned by this response, including an extension fee that is not covered by an accompanying payment, please charge any deficiency to Deposit Account No. 50/2762 (ref. no. W0537-701320).

Dated: December 17, 2012

Respectfully submitted,

<b>TERMINAL DISCLAIMER TO OBTAIN A DOUBLE PATENTING REJECTION OVER A "PRIOR" PATENT</b>	Docket Number (Optional) W0537-701320
---	--

In re Application of:      Kenneth P. Weiss

Application No.:      13/237,184

Filed:      September 20, 2011

For:      UNIVERSAL SECURE REGISTRY

The owner\*, Kenneth P. Weiss, of 100 percent interest in the instant application hereby disclaims, except as provided below, the terminal part of the statutory term of any patent granted on the instant application which would extend beyond the expiration date of the full statutory term of **prior patent** No. (see attached)

as the term of said **prior patent** is presently shortened by any terminal disclaimer. The owner hereby agrees that any patent so granted on the instant application shall be enforceable only for and during such period that it and the **prior patent** are commonly owned. This agreement runs with any patent granted on the instant application and is binding upon the grantee, its successors or assigns.

In making the above disclaimer, the owner does not disclaim the terminal part of the term of any patent granted on the instant application that would extend to the expiration date of the full statutory term of the **prior patent**, "as the term of said **prior patent** is presently shortened by any terminal disclaimer," in the event that said **prior patent** later:

- expires for failure to pay a maintenance fee;
- is held unenforceable;
- is found invalid by a court of competent jurisdiction;
- is statutorily disclaimed in whole or terminally disclaimed under 37 CFR 1.321;
- has all claims canceled by a reexamination certificate;
- is reissued; or
- is in any manner terminated prior to the expiration of its full statutory term as presently shortened by any terminal disclaimer.

Check either box 1 or 2 below, if appropriate.

1.  For submissions on behalf of a business/organization (e.g., corporation, partnership, university, government agency, etc.), the undersigned is empowered to act on behalf of the business/organization.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

2.  The undersigned is an attorney or agent of record. Reg. No. 52,957

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

Notice of the Office communication was sent electronically on above-indicated "Notification Date" to the following e-mail address(es):

docketing@LALaw.com  
gengelso@LALaw.com

<b>Office Action Summary</b>	<b>Application No.</b> 13/237,184	<b>Applicant(s)</b> WEISS, KENNETH P.	
	<b>Examiner</b> CALVIN CHEUNG	<b>Art Unit</b> 3621	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1)  Responsive to communication(s) filed on 20 September 2011.
- 2a)  This action is **FINAL**.
- 2b)  This action is non-final.
- 3)  An election was made by the applicant in response to a restriction requirement set forth during the interview on \_\_\_\_\_; the restriction requirement and election have been incorporated into this action.
- 4)  Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 5)  Claim(s) 1-20 is/are pending in the application.
- 5a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 6)  Claim(s) \_\_\_\_\_ is/are allowed.
- 7)  Claim(s) 1-20 is/are rejected.
- 8)  Claim(s) \_\_\_\_\_ is/are objected to.
- 9)  Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 10)  The specification is objected to by the Examiner.
- 11)  The drawing(s) filed on \_\_\_\_\_ is/are: a)  accepted or b)  objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 12)  The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 13)  Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a)  All   b)  Some \*   c)  None of:
  - 1.  Certified copies of the priority documents have been received.
  - 2.  Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  - 3.  Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**Attachment(s)**

### **DETAILED ACTION**

1. This office action is given an identifier, Paper No. 20120807, for reference purposes only.

#### *Status of Claims*

2. Claims 1-20, filed 20 September 2011, are pending and examined in this office action.

#### *Specification*

3. The disclosure is objected to because of the following informalities:

The Original Specification (p1:5) identifies “application No. 12/393586” however fails to identify it as Patent Number 8234220. Appropriate correction is required.

#### *Claim Objections*

4. Claim 13 is objected to because of the following informalities:

Regarding Claim 13, “a fingerprint” is recited twice. One recitation is sufficient therefore the second recitation should be deleted. Appropriate correction is required.

#### *Claim Rejections - 35 USC § 102*

5. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

Art Unit: 3621

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

6. Claims 1-2, 4-6 and 13-20 are rejected under 35 U.S.C. 102(b) as being anticipated by US 20020178364 A1 (“Weiss”) from IDS.

Regarding Claim 1, Weiss discloses a system (e.g., computer system **10**) configured to allow a user (e.g., person) to select any one of a plurality of accounts (e.g., “Credit Card and other financial information” in FIG. 1) associated with the user to employ in a financial transaction, comprising (Abstract, ¶¶ 17, 52, FIG. 1, 3-4 with associated text):

- a biometric sensor (e.g., data input devices, such as voice and other audio and video capture devices) configured to receive a biometric input provided by the user (¶¶ 17, 42);
- a user interface (e.g., user interface **26**) configured to receive:
  - a user input including secret information (e.g., personal identification number) known to the user (¶¶ 42, 53) and
  - identifying information (e.g., biometric information) concerning an account selected by the user from the plurality of accounts (Abstract, ¶¶ 43, 47, 57, FIG. 1, 3-4 with associated text);
- a communication link (e.g., Internet) configured to communicate with a secure registry (e.g., database **24**) (¶¶ 38, 41); and

- a processor (e.g., CPU **16**) coupled to the biometric sensor to receive information concerning the biometric input (§§ 38-42, 48-53, FIG. 1, 3 with associated text), the user interface and the communication link, the processor configured:
  - to generate a non-predictable value (e.g., non-predictable single use codes, ¶ 52) and
  - to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information (§§ 12, 45, 51-53, 74, 100. Weiss discloses (1) “transactions to and from the database may take place using a public key/private key security system” from ¶ 12 and (2) “a secret user code and/or time varying value...and personal identification code... combines these three numbers using a predetermined algorithm to generate a one-time nonpredictable code” from ¶ 51 is used to authenticate the user.), and
  - to communicate the encrypted authentication information via the communication link to the secure registry (§§ 12, 45, 51, 100).

Regarding Claim 2, Weiss discloses:

- wherein the communication link is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device (§§ 17, 51-52, 74 and FIG. 10, 17 with associated text), and

- wherein the POS device is configured to transmit at least a portion of the encrypted authentication information to the secure registry (“The merchant transmits to the credit card company...the code...The credit card company takes this information and passes the code...to the USR”, ¶ 74).

Regarding Claim 4, Weiss discloses wherein the processor is configured to generate the encrypted authentication information from each of the non-predictable value, the identifying information, the information concerning the biometric input and the secret information (¶ 42, 51-53, 74).

Regarding Claim 5, Weiss discloses wherein the biometric received by the biometric sensor is communicated to the secure registry for authentication prior to generation of the encrypted authentication information (¶ 12-13, 16-17, 41-42, 47-48).

Regarding Claim 6, Weiss discloses wherein the secret information includes the identifying Information (¶ 53).

Regarding Claim 13, Weiss discloses wherein the biometric sensor is configured to receive and process *at least one* (Only one option is required to satisfy the claimed limitation of ‘at least one’) of a fingerprint (e.g., fingerprint), a speech/voice input (e.g., voice print), an iris scan (e.g., iris), a retina scan, a facial scan (e.g., facial), a fingerprint (see Claim Objection above), written information (e.g., signature) and a DNA input (e.g., DNA analysis).

Regarding Claim 14, Weiss discloses a handheld device including each of the biometric sensor, the user interface, the communication link and the processor (§§ 17, 43, 52, FIG. 1 with associated text. The examples of devices listed in Weiss' ¶ 17 and 52 are types of "handheld devices" that verifies the user "at the point of use".).

Regarding Claim 15, Weiss discloses a method of generating authentication information comprising acts of (Abstract, §§ 17, 47-48, 54):

- authenticating an identity of a user to a device based on *at least one* (Only one option is required to satisfy the 'at least one' limitation) of biometric data received by the device from the user and secret information known to the user and provided to the device (§§ 17, 51-53);
- generating a non-predictable value with the device (§§ 51-53);
- receiving identifying information from the user concerning a selected one of a plurality of user accounts (Abstract, ¶ 74); and
- generating encrypted authentication information from the non-predictable value, the identifying information, and at least one of the biometric data and the secret information (§§ 12, 45, 51-53, 74, 100. Weiss discloses (1) "transactions to and from the database may take place using a public key/private key security system" from ¶ 12 and (2) "a secret user code and/or time varying value...and personal identification code... combines these three numbers using a predetermined algorithm to generate a one-time nonpredictable code" from ¶ 51 is used to authenticate the user.).

Regarding Claim 16, Weiss discloses generating encrypted authentication information from each of the non-predictable value, the biometric data, the secret information, and the identifying information (§§ 12, 45, 51-53, 74, 100).

Regarding Claim 17, Weiss discloses de-activating the device without generating the encrypted authentication information if the identity of the user is not successfully authenticated to the device (§§ 108).

Regarding Claim 18, Weiss discloses generating a seed from which the authentication information is generated by employing the biometric data and the secret information known to the user (§§ 17, 51-53, 74. Two options satisfy the 'at least two' limitation which are listed by Weiss).

Regarding Claim 19, Weiss discloses generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry (FIG. 3, 6-10, 13 with associated text).

Regarding Claim 20, Weiss discloses a method of controlling access to a plurality of accounts, the method comprising acts of (Abstract, §§ 17, 47-48, 54):

- generating, with a device, encrypted authentication information (§§ 12, 45) from:
  - a non- predictable value generated by the device (§§ 51-53),

- identifying information concerning an account selected by a user of the device from among a plurality of accounts associated with the user (Abstract, 41, 47-48, 54 and FIG. 1), and
- *at least one* (Only one option is required to satisfy this portion of the limitation) of a biometric of the user received by the device (§ 17, 53) and secret information provided to the device by the user (§ 17, 53);
- communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry (§ 12, 45, 51-53, 74, 100);
- authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated (§ 74-76. § 76 provides the results of a transaction.); and
- denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated (§ 74-76. § 76 provides the results of a transaction.).

7. Claim 3 is rejected under 35 U.S.C. 103(a) as being unpatentable over Weiss and further in view of US 20040117302 A1 (“Weichert”) from IDS.

Regarding Claim 3, Weiss discloses wherein the communication link is configured to wirelessly transmit the encrypted authentication information with the POS device (§§17, 51-52 and Figures 10 and 17 with associated text).

Weiss does not directly disclose wherein the POS device includes a magnetic stripe reader, and a converter device configured to generate an emulated magnetic stripe output.

However, Weichert teaches wherein a POS device (e.g., point-of-sale (POS) terminal) includes a magnetic stripe reader (e.g., magnetic stripe reader, ¶ 2), and a converter device configured to generate an emulated magnetic stripe output (§§ 54, 71). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss by incorporating a card reader feature at a POS terminal as taught by Weichert in order to read credit cards.

8. Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over Weiss and further in view of US 6819219 (“Bolle”) from IDS.

Regarding Claim 7, Weiss discloses a memory coupled to the processor (§§ 17, 52, FIG. 1 with associated text.).

Weiss does not directly disclose wherein the memory stores information employed by the device to authenticate the biometric received by the biometric sensor (§§ 17, 52, FIG. 1 with associated text.)

However, Bolle teaches a memory stores information employed by the device to authenticate the biometric received by the biometric sensor (Figure 1, 7 and 10 with associated

text. Observe Figure 10, Element 1004). It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss by incorporating biometric readers on portable devices as taught by Bolle in order to capture biometric information on a portable device

9. Claims 8-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Weiss in view of Bolle and further in view of Official Notice.

Regarding Claim 8, Weiss/Bolle Combination does not directly disclose wherein the device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the device.

The Examiner takes Official Notice it is well known in the art a mismatch or non-matched biometric reading not belonging to the rightful user provides a negative result which prevents access. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle Combination by incorporating a measure which prevents access when biometric readings do not match as taught by Official Notice in order to increase security to personal equipment and information.

Regarding Claim 9, Weiss discloses:

- wherein the secret information known to the user includes a PIN (§ 17, 53), and
- wherein the authentication of the secret information and the biometric input activate the device for the financial transaction (“The identity of the user possessing the

identifying device may be verified at the point of use via any combination...”, ¶ 17, 73, 100).

Regarding Claim 10, Weiss discloses a memory coupled to the processor (¶ 17, 52, FIG. 1 with associated text.).

Weiss/Bolle Combination does not directly disclose wherein data stored in the memory is unavailable to an individual in possession of the device until the device is activated.

The Examiner takes Official Notice it is well known in the art credit card holders call a telephone number associated with the credit card number to activate their credit cards before they are allowed to make purchases. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle Combination by incorporating an activation step as taught by Official Notice in order to verify the rightful credit card holder has obtained their card.

Regarding Claim 11, Weiss/Bolle Combination does not directly disclose wherein the data is subject to a mathematical operation that acts to modify the data such that it is unintelligible until the device is activated.

The Examiner takes Official Notice it is well known in the art the credit card data is blocked from making purchases until activated. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the electronic ID devices as disclosed by Weiss/Bolle Combination by incorporating a protection step of preventing access to

credit card usage as taught by Official Notice in order to protect the credit card holder in the event the card is obtained by someone other than the intended credit card holder.

Regarding Claim 12, Weiss discloses

- a memory:
  - coupled to the processor (§§ 17, 52, FIG. 1 with associated text) and
  - configured to the device (§§ 17, 52, FIG. 1 with associated text),
- wherein the processor is configured to generate a seed using *at least two* (Only two options are required to satisfy the ‘at least two’ limitation) of the electronic serial number, a discrete code associated with the device (§§ 74), the PIN (§§ 17, 53) and the biometric input (§§ 17) to generate the encrypted authentication information (§§ 51-53, 74), and
- wherein the seed is employed by the processor to generate the non-predictable value (§§ 51-53, 74).

Weiss/Bolle Combination does not directly disclose store an electronic serial number.

The Examiner takes Official Notice it is well known in the art electronic devices that operate an operating system have unique registration number. It would have been obvious to one of ordinary skill in the art at the time of the invention was made to modify the devices as disclosed by Weiss/Bolle combination by incorporating a unique digital number as taught by Official Notice in order to identify the device.

***Double Patenting***

10. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the “right to exclude” granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPQ 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

Claims 1-20 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-54 of U.S. Patent No. 8234220. Although the

conflicting claims are not identical, they are not patentably distinct from each other because the interactions between electronic ID devices and Universal Secure Registry system are in the same manner.

Claims 15-19 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-3, 5-8 and 43 of U.S. Patent No. 7809651.

Although the conflicting claims are not identical, they are not patentably distinct from each other because the authentication interactions between electronic ID devices and Universal Secure Registry system are utilized in the same manner.

### *Conclusion*

11. Any inquiry concerning this communication or earlier communications from the Examiner should be directed to Calvin Cheung whose telephone number is (571) 270-7041 and fax is (571) 270-8041. The Examiner can normally be reached on Monday - Friday, 8:00a.m. - 5:00p.m., EST.

If attempts to reach the Examiner by telephone are unsuccessful, Supervisory Primary Examiner (SPE), James Kramer can be reached on (571) 272-6783. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. **CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

- See attached certification statement.
- The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.
- A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Robert V. Donahoe/	Date (YYYY-MM-DD)	2011-09-20
Name/Print	Robert V. Donahoe	Registration Number	46,667

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

**Privacy Act Statement**

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

**Privacy Act Statement**

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

(54) Title: METHOD AND DEVICE FOR GENERATING A TIME-DEPENDENT PASSWORD

Fig. 2

(57) Abstract: The invention relates to the generation of a time-dependent password using an external time signal. For generating a time-dependent password in a temporary absence of the external time signal, the invention proposes a method comprising the steps of: - checking, whether the security device has access to an external time signal; - requesting a user of the security device to enter time information, if it is determined that the security device has no access to the external time signal; and - generating a time-dependent password using the time information entered in response to the request. The invention further relates to a device for performing the method.

## Method and device for generating a time-dependent password

5

### Technical Field

The invention relates to the generation of time-dependent passwords, particularly to the generation of time-synchronized one-time passwords. More specifically, the invention relates to a method for generating a time-dependent password in a mobile communication device. The invention further relates to a device for generating a time-dependent password in a mobile communication device and to a mobile communication device comprising the device.

15

### Background of the Invention

Conventional static passwords bear the risk to be discovered by unauthorized third parties. Protection against unauthorized access to restricted resources can be improved by using so-called one-time passwords (OTPs), which are valid only for one time. An OTP mechanism, commonly referred to as time-synchronised type OTP, involves synchronised time information for generating and validating OTPs. In regular time intervals, such as, for example, every minute, a security device or an application, which is usually called "token", generates a new OTP from current time information and a secret key assigned to the user. For validating the OTP, an authorisation station re-generates the OTP based on the secret key and own current time information using the same algorithm as the token and compares the self-generated password with the password generated by the token.

In the OTP environment described before, the time information used in the token and the time information used in the authorisation station have to be well synchronised. However, in OTP environments, certain time deviations are al-

lowed, which means that the authorisation station accepts OTPs generated and based on time information that differs from that time of the authorisation station by a predefined time deviation. Typical allowed time deviations may be in the range of one or several minutes, for example.

5

The token may be a closed, tamper-resistant hardware system dedicated to the generation of OTPs, which stores the secret key of the user and which usually has a built-in clock for providing the time information. As an alternative, the token may be configured as a so-called "soft token", which is a software applica-

10

The international patent application WO 2007/126227 describes a mobile communication device, such as, for example, a mobile phone or a PDA (Personal Data Assistant) or the like, which has an interface for accepting an IC chip (IC: Integrated Circuit) for generating time-synchronised type OTPs. The IC chip stores the user's secret key and comprises a module for generating the OTPs. The time information is provided by a base station and received by the radio frequency processing unit of the mobile communication device.

15

The IC chip allows for implementing the token for generating time-synchronised type OTPs in a mobile communication device. An external time signal provides the time information for generating the OTPs, such that a special clock for this purpose can be dispensed with. However, the time information is available only if the mobile communication device is connected to the base station. This means that the generation of OTPs is not possible, if the mobile communication device cannot be connected to the base station.

20  
25

### Summary of the Invention

Therefore, it is an object of the present invention to allow for generating time-synchronised type OTPs in a device having access to an external time signal, when the device cannot receive the external time signal.

30

The object is achieved by a method comprising the features of claim 1 and by a device comprising the features of claim 12. Embodiments of the method and the device are given in the dependent claims.

5

According to a first aspect of the invention, a method of the type described before is proposed, which comprises the following steps:

- checking, whether the security device has access to an external time signal;
  - requesting a user of the security device to enter the time information, if it is determined that the security device has no access to the external time signal; and
  - generating a time-dependent password using the time information entered in response to the request.
- 10

15 According to a second aspect, the invention proposes a device for generating a time-dependent password using time information. The device comprises:

- a checking means for checking, whether an external time signal is accessible;
  - a requesting means for requesting a user to enter the time information, if the checking means determines that the external time signal is not accessible, and
  - a calculation means for generating a time-dependent password using the time information entered in response to the request.
- 20

25 The invention has the advantage that a time-dependent password can be generated in the absence of the external time signal. This is achieved by allowing the user of the security device to specify the time information needed for generating a time-dependent password, if no external time signal is received in the mobile communication device.

30

By allowing the user to input the time information, the invention contradicts the usual opinion that the mechanism for generating the time information needed

for calculating time-dependent passwords is a sensitive component of the password generation, which has to be secured against access by the user. Particularly, it has been discovered that the possibility to generate a time-dependent password based on the time information provided by the user is very  
5 useful to bridge a temporarily absence of an external time signal.

However, if the external time signal can be received in the security device, the time signal can be used for generating the time-dependent password. This has the advantage that the risk of fraudulent misuse is reduced.

10

Therefore, in one embodiment of the method and the device, the time-dependent password is generated using the external time signal, if it is determined that the security device has access to the external time signal.

15 The time information used for generating the time-dependent password has to be synchronized with the time information used by the authorization station. However, the user may stay in a time zone different from the time zone in which the authorization station is located. If, in this case, the user entered his local time, the generated password would be invalid due to the time difference to the  
20 location of the authorization station.

Therefore, in one embodiment of the method and the device, the user is requested to specify a time zone to which the entered time information refers, the time information entered by the user is converted to the time zone of an authorization station for validating the password and the time-dependent password is  
25 generated using the converted time information.

In a further embodiment of the method and the device, the user is requested to enter an authentication code and the entered time information is only used for  
30 generating a time-dependent password, if the authentication code has been validated successfully.

This prevents an unauthorized third party that does not dispose of the authentication code from generating a password and making fraudulent use of it. Particularly, an unauthorized third party is prevented from generating and using a password that is valid in a future point in time.

5

Furthermore, one embodiment of the method and the device comprises the steps of:

- storing the entered time information;
- determining that the security device has access to the external time signal;
- 10 - checking, whether the entered time information refers to a future point in time compared to the currently received external time signal; and
- initiating an alarm routine, if the entered time information refers to a future point in time compared to the currently received time signal.

15 This provides security against an attack based on the aforementioned generation of a password, which is valid in a future point in time.

In order to prevent an attacker from gaining unauthorized access using such a password, in one embodiment of the method and the device, the password  
20 generated using the entered time information is being marked as invalid in the authorization station in response to the initiation of the alarm routine.

In a further embodiment of the method and the device, the user is requested to enter a secret key allocated to the user and the time-dependent password is  
25 generated using the secret key entered by the user.

Moreover, in one embodiment of the method and the device, the generated time-dependent password is displayed at the security device and/or the time-dependent password is transmitted from the security device to the authorisation  
30 station via a data network to which the security device is connected.

In one embodiment of the method, a mobile communication device comprises the security device.

5 Using a mobile communication device comprising security device for the generating the time-dependent password increases the user convenience, since a user who usually carries a mobile communication device does not need an additional device for generating the time-dependent password.

10 In one embodiment of the method and the device, the external time signal may be provided by the communication network to which the security device can be connected. Therefore, in this embodiment checking, whether the security device has access to the external time signal, comprises checking, whether the security device is connected to a communication network providing the external time signal.

15 Providing the external time signal in the communication network has the advantage that no additional equipment is needed to access the time signal, if a mobile communication device comprises the security device, since the mobile communication device usually has all components for connecting to a communication network.

20

In one embodiment of the invention, the device is a smartcard, which can be connected to a mobile communication device.

25 It is an advantage of this embodiment that the device can be provided to the user easily in the form of smartcard, which is connectable to his mobile communication device. The usage of a mobile communication device for generating the time-dependent password is especially convenient for the user due to the reasons described before. One further advantage of this embodiment is that the

30 security mechanism of the smartcard prevents fraudulent use of the device.

In mobile communication, smartcards are used for identifying and authenticating a user to a mobile communication network. Advantageously, such smartcards can also host the device according to the invention. Therefore, in one embodiment of the invention, the smartcard comprises a subscriber identification module for identifying and/or authenticating a user to a mobile communication network.

Furthermore, the invention provides a computer program comprising software code portions for performing a method of the type described before, when the computer program is run on a processor.

Moreover, the invention proposes a mobile communication device comprising a device of the type before.

These and other aspects of the invention will be apparent from and elucidated with reference to the embodiments described hereinafter making reference to the accompanying drawings.

### **Brief Description of the Drawings**

20

In the drawings

Fig. 1 is a schematic block diagram showing a mobile communication device for generating time-synchronised type OTPs, and

25

Fig. 2 is a schematic flow chart illustrating a method for providing time information for generating the time-synchronised type OTPs.

### **Detailed Description of Embodiments of the Invention**

30

Figure 1 shows a mobile communication device 101, which can be connected to a mobile communication network (PLMN – Public Land Mobile Network) 102,

which may be configured according to the GSM or UMTS standard, for example (GSM: Global System for Mobile communications; UMTS: Universal Mobile Telecommunications System). For connecting the mobile communication device 101 to the PLMN 102, the mobile communication device 101 comprises a radio interface 103. The radio interface 103 is coupled to a main processor 104 for controlling the operation of the mobile communication device 101. For interacting with the mobile user, the mobile communication device 101 comprises an input component 105 and a display component 106 both coupled to the main processor 104. Applications run by the main processor 104 and reference data are stored in a memory component 107 to which the main processor 104 has access.

The mobile communication device 101 interacts with a smartcard 108, which is inserted into a card reader unit 114 of the mobile communication device 101. The smartcard 108 includes a microprocessor 109 and a memory 110 and comprises a subscriber identification module allocated to the user of the mobile communication device 101. Particularly, the subscriber identification module includes information for identifying and authenticating the mobile user to the PLMN 102 and provides functionality for accessing services of the PLMN 102. The subscriber identification module may be configured in accordance with the type of the PLMN 102. If the PLMN 102 is a GSM or UMTS network, the subscriber identification module is a subscriber identity module (SIM) according to the GSM standard or a universal subscriber identity module (USIM) according to the UMTS standard.

The mobile user has the authorisation to access a restricted resource. In one embodiment, the resource may be a web application or a web service hosted by a network server 113, which is connected to a data network 112. Access to the resource is controlled by an authorisation station 111, which denies access to the resource unless the user is identified and authenticated successfully. The network server 113 may comprise the authorisation station 111, or the authorisation station 111 may reside in another network server. In the embodiment

depicted in figure 2, the network server 112 is connected to the data network 112 via the authorisation station 111. However, other network architectures are possible.

5 The authorisation station 111 performs the user authorisation using time-synchronised OTPs. This ensures a relatively high level of security of the access control. Thus, the web application may be a payment application, for example, that has to be secured efficiently against unauthorised access by third parties.

10

For generating time-synchronised OTPs, the mobile communication device 101 comprises an OTP application. The OTP application may be resident in the mobile terminal and run on the main processor 104 of the mobile communication device 101. In a different embodiment, the OTP application is resident in the smartcard 108 including the subscriber identification module. In this embodiment, the OTP application is stored in the memory 110 and run on the micro-processor 109 of the smartcard 108. This has the advantage that the OTP application is secured against unauthorised access by means of the security mechanism of the smartcard 108. In further embodiments, an OTP chip including the OTP application may be removably connected to the mobile terminal.

The mobile communication device 101 may be connected to the data network 112 via an access technology, such as, for example, a WLAN connection. In figure 1, this is schematically illustrated by means of the arrow 115. In this architecture, the mobile user may access the network server 113 using the mobile communication device 101 and OTPs generated in the mobile communication device 101 may be transmitted electronically from the mobile communication device 101 to the authorisation station 111. Furthermore, the PLMN 102 may be coupled to the data network 112, such that the mobile communication device 101 can be connected to the data network via the PLMN 102, if it is registered in the PLMN 102.

In another embodiment, the mobile user accesses the network server 113 using a further device connected to the data network 112, such as, for example, a personal computer. In this case, the OTP application outputs generated passwords at the mobile communication device 101. The user reads that generated password at the display component 106 of the mobile communication device 101 and enters the password at the device used for accessing the network server 113.

The OTP application provides a graphical user interface at the display component 106 of the mobile communication device 101 for depicting outputs to the user and for presenting input requests to the user. Moreover, the OTP application is configured to receive user inputs from the input component 105 of the mobile communication device 101. If the OTP application resides in the smartcard 108, the OTP application may access the functionalities of the mobile communication device 101 using SIM Toolkit commands, which, in general, are known to a person skilled in the art.

For generating time-synchronised OTPs, an algorithm is implemented in the OTP application, which is used to calculate OTPs based on time information and a secret key allocated to the user. The secret key may be a personal identification number (PIN), for example. The secret key may be entered by the user, when the OTP application is started or when the user requested the generation of a password. Likewise, it is possible that the secret key is stored securely in the mobile communication device 101, particularly in the smartcard 108. In this embodiment, the generation of a password may be possible only after an authorisation code entered by the user has been validated successfully by the OTP application. The authorisation code may be another PIN and differs from the secret key allocated to the user in that the secret key is used to calculate the passwords, while the authorisation code is used to unlock the password generation. Securing the OTP application with an authorisation code for unlocking the password generation has the advantage that an attacker has to use the mobile communication device 101 for generating passwords of the user, since

the secret key is secured against access within the mobile communication device 101.

For validating the password generated by the OTP application, the authorisation station 111 re-computes the passwords using the user's secret key, which is also stored in the authorisation station 111, and its own time information. The time information used by the OTP application and the time information present in the authorisation station 111 have to be synchronised accurately enough. Usually, the authorisation station 111 allows for generating passwords computed using a time information with a predetermined deviation from the time information present and authorisation station 111. For this purpose, the authorisation station 111 determines that the password is valid, if it is calculated using a time from a predetermined time interval around the current time of the authorisation station 111. The time interval may be between 1 and 15 minutes, preferably between 2 and 4 minutes.

The OTP application retrieves the time information needed for generating the time-synchronised OTPs from the PLMN 102. For this purpose, the PLMN 102 includes a supplementary service providing a time signal. The service may be accessed using so-called USSD commands (USSD: Unstructured Supplementary Service Data), which are, in general, known to a person skilled in the art in general. However, retrieving the time information from the PLMN 102 requires that the mobile communication device 101 was connected to the PLMN 102. This is not always true, since it may happen that the mobile communication device 101 is out of coverage of the PLMN 102, for example. Therefore, the OTP application requests the user to enter time information into the mobile communication device 101, in case no time information can be received from the PLMN 102.

In one embodiment, a method schematically depicted in figure 2 is implemented in the OTP application for this purpose: After the user has entered his secret key or his authorisation code in step 201, the OTP application sends a com-

mand to retrieve time information from the PLMN 102 in step 202. The command is passed to the radio interface 103 of the mobile communication device 101, which transmits the command to the PLMN 102, if the mobile communication device 101 is connected to the PLMN 102. After having passed the command to the radio interface 103 the OTP application checks, whether the command is responded within a predetermined time interval in step 203. This means that the OTP application checks, whether the time signal is received during the time interval. If the time signal is received in time, the OTP application computes a password based on the received time information and the secret key of the user in step 204.

If the OTP application determines in step 203 that no time information has been received from the PLMN 102 in the predetermined time interval, the OTP application checks, whether the mobile communication device 101 is connected to the PLMN 102 in step 205. This may be done by checking, whether the mobile communication device receives a predetermined data signal broadcasted in the PLMN 102, such as, for example, a signal identifying the PLMN 102. If it is determined in step 205 that the mobile communication device 101 is registered in the PLMN 102, the OTP application preferably goes back to step 202 and re-sends the command to retrieve the time information. However, if it is determined in step 205 that the mobile communication device 101 is not connected to the PLMN 102, the OTP application requests the user to enter time information at the mobile communication device 101. After having received the user input, the OTP application calculates a password using the time information specified by the user in step 204.

For requesting the user to input the time information, the user interface of the OTP application presented at the display component 106 of the mobile communication device may provide an input field, which may be filled in by the user using the input component 105 of the mobile communication device 101. The user may receive the time information from any available source. For example, this may be his wristwatch or a public watch in the vicinity of his position.

In order for the calculated password to be valid, the password has to be calculated using the time information present in the authorisation station 111. Particularly, this means that the time information used for the calculation should refer to the same time zone as the time information of the authorisation station 111. Therefore, in one embodiment, the user is requested to input a time information referring to the time zone of authorisation station 111 in step 206. This requires knowledge about the time zone of the authorisation station 111 and about the time shift between this time zone and the current time zone of the user.

10

In another embodiment, the user is requested to input his local time and to specify his current time zone. For the specification of the time zone, a list of the existing time zones may be presented to the user, such that the user can specify his time zone by choosing it from the list. Using the time information entered by the user and the information about the time zone the time information refers to, the OTP application calculates the local time of the authorisation station 111 and uses this calculated time to generate the password in step 204.

In order to prevent that an attacker uses the mobile communication device 101 to generate a password that will be valid in the future by inputting time information relating to a future point in time, the input of the time information by the user may be secured by an authorisation code. This means that the OTP application requests the user to enter the authorisation code besides the time information. The authorisation code is also stored securely in the mobile communication device 101, particularly in the smartcard 108. In this embodiment, the OTP application validates the authorisation code before generating a password using the time information given by the user.

Furthermore, in one embodiment, the OTP application stores at least the time information, when it calculates and outputs a password based on time information specified by the user. Particularly, the time information may be stored securely in the smartcard 108. After having stored the time information, the OTP

application monitors, whether the mobile communication device 101 connects to the PLMN 102 again. This may be done by sending commands to retrieve time information from the PLMN 102 or by checking in regular time intervals, whether a predetermined data signal broadcasted in the PLMN 102 is received in the mobile communication device 101. Again, this data signal may be a signal identifying the PLMN 102 that is broadcasted in the PLMN in regular time intervals.

If the OTP application determines that the mobile communication device 101 is connected to the PLMN 102 again, the OTP application checks, whether the time information used for calculating the password refers to a future point in time. If this is true, an alarm routine is started, since in this case an attacker might have generated the password for fraudulent use in the future. For the aforementioned check, the OTP application compares time information currently retrieved from the PLMN 102 and the stored time information. If it is determined that the stored time information referred to the future compared to the currently received time information, the OTP application starts the alarm routine.

The alarm routine may comprise informing the user that a password has been generated for a future point in time. If the user judges that the password might have been generated for fraudulent use, he may inform the authorization station 111. In another embodiment, the OTP application may inform the authorization station 111 automatically. For this purpose, the OTP application may generate a corresponding message specifying the time information in question, and the OTP application may control the mobile communication device 101 to transmit the message to the authorisation station 111. The message may be transmitted to the authorisation station 111 via the PLMN 102 or via another data connection between the mobile communication device 101 and the authorisation station 111.

After having been informed about the possible misuse, steps can be taken in the authorisation station 111 to prevent an unauthorised access to the network server 113 using the password in question. This may be done by blocking ac-

cess to the network server 113 with this password. Particularly, the password generated for the future point in time may be marked as invalid, such that this password cannot be used as an authorisation for accessing the network server 113.

5

While the invention has been illustrated and described in detail in the drawings and foregoing description, such illustration and description are to be considered illustrative or exemplary and not restrictive; the invention is not limited to the disclosed embodiments. Particularly, the invention is not limited to a download  
10 of an application or program code to smartcard 106. A person skilled in the art recognises that other data can be downloaded to the smartcard 106 in the same way as it has been described before in connection with the download of a program code of an application. Other variations to the disclosed embodiments can be understood and effected by those skilled in the art in practicing the claimed  
15 invention, from a study of the drawings, the disclosure, and the appended claims.

In the claims, the word "comprising" does not exclude other elements or steps, and the indefinite article "a" or "an" does not exclude a plurality. A single processor or other unit may fulfill the functions of several items recited in the claims.  
20 A computer program may be stored/distributed on a suitable medium, such as an optical storage medium or a solid-state medium supplied together with or as part of other hardware, but may also be distributed in other forms, such as via the Internet or other wired or wireless telecommunication systems. Any reference  
25 signs in the claims should not be construed as limiting the scope.

### Claims

1. A method for generating a time-dependent password in a security device (101; 108) using time information, the method comprising the steps of:
  - checking, whether the security device has access to an external time signal;
  - requesting a user of the security device to enter the time information, if it is determined that the security device has no access to the external time signal; and
  - generating a time-dependent password using the time information entered in response to the request.
2. The method according to claim 1, wherein the time-dependent password is generated using the external time signal, if it is determined that the security device (101; 108) has access to the external time signal.
3. The method according to one of the preceding claims, wherein the user is requested to specify a time zone to which the entered time information refers, wherein the time information entered by the user is converted to the time zone of an authorization station (111) for validating the password and wherein the time-dependent password is generated using the converted time information.
4. The method according to one of the preceding claims, wherein the user is requested to enter an authentication code and wherein the entered time information is only used for generating a time-dependent password, if the authentication code has been validated successfully.
5. The method according to one of the preceding claims, further comprising the steps of:
  - storing the entered time information;
  - determining that the security device (101; 108) has access to the external time signal;

- checking, whether the entered time information refers to a future point in time compared to the currently received external time signal; and
  - initiating an alarm routine, if the entered time information refers to a future point in time compared to the currently received time signal.
6. The method according to claim 5, wherein the password generated using the entered time information is marked as invalid in the authorization station (111) in response to the initiation of the alarm routine.
  7. The method according to one of the preceding claims, wherein the user is requested to enter a secret key allocated to the user and wherein the time-dependent password is generated using the secret key entered by the user.
  8. The method according to one of the preceding claims, wherein the generated time-dependent password is displayed at the security device (101; 108) and/or wherein the time-dependent password is transmitted from the security device (101; 108) to the authorisation station (111) via a data network to which the security device (101; 108) is connected.
  9. The method according to one of the preceding claims, wherein a mobile communication device (101) comprises the security device (101; 108).
  10. The method according to one of the preceding claims, wherein checking whether the security device (101; 108) has access to the external time signal comprises checking whether the security device (101; 108) is connected to a communication network (102) providing the external time signal.
  11. A computer program comprising software code portions for performing a method according to one of the preceding claims, when the computer program is run on a processor (104; 109).

12. A device (101; 108) for generating a time dependent password using time information comprising:
  - a checking means for checking, whether an external time signal is accessible;
  - a requesting means for requesting a user to enter the time information, if the checking means determines that the external time signal is not accessible, and
  - a calculation means for generating a time-dependent password using the time information entered in response to the request.
13. A device (101; 108) according claim 12, wherein the device is a smartcard (108), which can be connected to a mobile communication device (101).
14. A device according to claim 13, wherein the smartcard (108) comprises a subscriber identification module for identifying and/or authenticating a user to a mobile communication network (102).
15. A mobile communication (101) device comprising a device (101; 108) according to one of the claims 12 to 14.

Applicant's or agent's file reference W0537-7009W0	<b>FOR FURTHER ACTION</b> See paragraphs 1 and 4 below
International application No. PCT/US2007/004646	International filing date (day/month/year) 21/02/2007
Applicant WEISS, Kenneth P.	DOCKETED <i>Amend Claims on formal 1.27.08</i> DUE: <i>resp to W01 2.27.08</i>

1.  The applicant is hereby notified that the international search report and the written opinion of the International Searching Authority have been established and are transmitted herewith.

**Filing of amendments and statement under Article 19:**

The applicant is entitled, if he so wishes, to amend the claims of the International Application (see Rule 46):

**When?** The time limit for filing such amendments is normally two months from the date of transmittal of the International Search Report.

**Where?** Directly to the International Bureau of WIPO, 34 chemin des Colombettes  
 1211 Geneva 20, Switzerland, Facsimile No.: (41-22) 338.82.70

For more detailed instructions, see the notes on the accompanying sheet.

2.  The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.

3.  **With regard to the protest** against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

- the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.
- no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

4. **Reminders**

Shortly after the expiration of **18 months** from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in Rules 90bis.1 and 90bis.3, respectively, before the completion of the technical preparations for international publication.

The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. These comments would also be made available to the public but not before the expiration of 30 months from the priority date.

Within **19 months** from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase **until 30 months** from the priority date (in some Offices even later); otherwise, the applicant must, **within 20 months** from the priority date, perform the prescribed acts for entry into the national phase before those designated Offices.

In respect of other designated Offices, the time limit of **30 months** (or later) will apply even if no demand is filed within 19 months.

See the Annex to Form PCT/IB/301 and, for details about the applicable time limits, Office by Office, see the *PCT Applicant's Guide*, Volume II, National Chapters and the WIPO Internet site.

## NOTES TO FORM PCT/ISA/220

These Notes are intended to give the basic instructions concerning the filing of amendments under article 19. The Notes are based on the requirements of the Patent Cooperation Treaty, the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the *PCT Applicant's Guide*, a publication of WIPO.

In these Notes, "Article", "Rule", and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions, respectively.

### INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report and the written opinion of the International Searching Authority, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international publication. Furthermore, it should be emphasized that provisional protection is available in some States only (see *PCT Applicant's Guide*, Volume I/A, Annexes B1 and B2).

The attention of the applicant is drawn to the fact that amendments to the claims under Article 19 are not allowed where the International Searching Authority has declared, under Article 17(2), that no international search report would be established (see *PCT Applicant's Guide*, Volume I/A, paragraph 296).

#### What parts of the international application may be amended?

Under Article 19, only the claims may be amended.

During the international phase, the claims may also be amended (or further amended) under Article 34 before the International Preliminary Examining Authority. The description and drawings may only be amended under Article 34 before the International Examining Authority.

Upon entry into the national phase, all parts of the international application may be amended under Article 28 or, where applicable, Article 41.

#### When?

Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the international Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

#### Where not to file the amendments?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been/is filed, see below.

#### How?

Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement sheet must be submitted for each sheet of the claims which, on account of an amendment or amendments, differs from the sheet originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Section 205(b)).

**The amendments must be made in the language in which the international application is to be published.**

#### What documents must/may accompany the amendments?

##### Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confused with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

**The letter must be in English or French, at the choice of the applicant. However, if the language of the international application is English, the letter must be in English; if the language of the international application is French, the letter must be in French.**

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference W0537-7009WO	<b>FOR FURTHER ACTION</b>		see Form PCT/ISA/220 as well as, where applicable, item 5 below.
International application No. PCT/US2007/004646	International filing date (day/month/year) 21/02/2007	(Earliest) Priority Date (day/month/year) 21/02/2006	
Applicant WEISS, Kenneth P.			

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 6 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. **Basis of the report**

a. With regard to the **language**, the international search was carried out on the basis of:

- the international application in the language in which it was filed
- a translation of the international application into \_\_\_\_\_, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b))

b.  With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, see Box No. I.

2.  **Certain claims were found unsearchable** (See Box No. II)

3.  **Unity of invention is lacking** (see Box No III)

4. With regard to the **title**,

- the text is approved as submitted by the applicant
- the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant
- the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box No. IV. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority

6. With regard to the **drawings**,

- a. the figure of the **drawings** to be published with the abstract is Figure No. 1
  - as suggested by the applicant
  - as selected by this Authority, because the applicant failed to suggest a figure
  - as selected by this Authority, because this figure better characterizes the invention
- b.  none of the figures is to be published with the abstract

INTERNATIONAL SEARCH REPORT

International application No  
PCT/US2007/004646

A. CLASSIFICATION OF SUBJECT MATTER

INV. G06F21/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)  
G06F G07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	GB 2 382 006 A (IBM [US]) 14 May 2003 (2003-05-14) figure 3 page 4, line 29 - line 34 page 17, line 10 - line 27 page 18, line 5 - line 24	1, 63
Y	----- US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)  paragraph [0012] paragraph [0061] -----	2-9, 13, 20-22, 64-84
Y	US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)  paragraph [0012] paragraph [0061]	2-9, 13, 20-22, 64-84

Further documents are listed in the continuation of Box C.

See patent family annex.

\* Special categories of cited documents :

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \*&\* document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2007/004646

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
  
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:  
  
1-9, 13-14, 20-22, 63-84
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
- No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

## 1. claims: 1,63

Giving authorization for an operation to a second device by a third device depending on information given by a first device.

---

## 2. claims: 2-9, 20-22, 13-14,64-84

Emulating a credit card and providing the services associated to the credit card.

---

## 3. claims: 10-12, 38-41,46,47, 100-103, 108-109

Secure communications between the first and the second devices using cryptography.

---

## 4. claims: 15-19, 24-32, 86-94

Different methods of authenticating the user at a second the device, using user information sent from the first device.

---

## 5. claims: 33-37, 95-99

Accessing user information from a data base by the secure system. The secure system access user authentication information and send it to the second device.

---

## 6. claims: 42-45, 48-62, 104-107, 110-124

Authentication of a user at a first device, a second user at a second device, sending authentication information from the first device to the second to authenticate the first user at the second device. Permit two users to manipulate their respective devices and authenticate the one first user by the second via information sent from the first device to the second.

---

## 7. claims: 23,85 125, 129

Send to credit card information for validation at a credit card service.

---

## 8. claims: 126-128, 130-132

**FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210**

Information validation based on information sent from a  
first and third devices to a second device.

---

INV. G06F21/00

Applicant  
WEISS, Kenneth P.

1. This opinion contains indications relating to the following items:

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

2. **FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA") except that this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 66.1bis(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of 3 months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

3. For further details, see notes to Form PCT/ISA/220.

---

**Box No. I Basis of the opinion**

---

1. With regard to the **language**, this opinion has been established on the basis of:
  - the international application in the language in which it was filed
  - a translation of the international application into , which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1 (b)).
2. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application and necessary to the claimed invention, this opinion has been established on the basis of:
  - a. type of material:
    - a sequence listing
    - table(s) related to the sequence listing
  - b. format of material:
    - on paper
    - in electronic form
  - c. time of filing/furnishing:
    - contained in the international application as filed.
    - filed together with the international application in electronic form.
    - furnished subsequently to this Authority for the purposes of search.
3.  In addition, in the case that more than one version or copy of a sequence listing and/or table relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
4. Additional comments:

**Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability**

The questions whether the claimed invention appears to be novel, to involve an inventive step (to be non obvious), or to be industrially applicable have not been examined in respect of

- the entire international application
- claims Nos. 10-12,15-19,23-62, 85-132

because:

- the said international application, or the said claims Nos. relate to the following subject matter which does not require an international search (*specify*):
- the description, claims or drawings (*indicate particular elements below*) or said claims Nos. are so unclear that no meaningful opinion could be formed (*specify*):
- the claims, or said claims Nos. are so inadequately supported by the description that no meaningful opinion could be formed (*specify*):
- no international search report has been established for the whole application or for said claims Nos. 10-12,15-19,23-62, 85-132
- a meaningful opinion could not be formed without the sequence listing; the applicant did not, within the prescribed time limit:
  - furnish a sequence listing on paper complying with the standard provided for in Annex C of the Administrative Instructions, and such listing was not available to the International Searching Authority in a form and manner acceptable to it.
  - furnish a sequence listing in electronic form complying with the standard provided for in Annex C of the Administrative Instructions, and such listing was not available to the International Searching Authority in a form and manner acceptable to it.
  - pay the required late furnishing fee for the furnishing of a sequence listing in response to an invitation under Rules 13<sup>ter</sup>.1(a) or (b).
- a meaningful opinion could not be formed without the tables related to the sequence listings; the applicant did not, within the prescribed time limit, furnish such tables in electronic form complying with the technical requirements provided for in Annex C-bis of the Administrative Instructions, and such tables were not available to the International Searching Authority in a form and manner acceptable to it.
- the tables related to the nucleotide and/or amino acid sequence listing, if in electronic form only, do not comply with the technical requirements provided for in Annex C-bis of the Administrative Instructions.
- See Supplemental Box for further details

---

**Box No. IV Lack of unity of invention**

---

1.  In response to the invitation (Form PCT/ISA/206) to pay additional fees, the applicant has, within the applicable time limit:
- paid additional fees
  - paid additional fees under protest and, where applicable, the protest fee
  - paid additional fees under protest but the applicable protest fee was not paid
  - not paid additional fees
2.  This Authority found that the requirement of unity of invention is not complied with and chose not to invite the applicant to pay additional fees.
3. This Authority considers that the requirement of unity of invention in accordance with Rule 13.1, 13.2 and 13.3 is
- complied with
  - not complied with for the following reasons:  
see separate sheet
4. Consequently, this report has been established in respect of the following parts of the international application:
- all parts.
  - the parts relating to claims Nos. 1-9,13-14,20-22,63-84

---

**Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

---

1. Statement

Novelty (N)	Yes: Claims	<u>2-9,13-14,20-22,64-84</u>
	No: Claims	<u>1,63</u>
Inventive step (IS)	Yes: Claims	
	No: Claims	<u>1-9,13-14,20-22,63-84</u>
Industrial applicability (IA)	Yes: Claims	<u>1-9,13-14,20-22,63-84</u>
	No: Claims	

2. Citations and explanations

see separate sheet

**Re Item III.**

No opinion is given for claims 10-12,15-19,23-62 and 85-132 as no search report has been established for those claims.

**Re Item IV.**

The separate inventions/groups of inventions are:

I Claims 1,63:

Giving authorization for an operation to a second device by a third device depending on information given by a first device.

II Claims 2-9, 20-22, 13-14,64-84:

Emulating a credit card and providing the services associated to the credit card.

III Claims 10-12, 38-41,46,47, 100-103, 108-109:

Secure communications between the first and the second devices using cryptography.

IV Claims 15-19, 24-32, 86-94:

Different methods of authenticating the user at a second the device, using user information sent from the first device.

V Claims 33-37, 95-99:

Accessing user information from a data base by the secure system. The secure system access user authentication information and send it to the second device.

VI Claims 42-45, 48-62, 104-107, 110-124:

Authentication of a user at a first device, a second user at a second device, sending authentication information from the first device to the second to authenticate the first user at the second device. Permit two users to manipulate their respective devices and authenticate the one first user by the second via information sent from the first device to the second.

VII Claims 23,85 125, 129:

Send to credit card information for validation at a credit card service.

VIII Claims 126-128, 130-132:

Information validation based on information sent from a first and third devices to a second device.

They are not so linked as to form a single general inventive concept (Rule 13.1 PCT) for the following reasons:

The problems solved by each group of claims are:

Group 1:

The problem solved by this group is how to authorize operations at a device without letting this device access private information.

Group 2:

The problem solved by this group of claims is how to provide credit card services.

Group 3:

The problem solved by this group of claims is how to secure communications between devices.

Group 4:

The problem solved by this group of claims is how to authenticate a user.

Group 5:

The problem solved by this group of claims is how to limit access to private information.

Group 6:

The problem solved by this group of claims is how to prevent user authentication to a device that is being manipulated by a non-trusted user.

Group 7:

The problem to be solved by this group of claims is how to validate credit card information.

Group 8:

The problem solved by this group of claims is how to validate information using a third trusted device.

The common concept linking the groups of claims listed is claim 1 and 63.

Claims 1 and 63 are not novel, as their features are anticipated by the document GB2382006A. This document shows the following features:

- a) A system for validating an identity of a user to enable or prevent an occurrence of an event (Abstract).
- b) A first device including a wireless transmitter configured to transmit validation

information (pag. 17 I.11-12, pag. 25 I.8-11 the communication between the devices is considered wireless).

- c) A second device including a wireless receiver, the second device configured to receive the validation information and further transmit the validation information (pag. 17 I.11-13, pag. 25 I.8-11 the communication between the devices is considered as wireless).
- d) A secure system in communication with the second device, the secure system including a database (pag. 17 I.10-11).
- e) The secure system is configured to receive the validation information transmitted from the second device (pag. 17 I.12-13).
- f) The secure system is further configured to transmit additional information to the second device following a receipt of the validation information to assist the second device in either enabling or preventing the occurrence of the event (pag. 17 I.15-16).

Hence the groups of claims are not so linked as to form a general inventive concept. The application lacks unity, Rule 13.1 PCT.

**Re Item V.**

- 1 Reference is made to the following document:  
D1 : GB 2 382 006 A (IBM [US]) 14 May 2003 (2003-05-14)  
D2: US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)
- 2 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT. Reference is made to the above reasoning of lack of unity were the novelty of claim 1 is challenged.
- 3 The same above objection is also applicable to the corresponding method claim 63 to apparatus claim 1.
- 4. The additional features of dependent claims 2-9, 13-14, 20-22 and 64-84 are also

anticipated by D1 in combination with D2, and do not contribute to an inventive activity.

## Possible steps after receipt of the international search report (ISR) and written opinion of the International Searching Authority (WO-ISA)

---

General information	For all international applications filed on or after 01/01/2004 the competent ISA will establish an ISR. It is accompanied by the WO-ISA. Unlike the former written opinion of the IPEA (Rule 66.2 PCT), the WO-ISA is not meant to be responded to, but to be taken into consideration for further procedural steps. This document explains about the possibilities.
Amending claims under Art. 19 PCT	Within 2 months after the date of mailing of the ISR and the WO-ISA the applicant may file amended claims under Art. 19 PCT directly with the International Bureau of WIPO. The PCT reform of 2004 did not change this procedure. For further information please see Rule 46 PCT as well as form PCT/ISA/220 and the corresponding Notes to form PCT/ISA/220.
Filing a demand for international preliminary examination	<p>In principle, the WO-ISA will be considered as the written opinion of the IPEA. This should, in many cases, make it unnecessary to file a demand for international preliminary examination. If the applicant nevertheless wishes to file a demand this must be done before expiry of 3 months after the date of mailing of the ISR/ WO-ISA or 22 months after priority date, whichever expires later (Rule 54bis PCT). Amendments under Art. 34 PCT can be filed with the IPEA as before, normally at the same time as filing the demand (Rule 66.1 (b) PCT).</p> <p>If a demand for international preliminary examination is filed and no comments/amendments have been received the WO-ISA will be transformed by the IPEA into an IPRP (International Preliminary Report on Patentability) which would merely reflect the content of the WO-ISA. The demand can still be withdrawn (Art. 37 PCT).</p>
Filing informal comments	After receipt of the ISR/WO-ISA the applicant may file informal comments on the WO-ISA directly with the International Bureau of WIPO. These will be communicated to the designated Offices together with the IPRP (International Preliminary Report on Patentability) at 30 months from the priority date. Please also refer to the next box.
End of the international phase	At the end of the international phase the International Bureau of WIPO will transform the WO-ISA or, if a demand was filed, the written opinion of the IPEA into the IPRP, which will then be transmitted together with possible informal comments to the designated Offices. The IPRP replaces the former IPER (international preliminary examination report).

Cambridge, MA 02142  
ETATS-UNIS D'AMERIQUE

(PCT Rule 44.1)

Date of mailing (day/month/year) 11/03/2008	
Applicant's or agent's file reference W0537-7010W0	<b>FOR FURTHER ACTION</b> See paragraphs 1 and 4 below
International application No. PCT/US2007/070701	International filing date (day/month/year) 08/06/2007
Applicant WEISS, Kenneth P.	<b>COPY</b>

1.  The applicant is hereby notified that the international search report and the written opinion of the International Searching Authority have been established and are transmitted herewith.

**Filing of amendments and statement under Article 19:**

The applicant is entitled, if he so wishes, to amend the claims of the International Application (see Rule 46):

**When?** The time limit for filing such amendments is normally two months from the date of transmittal of the International Search Report.

**Where?** Directly to the International Bureau of WIPO, 34 chemin des Colombettes  
1211 Geneva 20, Switzerland, Facsimile No.: (41-22) 338.82.70

**For more detailed instructions,** see the notes on the accompanying sheet.

2.  The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.

3.  **With regard to the protest** against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

- the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.  
 no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

4. **Reminders**

Shortly after the expiration of **18 months** from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in Rules 90*bis*.1 and 90*bis*.3, respectively, before the completion of the technical preparations for international publication.

The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. These comments would also be made available to the public but not before the expiration of 30 months from the priority date.

Within **19 months** from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase **until 30 months** from the priority date (in some Offices even later); otherwise, the applicant must, **within 20 months** from the priority date, perform the prescribed acts for entry into the national phase before those designated Offices.

In respect of other designated Offices, the time limit of **30 months** (or later) will apply even if no demand is filed within 19 months.

See the Annex to Form PCT/IB/301 and, for details about the applicable time limits, Office by Office, see the *PCT Applicant's Guide*, Volume II, National Chapters and the WIPO Internet site.

## NOTES TO FORM PCT/ISA/220

These Notes are intended to give the basic instructions concerning the filing of amendments under article 19. The Notes are based on the requirements of the Patent Cooperation Treaty, the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the *PCT Applicant's Guide*, a publication of WIPO.

In these Notes, "Article", "Rule", and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions, respectively.

### INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report and the written opinion of the International Searching Authority, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international publication. Furthermore, it should be emphasized that provisional protection is available in some States only (see *PCT Applicant's Guide*, Volume I/A, Annexes B1 and B2).

The attention of the applicant is drawn to the fact that amendments to the claims under Article 19 are not allowed where the International Searching Authority has declared, under Article 17(2), that no international search report would be established (see *PCT Applicant's Guide*, Volume I/A, paragraph 296).

#### What parts of the international application may be amended?

Under Article 19, only the claims may be amended.

During the international phase, the claims may also be amended (or further amended) under Article 34 before the International Preliminary Examining Authority. The description and drawings may only be amended under Article 34 before the International Examining Authority.

Upon entry into the national phase, all parts of the international application may be amended under Article 28 or, where applicable, Article 41.

#### When?

Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the International Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

#### Where not to file the amendments?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been/is filed, see below.

#### How?

Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement sheet must be submitted for each sheet of the claims which, on account of an amendment or amendments, differs from the sheet originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Section 205(b)).

**The amendments must be made in the language in which the international application is to be published.**

#### What documents must/may accompany the amendments?

##### Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confused with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

**The letter must be in English or French, at the choice of the applicant. However, if the language of the international application is English, the letter must be in English; if the language of the international application is French, the letter must be in French.**

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference W0537-7010WO	<b>FOR FURTHER ACTION</b> see Form PCT/ISA/220 as well as, where applicable, item 5 below.	
International application No. PCT/US2007/070701	International filing date (day/month/year) 08/06/2007	(Earliest) Priority Date (day/month/year) 09/06/2006
Applicant WEISS, Kenneth P.		

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 4 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

a. With regard to the **language**, the international search was carried out on the basis of:

- the International application in the language in which it was filed
- a translation of the international application into \_\_\_\_\_, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b))

b.  This international search report has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43.6bis(a)).

c.  With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, see Box No. I.

2.  **Certain claims were found unsearchable** (See Box No. II)

3.  **Unity of invention is lacking** (see Box No III)

4. With regard to the **title**,

- the text is approved as submitted by the applicant
- the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant
- the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box No. IV. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority

6. With regard to the **drawings**,

- a. the figure of the **drawings** to be published with the abstract is Figure No. 21
  - as suggested by the applicant
  - as selected by this Authority, because the applicant failed to suggest a figure
  - as selected by this Authority, because this figure better characterizes the invention
- b.  none of the figures is to be published with the abstract

## A. CLASSIFICATION OF SUBJECT MATTER

INV. G06F21/00

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

G06F G07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2004/034771 A1 (EDGETT JEFF STEVEN [US] ET AL) 19 February 2004 (2004-02-19) figure 3 paragraph [0048] - paragraph [0050]	1,27-32, 38-40
X	US 2001/044900 A1 (UCHIDA KAORU [JP]) 22 November 2001 (2001-11-22) paragraph [0039]; figure 4	2-10,41, 42,67-75
X	US 2005/039027 A1 (SHAPIRO MICHAEL F [US]) 17 February 2005 (2005-02-17) abstract figure 2 paragraph [0015] - paragraph [0017] paragraph [0021] - paragraph [0022] paragraph [0024]	41-44

 Further documents are listed in the continuation of Box C. See patent family annex.

\* Special categories of cited documents :

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \* & \* document member of the same patent family

Applicant WEISS, Kenneth P.		

**1. This opinion contains indications relating to the following items:**

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

**2. FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA") except that this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 66.1bis(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of 3 months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

**3. For further details, see notes to Form PCT/ISA/220.**

IPR2018-00067

---

**Box No. I Basis of the opinion**

---

1. With regard to the **language**, this opinion has been established on the basis of:
  - the international application in the language in which it was filed
  - a translation of the international application into , which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1 (b)).
2.  This opinion has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43bis.1(a))
3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application and necessary to the claimed invention, this opinion has been established on the basis of:
  - a. type of material:
    - a sequence listing
    - table(s) related to the sequence listing
  - b. format of material:
    - on paper
    - in electronic form
  - c. time of filing/furnishing:
    - contained in the international application as filed.
    - filed together with the international application in electronic form.
    - furnished subsequently to this Authority for the purposes of search.
4.  In addition, in the case that more than one version or copy of a sequence listing and/or table relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
5. Additional comments:

---

**Re Item V.**

1 Reference is made to the following documents:

- D1 : US 2004/034771 A1 (EDGETT JEFF STEVEN [US] ET AL) 19 February 2004 (2004-02-19)
- D2 : EP 0 986 209 A (MITSUBISHI ELECTRIC CORP [JP]) 15 March 2000 (2000-03-15)
- D3 : US 2001/044900 A1 (UCHIDA KAORU [JP]) 22 November 2001 (2001-11-22)
- D4 : US 2005/039027 A1 (SHAPIRO MICHAEL F [US]) 17 February 2005 (2005-02-17)

2 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT.

Document D1 discloses (the references in parentheses applying to this document):

- a) A method of authenticating an identity of a first entity (Par. 48-50).
- b) Wirelessly transmitting from a first device, first encrypted authentication information of the first entity (par. 49 lines 3-8, It is considered that the network includes wireless means that are being used in the transmission).
- c) Receiving with a second device the wirelessly transmitted first encrypted authentication information (par. 49 line 8).
- d) Decrypting with the second device, the first wirelessly encrypted authentication information to provide the first authentication information of the first entity to the second device (par. 49 lines 20-24).
- e) Authenticating the identity of the first entity based upon the first authentication information and acting based on the authenticated identity of the first entity (par. 50).

3 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 41 is not new in the sense of Article 33(2) PCT.

Document D4 discloses (the references in parentheses applying to this document):

- a) A system for validating an identity of a first entity comprising a first wireless device comprising (par. 5).
  - b) A first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted authentication information (par. 5 l.33-36).
  - c) A first processor configured to compare stored biometric data with detected biometric data of the first entity and configured to enable or disable use of the first device based on a result of the comparison, and configured to encrypt first authentication information with a first private key into the first encrypted authentication information (par. 5 l.19-21, par. 15 l.34-36, par. 16 l.7-10 and par. 17).
  - d) A first biometric detector for detecting biometric data of the first entity (par. 5 l.21-25).
  - e) A first memory for storing biometric data of the first entity, a private key of the first entity authorized to use the first device, and the first authentication information (par. 5 l.19-21).
- 4 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 67 is not new in the sense of Article 33(2) PCT.  
Document D3 discloses (the references in parentheses applying to this document):
- a) A first wireless device (par. 30 and par. 54).
  - b) A processor configured to enable operation of the first wireless device if it receives an enablement signal validating first biometric information of a first entity and configured to generate a non-predictable signal from the biometric information (par. 36 The processor generates a non-predictable signal from the biometric data when it encrypts the data.)
  - c) A first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted biometric information of the first entity and to receive the enablement signal (par. 30, 36 and 39 The enablement signal comes from the authentication server via the ECSP unit in the form of a service).
  - d) A first biometric detector for detecting the first biometric information of the first entity (par. 36).
- 5 Dependent claims 2-40, 42-66, 68-75 do not contain any features which, in

combination with the features of any claim to which they refer, meet the requirements of the PCT in respect of novelty and/or inventive step (Article 33(2) and (3) PCT).

The dependent claims contain features that are part of the common general knowledge like encryption methods, biometric data capture devices and methods for securing communications. These features represent mere implementation details that are well-known to the person skilled in the art, and will not justify an inventive activity.

It is worth to say that the application merely contains a juxtaposition of different techniques used in authentication and cryptography functioning in their normal way and not producing any non-obvious working inter-relationship that justifies an inventive activity.

## Possible steps after receipt of the international search report (ISR) and written opinion of the International Searching Authority (WO-ISA)

---

### General information

For all international applications filed on or after 01/01/2004 the competent ISA will establish an ISR. It is accompanied by the WO-ISA. Unlike the former written opinion of the IPEA (Rule 66.2 PCT), the WO-ISA is not meant to be responded to, but to be taken into consideration for further procedural steps. This document explains about the possibilities.

---

### Amending claims under Art. 19 PCT

Within 2 months after the date of mailing of the ISR and the WO-ISA the applicant may file amended claims under Art. 19 PCT directly with the International Bureau of WIPO. The PCT reform of 2004 did not change this procedure. For further information please see Rule 46 PCT as well as form PCT/ISA/220 and the corresponding Notes to form PCT/ISA/220.

---

### Filing a demand for international preliminary examination

In principle, the WO-ISA will be considered as the written opinion of the IPEA. This should, in many cases, make it unnecessary to file a demand for international preliminary examination. If the applicant nevertheless wishes to file a demand this must be done before expiry of 3 months after the date of mailing of the ISR/ WO-ISA or 22 months after priority date, whichever expires later (Rule 54bis PCT). Amendments under Art. 34 PCT can be filed with the IPEA as before, normally at the same time as filing the demand (Rule 66.1 (b) PCT).

If a demand for international preliminary examination is filed and no comments/amendments have been received the WO-ISA will be transformed by the IPEA into an IPRP (International Preliminary Report on Patentability) which would merely reflect the content of the WO-ISA. The demand can still be withdrawn (Art. 37 PCT).

---

### Filing informal comments

After receipt of the ISR/WO-ISA the applicant may file informal comments on the WO-ISA directly with the International Bureau of WIPO. These will be communicated to the designated Offices together with the IPRP (International Preliminary Report on Patentability) at 30 months from the priority date. Please also refer to the next box.

---

### End of the international phase

At the end of the international phase the International Bureau of WIPO will transform the WO-ISA or, if a demand was filed, the written opinion of the IPEA into the IPRP, which will then be transmitted together with possible informal comments to the designated Offices. The IPRP replaces the former IPEA (international preliminary examination report).

Applicant's or agent's file reference W0537-7013WO	<b>PAYMENT DUE</b> within <b>ONE MONTH</b> from the above date of mailing
International application No. PCT/US2009/035282	International filing date (day/month/year) 26/02/2009
Applicant  WEISS, Kenneth P.	

1. This International Searching Authority

- (i) considers that there are 4 (number of) inventions claimed in the international application covered by the claims indicated on an extra sheet:
- (ii) therefore considers that **the international application does not comply with the requirements of unity of invention** (Rules 13.1, 13.2 and 13.3) for the reasons indicated on an extra sheet:
- (iii)  has carried out a partial international search (see Annex)  will establish the international search report on those parts of the international application which relate to the invention first mentioned in claims Nos.:  
see extra sheet
- (iv) will establish the international search report on the other parts of the international application only if, and to the extent to which, additional fees are paid.

2. Consequently, the applicant is hereby **invited to pay**, within the time limit indicated above, the amount indicated below:

EUR 1.700,00 x 3 = EUR 5.100  
Fee per additional invention      number of additional inventions      currency/total amount of additional fees

3. The applicant is informed that, according to Rule 40.2(c), **the payment of any additional fee may be made under protest**, i.e., a reasoned statement to the effect that the international application complies with the requirement of unity of invention or that the amount of the required additional fee is excessive, where applicable, subject to the payment of a protest fee.

Where the applicant pays additional fees under protest, the applicant is hereby invited, within the time limit indicated above, to pay a protest fee (Rule 40.2(e)) in the amount of EUR 750,00 (currency/amount)

Where the applicant has not, within the time limit indicated above, paid the required protest fee, the protest will be considered not to have been made and the International Searching Authority will so declare.

4.  Claim(s) Nos. \_\_\_\_\_ have been found to be unsearchable under Article 17(2)(b) because of defects under Article 17(2)(a) and therefore have not been included with any invention.

Name and mailing address of the International Searching Authority  European Patent Office, P.B. 5818 Patentlaan 2 NL-2280 HV Rijswijk Tel. (+31-70) 340-2040, Tx. 31 651 epo nl, Fax: (+31-70) 340-3016	Authorized officer  Eva Hehn

**Annex to Form PCT/ISA/206  
COMMUNICATION RELATING TO THE RESULTS  
OF THE PARTIAL INTERNATIONAL SEARCH**

International Application No  
PCT/US2009/035282

1. The present communication is an Annex to the invitation to pay additional fees (Form PCT/ISA/206). It shows the results of the international search established on the parts of the international application which relate to the invention first mentioned in claims Nos.:  
see 'Invitation to pay additional fees'
2. This communication is not the international search report which will be established according to Article 18 and Rule 43.
3. If the applicant does not pay any additional search fees, the information appearing in this communication will be considered as the result of the international search and will be included as such in the international search report.
4. If the applicant pays additional fees, the international search report will contain both the information appearing in this communication and the results of the international search on other parts of the international application for which such fees will have been paid.

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category °	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

- ° Special categories of cited documents :
- \*A\* document defining the general state of the art which is not considered to be of particular relevance
  - \*E\* earlier document but published on or after the international filing date
  - \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
  - \*O\* document referring to an oral disclosure, use, exhibition or other means
  - \*P\* document published prior to the international filing date but later than the priority date claimed
  - \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
  - \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
  - \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
  - \*&\* document member of the same patent family

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-2, 4, 6-16, 18-28, 30-31

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information setup by all entered data and sends it via another device to a third party system

1.1. claims: 1-2, 4, 6, 15-16, 18-20, 24-28, 30-31

A device with biometric sensor, user interface and wireless communication interface which encrypts particular authentication information setup by all entered data and sends it via another device to a third party system

1.2. claims: 7-12

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system with local biometric verification and activation of the device after successful authentication

1.3. claim: 14

A portable device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system

1.4. claims: 13, 21-23

A device with a special biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system

2. claim: 3

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system and a converter device emulating magnetic stripes

3. claim: 5

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system after biometric authentication

---

4. claims: 17, 29

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system. The device is deactivated when user is not authenticated or when rules of other policies apply.

---

Please note that all inventions mentioned under item 1, although not necessarily linked by a common inventive concept, could be searched without effort justifying an additional fee.

The reasons for which the inventions are not so linked as to form a single general inventive concept, as required by Rule 13.1 PCT, are as follows:

Claims 1, 2, 15 and 20 are not new and not inventive. The only common feature linking the parallel claims 3, 4, 5, 6, 7, 13, 14, 16, 17, 18, 19, 21, 24, 25, 29 and 30 is a device with biometric sensor, user interface and wireless communication interface which encrypts authentication information setup by all entered data and sends it via another device to a third party system

This is disclosed by the document US2006016884 (the references in parentheses applying to this document):

A device configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction (fig.1 "portable terminal 14"; fig. 4; par.[0245] "a multifunction card can store data corresponding to plurality of accounts in its memory. ..., data corresponding to a stored account can be selected ..."), comprising:

- a biometric sensor configured to receive a biometric input provided by the user (fig.4 "BIOMETRIC READER 47");
- a user interface (fig. 4 "40 DISPLAY", "42 MANUAL INPUTS") configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts (par.[0181] "The instructions stored in memory on the card or the memory of the terminal may cause screens associated with the entry of a PIN number and/or the selection of various accounts to be displayed when particular accounts are selected.");
- a communication link (fig.4 "50 MODEM") configured to communicate (fig.4 "54") with a secure registry (fig.4 "56"); and
- a processor (fig.4 "36 PROCESSOR") coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication link, the processor configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry (par.[0185] "Appropriate encryption is provided to enhance security.");

par.[0191]-[0192] "Data representative of the user's signature and/or the user's financial account information can be transmitted from the user's (customer's) portable hand-held device to the merchant's transaction system. ... , the merchant system can be operative to communicate with a third party ... the account data may include checking account number

(and/or bank routing number), check number, name, address, phone number, bank name, or combinations thereof.").

The 6 groups of inventions are directed towards the solution of different technical problems and are not linked by a common or corresponding special technical feature, problem or effect, which would contribute to the prior art.

Claims 1, 2, 4, 6, 15, 16, 18 to 20, 24 to 28, 30, 31 are directed towards a device for entering authentication data and generating encrypted authentication information to be communicated to a third party. The problem to be solved by these features can be construed as to protecting the secrecy of data authorizing financial transactions.

Claims 7 to 12 are directed towards authenticating the authorized user of the device locally. Claim 14 is directed towards a portable authentication device. The problem to be solved by these features can be construed as to improve the availability of the protected authentication. Hence two solutions form a common inventive concept.

Claims 13, 21, 22, 23 are directed towards biometric sensors. The problem to be solved by these features can be construed as to increase convenience for the user.

Claim 3 is directed towards a device for emulating magnetic stripes. The problem to be solved by these features can be construed as to improve the interoperability with existing authentication systems.

Claim 5 is directed towards sending biometric information to a third party before authenticating the financial transaction. The problem to be solved by these features can be construed as to improve the secrecy of the authentication process.

Claim 17 and 29 are directed towards restricting the usage of the device. The problem to be solved by these features can be construed as to protect the integrity of the device against unauthorized use.

In conclusion, the groups of claims define 6 different inventions not linked by a single general inventive concept.

The search has covered the first 4 groups of inventions (groups 1, 1.1, 1.2, 1.3).

(PCT Rule 44.1)

Date of mailing (day/month/year)		20 January 2012 (20-01-2012)
Applicant's or agent's file reference W0537-7018WO	<b>FOR FURTHER ACTION</b>	See paragraphs 1 and 4 below
International application No. PCT/US2011/051966	International filing date (day/month/year)	16 September 2011 (16-09-2011)
Applicant UNIVERSAL SECURE REGISTRY, LLC		

1.  The applicant is hereby notified that the international search report and the written opinion of the International Searching Authority have been established and are transmitted herewith.

**Filing of amendments and statement under Article 19:**  
 The applicant is entitled, if he so wishes, to amend the claims of the International Application (see Rule 46):

**When?** The time limit for filing such amendments is normally two months from the date of transmittal of the International Search Report.

**Where?** Directly to the International Bureau of WIPO, 34 chemin des Colombettes  
 1211 Geneva 20, Switzerland, Facsimile No.: (41-22) 338.82.70

**For more detailed instructions, see PCT Applicant's Guide, International Phase, paragraphs 9.004 - 9.011.**

2.  The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.

3.  **With regard to any protest** against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.

no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

4. **Reminders**

The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. Following the expiration of 30 months from the priority date, these comments will also be made available to the public.

Shortly after the expiration of **18 months** from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the international Bureau before completion of the technical preparations for international publication (Rules 90bis.1 and 90bis.3).

Within **19 months** from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase **until 30 months** from the priority date (in some Offices even later); otherwise, the applicant must, **within 20 months** from the priority date, perform the prescribed acts for entry into the national phase before those designated Offices.

In respect of other designated Offices, the time limit of **30 months** (or later) will apply even if no demand is filed within 19 months.

For details about the applicable time limits, Office by Office, see [www.wipo.int/pct/en/texts/time\\_limits.html](http://www.wipo.int/pct/en/texts/time_limits.html) and the *PCT Applicant's Guide*, National Chapters.

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference W0537-7018WO	<b>FOR FURTHER ACTION</b> see Form PCT/ISA/220 as well as, where applicable, item 5 below.	
International application No. PCT/US2011/051966	International filing date (day/month/year) 16/09/2011	(Earliest) Priority Date (day/month/year) 17/09/2010
Applicant  UNIVERSAL SECURE REGISTRY, LLC		

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 3 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

a. With regard to the **language**, the international search was carried out on the basis of:

- the international application in the language in which it was filed  
 a translation of the international application into \_\_\_\_\_, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b))

b.  This international search report has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43.6bis(a)).

c.  With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, see Box No. I.

2.  **Certain claims were found unsearchable** (See Box No. II)

3.  **Unity of invention is lacking** (see Box No III)

4. With regard to the **title**,

- the text is approved as submitted by the applicant  
 the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant  
 the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box No. IV. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority

6. With regard to the **drawings**,

a. the figure of the **drawings** to be published with the abstract is Figure No. 12

- as suggested by the applicant  
 as selected by this Authority, because the applicant failed to suggest a figure  
 as selected by this Authority, because this figure better characterizes the invention

b.  none of the figures is to be published with the abstract

Applicant  
**UNIVERSAL SECURE REGISTRY, LLC**

1. This opinion contains indications relating to the following items:

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43*bis*.1(a)(i) with regard to novelty, inventive step and industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

2. **FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA") except that this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 66.1*bis*(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of 3 months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

3. For further details, see notes to Form PCT/ISA/220.

**Box No. I Basis of the opinion**

---

1. With regard to the **language**, this opinion has been established on the basis of:
  - the international application in the language in which it was filed
  - a translation of the international application into , which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1 (b)).
2.  This opinion has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43bis.1 (a))
3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, this opinion has been established on the basis of a sequence listing filed or furnished:
  - a. (means)

**Box No. VIII Certain observations on the international application**

---

The following observations on the clarity of the claims, description, and drawings or on the question whether the claims are fully supported by the description, are made:

**see separate sheet**

**Re Item V**

**Reasoned statement with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

The following documents are referred to in this communication:

- D1 WO 2010/000455 A1 (VODAFONE HOLDING GMBH [DE]; MOUTARAZAK SAID [NL]; KORAICHI NAJIB [NL]) 7 January 2010 (2010-01-07)
- D2 US 2007/186115 A1 (GAO XIANG [CN] ET AL) 9 August 2007 (2007-08-09)

1 D1, regarded as the closest prior art, discloses a method and system for controlling access to restricted resources by means of a time-dependent password which is generated in a handheld communication device, after validating an authentication code entered by a user. The most relevant passages are cited in the search report.

The subject-matter of present claim 1 differs from D1 in that the password has a limited validity in the sense that the user is permitted to continue accessing the resource so long as computer operated by the user periodically receives subsequent authentication information from the handheld device. D1, on the other hand, is silent as to how long a user is given access once a valid password has been entered.

The problem solved by the present invention may thus be defined as "how to increase the security of a one-time password access control system".

As none of the available prior art documents discloses or suggests a similar solution, the subject-matter of independent claim 1 of the present application is considered novel and inventive in the sense of Art. 33(2) and (3) PCT, respectively.

2 The same reasoning applies, mutatis mutandis, to independent claim 24 which is, therefore, also novel and inventive.

3 The remaining claims, 2-23 and 25-33, are all dependent and thus also novel and inventive.

4 As to D2, this document discloses a card to be entered into the card slot of a mobile phone, the card generating a time-dependent password, which is displayed on the phone display to be entered by the user into a computer keyboard.

**Re Item VIII**

**Certain observations on the international application**

5 Claim 21 is not clear (Art. 6 PCT) because it refers to itself.

Possible steps after receipt of the international search report (ISR) and written opinion of the International Searching Authority (WO-ISA)

---

General information

For all international applications filed on or after 01/01/2004 the competent ISA will establish an ISR. It is accompanied by the WO-ISA. Unlike the former written opinion of the IPEA (Rule 66.2 PCT), the WO-ISA is not meant to be responded to, but to be taken into consideration for further procedural steps. This document explains about the possibilities.

---

Amending claims under Art. 19 PCT

Within 2 months after the date of mailing of the ISR and the WO-ISA the applicant may file amended claims under Art. 19 PCT directly with the International Bureau of WIPO. The PCT reform of 2004 did not change this procedure. For further information please see Rule 46 PCT as well as form PCT/ISA/220 and the corresponding Notes to form PCT/ISA/220.

---

Filing a demand for international preliminary examination

In principle, the WO-ISA will be considered as the written opinion of the IPEA. This should, in many cases, make it unnecessary to file a demand for international preliminary examination. If the applicant nevertheless wishes to file a demand this must be done before expiry of 3 months after the date of mailing of the ISR/ WO-ISA or 22 months after priority date, whichever expires later (Rule 54bis PCT). Amendments under Art. 34 PCT can be filed with the IPEA as before, normally at the same time as filing the demand (Rule 66.1 (b) PCT).

If a demand for international preliminary examination is filed and no comments/amendments have been received the WO-ISA will be transformed by the IPEA into an IPRP (International Preliminary Report on Patentability) which would merely reflect the content of the WO-ISA. The demand can still be withdrawn (Art. 37 PCT).

---

Filing informal comments

After receipt of the ISR/WO-ISA the applicant may file informal comments on the WO-ISA directly with the International Bureau of WIPO. These will be communicated to the designated Offices together with the IPRP (International Preliminary Report on Patentability) at 30 months from the priority date. Please also refer to the next box.

---

End of the international phase

At the end of the international phase the International Bureau of WIPO will transform the WO-ISA or, if a demand was filed, the written opinion of the IPEA into the IPRP, which will then be transmitted together with possible informal comments to the designated Offices. The IPRP replaces the former IPER (international preliminary examination report).

(54) Title: METHOD AND DEVICE FOR GENERATING A TIME-DEPENDENT PASSWORD

Fig. 2

(57) Abstract: The invention relates to the generation of a time-dependent password using an external time signal. For generating a time-dependent password in a temporary absence of the external time signal, the invention proposes a method comprising the steps of: - checking, whether the security device has access to an external time signal; - requesting a user of the security device to enter time information, if it is determined that the security device has no access to the external time signal; and - generating a time-dependent password using the time information entered in response to the request. The invention further relates to a device for performing the method.

## Method and device for generating a time-dependent password

5

### Technical Field

The invention relates to the generation of time-dependent passwords, particularly to the generation of time-synchronized one-time passwords. More specifically, the invention relates to a method for generating a time-dependent password in a mobile communication device. The invention further relates to a device for generating a time-dependent password in a mobile communication device and to a mobile communication device comprising the device.

15

### Background of the Invention

Conventional static passwords bear the risk to be discovered by unauthorized third parties. Protection against unauthorized access to restricted resources can be improved by using so-called one-time passwords (OTPs), which are valid only for one time. An OTP mechanism, commonly referred to as time-synchronised type OTP, involves synchronised time information for generating and validating OTPs. In regular time intervals, such as, for example, every minute, a security device or an application, which is usually called "token", generates a new OTP from current time information and a secret key assigned to the user. For validating the OTP, an authorisation station re-generates the OTP based on the secret key and own current time information using the same algorithm as the token and compares the self-generated password with the password generated by the token.

30 In the OTP environment described before, the time information used in the token and the time information used in the authorisation station have to be well synchronised. However, in OTP environments, certain time deviations are al-

lowed, which means that the authorisation station accepts OTPs generated and based on time information that differs from that time of the authorisation station by a predefined time deviation. Typical allowed time deviations may be in the range of one or several minutes, for example.

5

The token may be a closed, tamper-resistant hardware system dedicated to the generation of OTPs, which stores the secret key of the user and which usually has a built-in clock for providing the time information. As an alternative, the token may be configured as a so-called "soft token", which is a software application run on a general-purpose processor.

10

The international patent application WO 2007/126227 describes a mobile communication device, such as, for example, a mobile phone or a PDA (Personal Data Assistant) or the like, which has an interface for accepting an IC chip (IC: Integrated Circuit) for generating time-synchronised type OTPs. The IC chip stores the user's secret key and comprises a module for generating the OTPs. The time information is provided by a base station and received by the radio frequency processing unit of the mobile communication device.

15

The IC chip allows for implementing the token for generating time-synchronised type OTPs in a mobile communication device. An external time signal provides the time information for generating the OTPs, such that a special clock for this purpose can be dispensed with. However, the time information is available only if the mobile communication device is connected to the base station. This means that the generation of OTPs is not possible, if the mobile communication device cannot be connected to the base station.

20  
25

### Summary of the Invention

Therefore, it is an object of the present invention to allow for generating time-synchronised type OTPs in a device having access to an external time signal, when the device cannot receive the external time signal.

30

The object is achieved by a method comprising the features of claim 1 and by a device comprising the features of claim 12. Embodiments of the method and the device are given in the dependent claims.

5

According to a first aspect of the invention, a method of the type described before is proposed, which comprises the following steps:

- checking, whether the security device has access to an external time signal;
  - requesting a user of the security device to enter the time information, if it is determined that the security device has no access to the external time signal; and
  - generating a time-dependent password using the time information entered in response to the request.
- 10

15 According to a second aspect, the invention proposes a device for generating a time-dependent password using time information. The device comprises:

- a checking means for checking, whether an external time signal is accessible;
  - a requesting means for requesting a user to enter the time information, if the checking means determines that the external time signal is not accessible, and
  - a calculation means for generating a time-dependent password using the time information entered in response to the request.
- 20

25 The invention has the advantage that a time-dependent password can be generated in the absence of the external time signal. This is achieved by allowing the user of the security device to specify the time information needed for generating a time-dependent password, if no external time signal is received in the mobile communication device.

30

By allowing the user to input the time information, the invention contradicts the usual opinion that the mechanism for generating the time information needed

for calculating time-dependent passwords is a sensitive component of the password generation, which has to be secured against access by the user. Particularly, it has been discovered that the possibility to generate a time-dependent password based on the time information provided by the user is very  
5 useful to bridge a temporarily absence of an external time signal.

However, if the external time signal can be received in the security device, the time signal can be used for generating the time-dependent password. This has the advantage that the risk of fraudulent misuse is reduced.  
10

Therefore, in one embodiment of the method and the device, the time-dependent password is generated using the external time signal, if it is determined that the security device has access to the external time signal.

15 The time information used for generating the time-dependent password has to be synchronized with the time information used by the authorization station. However, the user may stay in a time zone different from the time zone in which the authorization station is located. If, in this case, the user entered his local time, the generated password would be invalid due to the time difference to the  
20 location of the authorization station.

Therefore, in one embodiment of the method and the device, the user is requested to specify a time zone to which the entered time information refers, the time information entered by the user is converted to the time zone of an authorization station for validating the password and the time-dependent password is  
25 generated using the converted time information.

In a further embodiment of the method and the device, the user is requested to enter an authentication code and the entered time information is only used for  
30 generating a time-dependent password, if the authentication code has been validated successfully.

This prevents an unauthorized third party that does not dispose of the authentication code from generating a password and making fraudulent use of it. Particularly, an unauthorized third party is prevented from generating and using a password that is valid in a future point in time.

5

Furthermore, one embodiment of the method and the device comprises the steps of:

- storing the entered time information;
- determining that the security device has access to the external time signal;
- 10 - checking, whether the entered time information refers to a future point in time compared to the currently received external time signal; and
- initiating an alarm routine, if the entered time information refers to a future point in time compared to the currently received time signal.

- 15 This provides security against an attack based on the aforementioned generation of a password, which is valid in a future point in time.

In order to prevent an attacker from gaining unauthorized access using such a password, in one embodiment of the method and the device, the password  
20 generated using the entered time information is being marked as invalid in the authorization station in response to the initiation of the alarm routine.

In a further embodiment of the method and the device, the user is requested to enter a secret key allocated to the user and the time-dependent password is  
25 generated using the secret key entered by the user.

Moreover, in one embodiment of the method and the device, the generated time-dependent password is displayed at the security device and/or the time-dependent password is transmitted from the security device to the authorisation  
30 station via a data network to which the security device is connected.

In one embodiment of the method, a mobile communication device comprises the security device.

5 Using a mobile communication device comprising security device for the generating the time-dependent password increases the user convenience, since a user who usually carries a mobile communication device does not need an additional device for generating the time-dependent password.

10 In one embodiment of the method and the device, the external time signal may be provided by the communication network to which the security device can be connected. Therefore, in this embodiment checking, whether the security device has access to the external time signal, comprises checking, whether the security device is connected to a communication network providing the external time signal.

15 Providing the external time signal in the communication network has the advantage that no additional equipment is needed to access the time signal, if a mobile communication device comprises the security device, since the mobile communication device usually has all components for connecting to a communication network.

20

In one embodiment of the invention, the device is a smartcard, which can be connected to a mobile communication device.

25 It is an advantage of this embodiment that the device can be provided to the user easily in the form of smartcard, which is connectable to his mobile communication device. The usage of a mobile communication device for generating the time-dependent password is especially convenient for the user due to the reasons described before. One further advantage of this embodiment is that the security mechanism of the smartcard prevents fraudulent use of the device.

30

In mobile communication, smartcards are used for identifying and authenticating a user to a mobile communication network. Advantageously, such smartcards can also host the device according to the invention. Therefore, in one embodiment of the invention, the smartcard comprises a subscriber identification module for identifying and/or authenticating a user to a mobile communication network.

Furthermore, the invention provides a computer program comprising software code portions for performing a method of the type described before, when the computer program is run on a processor.

Moreover, the invention proposes a mobile communication device comprising a device of the type before.

These and other aspects of the invention will be apparent from and elucidated with reference to the embodiments described hereinafter making reference to the accompanying drawings.

### Brief Description of the Drawings

20

In the drawings

Fig. 1 is a schematic block diagram showing a mobile communication device for generating time-synchronised type OTPs, and

25

Fig. 2 is a schematic flow chart illustrating a method for providing time information for generating the time-synchronised type OTPs.

### Detailed Description of Embodiments of the Invention

30

Figure 1 shows a mobile communication device 101, which can be connected to a mobile communication network (PLMN – Public Land Mobile Network) 102,

which may be configured according to the GSM or UMTS standard, for example (GSM: Global System for Mobile communications; UMTS: Universal Mobile Telecommunications System). For connecting the mobile communication device 101 to the PLMN 102, the mobile communication device 101 comprises a radio interface 103. The radio interface 103 is coupled to a main processor 104 for controlling the operation of the mobile communication device 101. For interacting with the mobile user, the mobile communication device 101 comprises an input component 105 and a display component 106 both coupled to the main processor 104. Applications run by the main processor 104 and reference data are stored in a memory component 107 to which the main processor 104 has access.

The mobile communication device 101 interacts with a smartcard 108, which is inserted into a card reader unit 114 of the mobile communication device 101. The smartcard 108 includes a microprocessor 109 and a memory 110 and comprises a subscriber identification module allocated to the user of the mobile communication device 101. Particularly, the subscriber identification module includes information for identifying and authenticating the mobile user to the PLMN 102 and provides functionality for accessing services of the PLMN 102. The subscriber identification module may be configured in accordance with the type of the PLMN 102. If the PLMN 102 is a GSM or UMTS network, the subscriber identification module is a subscriber identity module (SIM) according to the GSM standard or a universal subscriber identity module (USIM) according to the UMTS standard.

The mobile user has the authorisation to access a restricted resource. In one embodiment, the resource may be a web application or a web service hosted by a network server 113, which is connected to a data network 112. Access to the resource is controlled by an authorisation station 111, which denies access to the resource unless the user is identified and authenticated successfully. The network server 113 may comprise the authorisation station 111, or the authorisation station 111 may reside in another network server. In the embodiment

depicted in figure 2, the network server 112 is connected to the data network 112 via the authorisation station 111. However, other network architectures are possible.

- 5 The authorisation station 111 performs the user authorisation using time-synchronised OTPs. This ensures a relatively high level of security of the access control. Thus, the web application may be a payment application, for example, that has to be secured efficiently against unauthorised access by third parties.

10

For generating time-synchronised OTPs, the mobile communication device 101 comprises an OTP application. The OTP application may be resident in the mobile terminal and run on the main processor 104 of the mobile communication device 101. In a different embodiment, the OTP application is resident in the smartcard 108 including the subscriber identification module. In this embodiment, the OTP application is stored in the memory 110 and run on the microprocessor 109 of the smartcard 108. This has the advantage that the OTP application is secured against unauthorised access by means of the security mechanism of the smartcard 108. In further embodiments, an OTP chip including the OTP application may be removably connected to the mobile terminal.

15

20

The mobile communication device 101 may be connected to the data network 112 via an access technology, such as, for example, a WLAN connection. In figure 1, this is schematically illustrated by means of the arrow 115. In this architecture, the mobile user may access the network server 113 using the mobile communication device 101 and OTPs generated in the mobile communication device 101 may be transmitted electronically from the mobile communication device 101 to the authorisation station 111. Furthermore, the PLMN 102 may be coupled to the data network 112, such that the mobile communication device 101 can be connected to the data network via the PLMN 102, if it is registered in the PLMN 102.

25

30

In another embodiment, the mobile user accesses the network server 113 using a further device connected to the data network 112, such as, for example, a personal computer. In this case, the OTP application outputs generated passwords at the mobile communication device 101. The user reads that generated  
5 password at the display component 106 of the mobile communication device 101 and enters the password at the device used for accessing the network server 113.

The OTP application provides a graphical user interface at the display component 106 of the mobile communication device 101 for depicting outputs to the  
10 user and for presenting input requests to the user. Moreover, the OTP application is configured to receive user inputs from the input component 105 of the mobile communication device 101. If the OTP application resides in the smart-card 108, the OTP application may access the functionalities of the mobile  
15 communication device 101 using SIM Toolkit commands, which, in general, are known to a person skilled in the art.

For generating time-synchronised OTPs, an algorithm is implemented in the OTP application, which is used to calculate OTPs based on time information  
20 and a secret key allocated to the user. The secret key may be a personal identification number (PIN), for example. The secret key may be entered by the user, when the OTP application is started or when the user requested the generation of a password. Likewise, it is possible that the secret key is stored securely in the mobile communication device 101, particularly in the smartcard 108. In this  
25 embodiment, the generation of a password may be possible only after an authorisation code entered by the user has been validated successfully by the OTP application. The authorisation code may be another PIN and differs from the secret key allocated to the user in that the secret key is used to calculate the passwords, while the authorisation code is used to unlock the password  
30 generation. Securing the OTP application with an authorisation code for unlocking the password generation has the advantage that an attacker has to use the mobile communication device 101 for generating passwords of the user, since

the secret key is secured against access within the mobile communication device 101.

For validating the password generated by the OTP application, the authorisation station 111 re-computes the passwords using the user's secret key, which is also stored in the authorisation station 111, and its own time information. The time information used by the OTP application and the time information present in the authorisation station 111 have to be synchronised accurately enough. Usually, the authorisation station 111 allows for generating passwords computed using a time information with a predetermined deviation from the time information present and authorisation station 111. For this purpose, the authorisation station 111 determines that the password is valid, if it is calculated using a time from a predetermined time interval around the current time of the authorisation station 111. The time interval may be between 1 and 15 minutes, preferably between 2 and 4 minutes.

The OTP application retrieves the time information needed for generating the time-synchronised OTPs from the PLMN 102. For this purpose, the PLMN 102 includes a supplementary service providing a time signal. The service may be accessed using so-called USSD commands (USSD: Unstructured Supplementary Service Data), which are, in general, known to a person skilled in the art in general. However, retrieving the time information from the PLMN 102 requires that the mobile communication device 101 was connected to the PLMN 102. This is not always true, since it may happen that the mobile communication device 101 is out of coverage of the PLMN 102, for example. Therefore, the OTP application requests the user to enter time information into the mobile communication device 101, in case no time information can be received from the PLMN 102.

In one embodiment, a method schematically depicted in figure 2 is implemented in the OTP application for this purpose: After the user has entered his secret key or his authorisation code in step 201, the OTP application sends a com-

mand to retrieve time information from the PLMN 102 in step 202. The command is passed to the radio interface 103 of the mobile communication device 101, which transmits the command to the PLMN 102, if the mobile communication device 101 is connected to the PLMN 102. After having passed the command to the radio interface 103 the OTP application checks, whether the command is responded within a predetermined time interval in step 203. This means that the OTP application checks, whether the time signal is received during the time interval. If the time signal is received in time, the OTP application computes a password based on the received time information and the secret key of the user in step 204.

If the OTP application determines in step 203 that no time information has been received from the PLMN 102 in the predetermined time interval, the OTP application checks, whether the mobile communication device 101 is connected to the PLMN 102 in step 205. This may be done by checking, whether the mobile communication device receives a predetermined data signal broadcasted in the PLMN 102, such as, for example, a signal identifying the PLMN 102. If it is determined in step 205 that the mobile communication device 101 is registered in the PLMN 102, the OTP application preferably goes back to step 202 and re-sends the command to retrieve the time information. However, if it is determined in step 205 that the mobile communication device 101 is not connected to the PLMN 102, the OTP application requests the user to enter time information at the mobile communication device 101. After having received the user input, the OTP application calculates a password using the time information specified by the user in step 204.

For requesting the user to input the time information, the user interface of the OTP application presented at the display component 106 of the mobile communication device may provide an input field, which may be filled in by the user using the input component 105 of the mobile communication device 101. The user may receive the time information from any available source. For example, this may be his wristwatch or a public watch in the vicinity of his position.

In order for the calculated password to be valid, the password has to be calculated using the time information present in the authorisation station 111. Particularly, this means that the time information used for the calculation should refer to the same time zone as the time information of the authorisation station 111. Therefore, in one embodiment, the user is requested to input a time information referring to the time zone of authorisation station 111 in step 206. This requires knowledge about the time zone of the authorisation station 111 and about the time shift between this time zone and the current time zone of the user.

10

In another embodiment, the user is requested to input his local time and to specify his current time zone. For the specification of the time zone, a list of the existing time zones may be presented to the user, such that the user can specify his time zone by choosing it from the list. Using the time information entered by the user and the information about the time zone the time information refers to, the OTP application calculates the local time of the authorisation station 111 and uses this calculated time to generate the password in step 204.

In order to prevent that an attacker uses the mobile communication device 101 to generate a password that will be valid in the future by inputting time information relating to a future point in time, the input of the time information by the user may be secured by an authorisation code. This means that the OTP application requests the user to enter the authorisation code besides the time information. The authorisation code is also stored securely in the mobile communication device 101, particularly in the smartcard 108. In this embodiment, the OTP application validates the authorisation code before generating a password using the time information given by the user.

Furthermore, in one embodiment, the OTP application stores at least the time information, when it calculates and outputs a password based on time information specified by the user. Particularly, the time information may be stored securely in the smartcard 108. After having stored the time information, the OTP

application monitors, whether the mobile communication device 101 connects to the PLMN 102 again. This may be done by sending commands to retrieve time information from the PLMN 102 or by checking in regular time intervals, whether a predetermined data signal broadcasted in the PLMN 102 is received in the mobile communication device 101. Again, this data signal may be a signal identifying the PLMN 102 that is broadcasted in the PLMN in regular time intervals.

If the OTP application determines that the mobile communication device 101 is connected to the PLMN 102 again, the OTP application checks, whether the time information used for calculating the password refers to a future point in time. If this is true, an alarm routine is started, since in this case an attacker might have generated the password for fraudulent use in the future. For the aforementioned check, the OTP application compares time information currently retrieved from the PLMN 102 and the stored time information. If it is determined that the stored time information referred to the future compared to the currently received time information, the OTP application starts the alarm routine.

The alarm routine may comprise informing the user that a password has been generated for a future point in time. If the user judges that the password might have been generated for fraudulent use, he may inform the authorization station 111. In another embodiment, the OTP application may inform the authorization station 111 automatically. For this purpose, the OTP application may generate a corresponding message specifying the time information in question, and the OTP application may control the mobile communication device 101 to transmit the message to the authorisation station 111. The message may be transmitted to the authorisation station 111 via the PLMN 102 or via another data connection between the mobile communication device 101 and the authorisation station 111.

After having been informed about the possible misuse, steps can be taken in the authorisation station 111 to prevent an unauthorised access to the network server 113 using the password in question. This may be done by blocking ac-

cess to the network server 113 with this password. Particularly, the password generated for the future point in time may be marked as invalid, such that this password cannot be used as an authorisation for accessing the network server 113.

5

While the invention has been illustrated and described in detail in the drawings and foregoing description, such illustration and description are to be considered illustrative or exemplary and not restrictive; the invention is not limited to the disclosed embodiments. Particularly, the invention is not limited to a download  
10 of an application or program code to smartcard 106. A person skilled in the art recognises that other data can be downloaded to the smartcard 106 in the same way as it has been described before in connection with the download of a program code of an application. Other variations to the disclosed embodiments can be understood and effected by those skilled in the art in practicing the claimed  
15 invention, from a study of the drawings, the disclosure, and the appended claims.

In the claims, the word "comprising" does not exclude other elements or steps, and the indefinite article "a" or "an" does not exclude a plurality. A single processor or other unit may fulfill the functions of several items recited in the claims.  
20 A computer program may be stored/distributed on a suitable medium, such as an optical storage medium or a solid-state medium supplied together with or as part of other hardware, but may also be distributed in other forms, such as via the Internet or other wired or wireless telecommunication systems. Any reference  
25 signs in the claims should not be construed as limiting the scope.

### Claims

1. A method for generating a time-dependent password in a security device (101; 108) using time information, the method comprising the steps of:
  - checking, whether the security device has access to an external time signal;
  - requesting a user of the security device to enter the time information, if it is determined that the security device has no access to the external time signal; and
  - generating a time-dependent password using the time information entered in response to the request.
2. The method according to claim 1, wherein the time-dependent password is generated using the external time signal, if it is determined that the security device (101; 108) has access to the external time signal.
3. The method according to one of the preceding claims, wherein the user is requested to specify a time zone to which the entered time information refers, wherein the time information entered by the user is converted to the time zone of an authorization station (111) for validating the password and wherein the time-dependent password is generated using the converted time information.
4. The method according to one of the preceding claims, wherein the user is requested to enter an authentication code and wherein the entered time information is only used for generating a time-dependent password, if the authentication code has been validated successfully.
5. The method according to one of the preceding claims, further comprising the steps of:
  - storing the entered time information;
  - determining that the security device (101; 108) has access to the external time signal;

- checking, whether the entered time information refers to a future point in time compared to the currently received external time signal; and
  - initiating an alarm routine, if the entered time information refers to a future point in time compared to the currently received time signal.
6. The method according to claim 5, wherein the password generated using the entered time information is marked as invalid in the authorization station (111) in response to the initiation of the alarm routine.
  7. The method according to one of the preceding claims, wherein the user is requested to enter a secret key allocated to the user and wherein the time-dependent password is generated using the secret key entered by the user.
  8. The method according to one of the preceding claims, wherein the generated time-dependent password is displayed at the security device (101; 108) and/or wherein the time-dependent password is transmitted from the security device (101; 108) to the authorisation station (111) via a data network to which the security device (101; 108) is connected.
  9. The method according to one of the preceding claims, wherein a mobile communication device (101) comprises the security device (101; 108).
  10. The method according to one of the preceding claims, wherein checking whether the security device (101; 108) has access to the external time signal comprises checking whether the security device (101; 108) is connected to a communication network (102) providing the external time signal.
  11. A computer program comprising software code portions for performing a method according to one of the preceding claims, when the computer program is run on a processor (104; 109).

12. A device (101; 108) for generating a time dependent password using time information comprising:
- a checking means for checking, whether an external time signal is accessible;
  - a requesting means for requesting a user to enter the time information, if the checking means determines that the external time signal is not accessible, and
  - a calculation means for generating a time-dependent password using the time information entered in response to the request.
13. A device (101; 108) according claim 12, wherein the device is a smartcard (108), which can be connected to a mobile communication device (101).
14. A device according to claim 13, wherein the smartcard (108) comprises a subscriber identification module for identifying and/or authenticating a user to a mobile communication network (102).
15. A mobile communication (101) device comprising a device (101; 108) according to one of the claims 12 to 14.

(57) **ABSTRACT**

A dynamic password authentication system and the method thereof are disclosed. According to one aspect of the present invention, a dynamic password telecommunication card embedded with a security algorithm in the SIM card of a mobile telephone is used to generate a momentarily changed password. The technique as disclosed improves the security of identity authentication effectively and avoids the trouble for the user to remember the password and change the password frequently. The technique is also suitable to a systems that requires a higher security of the identify authentication, such as the bank, the securities, the police and the electronic government affair and the like, thereby to improve the security for the system administrator and the user to login the system.

## DYNAMIC PASSWORD AUTHENTICATION SYSTEM AND METHOD THEREOF

### FIELD OF THE INVENTION

[0001] The present invention relates to the field of information security. In particular, the present invention relates to a dynamic password authentication system and the method thereof.

### DESCRIPTION OF THE RELATED ART

[0002] With the rapid development of the computer and Internet technologies, many domestic large enterprises and government offices are trying to use the Internet to establish a fast and efficient network channel between the public and themselves in order to provide various network services to people. Due to the characteristics of the information service system based on the Internet, network security becomes more and more important. For example, in network bank, network tax reporting and network enterprise annual inspecting. In these systems, there is a large amount of information required to be kept secret. Thus, persons who access to these systems should be subject to strict identity authentication.

[0003] It is commonly understood that the identity authentication technology should be adopted in network information service systems. In addition, various technologies (for example, IC card technology and biology identify technology, fingerprint authentication) were applied in some systems to improve the reliability of the identity authentication. However, because of the restriction of some realistic conditions such as costs and technology maturity, currently a majority of systems still use the simple method based on user name+static password to perform the identity authentication.

[0004] Because the authentication mode based on the static password has the shortcomings of "unchangeable" and "easy to be decrypted", the method using the static password as a unique valid identity identification of a user in the network information service system can not meet the requirement on security. In addition, counterfeit user login is becoming increasingly problematic. Exemplary attacks to an authentication system based on the static password include network data stream sniffer, authentication information record/replay, dictionary attack, brute force, prying, social engineering and dumpster diving.

[0005] In recently years, a dynamic password technology has been proposed to remove the vulnerabilities in the static password. A continuously changing password is used to verify the identity of a user. The dynamic password token is kept with the user, and it is difficult for others to obtain dynamic password information in the token. In addition, the dynamic password is unpredictable, safe and convenient in use, and has a determined power and responsibility. Therefore, the technology can resolve the problem of identity authentication and authorization for remote and single time access required in network information service system.

[0006] However, the password token and backstage management system in this kind of dynamic password system is expensive and the system has a fixed renewal period. Further, dynamic password token used by the user has a single function, and the distribution, maintenance, replacement and

recovery of the token incurs an increase in expense and management cost to the user of the dynamic password system. For the above reasons, it is difficult for this kind of dynamic password system to be widely used in large numbers of general users.

### SUMMARY OF THE INVENTION

[0007] This section is for the purpose of summarizing some aspects of the present invention and to briefly introduce some preferred embodiments. Simplifications or omissions in this section as well as the title and the abstract of this disclosure may be made to avoid obscuring the purpose of the section, the title and the abstract. Such simplifications or omissions are not intended to limit the scope of the present invention.

[0008] One aspect of the present invention is to provide a dynamic password authentication system and method thereof for using a mobile telephone, in which the user uses a dynamic password telecommunication card embedded with a security algorithm in the mobile telephone to generate a momentarily changed, unpredictable and one-off password.

[0009] Another aspect of the present invention is to provide a mechanism for transmitting a dynamic password function of a mobile telephone and a security authentication server by means of a mobile communication network. Thus, a shared secret between the mobile telephone and the security authentication server can be built in an OTA (Over-the-Air) mode, which can not be achieved by the conventional dynamic password token scheme.

[0010] A still another aspect of the present invention is to provide a dynamic password authentication system which can provide a dynamic password authentication in security.

[0011] Other objects, features, and advantages of the present invention will become apparent upon examining the following detailed description of an embodiment thereof, taken in conjunction with the attached drawings.

[0012] According to one embodiment, the present invention is a dynamic password authentication method, the method comprises: performing in a mobile terminal an encrypting operation using a dynamic password algorithm generating key and an initialization parameter stored in a telecommunication card to obtain an encryption result; sending the encryption result and a user identity identification code to a security authentication server; the security authentication server seeking out the dynamic password generating algorithm key in a database based on the user identity identification code and performing a decrypting operation to the encryption result to obtain a decrypted parameter, comparing the initialization parameter with the decrypted parameter, the mobile terminal passing the authentication if the initialization parameter is consistent with the decrypted parameter, and the authentication being denied if not.

[0013] The initialization parameter is time information of the mobile terminal. If the time information is used as the initialization parameter, a communication delay and a clock error value are added into the decrypted parameter.

[0014] The initialization parameter is counting information of the mobile terminal. In one embodiment, if the

counting information is used as the initialization parameter, an error value caused by the previous denying of the authentication is added.

[0015] The dynamic password generating algorithm key, a user menu or applications which are stored in the mobile terminal and the security authentication server are updated or changed in an Over-the-Air (OTA) mode.

[0016] The OTA mode comprises a service provider updating new services used with a dynamic password in a database of a download server, the mobile terminal implementing a momentary query to a dynamic menu download server by a mobile telephone short message, and sending a dynamic menu downloading request to the download server if new services used with the dynamic password are found, the request of the user being upload by network to the short message service center and transmitted to the download server by a gateway, the download server packaging the dynamic menu requested by the user into a short message with a specified format, and downloading the dynamic password menu required by the user into the dynamic password telecommunication card of the user through a network link in a data short message mode.

[0017] The telecommunication card may be a SIM card or a UIM card. A dynamic password authentication system comprises an authentication server, and a mobile terminal connected to the authentication server via wireless communication, the mobile terminal is provided with a dynamic password telecommunication card to generate a dynamic password, the authentication server is stored therein with a dynamic password key corresponding to the dynamic password telecommunication card of the mobile terminal to verify the dynamic password submitted by the mobile terminal.

[0018] The system further comprises a short message service center wirelessly connected to the mobile terminal, and the short message service center provides update service for the user of the mobile terminal or the authentication server.

[0019] A dynamic password is submitted to perform the identity authentication when a user of the present invention login the network information service system. Thus, problems concerning the user identity authentication in the remote/network environment are effectively resolved. In addition, the present invention can provide a convenient, wieldy, reliable and cost effective information security product for users.

[0020] The password download mode according to the present invention can realize a safety and frequent changing of the shared secret information between the mobile telephone and the security authentication server. It also can perform the updating and amending of the user menu and applications in the dynamic password telecommunication card to provide a convenient, rapid and low-cost download service for shared secret information of the users.

#### BRIEF DESCRIPTION OF THE DRAWINGS

[0021] The invention will be readily understood by the following detailed description in conjunction with the accompanying drawings, wherein like reference numerals designate like structural elements, and in which:

[0022] FIG. 1 is a schematic view showing a dynamic password authentication system based on a mobile telephone according to the present invention;

[0023] FIG. 2 is a schematic view showing a specific structure of a dynamic password telecommunication card used with the present invention;

[0024] FIG. 3 is a flow chart of the short message service center providing services in an OTA mode according to the present invention;

[0025] FIG. 4 is a schematic view showing a structure of a security server according to the present invention;

[0026] FIG. 5 is a schematic diagram showing a dynamic password authentication system based on a mobile telephone according to the present invention;

[0027] FIG. 6 is a flowchart of the mobile telephone generating a dynamic password according to the present invention;

[0028] FIG. 7 is a flowchart of the dynamic password authentication system authenticating a dynamic password according to the present invention; and

[0029] FIG. 8 is a flowchart of a password distribution of the dynamic password telecommunication card according to the present invention.

#### DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS

[0030] The detailed description of the invention is presented largely in terms of procedures, steps, logic blocks, processing, and other symbolic representations that directly or indirectly resemble the operations of data processing devices coupled to networks. These process descriptions and representations are typically used by those skilled in the art to most effectively convey the substance of their work to others skilled in the art. Numerous specific details are set forth in order to provide a thorough understanding of the present invention. However, it will become obvious to those skilled in the art that the present invention may be practiced without these specific details. In other instances, well known methods, procedures, components, and circuitry have not been described in detail to avoid unnecessarily obscuring aspects of the present invention.

[0031] Reference herein to "one embodiment" or "an embodiment" means that a particular feature, structure, or characteristic described in connection with the embodiment can be included in at least one embodiment of the invention. The appearances of the phrase "in one embodiment" in various places in the specification are not necessarily all referring to the same embodiment, nor are separate or alternative embodiments mutually exclusive of other embodiments. Further, the order of blocks or steps in process flowcharts or diagrams representing one or more embodiments of the invention do not inherently indicate any particular order nor imply any limitations in the invention.

[0032] I. Description of the Structure of the Dynamic Password Authentication System Based on the Mobile Telephone

[0033] FIG. 1 is a schematic view showing a dynamic password authentication system based on a mobile telephone according to the present invention. As shown in FIG. 1, the

dynamic password authentication system mainly comprises a mobile phone, a dynamic password telecommunication card, a short message service center and a security authentication server.

**[0034]** 1. The Mobile Phone

**[0035]** At present, most of the mobile phones sold in the market can support the STK Class 2. A user with a mobile phone supporting the STK Class 2 can have services of the dynamic password authentication system based on the mobile telephone without special settings.

**[0036]** 2. Dynamic Password Telecommunication Card

**[0037]** Depending on implementation, the mobile phone uses a type of memory card (e.g., SIM card and UIM card) which is loaded with a module implementing a dynamic password security algorithm and can support a STK function (hereinafter referred as a "dynamic password telecommunication card"). The following description is taking the SIM card as an example. SIM (Subscriber Identity Model) card is also called a smart card or a user identity identification card, which is necessary for a GSM digital mobile phone to be used. The dynamic password telecommunication card according to the present invention is loaded with a module implementing a dynamic password security algorithm based on functions provided by the SIM card, and at the same time is stored therein with a user dynamic password key. In one instance, a calculating function of a microprocessor chip in the SIM card is configured to generate a one-off "dynamic password" with the time as a parameter, that is, according to the local time. In the other instance, a counter is used as a parameter to continuously and sequentially generate a one-off "dynamic password" which can not be predicted and tracked. Thus, the user password can not be stolen. In addition, the problem of frequently changing in the conventional password can also be resolved.

**[0038]** FIG. 2 is a schematic view showing an exemplary structure of a dynamic password telecommunication card used in some embodiments of the present invention. The dynamic password telecommunication card according to one embodiment comprises a microcircuit chip, in which not only is information concerning the user of the digital mobile phone stored, but also a dynamic password security algorithm and dynamic password key are loaded into its operating system. The microcircuit chip can perform an authenticating of a conventional GSM network to a subscriber identity and guarantee a normal communication of the subscriber strictly in conformity with the GSM international standard and criteria. At the same time, when the user calls a dynamic password function through the menu in the mobile telephone, if the PIN password verification is passed, the dynamic password telecommunication card uses the dynamic password key in the card to call a dynamic password security algorithm loaded in the operating system to calculate a dynamic password taking the time information in the mobile phone or accumulated counter information in the card as a parameter, then accomplishes the dynamic password operating process in the card.

**[0039]** Since the SIM card is used in the GSM system, the card can be separated from the mobile phone. One card can uniquely identify one subscriber. Therefore, at the time of loading a user dynamic password key, the dynamic password telecommunication card can use the unique identifier of the

SIM card to calculate the dynamic password key of each user with a root key, by which an effect of "one card with one password" can be achieved. Because the dynamic password telecommunication card of the user can be used in any one of GSM mobile telephones and different mobile telephones generate different dynamic passwords, the dynamic password authentication based on mobile phone is surely convenient and safety.

**[0040]** 3. Short Message Service Center

**[0041]** A short message service center provides services in an OTA mode to users of the dynamic password identity authentication system based on the mobile telephone. OTA technology (Over-the-Air technology) can have a remote management to the data and applications of the SIM card through the air interface of mobile communication (GSM or CDMA). It is the best scheme for the value-added service updating of the current 2G mobile communication network. STK (SIM card application tool kit) is a developing tool proposed in GSM11.14. The STK applies a mechanism based on a short message, which realizes a shift of a part of data service from a PC to a mobile phone and meets the requirement of the user of obtaining information in a moving state. At present, all the value added services provided by the China Mobile Communication Corporation are developed based on the STK. The "Monternet Program", which serves as a carrier of mobile internet services, can provide timely, abundant, manifold and individuated information services. In addition, because the operation of the STK services is simple and convenient, a great development has been taken. Current dynamic STK service over-the-air technology adopts advanced OTA (air interface mode) technology, by which applications in the SIM card are managed to realize a real individuated service.

**[0042]** OTA has the following technical advantages. The dynamic STK menu download technology takes a data short message as a carrier of information downloading. The data short message is a special short message which is not shown in a mobile telephone screen and is directly transmitted to the SIM card as data. The data is directly stored and processed by the SIM card after it is received by the card, and the transmitting and receiving of this kind of short message are only supported by the STK card.

**[0043]** No additional special devices are needed to be provided at mobile communication network end for using the over-the-air technology of the dynamic STK service. That is, it does not need a reconstruction of existing networks, a frequent card replacement of the users and a large investment of value added service providers, which provides a "both-win" mode for the users, operators and value added service providers.

**[0044]** The over-the-air technology of the dynamic STK service based on the short message can make the users download whatever they want according to their preference at any time, in any space, and it really realizes the concept of individuated service. The technology resolves the conflict between a limited card capacity and unlimited needs for value added services, and breaks through the restriction of time and space.

**[0045]** The "over-the-air technology of the dynamic STK service" can be applied in many circumstances using mobile electronic business, including domestic and foreign enter-

prises, banks, securities, information centers, hotels and supermarkets. The service provider can change or add contents and coding of the menu as the case may be for the choices of the users. The users can also download or update application menu timely according to their needs.

[0046] The "over-the-air technology of the dynamic STK service" can also be used to browse a dynamic menu download server of the service provider. The service provider can provide a multilevel menu on the server for the user to download, and at last one of the services can be selected by the user. The user can also select and change different service providers according to a server list provided by the mobile communication operator.

[0047] According to the present invention, an OTA mode is used to transmit data in the network by wireless communication technology. Only with clicks of the user's finger, a mobile user can transmit a dynamic password menu updating requirement towards the air menu download server by a mobile telephone. Then the server will update and amend user menu and applications in the dynamic password card in a wireless mode, by which a convenient, fast and cost effective menu download service is provided to the user.

[0048] Generally, if the user buys a dynamic password telecommunication card, all applications including the dynamic password applications are fixed. If the service provider wants to change applications in the card or provide update service to the system, in one possible way, the user should go to a designated business hall with the dynamic password telecommunication card to handle this matter. However, it is difficult for the telecommunication operator to uniformly change applications in the user card because all the cards are required to be recalled for such changing. If the OTA mode is used, the changing becomes easy. The user can apply to the telecommunication company for the contents which needs to be changed everywhere at any time. The telecommunication company can immediately send new applications to the user card after it receives the application. The telecommunication company can also change applications of all or a part of the users once by a batch sending mode.

[0049] FIG. 3 is a flowchart of the short message service center providing services in an OTA mode according to one embodiment of the present invention. As shown in FIG. 3, the operating flow of the short message service center providing services in an OTA mode is as follows:

[0050] First step: a service provider develops new services used with dynamic password application and updates timely the database of the dynamic download server.

[0051] Second step: a mobile user using the over-the-air technology of the dynamic STK service can implement a momentary query in the dynamic menu download server by a mobile telephone short message, and send timely a dynamic menu downloading request to the download server if a new service used with the dynamic password application is found, the request of the user is upload by GSM network to the SMS center (short message service center) and transmitted to the download server by a gateway;

[0052] Third step: the download server packages the dynamic menu requested by the user into a short message with a specified format, and downloads the dynamic password menu required by the user into the dynamic password

telecommunication card of the user through the primary network link in a data short message mode, which completes downloading process of the dynamic password menu and applications.

#### [0053] 4. Security Authentication Server

[0054] The security authentication server is the most important part of the whole system and is connected to an application system server via a local area network. It controls access to the network of all the remote users, provides all-round authentication, authorization and audit services. The security authentication server has a perfect data security self protection function in which all user data is encrypted and stored in the database, and also has safety and complete database management and backup functions. The security authentication server has a powerful graphics management interface and can provide all system management functions such as user management, operator management and audit management. The security authentication server comprises the following six parts: a system operation module, a user management module, a system communication module, a system management module, a dynamic password test module and a database.

[0055] FIG. 4 is a schematic view showing a structure of a security server according to one embodiment of the present invention. As shown in FIG. 4, the security server comprises the following parts:

#### System Operation Module

[0056] The system operation module uses the same dynamic password security algorithm as that in the dynamic password telecommunication card to realize verification function of the dynamic password and carefully records the operation journal. The system operation module can carry out the interconnection with the application interface.

#### User Management Module

[0057] The user management module has a powerful graphics management interface and can perform the delivery, delete, freezing and unfreezing of the dynamic password telecommunication card. The user management module can also carry out a query on basic information of a user of the dynamic password telecommunication card.

#### System Communication Module

[0058] The system communication module is connected with the system initialization module and processes the related data communications.

#### System Management Module

[0059] The system management module performs functions of managing each module of the system and implementing a query of the authentication journal. The system management module has a simple graphics interface to realize an all-around system management function.

#### Dynamic Password Telecommunication Card Test Module

[0060] The dynamic password test module is used to test in this mobile telephone whether the dynamic password telecommunication card operates properly.

#### Database

[0061] The database stores system information such as user information, card information, administrator informa-

tion, system settings, operating journal, in which important information (for example, user dynamic password key) is stored in an encryption mode.

**[0062]** II. Description of Operation Principle of the Dynamic Password Authentication System Based on the Mobile Telephone

**[0063]** The dynamic password telecommunication card according to the present invention is stored therein with a dynamic password security algorithm key and a dynamic password telecommunication card ID number. The dynamic password security algorithm is the 3DES algorithm which is a popular symmetrical key algorithm used worldwide. The user can have a normal mobile communication when the dynamic telecommunication card is inserted into the card slot of the mobile telephone. When the user wants to login the network information service system, a dynamic password function written in the STK menu of the card or an OTA mode can be used to download the menu into the mobile phone, after which the dynamic password function in the menu is called. At this time, the mobile telephone will prompt the user to input PIN password. If the input password is correct, the dynamic password telecommunication card will generate a dynamic password and display it in the screen of the mobile telephone.

**[0064]** FIG. 5 is a schematic diagram showing a dynamic password authentication system based on a mobile telephone according to the present invention.

**[0065]** The dynamic password telecommunication card provides the dynamic password in a time synchronism operation mode of a counter synchronism operation mode.

**[0066]** Time Synchronism Operation Mode

**[0067]** The dynamic password telecommunication card obtains time information from the mobile phone and uses a security algorithm key preset in the card to perform an encryption operation taking the time information as a parameter. Then an encryption result of an 8 or 16 bit character string is produced and displayed on the LCD of the mobile telephone.

**[0068]** All the information inputted by the user, including the user identity identification code and the dynamic password information, are sent to the security authentication server. The security authentication server picks up the security algorithm key of the user and the initialization time parameter of the card from the user database according to the user identity identification code, and then decrypts the received dynamic password using the security algorithm key. The decrypted time parameter is compared with the system time and a judging result of accept or deny is given considering the communication delay and the clock error.

Counter Synchronism Operation Mode

**[0069]** An 8 bit accumulator counter is made in the dynamic password telecommunication card. Taking the value of the counter as a parameter, the dynamic password telecommunication card uses a security algorithm key preset in the card to perform an encryption operation. Then an encryption result of an 8 bit character string is produced and displayed on the LCD of the mobile telephone. The counter will automatically plus one for each computation of the dynamic password.

**[0070]** All the information inputted by the user, including the user identity identification code and the dynamic password information, are sent to the security authentication server. The security authentication server picks up the security algorithm key of the user and the parameter of the previous login times from the user database according to the user identity identification code, and then decrypts the received dynamic password using the security algorithm key. The decrypted counter value is compared with the parameter of the previous login times, and a judging result of accept or deny is given considering the error caused by the denying of login.

**[0071]** III. Description of Operation Flow of the Dynamic Password Authentication System Based on the Mobile Telephone

**[0072]** A dynamic password telecommunication card is delivered to every user who wants to login the network information service system. The user can insert the dynamic password telecommunication card into the card slot of the mobile telephone to replace the telecommunication card, then a normal mobile communication can be carried out. Each time when the user login the network system via a computer to have the service, the menu can be downloaded into the mobile telephone through the STK or UTK menu written in the card or in the OTA mode, and then the dynamic password function in the menu is called. At this time, the mobile telephone prompts the user to input the PIN password of the mobile telephone. After the PIN password is verified, a dynamic password generated by the dynamic password telecommunication card is displayed on the display of the mobile telephone. The user only needs to take an 8 or 16 bit number displayed in the mobile telephone as a password of the current login and at the same time input the identity identification code of the user in the network information service system into the system through a computer keyboard, then the user can login the system.

**[0073]** FIG. 6 is a flowchart of the mobile telephone generating a dynamic password according to one embodiment of the present invention. FIG. 7 is a flowchart of the dynamic password authentication system authenticating a dynamic password according to the present invention. As shown in the figures, the process of the flowcharts is proceeded as follows:

**[0074]** A user prepares to login the system. The user takes out the mobile telephone and calls the dynamic password service item in the menu. The mobile telephone prompts the user to input the PIN password and verifies the password. After the PIN password is verified, a string of dynamic password is displayed on the LCD of the mobile telephone. The user inputs information such as the dynamic password and the identity identification code in the system through a computer keyboard at subscriber end.

**[0075]** All information inputted by the user, including the identity identification code and the dynamic password, are transmitted to the security authentication server. The security authentication server calls the security algorithm key of the user and initialization time parameter of the card or information of the previous login times from the user database according to the user identity identification code. The security authentication server decrypts the dynamic password transmitted from the user using the same security algorithm as the dynamic password telecommunication card

and verifies the dynamic password, and then the verification result is recorded in the system journal.

[0076] The security authentication server returns the verification result to the user and assigns the corresponding authority of the user according to the verification result, and permits the user to login the network information service system according to its authority to get corresponding information services, by which one time of authentication is carried out.

[0077] V. Description of the Distribution and Management of the Key of the Dynamic Password Telecommunication Card.

[0078] In order to realize the dynamic password authentication system based on the mobile telephone, a security algorithm key is required to be preset in the dynamic password telecommunication card of the mobile telephone. Since the mobile telephone commonly applies a symmetrical encryption algorithm in the current mobile communication, a symmetrical encryption algorithm is also used to perform the computation of the dynamic password in the present invention. In addition, the encryption and decryption key is controlled by the provider of the network information services. That is, if the provider of the network information services is a bank, then the security algorithm key is controlled by the bank; if the provider of the network information services is a government office, then the security algorithm key is controlled by the government office.

[0079] The provider of the network information services is in charge of the distribution and management of the key of the dynamic password telecommunication card.

[0080] FIG. 8 is a flowchart of a password distribution of the dynamic password telecommunication card according to one embodiment of the present invention.

[0081] The flow of the password distribution of the dynamic password telecommunication card is as follows. The provider of the network information services generates a CIC (Customer Injection Card) key through a key management system for the communication department to realize the individualization of the dynamic password telecommunication card. The provider of the network information services generates a HIC (Host Injection Card) key and uses this key in the decryption of the dynamic password information.

[0082] An authorized management center of the provider of the network information services injects the CIC key into the IC card and delivers the card to the communication department to form a master card, and at the same time provides the communication department with a control card of the card. At the time of producing the dynamic password telecommunication card of the mobile telephone, an encryption key is calculated using the CIC key and a unique identification code of the dynamic password telecommunication card and is stored in a specific area of the card, thus one card is ensured to be provided with one password.

[0083] The communication department provides the unique identification code of the individualized dynamic password telecommunication card to the provider of the network information services in a safe mode, and the dynamic password decryption module of the provider of the network information services uses the HIC key and the

unique identification code of the card to calculate the decryption key with the same algorithm. Then the decryption key which is the same as the encryption key is obtained.

[0084] HIC card is only used to download the master key into the decryption module. In order to guarantee its security, the HIC card can be used only once. After the downloading, the HIC card will be automatically disabled. The master key stored in the CIC card is consistent with that in the HIC card.

[0085] The technology improves the security of identity authentication effectively and avoids the trouble for the user to remember the password and change the password frequently. The technology is suitable to the systems that require a higher security of the identify authentication, such as the bank, the securities, the police and the electronic government affair and the like, thereby to improve the security for the system administrator and the user to register the system.

[0086] Although preferred embodiments of the present invention has been shown and described, it would be appreciated by those skilled in the art that changes may be made in these embodiments without departing from the principals and spirit of the invention, the scope of which is defined in the claims and their equivalents.

We claim:

1. A dynamic password authentication method comprising:

performing in a mobile terminal an encrypting operation using a dynamic password algorithm generating key and an initialization parameter stored in a telecommunication card to obtain an encryption result;

sending the encryption result and a user identity identification code to a security authentication server, the security authentication server seeking out the dynamic password generating algorithm key in a database based on the user identity identification code and performing a decrypting operation to the encryption result to obtain a decrypted parameter.

comparing the initialization parameter with the decrypted parameter, the mobile terminal passing the authentication if the initialization parameter is consistent with the decrypted parameter, and the authentication being denied if not.

2. The method according to claim 1, wherein the initialization parameter is time information of the mobile terminal.

3. The method according to claim 2, wherein if the time information is used as the initialization parameter, a communication delay and a clock error value are added into the decrypted parameter.

4. The method according to claim 1, wherein the initialization parameter is counting information of the mobile terminal.

5. The method according to claim 4, wherein if the counting information is used as the initialization parameter, an error value caused by the previous denying of the authentication is added.

6. The method according to claim 1, wherein the dynamic password generating algorithm key, a user menu or applications which are stored in the mobile terminal and the security authentication server are updated or changed in an Over-the-Air mode.

7. The method according to claim 6, wherein the Over-the-Air mode comprises:

a service provider updating new services used with a dynamic password in a database of a download server;

the mobile terminal implementing a momentary query to a dynamic menu download server by a mobile telephone short message, and sending a dynamic menu downloading request to the download server if new services used with the dynamic password are found, the request of the user being upload by network to the short message service center and transmitted to the download server by a gateway;

the download server packaging the dynamic menu requested by the user into a short message with a specified format, and downloading the dynamic password menu required by the user into the dynamic password telecommunication card of the user through a network link in a data short message mode.

8. The method according to claim 7, wherein the telecommunication card is a SIM card or a UIM card.

9. A dynamic password authentication system comprising:

an authentication server; and a mobile terminal connected to the authentication server via wireless communication,

the mobile terminal is provided with a dynamic password telecommunication card to generate a dynamic password,

the authentication server is stored therein with a dynamic password key corresponding to the dynamic password telecommunication card of the mobile terminal to verify the dynamic password submitted by the mobile terminal

10. The system according to claim 9, wherein it further comprises a short message service center wirelessly connected to the mobile terminal, and the short message service center provides update service for the user of the mobile terminal or the authentication server.

Commissioner for Patents  
Alexandria, VA 22313-1450

Dear Madam:

Pursuant to 37 CFR 1.56, 1.97 and 1.98, the attention of the Patent and Trademark Office is hereby directed to the references listed on the attached PTO/SB/08. It is respectfully requested that the information be expressly considered during the prosecution of this application, and that the references be made of record therein and appear among the "References Cited" on any patent to issue therefrom.

This Information Disclosure Statement is filed before the mailing date of a first Office Action on the merits as far as is known to the undersigned (37 CFR 1.97(b)(3)).

In accordance with 37 CFR 1.98(a)(2)(ii), Applicant has not submitted copies of U.S. patents and U.S. patent applications. Applicant submits herewith copies of foreign patents and non-patent literature in accordance with 37 CFR 1.98(a)(2).

In accordance with 37 CFR 1.97(g), the filing of this Information Disclosure Statement shall not be construed to mean that a search has been made or that no other material information as defined in 37 CFR 1.56(a) exists. In accordance with 37 CFR 1.97(h), the filing of this Information

Disclosure Statement shall not be construed to be an admission that any patent, publication or other information referred to therein is “prior art” for this invention unless specifically designated as such.

The Examiner is advised that the following co-pending applications contain subject matter that may be related to the present application. By bringing these applications to the Examiner’s attention, Applicant does not waive the confidentiality provisions of 35 U.S.C. § 122.

NOTICE OF PUBLICATION OF APPLICATION

The above-identified application will be electronically published as a patent application publication pursuant to 37 CFR 1.211, et seq. The patent application publication number and publication date are set forth above.

The publication may be accessed through the USPTO's publically available Searchable Databases via the Internet at www.uspto.gov. The direct link to access the publication is currently http://www.uspto.gov/patft/.

The publication process established by the Office does not provide for mailing a copy of the publication to applicant. A copy of the publication may be obtained from the Office upon payment of the appropriate fee set forth in 37 CFR 1.19(a)(1). Orders for copies of patent application publications are handled by the USPTO's Office of Public Records. The Office of Public Records can be reached by telephone at (703) 308-9726 or (800) 972-6382, by facsimile at (703) 305-8759, by mail addressed to the United States Patent and Trademark Office, Office of Public Records, Alexandria, VA 22313-1450 or via the Internet.

In addition, information on the status of the application, including the mailing date of Office actions and the dates of receipt of correspondence filed in the Office, may also be accessed via the Internet through the Patent Electronic Business Center at www.uspto.gov using the public side of the Patent Application Information and Retrieval (PAIR) system. The direct link to access this status information is currently http://pair.uspto.gov/. Prior to publication, such status information is confidential and may only be obtained by applicant using the private side of PAIR.

Further assistance in electronically accessing the publication, or about PAIR, is available by calling the Patent Electronic Business Center at 1-866-217-9197.

Receipt is acknowledged of this non-provisional patent application. The application will be taken up for examination in due course. Applicant will be notified as to the results of the examination. Any correspondence concerning the application must include the following identification information: the U.S. APPLICATION NUMBER, FILING DATE, NAME OF APPLICANT, and TITLE OF INVENTION. Fees transmitted by check or draft are subject to collection. Please verify the accuracy of the data presented on this receipt. If an error is noted on this Filing Receipt, please submit a written request for a Filing Receipt Correction. Please provide a copy of this Filing Receipt with the changes noted thereon. If you received a "Notice to File Missing Parts" for this application, please submit any corrections to this Filing Receipt with your reply to the Notice. When the USPTO processes the reply to the Notice, the USPTO will generate another Filing Receipt incorporating the requested corrections

UNIVERSAL SECURE REGISTRY

**Preliminary Class**

## **PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES**

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at <http://www.uspto.gov/web/offices/pac/doc/general/index.html>.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, <http://www.stopfakes.gov>. Part of a Department of Commerce initiative,

page 2 of 3

this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4158).

**LICENSE FOR FOREIGN FILING UNDER  
Title 35, United States Code, Section 184  
Title 37, Code of Federal Regulations, 5.11 & 5.15**

**GRANTED**

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

**NOT GRANTED**

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

Examiner: Not Yet Assigned

**RESPONSE TO NOTICE TO FILE CORRECTED APPLICATION PAPERS**

Commissioner for Patents

Dear Madam:

In response to the Notice to File Corrected Application Papers – Filing Date Granted mailed October 5, 2011, and prior to examination on the merits, please amend the above-identified U.S. patent application as follows:

**Amendments to the Abstract** begin on page 2 of this paper. Deletions are shown by ~~striketrough~~ and additions are shown by underlining.

**Remarks/Arguments** begin on page 3 of this paper.

**AMENDMENTS TO THE ABSTRACT**

Please amend the Abstract on page 80 of the specification with the following:

**ABSTRACT**

~~In one embodiment, a~~ A user device is configured to allow a user to select any ~~one~~ of a plurality of accounts ~~associated with the user~~ to employ in a financial transaction. ~~In one embodiment, the~~ The user device includes a biometric sensor configured to receive a biometric input ~~provided by the user~~, a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts. ~~In a further embodiment, the~~ The user device includes a communication link configured to communicate with a secure registry, and a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface, and the communication link. ~~According to one embodiment, the~~ The processor is configured to generate a non-predictable value and ~~to generate~~ encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and ~~to communicate the encrypted~~ authentication information via the communication link to the secure registry.

**REMARKS**

Applicants respectfully request that the Abstract be replaced as indicated herein, which correct the informalities listed on the Notice. Applicant respectfully asserts that the Abstract is now in compliance with 37 C.F.R. 1.72(b) and 37 C.F.R. 1.121. No new matter has been added to the application. If the Examiner has any questions regarding the application, he or she is invited to contact the Applicants' Attorney at the number provided below.

The Director is hereby authorized to charge any deficiency in the fees filed, asserted to be filed or which should have been filed herewith (or with any paper hereafter filed in this application by this firm) to our Deposit Account No. 50/2762, under Order No. W0537-701320.

Dated: February 3, 2012

Respectfully submitted,

NOTICE TO FILE CORRECTED APPLICATION PAPERS

Filing Date Granted

An application number and filing date have been accorded to this application. The application is informal since it does not comply with the regulations for the reason(s) indicated below. Applicant is given TWO MONTHS from the date of this Notice within which to correct the informalities indicated below. Extensions of time may be obtained by filing a petition accompanied by the extension fee under the provisions of 37 CFR 1.136(a).

The required item(s) identified below must be timely submitted to avoid abandonment:

- A replacement abstract not exceeding 150 words in length and commencing on a separate sheet in compliance with 37 CFR 1.72(b) and 37 CFR 1.121 is required.

Applicant is cautioned that correction of the above items may cause the specification and drawings page count to exceed 100 pages. If the specification and drawings exceed 100 pages, applicant will need to submit the required application size fee.

Replies should be mailed to:

Mail Stop Missing Parts
Commissioner for Patents
P.O. Box 1450
Alexandria VA 22313-1450

## **PROTECTING YOUR INVENTION OUTSIDE THE UNITED STATES**

Since the rights granted by a U.S. patent extend only throughout the territory of the United States and have no effect in a foreign country, an inventor who wishes patent protection in another country must apply for a patent in a specific country or in regional patent offices. Applicants may wish to consider the filing of an international application under the Patent Cooperation Treaty (PCT). An international (PCT) application generally has the same effect as a regular national patent application in each PCT-member country. The PCT process **simplifies** the filing of patent applications on the same invention in member countries, but **does not result** in a grant of "an international patent" and does not eliminate the need of applicants to file additional documents and fees in countries where patent protection is desired.

Almost every country has its own patent law, and a person desiring a patent in a particular country must make an application for patent in that country in accordance with its particular laws. Since the laws of many countries differ in various respects from the patent law of the United States, applicants are advised to seek guidance from specific foreign countries to ensure that patent rights are not lost prematurely.

Applicants also are advised that in the case of inventions made in the United States, the Director of the USPTO must issue a license before applicants can apply for a patent in a foreign country. The filing of a U.S. patent application serves as a request for a foreign filing license. The application's filing receipt contains further information and guidance as to the status of applicant's license for foreign filing.

Applicants may wish to consult the USPTO booklet, "General Information Concerning Patents" (specifically, the section entitled "Treaties and Foreign Patents") for more information on timeframes and deadlines for filing foreign patent applications. The guide is available either by contacting the USPTO Contact Center at 800-786-9199, or it can be viewed on the USPTO website at <http://www.uspto.gov/web/offices/pac/doc/general/index.html>.

For information on preventing theft of your intellectual property (patents, trademarks and copyrights), you may wish to consult the U.S. Government website, <http://www.stopfakes.gov>. Part of a Department of Commerce initiative,

page 2 of 3

this website includes self-help "toolkits" giving innovators guidance on how to protect intellectual property in specific countries such as China, Korea and Mexico. For questions regarding patent enforcement issues, applicants may call the U.S. Government hotline at 1-866-999-HALT (1-866-999-4158).

**LICENSE FOR FOREIGN FILING UNDER  
Title 35, United States Code, Section 184  
Title 37, Code of Federal Regulations, 5.11 & 5.15**

**GRANTED**

The applicant has been granted a license under 35 U.S.C. 184, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" followed by a date appears on this form. Such licenses are issued in all applications where the conditions for issuance of a license have been met, regardless of whether or not a license may be required as set forth in 37 CFR 5.15. The scope and limitations of this license are set forth in 37 CFR 5.15(a) unless an earlier license has been issued under 37 CFR 5.15(b). The license is subject to revocation upon written notification. The date indicated is the effective date of the license, unless an earlier license of similar scope has been granted under 37 CFR 5.13 or 5.14.

This license is to be retained by the licensee and may be used at any time on or after the effective date thereof unless it is revoked. This license is automatically transferred to any related applications(s) filed under 37 CFR 1.53(d). This license is not retroactive.

The grant of a license does not in any way lessen the responsibility of a licensee for the security of the subject matter as imposed by any Government contract or the provisions of existing laws relating to espionage and the national security or the export of technical data. Licensees should apprise themselves of current regulations especially with respect to certain countries, of other agencies, particularly the Office of Defense Trade Controls, Department of State (with respect to Arms, Munitions and Implements of War (22 CFR 121-128)); the Bureau of Industry and Security, Department of Commerce (15 CFR parts 730-774); the Office of Foreign Assets Control, Department of Treasury (31 CFR Parts 500+) and the Department of Energy.

**NOT GRANTED**

No license under 35 U.S.C. 184 has been granted at this time, if the phrase "IF REQUIRED, FOREIGN FILING LICENSE GRANTED" DOES NOT appear on this form. Applicant may still petition for a license under 37 CFR 5.12, if a license is desired before the expiration of 6 months from the filing date of the application. If 6 months has lapsed from the filing date of this application and the licensee has not received any indication of a secrecy order under 35 U.S.C. 181, the licensee may foreign file the application pursuant to 37 CFR 5.15(b).

**PETITION TO MAKE SPECIAL BASED ON AGE FOR ADVANCEMENT OF EXAMINATION  
UNDER 37 CFR 1.102(c)(1)**

**Application Information**

Application Number	13237184	Confirmation Number	7352	Filing Date	2011-09-20
Attorney Docket Number (optional)	W0537-701320	Art Unit		Examiner	
First Named Inventor	Kenneth P. Weiss				
Title of Invention	UNIVERSAL SECURE REGISTRY				

**Attention: Office of Petitions**

An application may be made special for advancement of examination upon filing of a petition showing that the applicant is 65 years of age, or more. No fee is required with such a petition. See 37 CFR 1.102(c)(1) and MPEP 708.02 (IV).

APPLICANT HEREBY PETITIONS TO MAKE SPECIAL FOR ADVANCEMENT OF EXAMINATION IN THIS APPLICATION UNDER 37 CFR 1.102(c)(1) and MPEP 708.02 (IV) ON THE BASIS OF THE APPLICANT'S AGE.

A grantable petition requires one of the following items:

- (1) Statement by one named inventor in the application that he/she is 65 years of age, or more; or
- (2) Certification by a registered attorney/agent having evidence such as a birth certificate, passport, driver's license, etc. showing one named inventor in the application is 65 years of age, or more.

**Name of Inventor who is 65 years of age, or older**

Given Name	Middle Name	Family Name	Suffix
Kenneth	P.	Weiss	

A signature of the applicant or representative is required in accordance with 37 CFR 1.33 and 10.18. Please see 37 CFR 1.4(d) for the format of the signature.

Select (1) or (2) :

- (1) I am an inventor in this application and I am 65 years of age, or more.
- (2) I am an attorney or agent registered to practice before the Patent and Trademark Office, and I certify that I am in possession of evidence, and will retain such in the application file record, showing that the inventor listed above is 65 years of age, or more.

Signature	/Robert V. Donahoe/	Date (YYYY-MM-DD)	2011-09-26
Name	Robert V. Donahoe	Registration Number	46667

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

In re Application of  
Kenneth P. Weiss

Application No. 13237184

Filed:

Attorney Docket No. W0537-701320

:

:DECISION ON PETITION TO MAKE SPECIAL  
:UNDER 37 CFR 1.102(c)(1)

:

This is a decision on the electronic petition under 37 CFR 1.102 (c)(1), filed 26-SEP-2011 to make the above-identified application special based on applicant's age as set forth in MPEP § 708.02, Section IV.

The petition is **GRANTED**.

A grantable petition to make an application special under 37 CFR 1.102(c)(1), MPEP § 708.02, Section IV: Applicant's Age must include a statement by applicant or a registered practitioner having evidence that applicant is at least 65 years of age. No fee is required.

Accordingly, the above-identified application has been accorded "special" status and will be taken up for action by the examiner upon the completion of all pre-examination processing.

Telephone inquiries concerning this electronic decision should be directed to the Electronic Business Center at 866-217-9197.

All other inquiries concerning either the examination or status of the application should be directed to the Technology Center.

### Warnings:

### Information:

IPR2018-00067

This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.

**New Applications Under 35 U.S.C. 111**

If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.

**National Stage of an International Application under 35 U.S.C. 371**

If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.

**New International Application Filed with the USPTO as a Receiving Office**

If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.

**CERTIFICATION STATEMENT**

Please see 37 CFR 1.97 and 1.98 to make the appropriate selection(s):

That each item of information contained in the information disclosure statement was first cited in any communication from a foreign patent office in a counterpart foreign application not more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(1).

**OR**

That no item of information contained in the information disclosure statement was cited in a communication from a foreign patent office in a counterpart foreign application, and, to the knowledge of the person signing the certification after making reasonable inquiry, no item of information contained in the information disclosure statement was known to any individual designated in 37 CFR 1.56(c) more than three months prior to the filing of the information disclosure statement. See 37 CFR 1.97(e)(2).

- See attached certification statement.
- The fee set forth in 37 CFR 1.17 (p) has been submitted herewith.
- A certification statement is not submitted herewith.

**SIGNATURE**

A signature of the applicant or representative is required in accordance with CFR 1.33, 10.18. Please see CFR 1.4(d) for the form of the signature.

Signature	/Robert V. Donahoe/	Date (YYYY-MM-DD)	2011-09-20
Name/Print	Robert V. Donahoe	Registration Number	46,667

This collection of information is required by 37 CFR 1.97 and 1.98. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 1 hour to complete, including gathering, preparing and submitting the completed application form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. **DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

---	---

International application No. PCT/US2009/035282	International filing date (day/month/year) 26/02/2009
--	---

Applicant  
WEISS, Kenneth P.

1. This International Searching Authority

- (i) considers that there are 4 (number of) inventions claimed in the international application covered by the claims indicated on an extra sheet:
- (ii) therefore considers that **the international application does not comply with the requirements of unity of invention** (Rules 13.1, 13.2 and 13.3) for the reasons indicated on an extra sheet:
- (iii)  has carried out a partial international search (see Annex)  will establish the international search report on those parts of the international application which relate to the invention first mentioned in claims Nos.:  
*see extra sheet*
- (iv) will establish the international search report on the other parts of the international application only if, and to the extent to which, additional fees are paid.

2. Consequently, the applicant is hereby **invited to pay**, within the time limit indicated above, the amount indicated below:

EUR 1.700,00 x 3 = EUR 5.100  
Fee per additional invention      number of additional inventions      currency/total amount of additional fees

3. The applicant is informed that, according to Rule 40.2(c), **the payment of any additional fee may be made under protest**, i.e., a reasoned statement to the effect that the international application complies with the requirement of unity of invention or that the amount of the required additional fee is excessive, where applicable, subject to the payment of a protest fee.

Where the applicant pays additional fees under protest, the applicant is hereby invited, within the time limit indicated above, to pay a protest fee (Rule 40.2(e)) in the amount of EUR 750,00 (currency/amount)

Where the applicant has not, within the time limit indicated above, paid the required protest fee, the protest will be considered not to have been made and the International Searching Authority will so declare.

4.  Claim(s) Nos. \_\_\_\_\_ have been found to be unsearchable under Article 17(2)(b) because of defects under Article 17(2)(a) and therefore have not been included with any invention.

Name and mailing address of the International Searching Authority  European Patent Office, P.B. 5818 Patentlaan 2 NL-2280 HV Rijswijk Tel. (+31-70) 340-2040, Tx. 31 651 epo nl, Fax: (+31-70) 340-3016	Authorized officer  Eva Hehn
--	------------------------------------

**Annex to Form PCT/ISA/206  
COMMUNICATION RELATING TO THE RESULTS  
OF THE PARTIAL INTERNATIONAL SEARCH**

International Application No  
PCT/US2009/035282

1. The present communication is an Annex to the invitation to pay additional fees (Form PCT/ISA/206). It shows the results of the international search established on the parts of the international application which relate to the invention first mentioned in claims Nos.:  
see 'Invitation to pay additional fees'
2. This communication is not the international search report which will be established according to Article 18 and Rule 43.
3. If the applicant does not pay any additional search fees, the information appearing in this communication will be considered as the result of the international search and will be included as such in the international search report.
4. If the applicant pays additional fees, the international search report will contain both the information appearing in this communication and the results of the international search on other parts of the international application for which such fees will have been paid.

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

Category °	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. claims: 1-2, 4, 6-16, 18-28, 30-31

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information setup by all entered data and sends it via another device to a third party system

1.1. claims: 1-2, 4, 6, 15-16, 18-20, 24-28, 30-31

A device with biometric sensor, user interface and wireless communication interface which encrypts particular authentication information setup by all entered data and sends it via another device to a third party system

1.2. claims: 7-12

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system with local biometric verification and activation of the device after successful authentication

1.3. claim: 14

A portable device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system

1.4. claims: 13, 21-23

A device with a special biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system

2. claim: 3

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system and a converter device emulating magnetic stripes

3. claim: 5

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system after biometric authentication

---

4. claims: 17, 29

A device with biometric sensor, user interface and wireless communication interface which encrypts authentication information and sends it via another device to a third party system. The device is deactivated when user is not authenticated or when rules of other policies apply.

---

Please note that all inventions mentioned under item 1, although not necessarily linked by a common inventive concept, could be searched without effort justifying an additional fee.

The reasons for which the inventions are not so linked as to form a single general inventive concept, as required by Rule 13.1 PCT, are as follows:

Claims 1, 2, 15 and 20 are not new and not inventive. The only common feature linking the parallel claims 3, 4, 5, 6, 7, 13, 14, 16, 17, 18, 19, 21, 24, 25, 29 and 30 is a device with biometric sensor, user interface and wireless communication interface which encrypts authentication information setup by all entered data and sends it via another device to a third party system

This is disclosed by the document US2006016884 (the references in parentheses applying to this document):

A device configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction (fig.1 "portable terminal 14"; fig. 4; par.[0245] "a multifunction card can store data corresponding to plurality of accounts in its memory. ..., data corresponding to a stored account can be selected ..."), comprising:

- a biometric sensor configured to receive a biometric input provided by the user (fig.4 "BIOMETRIC READER 47");
- a user interface (fig. 4 "40 DISPLAY", "42 MANUAL INPUTS") configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts (par.[0181] "The instructions stored in memory on the card or the memory of the terminal may cause screens associated with the entry of a PIN number and/or the selection of various accounts to be displayed when particular accounts are selected.");
- a communication link (fig.4 "50 MODEM") configured to communicate (fig.4 "54") with a secure registry (fig.4 "56"); and
- a processor (fig.4 "36 PROCESSOR") coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication link, the processor configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry (par.[0185] "Appropriate encryption is provided to enhance security.");

par.[0191]-[0192] "Data representative of the user's signature and/or the user's financial account information can be transmitted from the user's (customer's) portable hand-held device to the merchant's transaction system. ... , the merchant system can be operative to communicate with a third party ... the account data may include checking account number

(and/or bank routing number), check number, name, address, phone number, bank name, or combinations thereof.").

The 6 groups of inventions are directed towards the solution of different technical problems and are not linked by a common or corresponding special technical feature, problem or effect, which would contribute to the prior art.

Claims 1, 2, 4, 6, 15, 16, 18 to 20, 24 to 28, 30, 31 are directed towards a device for entering authentication data and generating encrypted authentication information to be communicated to a third party. The problem to be solved by these features can be construed as to protecting the secrecy of data authorizing financial transactions.

Claims 7 to 12 are directed towards authenticating the authorized user of the device locally. Claim 14 is directed towards a portable authentication device. The problem to be solved by these features can be construed as to improve the availability of the protected authentication. Hence two solutions form a common inventive concept.

Claims 13, 21, 22, 23 are directed towards biometric sensors. The problem to be solved by these features can be construed as to increase convenience for the user.

Claim 3 is directed towards a device for emulating magnetic stripes. The problem to be solved by these features can be construed as to improve the interoperability with existing authentication systems.

Claim 5 is directed towards sending biometric information to a third party before authenticating the financial transaction. The problem to be solved by these features can be construed as to improve the secrecy of the authentication process.

Claim 17 and 29 are directed towards restricting the usage of the device. The problem to be solved by these features can be construed as to protect the integrity of the device against unauthorized use.

In conclusion, the groups of claims define 6 different inventions not linked by a single general inventive concept.

The search has covered the first 4 groups of inventions (groups 1, 1.1, 1.2, 1.3).

NOTIFICATION OF TRANSMITTAL OF  
 THE INTERNATIONAL SEARCH REPORT AND  
 THE WRITTEN OPINION OF THE INTERNATIONAL  
 SEARCHING AUTHORITY, OR THE DECLARATION

(PCT Rule 44.1)

Date of mailing (day/month/year)	27/11/2007
Applicant's or agent's file reference W0537-7009W0	<b>FOR FURTHER ACTION</b> See paragraphs 1 and 4 below
International application No. PCT/US2007/004646	International filing date (day/month/year) 21/02/2007
Applicant WEISS, Kenneth P.	DOCKETED <i>Amend Claims on formal</i> DUE: <i>resp to W01</i> 1.27.08 <i>remit</i> 2.27.08

1.  The applicant is hereby notified that the international search report and the written opinion of the International Searching Authority have been established and are transmitted herewith.

**Filing of amendments and statement under Article 19:**

The applicant is entitled, if he so wishes, to amend the claims of the International Application (see Rule 46):

**When?** The time limit for filing such amendments is normally two months from the date of transmittal of the International Search Report.

**Where?** Directly to the International Bureau of WIPO, 34 chemin des Colombettes  
 1211 Geneva 20, Switzerland, Facsimile No.: (41-22) 338.82.70

For more detailed instructions, see the notes on the accompanying sheet.

2.  The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.

3.  **With regard to the protest** against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

- the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.
- no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

4. **Reminders**

Shortly after the expiration of **18 months** from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in Rules 90bis.1 and 90bis.3, respectively, before the completion of the technical preparations for international publication.

The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. These comments would also be made available to the public but not before the expiration of 30 months from the priority date.

Within **19 months** from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase **until 30 months** from the priority date (in some Offices even later); otherwise, the applicant must, **within 20 months** from the priority date, perform the prescribed acts for entry into the national phase before those designated Offices.

In respect of other designated Offices, the time limit of **30 months** (or later) will apply even if no demand is filed within 19 months.

See the Annex to Form PCT/IB/301 and, for details about the applicable time limits, Office by Office, see the *PCT Applicant's Guide*, Volume II, National Chapters and the WIPO Internet site.

## NOTES TO FORM PCT/ISA/220

These Notes are intended to give the basic instructions concerning the filing of amendments under article 19. The Notes are based on the requirements of the Patent Cooperation Treaty, the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the *PCT Applicant's Guide*, a publication of WIPO.

In these Notes, "Article", "Rule", and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions, respectively.

### INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report and the written opinion of the International Searching Authority, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international publication. Furthermore, it should be emphasized that provisional protection is available in some States only (see *PCT Applicant's Guide*, Volume I/A, Annexes B1 and B2).

The attention of the applicant is drawn to the fact that amendments to the claims under Article 19 are not allowed where the International Searching Authority has declared, under Article 17(2), that no international search report would be established (see *PCT Applicant's Guide*, Volume I/A, paragraph 296).

#### What parts of the international application may be amended?

Under Article 19, only the claims may be amended.

During the international phase, the claims may also be amended (or further amended) under Article 34 before the International Preliminary Examining Authority. The description and drawings may only be amended under Article 34 before the International Examining Authority.

Upon entry into the national phase, all parts of the international application may be amended under Article 28 or, where applicable, Article 41.

#### When?

Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the international Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

#### Where not to file the amendments?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been/is filed, see below.

#### How?

Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement sheet must be submitted for each sheet of the claims which, on account of an amendment or amendments, differs from the sheet originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Section 205(b)).

**The amendments must be made in the language in which the international application is to be published.**

#### What documents must/may accompany the amendments?

##### Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confused with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

**The letter must be in English or French, at the choice of the applicant. However, if the language of the international application is English, the letter must be in English; if the language of the international application is French, the letter must be in French.**

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference W0537-7009WO	<b>FOR FURTHER ACTION</b>		see Form PCT/ISA/220 as well as, where applicable, item 5 below.
International application No. PCT/US2007/004646	International filing date (day/month/year) 21/02/2007	(Earliest) Priority Date (day/month/year) 21/02/2006	
Applicant WEISS, Kenneth P.			

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 6 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. **Basis of the report**

a. With regard to the **language**, the international search was carried out on the basis of:

- the international application in the language in which it was filed
- a translation of the international application into \_\_\_\_\_, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b))

b.  With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, see Box No. I.

2.  **Certain claims were found unsearchable** (See Box No. II)

3.  **Unity of invention is lacking** (see Box No III)

4. With regard to the **title**,

- the text is approved as submitted by the applicant
- the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant
- the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box No. IV. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority

6. With regard to the **drawings**,

- a. the figure of the **drawings** to be published with the abstract is Figure No. 1
  - as suggested by the applicant
  - as selected by this Authority, because the applicant failed to suggest a figure
  - as selected by this Authority, because this figure better characterizes the invention
- b.  none of the figures is to be published with the abstract

INTERNATIONAL SEARCH REPORT

International application No  
PCT/US2007/004646

A. CLASSIFICATION OF SUBJECT MATTER

INV. G06F21/00

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

G06F G07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	GB 2 382 006 A (IBM [US]) 14 May 2003 (2003-05-14) figure 3 page 4, line 29 - line 34 page 17, line 10 - line 27 page 18, line 5 - line 24	1,63
Y	----- US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)  paragraph [0012] paragraph [0061] -----	2-9,13, 20-22, 64-84
Y	US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)  paragraph [0012] paragraph [0061]	2-9,13, 20-22, 64-84

Further documents are listed in the continuation of Box C.

See patent family annex.

\* Special categories of cited documents :

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \*&\* document member of the same patent family

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US2007/004646

## Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1.  Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2.  Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
  
3.  Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1.  As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2.  As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3.  As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:  
  
1-9, 13-14, 20-22, 63-84
  
4.  No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

### Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
- No protest accompanied the payment of additional search fees.

## FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

## 1. claims: 1,63

Giving authorization for an operation to a second device by a third device depending on information given by a first device.

---

## 2. claims: 2-9, 20-22, 13-14,64-84

Emulating a credit card and providing the services associated to the credit card.

---

## 3. claims: 10-12, 38-41,46,47, 100-103, 108-109

Secure communications between the first and the second devices using cryptography.

---

## 4. claims: 15-19, 24-32, 86-94

Different methods of authenticating the user at a second the device, using user information sent from the first device.

---

## 5. claims: 33-37, 95-99

Accessing user information from a data base by the secure system. The secure system access user authentication information and send it to the second device.

---

## 6. claims: 42-45, 48-62, 104-107, 110-124

Authentication of a user at a first device, a second user at a second device, sending authentication information from the first device to the second to authenticate the first user at the second device. Permit two users to manipulate their respective devices and authenticate the one first user by the second via information sent from the first device to the second.

---

## 7. claims: 23,85 125, 129

Send to credit card information for validation at a credit card service.

---

## 8. claims: 126-128, 130-132

**FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210**

Information validation based on information sent from a  
first and third devices to a second device.

---

Applicant  
WEISS, Kenneth P.

1. This opinion contains indications relating to the following items:

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

2. **FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA") except that this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 66.1bis(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of 3 months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

---

**Box No. I Basis of the opinion**

---

1. With regard to the **language**, this opinion has been established on the basis of:
  - the international application in the language in which it was filed
  - a translation of the international application into , which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1 (b)).
2. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application and necessary to the claimed invention, this opinion has been established on the basis of:
  - a. type of material:
    - a sequence listing
    - table(s) related to the sequence listing
  - b. format of material:
    - on paper
    - in electronic form
  - c. time of filing/furnishing:
    - contained in the international application as filed.
    - filed together with the international application in electronic form.
    - furnished subsequently to this Authority for the purposes of search.
3.  In addition, in the case that more than one version or copy of a sequence listing and/or table relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
4. Additional comments:

**Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability**

The questions whether the claimed invention appears to be novel, to involve an inventive step (to be non obvious), or to be industrially applicable have not been examined in respect of

- the entire international application
- claims Nos. 10-12,15-19,23-62, 85-132

because:

- the said international application, or the said claims Nos. relate to the following subject matter which does not require an international search (*specify*):
- the description, claims or drawings (*indicate particular elements below*) or said claims Nos. are so unclear that no meaningful opinion could be formed (*specify*):
- the claims, or said claims Nos. are so inadequately supported by the description that no meaningful opinion could be formed (*specify*):
- no international search report has been established for the whole application or for said claims Nos. 10-12,15-19,23-62, 85-132
- a meaningful opinion could not be formed without the sequence listing; the applicant did not, within the prescribed time limit:
  - furnish a sequence listing on paper complying with the standard provided for in Annex C of the Administrative Instructions, and such listing was not available to the International Searching Authority in a form and manner acceptable to it.
  - furnish a sequence listing in electronic form complying with the standard provided for in Annex C of the Administrative Instructions, and such listing was not available to the International Searching Authority in a form and manner acceptable to it.
  - pay the required late furnishing fee for the furnishing of a sequence listing in response to an invitation under Rules 13<sup>ter</sup>.1(a) or (b).
- a meaningful opinion could not be formed without the tables related to the sequence listings; the applicant did not, within the prescribed time limit, furnish such tables in electronic form complying with the technical requirements provided for in Annex C-bis of the Administrative Instructions, and such tables were not available to the International Searching Authority in a form and manner acceptable to it.
- the tables related to the nucleotide and/or amino acid sequence listing, if in electronic form only, do not comply with the technical requirements provided for in Annex C-bis of the Administrative Instructions.
- See Supplemental Box for further details

---

**Box No. IV Lack of unity of invention**

---

1.  In response to the invitation (Form PCT/ISA/206) to pay additional fees, the applicant has, within the applicable time limit:
- paid additional fees
  - paid additional fees under protest and, where applicable, the protest fee
  - paid additional fees under protest but the applicable protest fee was not paid
  - not paid additional fees
2.  This Authority found that the requirement of unity of invention is not complied with and chose not to invite the applicant to pay additional fees.
3. This Authority considers that the requirement of unity of invention in accordance with Rule 13.1, 13.2 and 13.3 is
- complied with
  - not complied with for the following reasons:  
**see separate sheet**
4. Consequently, this report has been established in respect of the following parts of the international application:
- all parts.
  - the parts relating to claims Nos. 1-9,13-14,20-22,63-84

---

**Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement**

---

1. Statement

Novelty (N)	Yes: Claims	<u>2-9,13-14,20-22,64-84</u>
	No: Claims	<u>1,63</u>
Inventive step (IS)	Yes: Claims	
	No: Claims	<u>1-9,13-14,20-22,63-84</u>
Industrial applicability (IA)	Yes: Claims	<u>1-9,13-14,20-22,63-84</u>
	No: Claims	

2. Citations and explanations

**see separate sheet**

**Re Item III.**

No opinion is given for claims 10-12,15-19,23-62 and 85-132 as no search report has been established for those claims.

**Re Item IV.**

The separate inventions/groups of inventions are:

I Claims 1,63:

Giving authorization for an operation to a second device by a third device depending on information given by a first device.

II Claims 2-9, 20-22, 13-14,64-84:

Emulating a credit card and providing the services associated to the credit card.

III Claims 10-12, 38-41,46,47, 100-103, 108-109:

Secure communications between the first and the second devices using cryptography.

IV Claims 15-19, 24-32, 86-94:

Different methods of authenticating the user at a second the device, using user information sent from the first device.

V Claims 33-37, 95-99:

Accessing user information from a data base by the secure system. The secure system access user authentication information and send it to the second device.

VI Claims 42-45, 48-62, 104-107, 110-124:

Authentication of a user at a first device, a second user at a second device, sending authentication information from the first device to the second to authenticate the first user at the second device. Permit two users to manipulate their respective devices and authenticate the one first user by the second via information sent from the first device to the second.

VII Claims 23,85 125, 129:

Send to credit card information for validation at a credit card service.

VIII Claims 126-128, 130-132:

Information validation based on information sent from a first and third devices to a second device.

They are not so linked as to form a single general inventive concept (Rule 13.1 PCT) for the following reasons:

The problems solved by each group of claims are:

Group 1:

The problem solved by this group is how to authorize operations at a device without letting this device access private information.

Group 2:

The problem solved by this group of claims is how to provide credit card services.

Group 3:

The problem solved by this group of claims is how to secure communications between devices.

Group 4:

The problem solved by this group of claims is how to authenticate a user.

Group 5:

The problem solved by this group of claims is how to limit access to private information.

Group 6:

The problem solved by this group of claims is how to prevent user authentication to a device that is being manipulated by a non-trusted user.

Group 7:

The problem to be solved by this group of claims is how to validate credit card information.

Group 8:

The problem solved by this group of claims is how to validate information using a third trusted device.

The common concept linking the groups of claims listed is claim 1 and 63.

Claims 1 and 63 are not novel, as their features are anticipated by the document GB2382006A. This document shows the following features:

- a) A system for validating an identity of a user to enable or prevent an occurrence of an event (Abstract).
- b) A first device including a wireless transmitter configured to transmit validation

information (pag. 17 I.11-12, pag. 25 I.8-11 the communication between the devices is considered wireless).

- c) A second device including a wireless receiver, the second device configured to receive the validation information and further transmit the validation information (pag. 17 I.11-13, pag. 25 I.8-11 the communication between the devices is considered as wireless).
- d) A secure system in communication with the second device, the secure system including a database (pag. 17 I.10-11).
- e) The secure system is configured to receive the validation information transmitted from the second device (pag. 17 I.12-13).
- f) The secure system is further configured to transmit additional information to the second device following a receipt of the validation information to assist the second device in either enabling or preventing the occurrence of the event (pag. 17 I.15-16).

Hence the groups of claims are not so linked as to form a general inventive concept. The application lacks unity, Rule 13.1 PCT.

**Re Item V.**

- 1 Reference is made to the following document:  
D1 : GB 2 382 006 A (IBM [US]) 14 May 2003 (2003-05-14)  
D2: US 2005/001711 A1 (DOUGHTY RALPH O [US] ET AL) 6 January 2005 (2005-01-06)
- 2 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT. Reference is made to the above reasoning of lack of unity were the novelty of claim 1 is challenged.
- 3 The same above objection is also applicable to the corresponding method claim 63 to apparatus claim 1.
- 4. The additional features of dependent claims 2-9, 13-14, 20-22 and 64-84 are also

anticipated by D1 in combination with D2, and do not contribute to an inventive activity.

Possible steps after receipt of the international search report (ISR) and written opinion of the International Searching Authority (WO-ISA)

---

General information For all international applications filed on or after 01/01/2004 the competent ISA will establish an ISR. It is accompanied by the WO-ISA. Unlike the former written opinion of the IPEA (Rule 66.2 PCT), the WO-ISA is not meant to be responded to, but to be taken into consideration for further procedural steps. This document explains about the possibilities.

---

Amending claims under Art. 19 PCT Within 2 months after the date of mailing of the ISR and the WO-ISA the applicant may file amended claims under Art. 19 PCT directly with the International Bureau of WIPO. The PCT reform of 2004 did not change this procedure. For further information please see Rule 46 PCT as well as form PCT/ISA/220 and the corresponding Notes to form PCT/ISA/220.

---

Filing a demand for international preliminary examination In principle, the WO-ISA will be considered as the written opinion of the IPEA. This should, in many cases, make it unnecessary to file a demand for international preliminary examination. If the applicant nevertheless wishes to file a demand this must be done before expiry of 3 months after the date of mailing of the ISR/ WO-ISA or 22 months after priority date, whichever expires later (Rule 54bis PCT). Amendments under Art. 34 PCT can be filed with the IPEA as before, normally at the same time as filing the demand (Rule 66.1 (b) PCT).

If a demand for international preliminary examination is filed and no comments/amendments have been received the WO-ISA will be transformed by the IPEA into an IPRP (International Preliminary Report on Patentability) which would merely reflect the content of the WO-ISA. The demand can still be withdrawn (Art. 37 PCT).

---

Filing informal comments After receipt of the ISR/WO-ISA the applicant may file informal comments on the WO-ISA directly with the International Bureau of WIPO. These will be communicated to the designated Offices together with the IPRP (International Preliminary Report on Patentability) at 30 months from the priority date. Please also refer to the next box.

---

End of the international phase At the end of the international phase the International Bureau of WIPO will transform the WO-ISA or, if a demand was filed, the written opinion of the IPEA into the IPRP, which will then be transmitted together with possible informal comments to the designated Offices. The IPRP replaces the former IPER (international preliminary examination report).

ETATS-UNIS D'AMERIQUE

(PCT Rule 44.1)

Date of mailing (day/month/year) 11/03/2008	
Applicant's or agent's file reference W0537-7010W0	<b>FOR FURTHER ACTION</b> See paragraphs 1 and 4 below
International application No. PCT/US2007/070701	International filing date (day/month/year) 08/06/2007
Applicant WEISS, Kenneth P.	<b>COPY</b>

1.  The applicant is hereby notified that the international search report and the written opinion of the International Searching Authority have been established and are transmitted herewith.

**Filing of amendments and statement under Article 19:**

The applicant is entitled, if he so wishes, to amend the claims of the International Application (see Rule 46):

**When?** The time limit for filing such amendments is normally two months from the date of transmittal of the International Search Report.

**Where?** Directly to the International Bureau of WIPO, 34 chemin des Colombettes  
1211 Geneva 20, Switzerland, Facsimile No.: (41-22) 338.82.70

**For more detailed instructions,** see the notes on the accompanying sheet.

2.  The applicant is hereby notified that no international search report will be established and that the declaration under Article 17(2)(a) to that effect and the written opinion of the International Searching Authority are transmitted herewith.

3.  **With regard to the protest** against payment of (an) additional fee(s) under Rule 40.2, the applicant is notified that:

- the protest together with the decision thereon has been transmitted to the International Bureau together with the applicant's request to forward the texts of both the protest and the decision thereon to the designated Offices.  
 no decision has been made yet on the protest; the applicant will be notified as soon as a decision is made.

**4. Reminders**

Shortly after the expiration of **18 months** from the priority date, the international application will be published by the International Bureau. If the applicant wishes to avoid or postpone publication, a notice of withdrawal of the international application, or of the priority claim, must reach the International Bureau as provided in Rules 90*bis*.1 and 90*bis*.3, respectively, before the completion of the technical preparations for international publication.

The applicant may submit comments on an informal basis on the written opinion of the International Searching Authority to the International Bureau. The International Bureau will send a copy of such comments to all designated Offices unless an international preliminary examination report has been or is to be established. These comments would also be made available to the public but not before the expiration of 30 months from the priority date.

Within **19 months** from the priority date, but only in respect of some designated Offices, a demand for international preliminary examination must be filed if the applicant wishes to postpone the entry into the national phase **until 30 months** from the priority date (in some Offices even later); otherwise, the applicant must, **within 20 months** from the priority date, perform the prescribed acts for entry into the national phase before those designated Offices.

In respect of other designated Offices, the time limit of **30 months** (or later) will apply even if no demand is filed within 19 months.

See the Annex to Form PCT/IB/301 and, for details about the applicable time limits, Office by Office, see the *PCT Applicant's Guide*, Volume II, National Chapters and the WIPO Internet site.

## NOTES TO FORM PCT/ISA/220

These Notes are intended to give the basic instructions concerning the filing of amendments under article 19. The Notes are based on the requirements of the Patent Cooperation Treaty, the Regulations and the Administrative Instructions under that Treaty. In case of discrepancy between these Notes and those requirements, the latter are applicable. For more detailed information, see also the *PCT Applicant's Guide*, a publication of WIPO.

In these Notes, "Article", "Rule", and "Section" refer to the provisions of the PCT, the PCT Regulations and the PCT Administrative Instructions, respectively.

### INSTRUCTIONS CONCERNING AMENDMENTS UNDER ARTICLE 19

The applicant has, after having received the international search report and the written opinion of the International Searching Authority, one opportunity to amend the claims of the international application. It should however be emphasized that, since all parts of the international application (claims, description and drawings) may be amended during the international preliminary examination procedure, there is usually no need to file amendments of the claims under Article 19 except where, e.g. the applicant wants the latter to be published for the purposes of provisional protection or has another reason for amending the claims before international publication. Furthermore, it should be emphasized that provisional protection is available in some States only (see *PCT Applicant's Guide*, Volume I/A, Annexes B1 and B2).

The attention of the applicant is drawn to the fact that amendments to the claims under Article 19 are not allowed where the International Searching Authority has declared, under Article 17(2), that no international search report would be established (see *PCT Applicant's Guide*, Volume I/A, paragraph 296).

#### What parts of the international application may be amended?

Under Article 19, only the claims may be amended.

During the international phase, the claims may also be amended (or further amended) under Article 34 before the International Preliminary Examining Authority. The description and drawings may only be amended under Article 34 before the International Examining Authority.

Upon entry into the national phase, all parts of the international application may be amended under Article 28 or, where applicable, Article 41.

#### When?

Within 2 months from the date of transmittal of the international search report or 16 months from the priority date, whichever time limit expires later. It should be noted, however, that the amendments will be considered as having been received on time if they are received by the International Bureau after the expiration of the applicable time limit but before the completion of the technical preparations for international publication (Rule 46.1).

#### Where not to file the amendments?

The amendments may only be filed with the International Bureau and not with the receiving Office or the International Searching Authority (Rule 46.2).

Where a demand for international preliminary examination has been/is filed, see below.

#### How?

Either by cancelling one or more entire claims, by adding one or more new claims or by amending the text of one or more of the claims as filed.

A replacement sheet must be submitted for each sheet of the claims which, on account of an amendment or amendments, differs from the sheet originally filed.

All the claims appearing on a replacement sheet must be numbered in Arabic numerals. Where a claim is cancelled, no renumbering of the other claims is required. In all cases where claims are renumbered, they must be renumbered consecutively (Section 205(b)).

**The amendments must be made in the language in which the international application is to be published.**

#### What documents must/may accompany the amendments?

##### Letter (Section 205(b)):

The amendments must be submitted with a letter.

The letter will not be published with the international application and the amended claims. It should not be confused with the "Statement under Article 19(1)" (see below, under "Statement under Article 19(1)").

**The letter must be in English or French, at the choice of the applicant. However, if the language of the international application is English, the letter must be in English; if the language of the international application is French, the letter must be in French.**

PATENT COOPERATION TREATY

PCT

INTERNATIONAL SEARCH REPORT

(PCT Article 18 and Rules 43 and 44)

Applicant's or agent's file reference W0537-7010WO	<b>FOR FURTHER ACTION</b> see Form PCT/ISA/220 as well as, where applicable, item 5 below.	
International application No. PCT/US2007/070701	International filing date (day/month/year) 08/06/2007	(Earliest) Priority Date (day/month/year) 09/06/2006
Applicant WEISS, Kenneth P.		

This international search report has been prepared by this International Searching Authority and is transmitted to the applicant according to Article 18. A copy is being transmitted to the International Bureau.

This international search report consists of a total of 4 sheets.

It is also accompanied by a copy of each prior art document cited in this report.

1. Basis of the report

a. With regard to the **language**, the international search was carried out on the basis of:

- the International application in the language in which it was filed
- a translation of the international application into \_\_\_\_\_, which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1(b))

b.  This international search report has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43.6bis(a)).

c.  With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application, see Box No. I.

2.  **Certain claims were found unsearchable** (See Box No. II)

3.  **Unity of invention is lacking** (see Box No III)

4. With regard to the **title**,

- the text is approved as submitted by the applicant
- the text has been established by this Authority to read as follows:

5. With regard to the **abstract**,

- the text is approved as submitted by the applicant
- the text has been established, according to Rule 38.2(b), by this Authority as it appears in Box No. IV. The applicant may, within one month from the date of mailing of this international search report, submit comments to this Authority

6. With regard to the **drawings**,

- a. the figure of the **drawings** to be published with the abstract is Figure No. 21
  - as suggested by the applicant
  - as selected by this Authority, because the applicant failed to suggest a figure
  - as selected by this Authority, because this figure better characterizes the invention
- b.  none of the figures is to be published with the abstract

## A. CLASSIFICATION OF SUBJECT MATTER

INV. G06F21/00

According to International Patent Classification (IPC) or to both national classification and IPC

## B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

G06F G07C

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal

## C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category*	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2004/034771 A1 (EDGETT JEFF STEVEN [US] ET AL) 19 February 2004 (2004-02-19) figure 3 paragraph [0048] - paragraph [0050]	1,27-32, 38-40
X	US 2001/044900 A1 (UCHIDA KAORU [JP]) 22 November 2001 (2001-11-22) paragraph [0039]; figure 4	2-10,41, 42,67-75
X	US 2005/039027 A1 (SHAPIRO MICHAEL F [US]) 17 February 2005 (2005-02-17) abstract figure 2 paragraph [0015] - paragraph [0017] paragraph [0021] - paragraph [0022] paragraph [0024]	41-44
	----- -/--	

 Further documents are listed in the continuation of Box C. See patent family annex.

\* Special categories of cited documents :

- \*A\* document defining the general state of the art which is not considered to be of particular relevance
- \*E\* earlier document but published on or after the international filing date
- \*L\* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- \*O\* document referring to an oral disclosure, use, exhibition or other means
- \*P\* document published prior to the international filing date but later than the priority date claimed

- \*T\* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- \*X\* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- \*Y\* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- \* & \* document member of the same patent family

Applicant WEISS, Kenneth P.		

**1. This opinion contains indications relating to the following items:**

- Box No. I Basis of the opinion
- Box No. II Priority
- Box No. III Non-establishment of opinion with regard to novelty, inventive step and industrial applicability
- Box No. IV Lack of unity of invention
- Box No. V Reasoned statement under Rule 43bis.1(a)(i) with regard to novelty, inventive step or industrial applicability; citations and explanations supporting such statement
- Box No. VI Certain documents cited
- Box No. VII Certain defects in the international application
- Box No. VIII Certain observations on the international application

**2. FURTHER ACTION**

If a demand for international preliminary examination is made, this opinion will usually be considered to be a written opinion of the International Preliminary Examining Authority ("IPEA") except that this does not apply where the applicant chooses an Authority other than this one to be the IPEA and the chosen IPEA has notified the International Bureau under Rule 66.1bis(b) that written opinions of this International Searching Authority will not be so considered.

If this opinion is, as provided above, considered to be a written opinion of the IPEA, the applicant is invited to submit to the IPEA a written reply together, where appropriate, with amendments, before the expiration of 3 months from the date of mailing of Form PCT/ISA/220 or before the expiration of 22 months from the priority date, whichever expires later.

For further options, see Form PCT/ISA/220.

**3. For further details, see notes to Form PCT/ISA/220.**

IPR2018-00067

---

**Box No. I Basis of the opinion**

---

1. With regard to the **language**, this opinion has been established on the basis of:
  - the international application in the language in which it was filed
  - a translation of the international application into , which is the language of a translation furnished for the purposes of international search (Rules 12.3(a) and 23.1 (b)).
2.  This opinion has been established taking into account the **rectification of an obvious mistake** authorized by or notified to this Authority under Rule 91 (Rule 43bis.1(a))
3. With regard to any **nucleotide and/or amino acid sequence** disclosed in the international application and necessary to the claimed invention, this opinion has been established on the basis of:
  - a. type of material:
    - a sequence listing
    - table(s) related to the sequence listing
  - b. format of material:
    - on paper
    - in electronic form
  - c. time of filing/furnishing:
    - contained in the international application as filed.
    - filed together with the international application in electronic form.
    - furnished subsequently to this Authority for the purposes of search.
4.  In addition, in the case that more than one version or copy of a sequence listing and/or table relating thereto has been filed or furnished, the required statements that the information in the subsequent or additional copies is identical to that in the application as filed or does not go beyond the application as filed, as appropriate, were furnished.
5. Additional comments:

**Re Item V.**

1 Reference is made to the following documents:

- D1 : US 2004/034771 A1 (EDGETT JEFF STEVEN [US] ET AL) 19 February 2004 (2004-02-19)
- D2 : EP 0 986 209 A (MITSUBISHI ELECTRIC CORP [JP]) 15 March 2000 (2000-03-15)
- D3 : US 2001/044900 A1 (UCHIDA KAORU [JP]) 22 November 2001 (2001-11-22)
- D4 : US 2005/039027 A1 (SHAPIRO MICHAEL F [US]) 17 February 2005 (2005-02-17)

2 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 1 is not new in the sense of Article 33(2) PCT.

Document D1 discloses (the references in parentheses applying to this document):

- a) A method of authenticating an identity of a first entity (Par. 48-50).
- b) Wirelessly transmitting from a first device, first encrypted authentication information of the first entity (par. 49 lines 3-8, It is considered that the network includes wireless means that are being used in the transmission).
- c) Receiving with a second device the wirelessly transmitted first encrypted authentication information (par. 49 line 8).
- d) Decrypting with the second device, the first wirelessly encrypted authentication information to provide the first authentication information of the first entity to the second device (par. 49 lines 20-24).
- e) Authenticating the identity of the first entity based upon the first authentication information and acting based on the authenticated identity of the first entity (par. 50).

3 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 41 is not new in the sense of Article 33(2) PCT.

Document D4 discloses (the references in parentheses applying to this document):

- a) A system for validating an identity of a first entity comprising a first wireless device comprising (par. 5).
  - b) A first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted authentication information (par. 5 l.33-36).
  - c) A first processor configured to compare stored biometric data with detected biometric data of the first entity and configured to enable or disable use of the first device based on a result of the comparison, and configured to encrypt first authentication information with a first private key into the first encrypted authentication information (par. 5 l.19-21, par. 15 l.34-36, par. 16 l.7-10 and par. 17).
  - d) A first biometric detector for detecting biometric data of the first entity (par. 5 l.21-25).
  - e) A first memory for storing biometric data of the first entity, a private key of the first entity authorized to use the first device, and the first authentication information (par. 5 l.19-21).
- 4 The present application does not meet the criteria of Article 33(1) PCT, because the subject-matter of claim 67 is not new in the sense of Article 33(2) PCT.  
Document D3 discloses (the references in parentheses applying to this document):
- a) A first wireless device (par. 30 and par. 54).
  - b) A processor configured to enable operation of the first wireless device if it receives an enablement signal validating first biometric information of a first entity and configured to generate a non-predictable signal from the biometric information (par. 36 The processor generates a non-predictable signal from the biometric data when it encrypts the data.)
  - c) A first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted biometric information of the first entity and to receive the enablement signal (par. 30, 36 and 39 The enablement signal comes from the authentication server via the ECSP unit in the form of a service).
  - d) A first biometric detector for detecting the first biometric information of the first entity (par. 36).
- 5 Dependent claims 2-40, 42-66, 68-75 do not contain any features which, in

combination with the features of any claim to which they refer, meet the requirements of the PCT in respect of novelty and/or inventive step (Article 33(2) and (3) PCT).

The dependent claims contain features that are part of the common general knowledge like encryption methods, biometric data capture devices and methods for securing communications. This features represent mere implementation details that are well-known to the person skilled in the art, and will not justify an inventive activity.

It is worth to say that the application merely contains a juxtaposition of different techniques used in authentication and cryptography functioning in their normal way and not producing any non-obvious working inter-relationship that justifies an inventive activity.

## Possible steps after receipt of the international search report (ISR) and written opinion of the International Searching Authority (WO-ISA)

---

### General information

For all international applications filed on or after 01/01/2004 the competent ISA will establish an ISR. It is accompanied by the WO-ISA. Unlike the former written opinion of the IPEA (Rule 66.2 PCT), the WO-ISA is not meant to be responded to, but to be taken into consideration for further procedural steps. This document explains about the possibilities.

---

### Amending claims under Art. 19 PCT

Within 2 months after the date of mailing of the ISR and the WO-ISA the applicant may file amended claims under Art. 19 PCT directly with the International Bureau of WIPO. The PCT reform of 2004 did not change this procedure. For further information please see Rule 46 PCT as well as form PCT/ISA/220 and the corresponding Notes to form PCT/ISA/220.

---

### Filing a demand for international preliminary examination

In principle, the WO-ISA will be considered as the written opinion of the IPEA. This should, in many cases, make it unnecessary to file a demand for international preliminary examination. If the applicant nevertheless wishes to file a demand this must be done before expiry of 3 months after the date of mailing of the ISR/ WO-ISA or 22 months after priority date, whichever expires later (Rule 54bis PCT). Amendments under Art. 34 PCT can be filed with the IPEA as before, normally at the same time as filing the demand (Rule 66.1 (b) PCT).

If a demand for international preliminary examination is filed and no comments/amendments have been received the WO-ISA will be transformed by the IPEA into an IPRP (International Preliminary Report on Patentability) which would merely reflect the content of the WO-ISA. The demand can still be withdrawn (Art. 37 PCT).

---

### Filing informal comments

After receipt of the ISR/WO-ISA the applicant may file informal comments on the WO-ISA directly with the International Bureau of WIPO. These will be communicated to the designated Offices together with the IPRP (International Preliminary Report on Patentability) at 30 months from the priority date. Please also refer to the next box.

---

### End of the international phase

At the end of the international phase the International Bureau of WIPO will transform the WO-ISA or, if a demand was filed, the written opinion of the IPEA into the IPRP, which will then be transmitted together with possible informal comments to the designated Offices. The IPRP replaces the former IPEA (international preliminary examination report).

**This Acknowledgement Receipt evidences receipt on the noted date by the USPTO of the indicated documents, characterized by the applicant, and including page counts, where applicable. It serves as evidence of receipt similar to a Post Card, as described in MPEP 503.**

**New Applications Under 35 U.S.C. 111**

**If a new application is being filed and the application includes the necessary components for a filing date (see 37 CFR 1.53(b)-(d) and MPEP 506), a Filing Receipt (37 CFR 1.54) will be issued in due course and the date shown on this Acknowledgement Receipt will establish the filing date of the application.**

**National Stage of an International Application under 35 U.S.C. 371**

**If a timely submission to enter the national stage of an international application is compliant with the conditions of 35 U.S.C. 371 and other applicable requirements a Form PCT/DO/EO/903 indicating acceptance of the application as a national stage submission under 35 U.S.C. 371 will be issued in addition to the Filing Receipt, in due course.**

**New International Application Filed with the USPTO as a Receiving Office**

**If a new international application is being filed and the international application includes the necessary components for an international filing date (see PCT Article 11 and MPEP 1810), a Notification of the International Application Number and of the International Filing Date (Form PCT/RO/105) will be issued in due course, subject to prescriptions concerning national security, and the date shown on this Acknowledgement Receipt will establish the international filing date of the application.**

## UNIVERSAL SECURE REGISTRY

### CROSS REFERENCE TO RELATED APPLICATIONS

This application claims the benefit under 35 U.S.C. § 120 as a continuation of U.S. patent application No. 12/393,586 filed February 26, 2009, which is a continuation-in-part of each of U.S. patent application serial no. 11/760,732 filed June 8, 2007, now U.S. Patent No. 7,809,651; U.S. patent application serial no. 11/760,729 filed June 8, 2007, now U.S. Patent No. 7,805,372; and U.S. patent application serial no. 11/677,490 filed February 21, 2007, now U.S. Patent No. 8,001,055. This application also claims the benefit under 35 U.S.C. § 120 as a continuation-in-part of U.S. patent application no. 13/168,556 filed on June 24, 2011, which claims the benefit under 35 U.S.C. § 120 as a continuation of U.S. application no. 11/677,490. Each of U.S. application nos. 11/760,732, 11/760,729 and 11/677,490 claim priority under 35 U.S.C. § 119 (e) to U.S. Provisional Application Nos. 60/812,279 filed on June 9, 2006, and 60/859,235 filed on November 15, 2006. U.S. application no. 11/677,490 also claims priority under 35 U.S.C. § 119 (e) to U.S. Provisional Application No. 60/775,046 filed on February 21, 2006. Each of the above-identified applications is hereby incorporated herein by reference in its entirety.

Application serial no. 12/393,586 filed February 26, 2009 claims priority under 35 U.S.C. § 119(e) to U.S. Provisional Application Serial No. 61/031,529, entitled "UNIVERSAL SECURE REGISTRY," filed on February 26, 2008, which is herein incorporated by reference in its entirety.

### BACKGROUND OF INVENTION

1. Field of Invention

Embodiments of the invention generally relate to systems, methods, and apparatus for authenticating identity or verifying the identity of individuals and other entities seeking access to certain privileges and for selectively granting privileges and providing other services in response to such identifications/verifications. In addition, embodiments of the invention relate

generally to systems and methods for obtaining information from and/or transmitting information to a user device and, in particular, to systems, methods, and apparatus that provide for contactless information transmission.

5 2. Discussion of Related Art

Control of access to secure systems presents a problem related to the identification of a person. An individual may be provided access to the secure system after their identity is authorized. Generally, access control to secure computer networks is presently provided by an authentication scheme implemented, at least partly, in software located on a device being  
10 employed to access the secure computer network and on a server within the secure computer network. For example, if a corporation chooses to provide access control for their computer network, they may purchase authentication software that includes server-side software installed on a server in their computer system and corresponding client-side software that is installed on the devices that are used by employees to access the system. The devices may include desktop  
15 computers, laptop computers, and handheld computers (e.g., PDAs and the like).

In practice, the preceding approach has a number of disadvantages including both the difficulty and cost of maintaining the authentication system and the difficulty and cost of maintaining the security of the authentication system. More specifically, the software resides in the corporation's computers where it may be subject to tampering/unauthorized use by  
20 company employees. That is, the information technology team that manages the authentication system has access to the private keys associated with each of the authorized users. As a result, these individuals have an opportunity to compromise the security of the system. Further, any modification and/or upgrade to the authentication system software is likely to require an update to at least the server-side software and may also require an update of the software located on  
25 each user/client device. In addition, where the company's computer systems are geographically distributed, software upgrades/updates may be required on a plurality of geographically distributed servers.

There is also a need, especially in this post September 11 environment, for secure and valid identification of an individual before allowing the individual access to highly secure  
30 areas. For example, an FBI agent or an air marshal may need to identify themselves to airport security or a gate agent, without compromising security. Typically such identification may

comprise the air marshal or FBI agent showing identification indicia to appropriate personnel. However, there are inherent flaws in this process that allow for security to be compromised, including falsification of identification information and failure of the airport security or other personnel to recognize the situation. Of course this process could be automated, for example, 5 by equipping airport personnel or security with access to a database and requiring the FBI agent or air marshal to appropriately identify themselves to the database, for example, by again providing identification which airport personnel can then enter into the database to verify the identity of the person seeking access to a secure area. However, this process also has the inherent flaws in it as described above. In addition, there may be times when airport security 10 or personnel may not be able to communicate with the database to check the identity of the person seeking access, for example, when they are not near a computer terminal with access to a database or are carrying a hand-held device that does not have an appropriate wireless signal to access the database. In addition, there is a need to ensure that if such a hand-held device ends up the wrong hands, that security is not compromised.

15 Further, both commercial (e.g., banking networks) and non-commercial (e.g., security systems) information systems often rely on magnetic card readers to collect information specific to a user (e.g., a security code, a credit card number, etc.) from a user device (e.g., a transaction card). Credit card purchases made in person provide an example of the most common transaction-type that relies on a user device, the credit or debit card, which is read by 20 a magnetic card reader. User devices that rely on magnetic-stripe based technology magnetically store information (e.g., binary information) in the magnetic stripe. The magnetic stripe reader provides an interface to a larger computerized network that receives the user's information to determine, for example, whether to authorize a transaction, to allow the user access to a secure area, etc.

25 Recently, such devices have seen technological advances that increase their capabilities and improve their security. For example, such devices may now include embedded processors, integral biometric sensors that sense one or more biometric feature (e.g., a fingerprint) of the user, and magnetic stripe emulators. As one result, such devices may provide greater security by dynamically generating the necessary information, for example, generating the credit card 30 number at the time of a transaction. Improved security can also be provided by such devices because more sophisticated authentication schemes can be implemented with the devices.

In addition, user devices such as transaction cards may now also provide for one or more modes of information transmission other than transmission via a magnetic stripe/card reader combination. For example, user devices that may transmit information optically or via radio frequency (“RF”) signal transmission to a compatible system interface are now available. Further, the architecture of a user device that includes a processor is generally compatible with both the improved security features described above and the contactless transmission modes such as optical and RF signal transmission. As a result of the improved security and greater functionality of some current user devices, there is a desire to replace magnetic-stripe based user devices with devices that include forms of information transmission other than the reading of a magnetic-stripe.

There is, however, a substantial installed base of interfaces (for example, at points of sale, at automatic teller machines (“ATM”), and the like) that include magnetic card readers which are not equipped to receive information from a user device in any other format other than from a magnetic stripe. As a result of the cost to replace or retrofit the installed base, efforts to more-widely introduce user devices that do not employ magnetic stripe devices have not been developed. Because of the potential to substantially reduce fraud, however, the further implementation of such devices is of great interest to financial institutions among others. RF devices that transmit information wirelessly are expected to become much more prevalent and at some point, the predominant form of information transmission for user authentication based on a hand-held device, for example, credit card, debit card, drivers license, passport, social security card, personal identification, etc. Thus, new and improved methods for transitioning from a purely magnetic based form of communication to a wireless form of communication are desired.

One current approach that is intended to “transform” a smart card for use with a magnetic stripe card reader employs a “bridge” device. The bridge device requires that the smart card be inserted within it. The bridge device includes a slot for receiving the smart card, a key pad whereby the user may enter information (e.g., a PIN number), and a credit card sized extension member. Operation of the bridge device requires that the smart card be inserted within it and that an electrical contact surface of the smart card engage a similar surface within the bridge device before the bridge device (i.e., the extension member) can be used with a magnetic card reader. Thus, the contactless nature of more advanced information transmission

systems is lost with the bridge device because it does not support wireless signal transmission.

Accordingly, there is a desire for one or more devices, systems and methods for accomplishing any of the herein mentioned objectives.

5

## SUMMARY OF INVENTION

There is thus a need for an identification system that will enable a person to be accurately identified (“identification” sometimes being used hereinafter to mean either identified or verified) and/or authenticated without compromising security, to gain access to secure systems and/or areas. Likewise, there is a need for an identification system that will  
10 enable a person to be identified universally without requiring the person to carry multiple forms of identification.

Accordingly, this invention relates, in one embodiment, to an information system that may be used as a universal identification system and/or used to selectively provide information about a person to authorized users. Transactions to and from a secure database may take place  
15 using a public key/private key security system to enable users of the system and the system itself to encrypt transaction information during the transactions. Additionally, the private key/public key security system may be used to allow users to validate their identity. For example, in one embodiment, a smart card such as the Secure ID™ card from RSI Security, Inc. may be provided with the user’s private key and the USR system’s public key to enable  
20 the card to encrypt messages being sent to the USR system and to decrypt messages from the USR system 10.

The system or database of the invention may be used to identify the person in many situations, and thus may take the place of multiple conventional forms of identification. Additionally, the system may enable the user’s identity to be confirmed or verified without  
25 providing any identifying information about the person to the entity requiring identification. This can be advantageous where the person suspects that providing identifying information may subject the identifying information to usurpation.

Access to the system may be by smart card, such as a Secure ID™ card, or any other secure access device. The technology enabling the user to present their identity information  
30 may be physically embodied as a separate identification device such as a smart ID card, or may be incorporated into another electronic device, such as a cell phone, pager, wrist watch,

computer, personal digital assistant such as a Palm Pilot<sup>™</sup>, key fob, or other commonly available electronic device. The identity of the user possessing the identifying device may be verified at the point of use via any combination of a memorized PIN number or code, biometric identification such as a fingerprint, voice print, signature, iris or facial scan, or DNA analysis, or any other method of identifying the person possessing the device. If desired, the identifying device may also be provided with a picture of the person authorized to use the device to enhance security.

According to one embodiment of the invention, a method of controlling access to a plurality of secure computer networks using a secure registry system located remotely from the secure computer networks is disclosed. The secure registry system includes a database containing selected data of a plurality of users each authorized to access at least one of the plurality of secure computer networks. The method comprises acts of receiving authentication information from an entity at a secure computer network, communicating the authentication information to the secure registry system, and validating the authentication information at the secure registry system. The method also includes receiving from the secure registry system an indication of whether the entity is authorized to access the secure computer network, granting the entity access to the secure computer network when the authentication information of the entity corresponds to one of the plurality of users, and denying the entity access to the secure computer network when the authentication information of the user does not correspond to one of the plurality of users.

Another embodiment of the invention comprises a method of controlling access to a secure computer network using a secure registry system. The secure registry system includes a database containing selected data of a plurality of users authorized to access the secure computer network and selected data identifying the secure computer network. The method comprises receiving an access request including authentication information and a computer network ID from an entity, determining whether the authentication information is valid for any of the plurality of users, accessing data when the authentication information of the entity is valid for one of the plurality of users to determine whether the entity is authorized to access the computer network identified by the computer network ID, and allowing the entity to access the secure computer network when the authentication information of the entity is valid for one of

the plurality of users authorized to access the computer network identified by the computer network ID.

Another embodiment of the invention comprises a method of authenticating an identity of a first entity. The method comprises the acts of wirelessly transmitting from a first device, first encrypted authentication information of the first entity, receiving with a second device the wirelessly transmitted first encrypted authentication information, decrypting with the second device, the first wirelessly encrypted authentication information to provide the first authentication information of the first entity to the second device; and authenticating the identity of the first entity based upon the first authentication information; and acting based on the assessed identity of the first entity.

Another embodiment of the invention comprises a system for authenticating an identity of a first entity, comprising a first wireless device comprising a first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted authentication information, a first processor configured to compare stored biometric data with detected biometric data of the first entity and configured to enable or disable use of the first device based on a result of the comparison, and configured to encrypt first authentication information with a first private key of the first entity into the first encrypted authentication information, a first biometric detector for detecting biometric data of the first entity, and a first memory for storing biometric data of the first entity, a private key of the first entity authorized to use the first device, and the first authentication information.

According to some embodiments, the system further comprises a second wireless device comprising a second wireless transmitter and receiver configured to receive the first wireless signal and to process the first wireless signal, a second processor configured to compare detected biometric data of a second entity with stored biometric data and configured to enable or disable use of the second device based upon a result of the comparison, and configured to decrypt the first authentication information received in the first wireless signal, a biometric detector for detecting biometric data of a second entity, and a second memory storing biometric data of the second entity and a plurality of public keys of a plurality of first entities.

Another embodiment of the invention provides a first wireless device comprising a processor configured to enable operation of the first wireless device if it receives an

enablement signal validating first biometric information of a first entity and configured to generate a non-predictable signal from the biometric information, a first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted biometric information of the first entity and to receive the enablement signal, and a first biometric  
5 detector for detecting the first biometric information of the first entity.

In one aspect of the invention, a device converts a wireless transaction device to a magnetic-stripe emulator device. In one embodiment, the device includes a wireless signal receiver that is configured to receive a wireless signal and provide information from the wireless signal. In addition, the device may include a magnetic-stripe emulator which is  
10 communicatively coupled to the wireless signal receiver and adapted to provide a time-varying signal which emulates data provided by a magnetic-stripe card to a magnetic card reader in response to receiving the information from the wireless signal. In one embodiment, the device includes a processor communicatively coupled to the wireless signal receiver and to the magnetic-stripe emulator. The device may also include an LED. In a version of this  
15 embodiment, the processor is configured to control the LED to indicate that the device is properly aligned with the magnetic card reader. In another embodiment, the device includes an output device that can provide information to a network or to a network device. In a version of this embodiment, the output device is a wireless transmitter device.

Further embodiments of the invention may include additional features, for example, in  
20 one embodiment the output device is a data port to which the device can provide data to a network or to a network device. In a version of this embodiment, the data port is also configured to receive data from the network or the network's device. In a further embodiment, the device is configured to communicate with the magnetic card reader via the data port.

In a further embodiment, the wireless receiver and/or processors configure, decrypt and  
25 encrypt the wireless signal. In a further embodiment, the processor is configured to determine whether a user is authorized to provide the information contained within the wireless signal from data within the wireless signal. In a version of this embodiment, the data contained within the wireless signal includes user ID information. In yet another embodiment, the data contained within the wireless signal includes biometric information of the user.

30 According to another aspect, the invention provides a system for validating an identity of a user to enable or prevent an occurrence of an event. In one embodiment, the system

includes a first device including a wireless transmitter which is configured to transmit validation information, a second device including a wireless receiver, where the second device is configured to receive the validation information and further transmit the validation information; and a secure system in communication with the second device. According to one  
5 embodiment, the secure system includes a database. In a further embodiment, the secure system is configured to receive the validation information transmitted from the second device, and to transmit additional information to the second device following a receipt of the validation information to assist the second device in either enabling or preventing the occurrence of the event. In various embodiments, the event that is enabled or prevented may be a transaction  
10 (e.g., a financial transaction), access control (e.g., physical or electronic access) or other action that is either enabled or prevented.

According to a further aspect, the invention provides a method employing a system to validate an identity of a user to enable or prevent an occurrence of an event. In one embodiment, the system includes a first device, a second device and a secure system including  
15 a database. According to one embodiment, the method includes acts of receiving at the second device validation information wirelessly transmitted from the first device, communicating the validation information from the second device to the secure system, and receiving at the second device additional information from the secure system. In a further embodiment, the additional information assists the second device in either enabling or preventing the occurrence  
20 of the event. In various embodiments, the event that is enabled or prevented may be a transaction (e.g., a financial transaction), access control (e.g., physical or electronic access) or other action that is either enabled or prevented.

In still another aspect, a user device is configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction. In one  
25 embodiment, the user device includes a biometric sensor configured to receive a biometric input provided by the user, a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts. In a further embodiment, the user device includes a communication link configured to communicate with a secure registry, and a processor  
30 coupled to the biometric sensor to receive information concerning the biometric input, the user interface, and the communication link. According to one embodiment, the processor is

configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry.

5           In accordance with another aspect, a method of generating authentication information includes acts of authenticating an identity of a user to a device based on at least one of biometric data received by the device from the user and secret information known to the user and provided to the device. The method can also include the generation of a non-predictable value with the device. The method can further include acts of receiving identifying  
10 information from the user concerning a selected one of a plurality of user accounts and generating encrypted authentication information from the non-predictable value, the identifying information, and at least one of the biometric data and the secret information. In a further embodiment, the device can generate encrypted authentication information from each of the non-predictable value, the biometric data, the secret information, and the identifying  
15 information.

          According to a still further aspect, a method of controlling access to a plurality of accounts is provided where the method includes acts of generating, with a device, encrypted authentication information from a non-predictable value generated by the device, identifying information concerning an account selected by a user of the device from among a plurality of  
20 accounts associated with the user, and at least one of a biometric of the user received by the device and secret information provided to the device by the user, communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry, authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account  
25 selected by the user when the encrypted authentication information is successfully authenticated, and denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

### BRIEF DESCRIPTION OF DRAWINGS

This invention is pointed out with particularity in the appended claims. The above and further advantages of this invention may be better understood by referring to the following description when taken in conjunction with the accompanying drawings. The accompanying drawings are not intended to be drawn to scale. In the drawings, each identical or nearly identical component that is illustrated in various figures is represented by a like numeral. For purposes of clarity, not every component may be labeled in every drawing. In the drawings:

FIG. 1 is a functional block diagram of a computer system configured to implement the universal secure registry (“USR”), including a USR database, according to one embodiment of the invention;

FIG. 2 is a functional block diagram of a first embodiment of a networked environment including the computer system of FIG. 1;

FIG. 3 is a functional block diagram of an entry of a database forming the USR database of FIG. 1;

FIG. 4 is a functional block diagram of a second embodiment of a networked environment including the computer system of FIG. 1;

FIG. 5 is a flow chart illustrating steps in a process of inputting data into the USR database;

FIG. 6 is a flow chart illustrating steps in a process of retrieving data from the USR database;

FIG. 7 is a flow chart illustrating a first protocol for purchasing goods from a merchant via the USR database without transmitting credit card information to the merchant;

FIG. 8 is a flow chart illustrating a second protocol for purchasing goods from a merchant via the USR database without transmitting credit card information to the merchant;

FIG. 9 is a flow chart illustrating a protocol for purchasing goods from a merchant via the USR database by validating the user’s check;

FIG. 10 is a flow chart illustrating a protocol for purchasing goods from an on-line merchant via the USR database without transmitting credit card information to the on-line merchant, and enabling the on-line merchant to ship the goods to a virtual address;

FIG. 11 is a flow chart illustrating a protocol for shipping goods to a virtual address via the USR database;

FIG. 12 is a flow chart illustrating a protocol for telephoning a virtual phone number via the USR database;

FIG. 13 is a flow chart illustrating a protocol for identifying a person via the USR database;

5 FIG. 14 is a flow chart illustrating a protocol for identifying a person to a policeman via the USR database;

FIG. 15 is a flow chart illustrating a protocol for providing information to an authorized recipient of the information via the USR database;

10 FIG. 16 is a flow chart illustrating a protocol for providing application information to an authorized recipient of the information via the USR database;

FIG. 17 is a functional block diagram of an embodiment configured to use information in the USR system to activate or keep active property secured through the USR system; and

FIG. 18A is a functional block diagram of an embodiment configured to use the USR system to control access to a secure computer network;

15 FIG. 18B is a functional block diagram of another embodiment configured to use the USR system to control access to a secure computer network;

FIG. 19 is a flow diagram of a process for controlling access to a secure computer network with the USR system in accordance with an embodiment of the invention;

20 FIG. 20 is a flow diagram of a process for controlling access to a secure computer network with the USR system in accordance with another embodiment of the invention;

FIG. 21 illustrates an embodiment of a system for validating the identity of an individual;

FIGS. 22A and 22B illustrate one embodiment of a process for validating the identity of an individual;

25 FIG. 23 illustrates one embodiment of various fields included within a first wireless signal and a second wireless signal as transmitted by the system of FIG. 21;

FIG. 24 illustrates one embodiment of a process for verifying or authenticating the identity of a first user of a first wireless transmission device;

30 FIG. 25 illustrates another embodiment of a process for authenticating the identity of a first user of a wireless transmission device;

FIG. 26 illustrates still another embodiment of a process for authenticating the identity of a first user of a wireless transmission device; and

FIG. 27 illustrates one embodiment of a data structure that can be used by any wireless device of the system of FIG. 21;

5 FIG. 28 illustrates a system in accordance with one embodiment of the invention;

FIG. 29 illustrates a process in accordance with an embodiment of the invention;

FIGS. 30A-30D illustrate a converter device in accordance with one embodiment of the invention; and

FIG. 31 illustrates a further embodiment of a system that employs the USR system.

10

#### DETAILED DESCRIPTION

This invention is not limited in its application to the details of construction and the arrangement of components set forth in the following description or illustrated in the drawings. The invention is capable of other embodiments and of being practiced or of being carried out in various ways. Also, the phraseology and terminology used herein is for the purpose of  
15 description and should not be regarded as limiting. The use of “including,” “comprising,” or “having,” “containing”, “involving”, and variations thereof herein, is meant to encompass the items listed thereafter and equivalents thereof as well as additional items.

In one embodiment, an information system is formed as a computer program running  
20 on a computer or group of computers configured to provide a universal secure registry (USR) system. The computer, in this instance, may be configured to run autonomously (without the intervention of a human operator), or may require intervention or approval for all, a selected subset, or particular classes of transactions. The invention is not limited to the disclosed embodiments, and may take on many different forms depending on the particular requirements  
25 of the information system, the type of information being exchanged, and the type of computer equipment employed. An information system according to this invention, may optionally, but need not necessarily, perform functions additional to those described herein, and the invention is not limited to a computer system performing solely the described functions.

In the embodiment shown in FIG. 1, a computer system 10 for implementing a USR  
30 system according to the invention includes at least one main unit 12 connected to a wide area network, such as the Internet, via a communications port 14. The main unit 12 may include

one or more processors (CPU 16) running USR software 18 configured to implement the USR system functionality discussed in greater detail below. The CPU 16 may be connected to a memory system including one or more memory devices, such as a random access memory system RAM 20, a read only memory system ROM 22, and one or more databases 24. In the  
5 illustrated embodiment, the database 24 contains a universal secure registry database. The invention is not limited to this particular manner of storing the USR database. Rather, the USR database may be included in any aspect of the memory system, such as in RAM 20, ROM 22 or disc, and may also be separately stored on one or more dedicated data servers.

The computer system may be a general purpose computer system which is  
10 programmable using a computer programming language, such as C, C++, Java, or other language, such as a scripting language or even assembly language. The computer system may also be specially programmed, special purpose hardware, an application specific integrated circuit (ASIC) or a hybrid system including both special purpose components and programmed general purpose components.

15 In a general purpose computer system, the processor is typically a commercially available microprocessor, such as Pentium series processor available from Intel, or other similar commercially available device. Such a microprocessor executes a program called an operating system, such as UNIX, Linux, Windows NT, Windows 95, 98, or 2000, or any other commercially available operating system, which controls the execution of other computer  
20 programs and provides scheduling, debugging, input/output control, accounting, compilation, storage assignment, data management, memory management, communication control and related services, and many other functions. The processor and operating system defines a computer platform for which application programs in high-level programming languages are written.

25 The database 24 may be any kind of database, including a relational database, object-oriented database, unstructured database, or other database. Example relational databases include Oracle 81 from Oracle Corporation of Redwood City, California; Informix Dynamic Server from Informix Software, Inc. of Menlo Park, California; DB2 from International Business Machines of Armonk, New York; and Access from Microsoft Corporation of  
30 Redmond, Washington. An example object-oriented database is ObjectStore from Object Design of Burlington, Massachusetts. An example of an unstructured database is Notes from

the Lotus Corporation, of Cambridge, Massachusetts. A database also may be constructed using a flat file system, for example by using files with character-delimited fields, such as in early versions of dBASE, now known as Visual dBASE from Inprise Corp. of Scotts Valley, California, formerly Borland International Corp.

5           The main unit 12 may optionally include or be connected to an user interface 26 containing, for example, one or more input and output devices to enable an operator to interface with the USR system 10. Illustrative input devices include a keyboard, keypad, track ball, mouse, pen and tablet, communication device, and data input devices such as voice and other audio and video capture devices. Illustrative output devices include cathode ray tube  
10 (CRT) displays, liquid crystal displays (LCD) and other video output devices, printers, communication devices such as modems, storage devices such as a disk or tape, and audio or video output devices. Optionally, the user interface 26 may be omitted, in which case the operator may communicate with the USR system 10 in a networked fashion via the communication port 14. It should be understood that the invention is not limited to any  
15 particular manner of interfacing an operator with the USR system.

          It also should be understood that the invention is not limited to a particular computer platform, particular processor, or particular high-level programming language. Additionally, the computer system may be a multiprocessor computer system or may include multiple computers connected over a computer network. It further should be understood that each  
20 module or step shown in the accompanying figures and the substeps or subparts shown in the remaining figures may correspond to separate modules of a computer program, or may be separate computer programs. Such modules may be operable on separate computers. The data produced by these components may be stored in a memory system or transmitted between computer systems.

25           Such a system may be implemented in software, hardware, or firmware, or any combination thereof. The various elements of the information system disclosed herein, either individually or in combination, may be implemented as a computer program product, such as USR software 18, tangibly embodied in a machine-readable storage device for execution by the computer processor 16. Various steps of the process may be performed by the computer  
30 processor 16 executing the program 18 tangibly embodied on a computer-readable medium to perform functions by operating on input and generating output. Computer programming

languages suitable for implementing such a system include procedural programming languages, object-oriented programming languages, and combinations of the two.

As shown in FIG. 2, the computer system 10 may be connected to a plurality of interface centers 27 over a wide area network 28. The wide area network 28 may be formed from a plurality of dedicated connections between the interface centers 27 and the computer system 10, or may take place, in whole or in part, over a public network such as the Internet. Communication between the interface centers 27 and the computer system 10 may take place according to any protocol, such as TCP/IP, ftp, OFX, or XML, and may include any desired level of interaction between the interface centers 27 and the computer system 10. To enhance security, especially where communication takes place over a publicly accessible network such as the Internet, communications facilitating or relating to transmission of data from/to the USR database 24 or the computer system 10 may be encrypted using an encryption algorithm, such as PGP, DES, or other conventional symmetric or asymmetric encryption algorithm.

In one embodiment, the USR system 10 or USR database 24 may be able to authenticate its identity to a user or other entity accessing the system by providing an appropriate code which may be displayed on the user's smart card, for example a SecurID™ card or its equivalent, or other code generator, for example a single use code generator, being employed by the user. A comparison by the user or the code generator between the provided number and an expected number can validate, to the user (or other entity) or the code generator, that communication is with the database and not an imposter. In another embodiment, a challenge-response protocol is employed to authenticate the identity of the USR system and/or the user to the other.

The database 24 shown in FIG. 1 has a USR database containing entries related to persons 1-n. The data in the USR database may also be segregated, as shown in FIG. 4, according to data type to enable individual computer modules to handle discrete applications on discrete data types. Segregating the data, as illustrated in FIG. 4, may make access to the database more robust by enabling portions of the data in the USR database 24 to be accessible even when it is necessary to perform maintenance on a portion of the database. However, storing the data in the USR database 24 according to the scheme illustrated in FIG. 1 may make it easier for a user of the database to make changes to multiple types of data simultaneously or in a single session. There are advantages and disadvantages to each data

structure, and the invention is not limited to a particular manner of organizing the data within the database 24, data structures other than the two shown also being possible.

As shown in FIG. 3, each entry 30 in the database 24 may contain multiple types of information. For example, in the embodiment shown in FIG. 3, the entry contains validation  
5 information 32, access information 34, publicly available information 36, address information 38, credit card and other financial information 40, medical information 42, job application information 44, and tax information 46. The invention is not limited to a USR containing entries with all of this information or only this particular information, as any information on a person or other entity such as a company, institution, etc. may be stored in USR database 24.

10 If the database information is split between multiple databases, each database will typically include at least the validation and access information to enable the USR software to correlate a validation attempt with a verified validation, and to enable the USR software to determine access privileges to the requested data. Alternatively, databases may be linked to permit information not in a main USR database to be retrieved, with validation/identification  
15 for all databases accessed being done at the USR system.

In FIG. 3, the validation information is information about the user of the database to whom the data pertains and is to be used by the USR software 18 to validate that the person attempting to access the information is the person to whom the data pertains or is otherwise authorized to receive it. The validation information may be any type of information that will  
20 reliably authenticate the identity of the individual. For example, in some embodiments, the information may include any of a secret known by the user (e.g., a pin, a phrase, a password, etc.), a token possessed by the user that is difficult to counterfeit (e.g., a secure discrete microchip), and/or a measurement such as a biometric (e.g., a voiceprint, a fingerprint, DNA, a retinal image, a photograph, etc.).

25 The user's identifying information may be manually entered or scanned at the interface center. However, a variety of types of communication may be employed to communicate the user's identifying information from the identification card or token to the computer system. For example, near field signal may be employed to communicate information between the identification card or token and the computer system 10. According to one embodiment, the  
30 user's identifying information is included in (or entered via) the user's cell phone where it is

then communicated to the computer system 10. In one embodiment, the cell phone is also configured to receive information from the computer system 10 at the interface center 27.

In one embodiment, the user of the database will carry a SecurID™ card available from RSA Security, formerly Security Dynamics Technologies, Inc., of Cambridge, MA. Use of this card enables secure access to the USR database without requiring the user to transmit any personal information. Specifically, to access the USR database, the card retrieves a secret user code and/or time varying value from memory and obtains from the user a secret personal identification code. The card mathematically combines these three numbers using a predetermined algorithm to generate a one-time nonpredictable code which is transmitted to the computer system 10. The computer system, specifically USR software 18, utilizes the received one-time nonpredictable code to determine if the user is authorized access to the USR database and grants access to the USR database if the user is determined to be authorized. The verification information 32 in the database entry in the embodiment of the invention illustrated in FIG. 3 contains information to enable the USR software 18 to validate the user using such a card in this manner.

Alternative types of identification cards or tokens may likewise be used. For example, other smart cards may be used which generate non-predictable single use codes, which may or may not be time varying, or other access code generators may be used. An algorithm generating such non-predictable codes may also be programmed onto a processor on a smart card or other computing device, such as a cell phone, pager, ID badge, wrist watch, computer, personal digital assistant, key fob, or other commonly available electronic device. For convenience, the term “electronic ID device” will be used generically to refer to any type of electronic device that may be used to obtain access to the USR database.

Likewise, various types of biometric information may be stored in the verification area of the database entry to enable the identity of the user possessing the identifying device to be verified at the point of use. Examples of the type of biometric information that may be used in this situation includes a personal identification number (PIN), fingerprint, voice print, signature, iris or facial scan, or DNA analysis. If desired, the verifying section of the database may contain a picture to be transmitted back to the person seeking to validate the device to ensure the person using the device is the correct person. Optionally, the identifying device

itself may also be provided with a picture of the person authorized to use the card to provide a facial confirmation of the person's right to use the card.

Further, a challenge-response protocol may be employed in combination with or as an alternative to the preceding to validate the person attempting to access the information.

5 Various embodiments may employ a challenge-response protocol with or without an identification card.

In FIG. 3, the Access information 34 is provided to enable different levels of security to attach to different types of information stored in the entry 30 in the USR database 14. For example, the person may desire that their address information be made available only to certain  
10 classes of people, for example colleagues, friends, family, Federal Express, U.P.S., and the U.S. mail service. The names or universal identifiers for those selected individuals, companies, organizations and/or agencies may be entered into appropriate fields in the Access information to specify to the USR software 18 those individuals to whom the address information may be released. Likewise, access fields may be specified for the other types of  
15 information. For example, the individual may specify that only particular individuals and/or companies have access to the credit card and other financial information 40, medical information 42, job application information 44 and tax information 46. Additionally, the individual may specify that no one have access to that information unless the individual participates in the transaction (see FIG. 6).

20 As shown in FIG. 1, the USR software 18 contains algorithms for execution by the CPU 16 that enables the CPU 16 to perform the methods and functions of the USR software described below in connection with Figs. 5-16. The USR software 18, in this embodiment, performs all functions associated with validating an electronic ID card. If desired, a separate validation software module may be provided to validate electronic ID devices outside of a  
25 firewall segregating the validation information from other user information.

This algorithm comprising the USR software 18 may be used to implement, in one exemplary embodiment, a USR system configured to enable selected information to be disseminated to selected individuals in a secure and dynamic fashion. This information may be used for numerous purposes, several of which are set forth below and discussed in greater  
30 detail in connection with Figs. 5-16.

For example, the USR system may be used to identify the person, enable the person to be contacted by telephone or mail anonymously, enable the person to be contacted by telephone or by mail without revealing the person's telephone number or present location, enable the person to purchase items over the Internet or in a store without revealing to the merchant any personal identification information or credit card information, enable the person to complete a job application without completing a job application form, enable the police to discern the person's identity and any outstanding warrants on the individual, and numerous other uses. The invention is not limited to these several enumerated uses, but rather extends to any use of the USR database. The methods of using the USR database 24 will now be discussed in connection with Figs. 5-16.

FIG. 5 illustrates a method of training the USR database 24. As shown in FIG. 5, the USR software 18 first validates the person's identification (500). The initial validation of the person's identification (500) may take place at the point of sale of an electronic ID device (for example, a smart card). This may be done in any conventional manner, such as by requiring the person to show a government issued identification card, passport, birth certificate, etc. Once the person's electronic ID device has been issued and initially validated, the validation process proceeds as discussed above.

After the validation process (500), the USR software 18 determines if the person has rights to enter data into the system (502). This step enables the system to charge persons for maintaining information in the USR database 24. For example, the USR software 18 may poll a database of current accounts or a database of accounts that are currently in default to determine if the person has paid the access fee to enter data into the database. A similar account status inquiry process may be performed by the USR software 18 in connection with each of the other methods set forth in Figs. 6-16. If the person is not authorized to enter data into the USR database 24, the person is notified of the status of their account and the process returns (512) to wait for further input from another person. Alternatively, a person may be permitted to enter some classes of data into the system and update such classes of data at no charge, with a fee possibly being required for other classes of data, for example medical records. This would facilitate a more robust database.

If the person is authorized, the USR software 18 then enables the person to enter basic personal data into the USR database 24 (504). Optionally, personal data may be one class of

data the USR software 18 allows the person to enter into the USR database 18 regardless of account status, i.e., for free.

The USR software 18 will then check to see if the person has additional rights to enter additional data (506), such as data to be entered into one of the other categories of data in FIG. 3. 5 3. Optionally, this step of checking the person's rights to enter data (506) may be combined with the initial check (502). If the person does not have rights to enter any further data, the USR software 18 notifies the user and returns (512).

If the USR software 18 determines that the person has the right to enter additional data into the USR database 24, the person is prompted through the use of appropriate prompts, 10 provided with forms, and otherwise enabled to enter advanced personal data into the USR database 24 (508). For each type of data entered, the person is asked to specify the type of access restrictions and/or whom should be allowed to access the advanced personal data (510). When the person has completed entering data into the database, the process returns (512) and commits the data to the database.

15 In the situation where only one person has access to enter and/or modify data for a given person in the database, there should be no conflict with committing data to the database. If, however, multiple people have access to a given account to modify data, the database may perform an integrity check to ensure the absence of conflict in the data before committing the new data to the database.

20 Enabling access to the information in the database will be explained in greater detail in connection with FIG. 6. As shown in FIG. 6, the database will generally allow anyone to access basic personal data on anyone without performing any authorization check (600).

If information beyond that specified in the basic personal information area is requested, the USR software 18 queries whether the requestor has the right to access the type of requested 25 data (602). The process of determining the requestor's rights (602) typically involves validating the requestor's identity and correlating the identity, the requested information and the access information 34 provided by the person to the USR database during the training process described above with respect to FIG. 5.

If the USR software 18 determines that the requestor has rights to access the type of 30 requested data (604), the USR software 18 instructs the USR database 24 to enable access to the type of requested data (606). The actual step of enabling access to the type of requested

data may involve multiple steps of formulating a database query, querying the USR database 24, retrieving the results, assembling the results into a user friendly or user readable format, and transmitting the information to the user.

If the USR software 18 determines that the requestor does not have the appropriate 5 rights to access the type of requested data (604), the USR software 18 checks to see if the person is participating in the transaction (608). Checking to see if the person is participating in the transaction enables the user to authorize access to the requested data in real time. For example, a person may wish to participate in a transaction to give a potential employer one-time access to job application information 44 (see FIG. 3). If the person is not participating in 10 the transaction, the USR software 18 determines that the requestor is not authorized to have access to the requested data, notifies the requestor of this determination, and ends (610).

If the person is participating in the transaction (608), however, the USR software 18 validates the person's identity (612) and enables the person to change access rights to the data (614). If the USR software 18 is not able to validate the person's identity, the USR software 15 18 refuses to allow the person to update the database, notifies the person and/or requestor of this determination, and returns (610).

It is also possible that a person may be required to grant access to certain data, for example financial data such as account numbers, under duress. The system may provide the person with the ability to safely signal this when accessing the system by using a selected 20 access code or by making a known modification to the access code provided by the electronic ID device. On receiving such code, the system would take appropriate steps to protect the person, including for example alerting the police, tracking the person's location to the extent possible, providing traceable data, and the like.

Once the person has had the opportunity to change access rights to the data (614), the 25 USR software 18 again checks to see if the requestor has rights to access the type of requested data (616). Although step 616 may seem redundant, given the fact that the person is participating in the transaction and has just previously changed access rights to the database to enable the requestor to have access to the data, step 616 is actually useful at preventing a different type of fraud. Specifically, the requestor may not be forthright with the person 30 regarding the type of information they are requesting. If step 616 were omitted, the USR

software 18 may inadvertently allow access to an unauthorized type of information in the situation where the requestor has surreptitiously requested multiple types of data.

If the USR software 18 determines that the requestor has rights to the type of data requested (616), it causes the USR database to enable access to the type of requested data (606). Otherwise, it notifies the requestor of the decision to deny access to the requested data and returns (610).

Various applications of the USR database 24 and USR software 18 will now be discussed in connection with Figs. 7-16. These applications are merely exemplary of the types of applications enabled by the USR software 18 and USR database 24, and the invention is not limited to these particular applications.

Figure 7 illustrates one embodiment of a method of using the USR software 18 and USR database 24 to purchase goods or services from a merchant without revealing to the merchant account information relating to the person's bank or credit card.

As shown in FIG. 7, when a user initiates a purchase (700), the user enters a secret code in the user's electronic ID device (702) to cause the ID device to generate a onetime code or other appropriate code, and presents the electronic ID device with the code to the merchant or otherwise presents the code to the merchant. The merchant transmits to the credit card company (1) the code from the electronic ID device, (2) the store number, (3) the amount of the purchase (704), and the time of receipt of the code. The credit card company takes this information and passes the code from the electronic ID device to the USR software 18 (706). The USR software 18 determines if the code is valid, or was valid at the time offered, and if valid accesses the user's credit card information and transmits the appropriate credit card number to the credit card company (708). While the link between the USR system and the credit card system is a secure link, there is always a danger that the link may be penetrated and credit card numbers obtained. This may be avoided by instead transmitting, on approval, a multidigit public ID code for the credit card holder which the credit card company can map to the correct credit card number. Even if the link is violated, the public ID code is of no value and the secure link prevents this code from being improperly sent to the credit card company. The credit card company checks the credit worthiness of the user and declines the card or debits the user's account in accordance with its standard transaction processing system (710). The credit card company then notifies the merchant of the result of the transaction (712). In

this embodiment, the user has been able to purchase goods or services from a merchant without ever providing to the merchant the credit card number. Since the electronic ID device generates a time variant code or otherwise generates a code that can for example only be used for a single transaction, the merchant retains no information from the transaction that may be fraudulently used in subsequent transactions.

Another embodiment of a system for facilitating purchase of goods or services without providing financial information to the merchant is set forth in FIG. 8. In FIG. 8, like FIG. 7, the user initiates a purchase (800), enters a secret code in the electronic ID device (802) and presents the resultant code to the merchant. The merchant, in this embodiment, transmits to the 10 USR software 18, (1) the code from the electronic ID, (2) the store number, and (3) the amount of the purchase (804). The USR software 18 determines if the code is valid (806) and, if valid, accesses from the USR database 24 the user's credit card information (808). The USR software then transmits to the credit card company (1) the credit card number, (2) the store number, and (3) the amount of purchase (808). The information in this embodiment 15 transmitted to the credit card company is intended to be in a format recognizable to the credit card company. Accordingly, the invention is not limited to transferring from the USR system 10 to the credit card company the enumerated information, but rather encompasses any transfer of information that will enable the use of the USR system 10 to appear transparent to the credit card company.

20 The credit card company then processes the transaction in a standard fashion, such as by checking the credit worthiness of the person, declining the card or debiting the user's account and transferring money to the merchant's account (810). The credit card company then notifies the USR system 10 the result of the transaction (812) and the USR software 18 in turn notifies the merchant of the result of the transaction (814).

25 In this embodiment, like the embodiment of FIG. 7, the user can use the USR system 10 to purchase goods or services from a merchant without providing the merchant with the user's credit card number. In the embodiment of FIG. 8, the interposition of the USR system 10 between the merchant and the credit card company is transparent to the credit card company and thus requires no or minimal cooperation from the credit card company to implement.

30 FIG. 9 illustrates one embodiment of a method of using the USR system 10 to verify funds when using a check to purchase goods or services from a merchant. In the embodiment

of FIG. 9, the user initiates a purchase and writes a check to the merchant (900). The check may be a conventional check containing identifying information, or may be a check bearing a unique serial number and no identifying information to enable the check to be used anonymously.

5           In either situation, the user enters a secret code into the electronic ID card and presents the resulting code to the merchant along with the check (902). The merchant transmits to the USR software 18 (1) the code from the electronic ID card, (2) the store number, and (3) the amount of the purchase (904). Where the check is an anonymous check, the merchant also transmits to the USR software 18 the check number.

10           The USR software 18 then determines if the code from the electronic ID is valid (906), and if valid accesses the user's bank information and transmits to the bank: (1) the user's bank account number, (2) the store number, and (3) the amount of the purchase (908). Optionally, the USR software 18 may additionally inform the bank of the check number.

          The bank polls its own database to determine if there are sufficient funds in the user's  
15   account (910) and notifies the USR software 18 of the result (912). The USR software 18 then, in turn, notifies the merchant of the result of the verification (914).

          This check verification system may take place over an unsecured connection between the merchant and the USR system 10 since the user's bank account information is not sent over the connection between the merchant and the USR system 10. Moreover, where an anonymous  
20   check is used, the merchant is not even provided with the person's name or account information in written form. This provides additional security against unauthorized persons writing subsequent checks.

          The check verification system may be conducted over a telephone network, such as by having the merchant call a toll free number or over a network connection such as over the  
25   Internet.

          FIG. 10 illustrates a method of conducting a transaction with a merchant without requiring the user to provide to the merchant the user's name, address, or other identifying information, while enabling the merchant to ship the goods to the user. This may be beneficially employed, for example, in connection with transactions that take place between  
30   remote parties in a networked environment, such as the Internet.

As shown in FIG. 10, the user initiates an anonymous purchase by entering a secret code into the electronic ID device and transmitting the result to the on-line merchant (1000). The merchant transmits this information to the USR software 18, along with the store number and the amount of the purchase (1002). Optionally, the merchant may provide the store  
5 number and purchase price to the user and the user may send this information directly to the USR software 18 along with the code from the electronic ID. Where the number from the electronic ID device is a time varying number, the merchant may also need to input the time the number was received. Alternatively, the electronic ID device may encode or encrypt the time with the number, the USR software being able to extract time when receiving the number  
10 from the merchant. This may not be required where the time varying number varies slowly, for example changing every hour rather than every minute as with some devices.

In either event, the USR software 18 determines if the code is valid (1004) and, if valid, accesses the user's credit card information from the USR database 24 (1006). The USR software 18 then contacts the user's credit card company, as described above in connection  
15 with FIG. 8 (1008) and notifies the USR software 18 of the result (1010).

If the user's credit is declined, the USR software 18 notifies the on-line merchant and the transaction is terminated (1012). If the user's credit is honored, the USR software 18 polls the USR database 24 for the user's address and/or address code (1014). Address codes are discussed below in greater detail with reference to FIG. 11. The merchant then packages the  
20 goods into a parcel, labels the parcel with the appropriate address and/or address code and ships the parcel to the user (1016). Having the USR system 10 provide the address and/or address code to the on-line merchant enables the user to purchase items in a networked environment without requiring the user to input address information in connection with every sale.

FIG. 11 illustrates a use of the USR database 24 to deliver mail to a user without  
25 requiring the user to provide address information to the sender. This may be useful in many contexts. For example, the user may wish that the address information be known only by the post office. In this instance, using the USR database 24 according to the method of the invention described below will enable the user to receive parcels without requiring the user to  
30 provide the merchant with the address information. Additionally, the user's address may change, temporarily, permanently, or frequently. Enabling the sender to send mail by entering

a code instead of an address enables the post office to effectively deliver the coded mail to the corresponding address regardless of the frequency with which the address changes or the duration in which the address will remain valid.

In FIG. 11, the user provides an address code on a public area of the USR database 24 that is available to all persons to see (1100). This code may for example be six alpha  
5 characters, which should be adequate for currently anticipated system populations. Optionally, the user may provide this code directly to a merchant or other person desirous of sending the person one or more parcels.

The user also provides address information to the address information area 38 of the  
10 user's entry in the USR database 24 (1102). Access to the address information 38 is restricted by a rule or other appropriate entry in the access information 34 of the user's entry to only permit mail, parcel or other material delivery services, such as the US mail, UPS and Fed Ex to access the address information.

When someone wishes to have a parcel or other items delivered to the user, the sender  
15 retrieves the user's address code from the USR database 24 or otherwise receives the address code from the user, and prints the address code on the parcel (1104).

The delivery service accesses the USR software 18, validates its identity, and queries the USR database 24 for address information corresponding to the address code (1106). The USR database 24 retrieves the appropriate address data and provides the address information to  
20 the delivery service. The delivery service then either prints out an address label, prints a machine readable bar code to be attached to the package, or correlates an entry in a delivery database between the address code and the user address (1110). The delivery service then uses this retrieved information to deliver the package to the user while never supplying the merchant with the user's permanent or temporary address. A user may also assure that mail,  
25 parcels, etc. are delivered to a current location by providing only a single notice to the USR system, regardless of how frequently the person moves. The person can also automatically provide for address changes where the person moves according to a known schedule. Thus, deliveries to be made on a weekday could be directed to one address and deliveries on a  
30 weekend to another address; or deliveries during winter months to one address and during summer months to a different address.

FIG. 12 illustrates a method of enabling a person to telephone a user of the USR system 10 without providing the user's telephone number to the person. In the embodiment illustrated in FIG. 12, the user provides a telephone code on the publicly available area of his entry on the USR database 24 (1200). This code may be assigned by the USR software 18 or made up by the user. The user also provides the USR database 24 with actual telephone information to enable the USR system 10 to connect callers with the user (1202).

The person wishing to telephone the user of the USR system 10 calls a telephone number and enters the telephone code of the user (1204). The USR software 18, optionally, may require the person to identify themselves to see if they are authorized to call the user. Assuming that the person is authorized to call the person, or if no authorization check is performed, the USR connects the person to the telephone number in the USR database 24 without providing the person with the telephone number.

Enabling the user to specify the telephone number may be advantageous for many reasons. First, the user may frequently be switching between telephone coverage areas and may wish to be reachable at all times. Simply by instructing the USR database 24 to connect incoming telephone calls to one of a myriad of numbers will facilitate connecting the incoming calls to, for example, the user's cell phone, work phone, pager, car phone or home phone, without necessitating the user to provide all these numbers to the caller. A similar system may be implemented for facsimile transmissions, e-mails or other communications.

The user also may have predefined rules to enable telephone calls to follow a set pattern. For example, the user may desire to receive telephone calls only from family members during the night time at home, may wish to have all incoming calls routed to a car phone during commuting hours, and may wish to have all incoming calls routed to a cell phone during lunch. These time dependent rules may and/or caller specific rules may be entered into the USR database to specify accessibility and connectivity of incoming telephone calls.

The publicly available address code and telephone code and any other codes may be the same, or may be different, there being some advantages to having a single code usable for all such applications for each person on the system. The codes could be accessible through a variety of media including telephone and the Internet. Where two or more people on the system have the same name, which will frequently be the case, additional publicly available biographical data may be provided with the name to assure that the right code is selected. The

system may similarly be used to provide public keys for use in a public key/private key encryption system, to provide other public codes for an individual or to provide other public information. Access to such information would typically be unrestricted.

Where the system is used to provide public keys, the public code used to obtain the key, or possibly the public key itself, may be used as above to obtain the e-mail address, telephone number or the like for the person to whom the message is being sent, and the USR system may also be used to perform the encryption. When the recipient receives the message, he deencrypts it using the recipient's private key in standard fashion, including deencrypting the name of the sender. However, this does not necessarily verify the sender and such verification may be desirable for important messages, particularly ones involving large financial transactions. The USR system may accomplish such verification by also storing private keys for people in the system. The sender first authenticates himself to the system, and the system then adds a second signature to the message which is encrypted with the sender's private key. The receiving party deencrypts this signature with the sender's public key. Since the system only sends such signatures for authenticated users, the message is thus verified.

FIG. 13 illustrates a general method of using the USR database 24 to authenticate a user's identification. This may be used in connection with any of the other methods disclosed herein to ensure that the electronic ID device has not been stolen and/or hacked by an unauthorized holder.

Specifically, in the embodiment illustrated in FIG. 13, the user attempts to prove identification to a validator, such as to prove that the possessor of the electronic ID device is of sufficient age to purchase alcohol (1300). In connection with this attempt, the user enters a secret code into the electronic ID (1302). The validator transmits to the USR software 18 the code from the electronic ID (1304). If the USR software 18 determines that the code is valid (1306), it accesses the user's photograph, age information, or any other desired information, and transmits that information to the validator (1308). By transmitting back to the validator a picture of the person to whom the electronic ID card was issued, the validator can ensure that the person using the electronic ID card is the proper person. Likewise, the validator can ensure, based on the information provided by the USR system 10, that the person is as old as the person claims to be.

A specific embodiment of this identification validation procedure is illustrated in FIG. 14. In FIG. 14, a policeman takes the place of the validator. In this scenario, however, instead of simply transmitting to the policeman a validation of the user's identity, such as their picture, the policeman may also receive additional information, such as the user's police records, records of any arrests, outstanding warrants, and other similar information that may be of use to the policeman when determining how to handle a particular individual.

FIG. 15 illustrates a process for enabling the user to provide specific information to a party, such as medical staff in an emergency room. As shown in FIG. 15, if the user desires to provide information to a party (1500), the user enters a secret code in the electronic ID device and provides the electronic ID code to the party (1502). The party transmits to the USR software 18 the ID code and the party code (1504). The party code may be a code from for example an electronic device which identifies the party, may be a status code which identifies the class of users to which the party belongs, for example policeman, emergency room personnel, doctor, etc. or may be a combination of both, the status code for example being encrypted into the ID code. The USR software 18 determines if the code is valid (1506), accesses the user's information in the USR database 24 and transmits available information to the party (1508). In this scenario, the user may be provided with a plurality of different codes to enter into the electronic ID device depending on the type of information to be released to the party. For example, the user's basic code may be 1234. The fifth digit of the electronic code may specify the type of information to be provided, i.e., 1 = address information, 2 = medical information; 3 = telephone information, 4 = job application information, etc. Using multiple codes eliminates any ambiguity about the authority provided by the user to the party, but requires the user to remember additional information.

The above assumes the user is able to provide an ID code when the information is required. However, in for example an emergency room situation, the user may not be in a position to provide the ID code, but would still want medical records provided. The release authorization for certain portions of the user's database could therefore specify that the information be released to certain class or classes of individuals and the USR system would release such information to individuals or organizations based only on status code. Thus, the status code of an emergency room could alone trigger release of medical data.

FIG. 16 illustrates one embodiment of a method of using the USR database 24 to complete a standard application, such as a job application or an application to rent an apartment. This embodiment is a specific example of the more generic method of enabling a party to retrieve information discussed above with respect to FIG. 15. In FIG. 16, however, the party may be provided with the opportunity to provide a form to the USR software 18, the fields of which may be automatically completed with information from the job application information section of the USR database 24.

As can be seen from the above, many of the users of the USR system are organizations or agencies such as carriers (post office, UPS, FedEx), communication companies, law enforcement organizations, hospitals and other medical facilities and the like. Each of these organizations can be provided with specialized software either on a disc or other suitable media or electronically, for example over the Internet, which performs a number of functions, for example automatically generating status codes for data access requests, controlling information received, and formatting data received in response to a request in a desired way. This can result in an access request from such organization for a given user causing all data on the user required to complete the form being retrieved and presented to the organization in the format of their form. A user may also authorize an organization for which a form has been completed using the USR system to receive updates, either in response to a request from the organization or at selected intervals, for example once a year, so as to maintain information in the forms current. Since the user will be providing information to the system on a regular basis, this is a relatively easy and painless way for the user to maintain current information with many organizations the user deals with.

Another potential use of the system is to permit a person to be located where only limited biographical information on the person is known. Users of the USR system wishing to participate in this feature could be cued to provide non-confidential biographical data when they come on the system or at any time thereafter when they decide to participate. They can also indicate whether they wish their name given out in response to such an inquiry or to merely be alerted to an inquiry which might involve them and information on the requester. A person seeking to find another person or group of people can input appropriate biographical data, for example members of 1975 Harvard University hockey team, or information of a person's last known address plus school information, etc. The system will then provide a list

of persons who meet the listed criteria from which the person making the inquiry can hopefully find the person they are looking for.

In the above application and others, when a person is located, the person may request that only the person's address code or general access code (i.e. a single code which is used to get current address, telephone, e-mail, etc. information) be provided when the person is  
5 located. This can further protect the individual from undesired contacts.

Further, although each of FIGS. 13-16 refer to the entry of a secret code for validation by the USR system, the processes illustrated for each of FIGS. 13-16 may include a challenge-response protocol by which the user's identity is authenticated.

10 FIG. 17 illustrates another embodiment of the invention. As shown in FIG. 17, the USR system 10 may be used to secure expensive personal equipment, such as stereos, televisions, laptop computers, cellular telephones, cars, boats, and other items of value to a person. In this embodiment, each item to be secured using the USR system is provided with a USR timer chip imbedded in the electronics. If the USR timer chip is not provided with a code  
15 within a predefined period of time, for example every 30 days, the equipment is deactivated. Thus, for example, a television, mobile phone, laptop computer, automobile, heavy equipment, weapon or facility may be provided with a security chip having an internal timer that must be reset before expiration by provision of a particular code. When reset does not occur, the timer will disable the electronic device or other device using any one of a number of known  
20 disablement methods. Exemplary codes may be transmitted in the same manner as beeper signals are conventionally transmitted or may be transmitted to wired devices over the Internet or other public network.

The USR system 10 may be advantageously employed to automatically provide the secured property with the necessary codes at appropriate intervals, unless instructed by the user  
25 of the USR system 10 to cease doing so. Alternatively, the USR system 10 may require participation by the user prior to sending out the activation codes.

In this embodiment, the user may provide to the USR system 10, information indicative of the codes to be transmitted, timing information, and automation information -- i.e., whether the codes should be sent automatically or should require user intervention. Optionally, where  
30 the user opts to require user intervention, the USR system 10 may notify the user of the upcoming deadline via e-mail or another method.

This system may be useful to secure sensitive equipment other than personal equipment as well, such as military equipment, public equipment, school equipment and any other equipment that is subject to theft.

FIG. 18A illustrates another embodiment of the invention that can provide a centralized system to control access to a plurality of secure networks. As shown in FIG. 18A, for example, a system 1800 may employ the USR 10 to control access to a plurality of secure systems 1804 (e.g., a plurality of secure computer networks). The system 1800 may include one or more access devices 1802 that can be employed by a user to access a secure computer network included in the plurality of secure systems. In addition, the system 1800 may be employed to protect other secure systems such as secure communication networks and/or other resources that are accessed electronically. According to one embodiment, the system 1800 includes a first communication link 1801 that provides a communication path between the access device 1802 and the USR 10, and a second communication link 1803 that provides a communication path between the USR 10 and the plurality of secure system 1804. In one embodiment, each of the first communication link 1801 and the second communication link 1803 are wide area networks, for example, the Internet.

Each of the secure systems 1804 can be associated with an organization. An organization is any entity that employs a secure (e.g., restricted access) host system to provide resources to a plurality of users. For example, an organization may be a corporation (including a non-profit corporation), partnership, other business entity, an affiliation or individual that employs a secure host system to provide resources to a plurality of authorized users. As should be apparent to those of ordinary skill in the art, an organization is not restricted to any particular size, for example, as measured by the number of members or employees.

More specifically, each of the secure systems No. 1, No. 2, No. 3, etc. may be associated with a different organization and the USR 10 may control access to each of the secure systems. That is, the USR 10 can provide access control for a plurality of secure computer networks each associated with a different and unrelated organization. Further, each of the secure computer networks may have a different plurality of users who are authorized to access the network.

The access device may include any of a desktop computer, a laptop computer, and a handheld computer (e.g., a PDA, call phone and the like). Further, as shown in phantom, a

plurality of access devices may communicate with the USR 10. Where a web-based system is employed, for example, each of a plurality of computers connected to the Internet may be individually employed as a separate access device to communicate (e.g., independently communicate) with the USR 10 to gain access to one or more of the secure systems 1804.

5 For example, the access device 1802 may be a computer employed with a client-server network. In this example, to access resources provided by one of the secure system 1804, the user initiates an access request for a secure system 1804 selected by the user. That is, the user may supply authentication information and a computer network ID to the USR. As is described in further detail below, the authentication information and the computer network ID  
10 are processed by the USR to authenticate the user and determine whether the user is authorized to access the secure system 1804 that is identified by the computer network ID. The USR then routes communications between the user and the secure system provided that the user authentication is successfully completed.

According to one embodiment, the USR 10 connects the access device 1802 to one of  
15 the secure systems 1804 via a communication path that does not include the USR 10. In an alternate embodiment, the USR 10 connects the access device 1802 to one of the secure system 1804 via a communication path that does include the USR.

Referring now to FIG. 18B, a system 1810 employs a USR 10 to control access to a secure system (e.g., a secure computer network) according to another embodiment. In one  
20 embodiment, the system 1810 includes the USR 10, an access device 1802, and a plurality of secure system 1804. According to this embodiment, the user selects from the plurality of secure systems 1804 a secure system that the user would like to access. With the access device 1802, the user communicates authentication information directly to the selected secure system 1804, e.g., without gaining access to the system. The secure system then communicates the  
25 authentication information and/or information corresponding to the authentication information to the USR 10. The USR 10 processes the information received from the secure system and then communicates an indication of whether the authentication information corresponds to one of the plurality of users authorized to access the secure system. The secure system grants or denies access to the secure system (and the associated resources) based on the indication  
30 received from the USR 10.

As illustrated in Figs. 18A and 18B, the USR 10 can provide a centralized access control system (e.g., an authentication system) for a plurality of secure systems 1804 that are associated with independent organizations that may have no affiliation with one another. Referring to Figs. 18A and 18B, a first organization may be associated with (have resources  
5 located on and/or accessed by) the secure system no. 1, a second organization may be associated with the secure system no. 2, and so on. In addition, a single organization may also be associated with a plurality of the secure systems 1804. Thus, in one embodiment, the USR 10 provides access control to a plurality of secure systems for a single organization.

The systems 1800 and 1810 allow an organization to operate a secure system without  
10 hosting the authentication system software or at least without the need to host a substantial part of authentication system software. Thus, in one embodiment, software upgrades/maintenance can be implemented at the USR 10 (e.g., centrally) for the plurality of secure systems 1804 and specialized authentication software is not required at the access device. In a further embodiment, specialized authentication software is also not required at the secure system. In  
15 versions of these embodiments, the USR 10 provides a web-based system in which the user employs a web-browser when communicating with the USR 10 and the secure system.

The USR 10 can also provide centralized administration and management for the plurality of secure systems 1804. The centralized administration can include routine tasks such as adding or removing authorized users for each of the plurality of secure systems 1804, for  
20 example, based on the hiring or resignation, respectively, of an employee. Additional administrative functions such as maintaining a secure database of private keys associated with each user, generating time varying codes, maintaining encryption software, maintaining audit trails and other functions may also be accomplished in a centralized fashion with the USR 10 for a plurality of organizations.

25 In one embodiment, following the connection of the access device 1802 to the secure system 1804, the USR 10 develops an audit trail by monitoring the communication path to capture information concerning the use of the secure system. For example, the USR 10 may collect and store information concerning the length of time during which the access device remains connected to the secure system, the type of resources accessed by the user, the type of  
30 data transmitted (including the identification of specific documents) during a login period and the volume of data transmitted.

According to one embodiment, the USR continuously monitors the communication between a plurality of access devices 1802 and a secure computer network and collects information to generate an audit trail for each device. According to another embodiment, the USR does not continuously monitor communications. Instead, the secure computer network  
5 intermittently (e.g., periodically) transmits audit information to the USR 10 where the audit information may concern one or a plurality of users connected to the network during a specific time period.

In each of the embodiments, described with reference to FIGS. 18A and 18B, the USR 10 may be located in an ultra-secure facility that employs heightened security relative to the security provided by the organizations that it serves. The physical facility where the USR is  
10 located may meet requirements generally associated with critical military installations. For example, the USR 10 may be housed in a facility that is hardened against radiation, shielded against electromagnetic interference, and/or protected against earthquakes, hurricanes, etc. to allow operation of the USR during times of general emergency. Further, the personnel and  
15 hiring policies of the facility operating the USR 10 may also be more secure relative to the security measures taken by the organizations associated with the secure systems 1804. That is, the individuals operating the USR 10 may undergo more rigorous background checks that include a detailed investigation of their personal and employment histories.

The centralized approach described above can provide increased security because the  
20 administration of the access control system (e.g., authentication software) is in the hands of a highly trusted third party who has taken heightened security measures regarding the hiring of the administrative personnel, in particular, the personnel who have access to authentication data (e.g., private encryption keys, etc.).

In any of the preceding embodiments, the USR 10 may be geographically remote from  
25 the secure systems.

Further, in any of the preceding embodiments, there may be situations where a user employs the access device 1802 to connect to more than one of the plurality of secure systems 1804. In one embodiment, the user is independently authorized to access separate secure systems 1804 associated with independent organizations. In another embodiment, the user is  
30 authorized to access separate secure systems 1804 each associated with the same organization.

In either situation, the user may employ one or more of the authentication procedures described herein before being allowed access to any one of the secure systems 1804.

Referring now to FIG. 19, a process 1900 that employs a USR to control access to a secure computer network is illustrated. In one embodiment, the process 1900 is employed with the system 1800 illustrated in FIG. 18A. At step 1902 an entity initiates an access request. In general, the access request will be initiated when the user or entity inputs information into an access device such as a computer. At stage 1904, the entity supplies authentication information and a computer network ID to the USR (e.g., the information is electronically transmitted from the access device to the USR). According to one embodiment, the information is transmitted via the Internet from the access device to the USR. At stage 1906, the USR receives the access request which includes the authentication information and the computer network ID. At stage 1908, the USR determines whether the authentication information is valid for a user. According to one embodiment, the USR includes a database containing selected data of a plurality of users authorized to access a secure computer network, and may compare the authentication information supplied by the entity with authentication information included in the database to determine whether the authentication information corresponds or is valid for a user. If the authentication information is valid, the process 1900 moves to stage 1910 where the USR determines whether the entity is authorized to access the computer network identified by the computer network ID. If the entity is authorized to access the computer network then the USR may allow communication between the entity and the secure computer network at stage 1912. As previously indicated, the USR may route communications between the entity and the secure computer network and remain in the communication path employed by the access device to communicate with the secure computer network. Alternatively, the USR may simply provide a connection between the access device and the secure computer network where the communication path provided by the connection does not involve the USR.

Returning to stage 1908 if the authentication information supplied by the entity is not valid for any of the plurality of users then the process 1900 moves to stage 1914 where an indication is provided to the entity that access is denied. Similarly, if at stage 1910 the entity is not authorized to access the computer network identified by the computer network ID, an

indication is provided that the entity is denied access at stage 1914. In various embodiments, the entity may be allowed additional opportunities to successfully access the system.

Referring now to FIG. 20, a process 2000 for controlling access to a secure computer network is illustrated in accordance with one embodiment. In one embodiment, the process 2000 is employed with the system 1810 illustrated in FIG. 18B.

In one embodiment the entity initiates an access request at stage 2002. As described above, the access request can be initiated using an access device and each secure computer network may communicate with a plurality of access devices. At stage 2004, the entity supplies authentication information to the secure computer network, for example, by entering the information in a web browser and transmitting the authentication information over the Internet to the secure computer network. At stage 2006, the secure computer network receives the authentication information. At stage 2008, the secure computer network communicates authentication information to the USR (or information corresponding to the authentication information) to allow the USR to authenticate the access request. At stage 2010, the USR validates the authentication information to determine whether the entity is authorized to access the secure system, and at stage 2014, the secure system receives an indication from the USR concerning whether the entity is authorized to access the system. In one embodiment, the indication is transmitted from the USR to the secure system via the Internet. At stage 2016, the secure system grants or denies the entity access to the secure system based on the indication received from the USR.

As should be recognized by those of ordinary skill, the processes 1900 and 2000 can be accomplished in a variety of stages that may include any of the stages described above in various combinations and sequences including one or more of the stages described above in combination with one or more additional stages.

Various embodiments can be employed to control access to a physical facility. That is, an electronic device (e.g., a keypad, a card reader, a biometric scanner, etc.) or combination of electronic devices can be located at an access point to a secure area (e.g., a door, a gate, etc.). The entity initiates the request using the electronic device. In one embodiment, the physical facility includes all or a portion of the secure computer network. Thus, in one embodiment, the secure system receives an indication of whether an entity is authorized to access a physical facility. The secure system communicates authentication information to the USR. The USR

validates the authentication information and communicates an indication of whether the entity is authorized to access the physical facility. The secure system receives the indication and grants or denies the entity access to the physical facility.

Each of the embodiments described with reference to any FIGS. 18-20, may include a challenge-response protocol, for example, to authenticate the identity of the entity and/or the USR system to the other.

FIG. 21 illustrates an embodiment of a system 2100 for validating the identity of an individual or an entity. The system includes a first wireless device 2110 and a second wireless device 2112. The first wireless device 2110 comprises a first wireless transmitter and receiver 2114, a first processor 2116 and a first memory 2118. Similarly, the second wireless device 2112 comprises a second wireless transmitter and receiver 2120, a second processor 2122 and a second memory 2124. According to aspects of the invention, the first wireless device and the second wireless device are configured to wirelessly communicate with each other so that the entity associated with the first wireless device can communicate his identity to the entity associated with the second wireless device. It is to be appreciated that the first wireless transmitter and the second wireless transmitter can be configured to communicate by any form of a wireless signal such as low power Bluetooth signal, infrared signals, RF signals and electromagnetic signals in general. In accordance with one embodiment, the first wireless device and the second wireless device communicate via near field signal.

The first wireless device can also comprise user interface 2126 that allows the first entity to interact with the first wireless device and can also comprise a display, such as a LCD display, 2118 that allows the first entity to further interact with the first wireless device. In accordance with some embodiments the invention, the first wireless device can be configured so that the first entity must enter a PIN identification number, for example, via the user interface to gain access to the wireless device. Alternatively, or in addition, the first wireless device may comprise a biometric sensor or detector 2130 that enable the first entity to present biometric data to the first wireless device to gain access to the first wireless device. For example, the biometric sensor can be configured to detect a fingerprint of the first entity. For such embodiment, the memory 2128 also comprises stored biometric data of the first entity, which is compared, for example, by the processor 2116 with the detected biometric data to determine whether the first entity is enabled or should be disabled from using the first wireless

device. It is also to be appreciated that the biometric data need not be fingerprint data and can be any biometric data known to those of skill in the art, and that the biometric sensor need not be a fingerprint sensor and can be any biometric sensor known to those of skill in the art.

Similarly, the second wireless device 2112 can also be configured as discussed above  
5 with respect to the first wireless device, namely with any or all of a user interface 2132, a display 2134 and a biometric sensor 2136 and can be configured to require any and/or all of a second entity to provide a PIN number, or the second wireless device to match biometric information of the second entity with stored biometric information to enable or disable the second entity to gain access to the second wireless device. Each of the first wireless device  
10 2110 and the second wireless device 2112 comprise a power source or a power source interface 2138, 2140 that can be coupled to a power source that provides power to respective devices. It is to be appreciated that the power source can be any power source, such as, alkaline batteries, rechargeable batteries, proprietary power sources, and interfaces to power sources such as standard 120 VAC, or an AC to DC conversion device, as well as any other type of power  
15 source known to those of skilled in the art. In addition, it is to be appreciated that each of the first wireless device 2110 and the second wireless device 2112 can also comprise an additional wireless transmitter and receiver device 2142, 2144, respectively, which enable each of these devices to communicate wirelessly via other wireless communication systems such as, via any cell phone standard, via satellite communications, over wireless area networks, local area  
20 networks, wide area networks, as well as any other wireless communication standard know to those of skill in the art.

According to some embodiments of the system 2100 of FIG. 21, either or both of the first wireless device 2110 and the second wireless device 2112 can be configured to communicate with a secure database 2146, as will be discussed in further detail herein.  
25 According to some embodiments, either of the first or second wireless devices may communicate with the secure database on a periodic basis to update it's corresponding data, or to stay alive as will be discussed herein, or to retrieve information in the secure database that is used in the communication protocol between the first and second wireless devices to verify the identity of at least the first entity. Accordingly, it is to be appreciated that communication with  
30 a secure database can be, for example, via the additional respective wireless transmitters and receivers 2142, 2144 of the first and second wireless devices, or can be via a network interface

2152, 2154 of the respective devices, that communicate with a network 2148 and to the secure database 2146.

Referring now to FIG. 22, there is illustrated one embodiment of an overall communication process that occurs with the system 2100 of FIG. 21. In particular, the process is effected by the system of FIG. 1 so as to identify and authenticate the identity of the first user associated with the first wireless device 2110 to the second user associated with the second wireless device 2112. For example, consider the situation where an air marshal or an FBI agent is carrying the first wireless device 2110 and airport security or security personnel generally want to ensure the identity of the user of the device 2110. The communication protocol 200 illustrated in FIG. 22 is one embodiment of a protocol that enables secure authentication of the first user of the wireless device 2110.

According to one embodiment of the process, the first user of the first wireless device 2110 first authenticates his or herself to the wireless device 2110, for example as has been discussed above, by either entering a PIN via the user interface 2126 of the first wireless device or by interacting with the biometric sensor of the first wireless device at step 202. In various embodiments, a challenge-response protocol is employed in which the first user supplies information (a biometric, a PIN or other information) to authenticate his or herself to the wireless device 2110. If the user of the device does not enter the correct PIN number or does not match the biometric data stored in memory 2118 of the first authorized user of the device, then the device at a minimum shuts down at step 204. However, according to some embodiments, the device 2110 can also be configured to automatically delete any portion of or all of the data stored in memory 2118 at step 206. In addition, as will be discussed in further detail herein, according to some aspects of the invention, the first wireless device can be configured to periodically communicate with the secure database 2146 to remain alive, for example, after the first user of the first device authenticates itself to the first device. If the first device does not communicate with the secure database at such periodic intervals at step 208, then the first device can be configured to delete any or a portion of the data stored in memory at step 206.

The communication protocol also comprises a second user of the second device to authenticate his or herself to the second device at step 210. It is to be appreciated that the authentication by the second device of the second user by any of the mechanisms discussed

herein and above with respect to the first wireless device, including entering a PIN number to the user interface 2132 of the second wireless device or by interacting with the biometric sensor 2136 of the second wireless device. In addition, it is to be appreciated that as discussed above with respect to the first wireless device, if such identification is not successful, the second wireless device will at a minimum shut itself down at step 212. However, it is also to be appreciated that the second wireless device can be configured to automatically delete a portion of or all of the data stored in the memory 2124 of the second wireless device, should such authentication not be successful at step 214. In addition, it is to be appreciated that the second wireless device can also be configured at step 216 to communicate with the secure database 2146 within defined periods of time, or even a periodic interval once the second user authenticates himself to the second wireless device, and to delete a portion of or all of the data in memory 2124 should such periodic communication not occur.

If both the first user and the second user are successful in authenticating themselves to the first and second wireless devices respectively, then a communication protocol is initiated between the first wireless device 2110 and the second wireless device 2112 at step 218. If the communication protocol is not a valid communication protocol between the devices, the devices wait until there is a valid communication protocol. If the communication protocol is a valid protocol (218 yes), then the first wireless device transmits a first wireless signal containing encrypted authentication information of the first user to the second wireless device 2112 at step 220. The details of the communication protocol and the encrypted authentication information will be discussed further herein.

The second wireless device 2112 receives the first wireless signal and processes the wireless signal to determine the identity of the first user. In particular, as will be discussed herein, according to some aspects of the invention, the authentication of the first user includes displaying a picture of the first user to the second user on the display 2134 of the second wireless device as a result of the communication from the first wireless device to the second wireless device. The user of the second wireless device can view the picture on the display and ascertain whether the first user of the first wireless device is who he or she purports to be. However, as will also be discussed herein, it is to be appreciated that the second wireless device need not be a device that requires a user to interact with it and can be, for example, an unmanned detection system that receives the first encrypted authentication information and

determines from the first authenticated encrypted information whether the first user is authorized to gain access to a secured place, a secure network, or a secure computer, to do whatever the first person is seeking to do. If the first user is not who they purport to be, the communication process goes back to look for a valid communication protocol. In addition, the process allows the second user or the system associated with the second wireless device to take an appropriate action such as denying access to the secure site at step 224.

If the user of the first wireless device is authenticated (at step 222 yes), then according to some aspects of the invention, the communication process allows for the second wireless device to transmit a second wireless signal comprising encrypted authentication information of the second user to the first wireless device at step 226. In addition, according to such aspects, the communication protocol and the first wireless device are configured to authenticate the identity of the second user to the first user at step 228. It is to be appreciated that the authentication of the second user to the first user can be in any of the manners discussed above with respect to the authentication of the first user of the first device, such as by viewing a picture of the second user as provided on the display 2128 of the first wireless device, by matching one-time information contained in the encrypted authentication information or via a challenge-response protocol.

In addition, according to some embodiments of the protocol, either or both of the first wireless device 2110 and the second wireless device 2112 may communicate with the secure database 2146 to retrieve additional information at step 230. Such information, as will be discussed herein, can include for example, a portion of the biographic data of the first user of the first wireless device or of the second user of the second wireless device, or full biometric information of the first user or the second user, which can be communicated back to the respective device and used by the respective device to authenticate the user. In addition, the information can be periodic updates as provided the secure database to the respective device, such as will be described herein, including periodic updates of public keys of a plurality of first users as stored in memory on the second wireless device, or updates to public keys of a plurality of second users as stored in memory on the first wireless device. In addition, such information may include periodic updates of the biometric information of a plurality of first users as stored on the second wireless device or a plurality of second users as stored on the first

wireless device, which can comprise for example a portion of the biometric information or all of the biometric information.

Referring now to FIG. 23, there is illustrated one embodiment of various fields included within the first wireless signal and the second wireless signal as transmitted between the first wireless device and the second wireless device. According to some embodiments, the signal comprises a header field 302. The header field can be any header field known to those of skill in the art. In addition, the signal comprises a public ID field 304, which can comprise, for example, any of name information, a badge number, an employee number, an e-mail address, a social security number, and the like, of the first user. In addition, the first wireless signal may also include a digital signature field 306 containing a digital signature of the first user. For example, the digital signature may be generated with the user's private PKI key. Further, the first wireless signal may comprise a one-time time varying code field 308 that includes a random code as generated by the first wireless device. According to some embodiments, the digital signature field and the one-time code field can be used, for example by the second wireless device, to allow access to a secure place without the need for a user of the second wireless device to interact with the second wireless device to authenticate the first user. As an example, referring to FIG. 24, the digital signature and one time code can be encrypted with the private key of the first user and transmitted to the second wireless device. The second wireless device can decrypt the digital signature and one time code with the public key of the first user at steps 402-404 to authenticate or not the first user at step 406.

In addition, referring back to FIG. 23, the first wireless signal also comprises a PKI encrypted one-time DES key field 310 comprising a PKI encrypted one-time DES key. Further, the first wireless signal comprises a DES key encrypted biometric data field 312, which includes at least a portion of biometric data of the first user encrypted with the DES key. As will be discussed in further detail herein, according to some aspects of the invention, the public key of a first user, for example, stored in memory 24 of the second wireless device can be used to decrypt the DES key, and the DES key can be used to decrypt at least a portion of the biometric data of the first user to use in the authentication of the identity of the first user. According to some embodiments, the first wireless signal can also comprise another ID data field 314, which can contain other information such as name, height, weight, eye color or anything else.

It is to be appreciated that although the embodiment of the wireless signal discussed in FIG. 23 has been discussed with reference to the first wireless signal transmitted from the first wireless device 2110 of FIG. 21 to the second wireless 2112, that the same protocol can be used when transmitting a second wireless signal from the second wireless device 2112 to the first wireless device 2110 to authenticate the identity of the user of the second wireless device to the user of the first wireless device. It is to be further appreciated that various fields of the signal can be used and not all of the fields of the wireless signal are needed to authenticate identity of the user.

Referring now to FIG. 24, there is illustrated one embodiment of a process 400 as identified by act 222 in FIG. 22 for verifying or authenticating the identity of the first user of the first device. According to this embodiment, which has been briefly discussed herein with respect to FIG. 23, the second wireless device can verify the identity of the respondent without necessarily interacting with a second user by decrypting the first user's digital signature from the digital signature field 306 at step 402 and verifying that it is the digital signature of the first user, decrypting the one-time code from the one-time code field 308 at step 404, and using this information at step 406 to authenticate the first user. If the first user is authenticated at 406, an appropriate action such as allowing access to the secure site, or computer, or network can be granted.

Referring now to FIG. 25 there is illustrated another embodiment of a process 520 for authenticating the identity of the first user at step 222 of the communication process of FIG. 22. According to aspects of the invention, the second wireless device at step 522 receives the first wireless signal and extracts the PKI encrypted DES key from field 310. The wireless device looks up the public key of the first user from memory 2124 [See FIG. 21] or from a secure server based on the information provided in the public ID field 304 at step 524. The second wireless device uses the first public key to decrypt the PKI encrypted DES key at step 526. The second wireless device acts on the DES key encrypted biometric information from the field 312 and uses the decrypted DES key to decrypt the at least a portion of the biometric information of the first user as included in the first wireless signal at step 528.

According to some embodiments, the biometric information included in the first wireless signal is a portion of the biometric information of the first user and the second wireless device is configured to store a remainder of the biometric information of the first user

in memory. According to such embodiments, the process 520 also comprises looking up the remainder of the biometric information stored in the memory at step 530 and combining the remainder of the biometric information with the decrypted and extracted biometric information to provide complete biometric information of the first user at step 532. According to some  
5 aspects of the invention, the biometric information can comprise a digital image of the first user and for such aspects, the digital image can be displayed on display 2134 of the second wireless device so that the second user can ascertain whether the first user associated with the first device is who he or she purports to be. However, it is to also be appreciated that the biometric information can be fingerprint information, a voiceprint, DNA codes of the first user,  
10 or any other biometric information known and used by those of skill in the art. Accordingly, the processor 2122 of device 2112 can also be configured to process the combined biometric information to authenticate the first user at step 536.

Referring now to FIG. 26, there is illustrated another embodiment of a process 620 that can be used to authenticate the identity of the first user at step 222 of the process 200 of FIG.  
15 22. According to this embodiment, some of the steps are similar to the steps of the process 520 illustrated in FIG. 25 and accordingly a full description of these steps will not be herein duplicated. It is to be appreciated that this embodiment can be used for example, where the biometric information of the plurality of first users is not stored on the second wireless device 2112 but is instead stored at the secure database 2146 as illustrated in FIG. 21. In particular,  
20 for highly secure applications, where there is a worry that the second wireless device can be compromised (even with the necessity to authenticate the second user to the second wireless device), the second wireless device can be configured to interact with the secure database to obtain at least a portion of the biometric information of the first user, rather than storing at least a portion of the biometric information of the first user in memory on the second wireless  
25 device.

According to such embodiments, the second wireless device can receive the first wireless signal including the fields discussed above in respect to FIG. 23, in particular, the public ID field 304 and optionally the PKI encrypted DES key. According to some  
30 embodiments, the PKI encrypted DES key may be used by this process. At step 624, the second wireless device accesses public key information of the first user from the public keys stored in memory on the second wireless device. However, it is to be appreciated that in some

embodiments, the public keys may not be stored on the second wireless device. For such  
embodiments, the second wireless device will communicate with the secure database to obtain  
the public key of the first user also at step 624. According to some embodiments, at step 626  
the second wireless device transmits a signal to the secure database comprising public  
5 identification number to identify the second device to the secure database, presumably after the  
second user of the second device has authenticated his or herself to the second device. For  
such embodiments, at step 628, the secure database determines whether the second device is  
authorized to access the secure database at step 628. It is to be appreciated that according to  
some embodiments, this communication between the second wireless device and the secure  
10 database can be accomplished with encrypted signals and in some embodiments the encrypted  
signals can include using time varying one time codes to further secure the communication. If  
the second device is authorized to interact with the secure database, the process also comprises  
transmitting the first public ID from the second wireless device 2112 to the secure database at  
step 630, and with this information, the secure database accesses the biometric or identification  
15 information of the first user at step 632. The biometric or the at least a portion of the biometric  
information can then be transmitted by the secure database to the second wireless device at  
step 634. Again, this transmission can be encrypted and further include time varying or one  
time codes to further secure the communication. The second wireless device can use the  
received portion of the first biometric information and combine it with portion of the first  
20 biometric information provided in the first wireless signal, or can receive all of the first  
biometric information as provided by the secure database and, for example, display it on the  
display 2134 of the second wireless device 2112 at step 636, or can process the biometric or  
identification information at step 638 to determine whether the first user is authenticated.

Referring now to FIG. 27 there is illustrated one embodiment of a data structure 720  
25 that can comprise memory 2124 of the second wireless device 2112. It is to be appreciated that  
any or all of the various portions of this data structure can be present in the memory 2124.  
According to some aspects of the invention, the memory will include the private key of the  
second user at field 722. The private key can be used, for example, when communicating by  
the second wireless device to the first wireless device to provide a digital signature of the  
30 second entity encrypted with the second user's private PKI key to the first user. In addition,  
the memory can also comprise a plurality of public keys of a plurality of first users at area 724.

Such public keys of a plurality of first users can be used as has been discussed herein in combination with the private key of the first user to decrypt information of the first user. For example, the public and private key can be used to decrypt the DES key of the first user. In addition, the memory can also comprise at least a portion of biometric data of a plurality of first users, at area 726. As been discussed herein, the at least a portion of the biometric data of the plurality of first users can be combined with the portion of the biometric data provided in the first wireless signal or from the secure database, to create the complete biometric data of the first user for ascertaining or authenticating the identity of the first user as has been described herein. In addition, the memory can also comprise biometric data of the second user at field 728. The biometric information of the second user can be used, for example, as has been discussed herein to compare the biometric data detected by the biometric sensor 2136 of the second wireless device to determine whether the second user is authorized to have access to the second wireless device. It is to be appreciated that the data structure 720 of FIG. 27 can also comprise the memory 2118 of the first wireless device 2110, and that any or all of the fields of the data structure 720 can exist in the memory 2118 in the first wireless device. It is also to be appreciated that the first wireless device can access the data structure 720 and the various fields for the same purposes as discussed above with respect to the second wireless device, namely, to provide the first digital signature of the first entity encrypted with the first private key in the first wireless signal, to access the public keys of a plurality of second users for the purpose of decrypting information provided in the second wireless signal, to access at least a portion of biometric information of the second user stored in the field 726, as well as to compare biometric information of the first user with sensed biometric data provided by the biometric sensor 2130 of the first wireless device.

In one embodiment, the method comprises acts of receiving first authentication information about the first entity with the first device, transmitting the authentication information about the first entity to a secure database, determining whether or not the first entity is allowed to access the first device based on the first authentication information, and transmitting an enablement signal to the first device indicating to enable nor not enable the first entity to access the first device. According to a further embodiment, the method also includes an act of allowing or not allowing operation of the first device based on the enablement signal. In another embodiment, the act of receiving the first authentication information of the first

entity comprises receiving biometric information of the first entity by detecting the biometric information with the first device.

In yet another embodiment, the act of transmitting the first authentication information about the first entity to a secure database comprises generating a non-predictable signal from the biometric information. In a further embodiment, the act of generating the non-predictable signal from the biometric information comprises generating a time varying non-predictable signal from the biometric information. In a still further embodiment, the act of receiving biometric information of the first entity comprises receiving a voice signature of the first entity with the first device and the act of generating the non-predictable signal from the biometric information comprises mixing the voice signature of the first entity with a random code to generate the non-predictable signal. In yet a further embodiment, the act of transmitting the enablement signal to the first device comprises sending the random code to the first device. In a still further embodiment, the act of receiving biometric information of the first entity comprises receiving fingerprint data of the first entity with the first device and the act of generating the non-predictable signal from the biometric information comprises mixing the fingerprint data of the first entity with a random code to generate the non-predictable signal. In another embodiment, the act of transmitting the enablement signal to the first device comprises sending the random code to the first device.

In a further embodiment, the act of authenticating the biometric of the first entity comprises authenticating a voice signature of the first entity. In another embodiment, the act of authenticating the biometric information of the first entity comprises authenticating a fingerprint of the first entity.

In one embodiment, a first wireless device includes a biometric detector comprising a fingerprint detector that detects a fingerprint of the first entity. In an alternate embodiment, the biometric detector comprises a voice signature that detects a voice signature of the first entity.

According to one embodiment, the system comprises a first wireless device including a processor configured to enable operation of the first wireless device if it receives an enablement signal validating first biometric information of a first entity and configured to generate a non-predictable signal from the biometric information, a first wireless transmitter and receiver configured to transmit a first wireless signal including first encrypted biometric information of the first entity and to receive the enablement signal, a first biometric detector

for detecting the first biometric information of the first entity and a secure database configured receive the first wireless signal, to authenticate or not authenticate the first biometric information of the first entity, and to provide the enablement signal validating or not validating the first biometric data of the first entity.

5           In a further embodiment, the secure database further comprises biometric data of a plurality of first entities. In another embodiment, the processor is configured to generate the non-predictable signal from the biometric information by generating a time varying non-predictable signal from the biometric information. In a still further embodiment, the processor is configured to generate the non-predictable signal from the biometric information by mixing  
10 the biometric information of the first entity with a random code to generate the non-predictable signal. In yet another embodiment, the secure database is configured to transmit the enablement signal to the first device including the random code so as to authenticate the secure database to the first device. In still another embodiment, the system includes a memory for storing a private key of the first entity authorized to use the first device.

15           It should be understood that various changes and modifications of the embodiments shown in the drawings and described in the specification may be made within the spirit and scope of the present invention. Accordingly, it is intended that all matter contained in the above description and shown in the accompanying drawings be interpreted in an illustrative and not in a limiting sense. The invention is limited only as defined in the following claims  
20 and the equivalents thereto.

          FIG. 28 illustrates an embodiment of a system 100 that employs a converter device 102 to provide an interface between a user device 104 (e.g., a transaction card, a cell phone, etc.) and a system interface 106 where, for example, the system interface 106 employs a magnetic card reader and the user device 104 is not equipped with a magnetic stripe. That is, in one  
25 embodiment, the converter device 102 provides a mode of information transmission between the user device 102 and the system interface 106 which would otherwise be unavailable to the user device 102. The converter device 102 provides a modified system 100 that provides compatibility with a greater variety of user devices, for example, user devices such as transaction cards, cell phones or PDAs that are not equipped with a magnetic stripe. For  
30 example, in one embodiment, the converter device 102 includes a magnetic stripe emulator 137 communicatively coupled to a wireless signal receiver 140 and adapted to provide a time-

varying signal emulating data provided by a magnetic stripe card to a magnetic card reader  
152.

The user device need not be a “card” and may, for example, take the form of a fob used  
as a key ring, a cell phone, a watch, a personal digital assistant or any device that can include a  
5 wireless transmitter, or a magnetic stripe emulator.

In various embodiments, the user device 104 employs near field signal to communicate  
with the converter device 102. In one embodiment, the near field communication is bi-  
directional such that the user device 104 may both send and receive wireless communication.  
That is, the user device includes a transceiver.

10 In general, the system interface 106 provides an interface to a larger information system  
(e.g., a financial system, an access control system, a medical records system, and the like) that  
in one embodiment includes a system processor or controller 110, a database 112, a network  
114, other systems 116, such as a universal secure registry 118 as will be described further  
herein. Each of the preceding system elements may be placed in communication with any one  
15 or any combination of the system elements, for example, over communication links 120A,  
120B, 120C, 120D. It should be recognized that the communication links 120 need not  
provide the communication paths shown in FIG. 28 and that other communication paths may  
be employed. For example, the database 112 may be connected to the network 114 via the  
communication link 120A and to the system processor 110 via the communication link 120B  
20 instead of being connected as shown in FIG. 28.

The communication link may be a wireless communication link, a hardwired  
communication link, a fiber optic communication link, any communication link used in the art,  
as well as a combination of any of the preceding or any other any communication link capable  
of transmitting signals between the elements of the system 100. The system processor 110  
25 allows information transfer of both data and instructions, for example, between the interface  
106 and one or more databases which may be connected to the system or other network  
elements.

In general, the operation of the converter device 102 allows a user in possession of the  
user device 104 to wirelessly communicate information to the device so that the device can be  
30 employed to interface with a network system. For example, in one embodiment, the network  
system may provide a magnetic card reader interface and the converter device 102 provides a

magnetic stripe emulator that can interface with the system. In general, the overall operation of the system 100 includes the communication of information between the user device 104 and the converter device 102, for example, RF communication. In one embodiment, the communication is bi-directional such that information can be communicated both to and from the user device 104. The converter device 102 provides an interface by which information derived from the information being transmitted to or from the user device 104 is transmitted between the converter device and the system interface 106. The system interface 106 provides the communication interface between it and the remainder of the system 100 (e.g., processor 110, database 112, network 114, etc.).

10 According to one embodiment, the user device 104 includes a processor 122, a user interface 124, a wireless transmitter 126 and device indicia 128. In another embodiment, the user device 104 includes a biometric sensor 130. In various embodiments, the processor 122 is communicatively coupled to each of the wireless transmitter 126, the user interface 124 and the biometric sensor 130.

15 The processor 122 may include a chip such as a general purpose processor, an application specific integrated circuit (“ASIC”), or a field programmable gate array (“FPGA”) and the like that may execute various programs and/or provide logic inputs and outputs. For example, the processor 122 may process biometric information received from the biometric sensor 130 to verify the identity of the user before the user can employ the user device 104. Exemplary details of a processor and biometric sensor which are configured to authenticate a fingerprint of a user are disclosed in U.S. published application 2004/0133787, published on July 8, 2004, which is herein incorporated by reference in its entirety. The processor 122 may also include or be coupled to driver circuitry to drive a display included in the user interface 124 and can be configured to process user input data entered via the user interface 124. In one embodiment, the user interface 124 includes one or more control inputs (for example, control buttons).

20 The wireless transmitter 126 can process information provided by the processor and convert the information to an RF signal and can also include an RF antenna that transmits the RF information wirelessly. In another embodiment, the user device may also include an RF receiver that receives a wireless RF signal from the RF antenna and converts the RF signal to an information signal provided to the processor. It is to be appreciated that the wireless

transmitter and/or receiver need not be an RF device; it can also be any of an IR device, an optical device, a Bluetooth signal or any other wireless signal transmitter or receiver used in the art.

The user device may also include a power source such as a battery that fits within the device. In one alternative embodiment, the user device remains in a sleep mode until it is placed in the vicinity of an RF transmitter at which time the user device 104 converts received RF energy into electrical energy used to provide power to the processor 122 and the other components included in the user device 104.

According to one embodiment, the user device 104 can be a smart card configured for wireless signal transmission using RF signals. For example, the wireless transmitter 126 may be an RF transmitter device or any other wireless transmitter device configured to transmit the smart card information of the card. Alternatively, it is to be appreciated that the card can be many cards such as a debit card, a plurality of credit cards such as VISA, MasterCard, American Express, or any other card with the card indicia and relevant information being stored in card memory 129 and read out by processor 122 and provided to the wireless transmitter 126. However, the user device 104 need not be in the form of a card and may instead include a cell phone or PDA.

In the embodiment illustrated in FIG. 28, the converter device 102 includes a substrate 132 which may include a stripe 134 and a magnetic field generator 136 which together comprise the magnetic stripe emulator 137, a processor 138, a wireless receiver 140, a user interface 142, a memory 144, and a power source 146. In a further embodiment, the converter device 102 includes an indicating light 148 (e.g., an LED) and an output device 150.

According to one embodiment, the system interface 106 with which the converter device 132 is employed includes any of or all of a magnetic card reader 152, a wireless transceiver 154 and a data port 156.

In general, according to one embodiment, the converter device 102 receives a wireless signal from the user device 104, processes the information that is received and provides an output in the form of a time-varying signal provided to the stripe 134 (e.g., a magnetic stripe). The signal provided to the stripe 134 can then be provided to the system processor 110 by inserting the stripe and the associated substrate 132 or portion thereof in the magnetic card reader of the system interface 106. That is, in one embodiment, the stripe 134 and at least a

portion of the substrate 132 can be either slid by the magnetic card reader 152 or inserted to sit statically in front of the read head of the card reader.

The processor 138 may be a general purpose processor, an application specific integrated circuit (“ASIC”), or a field programmable gate array (“FPGA”) and may be implemented in hardware, software, firmware or any combination of the preceding. The processor 138 may be communicatively coupled with any of the magnetic field generator 136 the wireless receiver 140, the memory 144, the user interface 142, the light source 148, the power source 146 and the output device 150. In general, the processor can be configured to receive inputs from one or more of the preceding elements and may provide outputs to each of the elements included in converter device 138.

For example, according to one embodiment, the magnetic stripe 134 is a programmable magnetic stripe and the magnetic field generator 136 generates a magnetic signal that controls the information provided by the magnetic stripe 134. The U.S. Patent Application No. 10/680,050, filed October 7, 2003, entitled “System Method and Apparatus for Enabling Transactions Using a Biometrically Enabled Programmable Magnetic Stripe which was published on July 8, 2004 as US2004/0133787 (the ‘050 application), provides further details concerning embodiments of the user device that emulates a magnetic stripe and may also include, for example, a biometric sensor. The ‘050 application is incorporated herein by reference in its entirety. In this embodiment, the processor 138 may control the operation of the magnetic field generator 136 to provide the desired information to the stripe 134. For example, the processor 138 may provide an output to the stripe 134 in response to receiving information from the wireless receiver 140, where the information from the wireless receiver is information transmitted from the user device 104.

Further, the processor 138 may be configured to provide signals to drive a display included in the user interface 142 and process user input data entered with the user interface 142. In one embodiment, the user interface 142 includes a display screen that can be used to display an image of the user to whom the user device 104 belongs, for security purposes. The image to be displayed by the UI can either be part of the information transmitted by the user device 104, for example, where the user device 104 also requires some authentication by the user before transmitting the device information and image, or can be provided, for example, by the USR system 118 through the system interface 106 as part of the user authentication

process, as will be described in more detail herein. In further embodiments, the user interface 142 may include a plurality of control elements that allow the user and/or the transaction processor (e.g., store clerk, security guard, medical service provider, etc.) to enter information into the converter device 102. According to one embodiment, the user interface 142 includes  
5 an LCD display.

The processor 138 may also be configured to provide signals to operate the indicating light 148. The indicating light 148 may provide an indication of the operational status of the converter device 102, for example, the indicating light 148 may indicate any of the following:  
10 that the converter device 102 is receiving a transmission from a user device 104; that the converter device 102 has generated output data to the stripe 134; the status of the power source 146 is normal or conversely that the power source has a low power level; that the converter device 102 is transmitting information via the output device 150; that the converter device 102 is properly aligned with the magnetic card reader 152; that the converter device 102 has received authorization for a transaction; and the like. It should be apparent to one of skill in  
15 the art that the indicating light may be a single lamp or a plurality of lamps and that the lamp or lamps may be a single color including white or may included a plurality of colors. Further, it should also be apparent that the lights may provide a plurality of status indications based on their color, intensity, rate of change of the preceding characteristics or any combination of these and other features.

20 The power source 146 may include a battery power source or other energy sources suitable for the form factor of the converter device 102. For example, in a form factor where the converter device 102 is a hand-held device the power source 146 may be any one of a standard size battery (e.g., a AA battery). In a further embodiment, the power source is a lithium battery. Alternatively, the power source can be any of an AC power source, an AC to  
25 DC converter device, or any other DC power source known to those skilled in the art.

According to one embodiment, the converter device 102 includes a power bus 158 that provides a path for the transmission of power to the various components included in the converter device 102.

In accordance with one embodiment, the converter device 102 includes the output  
30 device 150. It is to be appreciated that the output device can be any standard interface device to be coupled to a data bus such as a USB device, or the output device can be configured for

contactless communication with the system interface 106. For example, in one embodiment, the output device is an optical transmitter device. In general, the communication between the converter device 102 and the system interface 106 is bi-directional such that information (e.g., information associated with the user's identity) may be transmitted to the system interface 106, the system processor 110 may generate a response (e.g., a transaction approval), and the response may be transmitted to the converter device 102 via the system interface 106.

In one embodiment, the processor 138 is configured in combination with the output device 150 to provide an encrypted output signal. In a further embodiment, the processor 138 is configured in combination with the output device 150 to provide a time-varying encrypted output signal. In yet another embodiment, the processor 138 is configured in combination with the output device 150 to provide a time-varying encrypted (or not) public and private key output signal. In addition, the processor can also be configured in combination with the wireless receiver to receive and decrypt any and all of an encrypted signal, a time-varying encrypted signal and a signal encrypted with a private key as provided by the user device 104. A challenge-response protocol may also be employed alternatively or in addition to any of the preceding.

For example, embodiments of the invention may employ a protocol that does not require synchronized clocks in each of the user device 104 and the converter device and/or elsewhere in the system 100 to complete a validation and/or authentication process. That is, according to one embodiment, an information exchange between the user device 104 and the converter device 102 includes a first piece of information transmitted from the user device 104 to the converter device 102 and a subsequent challenge (e.g., an encrypted challenge) generated by the converter device and transmitted from the converter device to the user device 104. According to one embodiment, the user employs the user device to respond to the challenge. In one embodiment, the user's response is at least in part based on information included in the challenge. An identity of a user who responds accurately to the challenge can be successfully validated. In various embodiments, a challenge-response protocol includes an information exchange whereby the identity of the converter 102 is also authenticated by the user with the user device 104.

In various embodiments, the above-described challenge-response protocol may not require any further action by the user than is required under current approaches that require synchronized clocks in disparate devices.

In some embodiments, the output device 150 need not transmit any personal  
5 information associated with the user. For example, commonly owned U.S. Patent Application  
No. 09/810,703, filed March 16, 2001, entitled “Universal Secure Registry” (“the ‘703  
application”) describes an approach that can improve security and reduce the need for multiple  
forms of identification. The ‘703 application is incorporated herein by reference in its entirety.  
The universal secure registry 118 included in the system 100 provides one example of the  
10 integration of such a registry into a system that employs a converter device 102. With the USR  
system, for example, the user device 104 can provide some information, e.g., such as a public  
code of the user, which can be authenticated by the user, for example by providing an ID  
through the user interface 124 or through biometric sensor 130. The public code can be  
provided to the USR via the converter 102, system interface 104, and network 114. The USR  
15 can then provide back to any of the system interface and the converter device any or all of  
device information (e.g., transaction card information), authorization for a transaction, e.g.,  
where the network or the USR also communicates with the relevant authority, and indicia  
about the holder of the user device.

The system 100 may include a variety of system interfaces 106 of different types such  
20 as the wireless transceiver 154 and the data port 156 in addition to the magnetic card reader  
152. Although not illustrated, other system interfaces such as an optical interface, a smart card  
reader interface or any other system interface known to those of skill in the art can also be  
included. Further, the system interfaces may be either commonly located or may be  
geographically distributed such that some locations include a wireless transceiver 154, some  
25 locations include a data port 156, some locations include a magnetic card reader 152, and some  
locations include a plurality of types of system interfaces.

Thus, in some embodiments the output device 150 of the converter device 102 may  
include a data port via which the converter device 102 can provide data to a network or a  
networked device. In one embodiment, the data port is also configured to receive data from the  
30 network or a networked device.

Embodiments of the converter device 102 can be configured to provide communication to the system interface 106 via any of the preceding approaches including wireless signal transmission. In a version of this embodiment, the converter device 102 may receive wireless signals from the user device and transmit wireless signals to the system interface 106. Further, the converter device may include a transmitter that allows it to transmit information back to the user device.

Referring now to FIG. 29, a process 260 employing the converter device 102 is illustrated in accordance with one embodiment. The process begins at Stage 262 –START. Here, the converter device 102 is in a steady state in which it awaits receipt of a signal from a user device 104. At Stage 264, the converter device 102 receives data, for example, a wireless signal transmitted from the user device 104. At Stage 266, the converter device 266 extracts information from the wireless signal for processing. As one example, the converter device 102 may extract information corresponding to the user's identity and/or the identity of the individual to whom the user device was issued. The extracted information is then provided to the system interface, for example, it is simulated as magnetic striped data to the magnetic card reader. At Stage 268, the system 100 authenticates the user. In one embodiment, if the authentication is successful, the process continues at Stage 270. In this embodiment, if the authentication is unsuccessful, the process returns to Stage 262 where, for example, the user may be prompted to attempt to authenticate again.

Various user authentication approaches may be implemented using the converter device 102. For example, the authentication may be performed locally, that is, without the need for communication between the converter device 102 and the system interface 106 and system processor 110. In one embodiment, the authentication process employs the universal secure registry 118. In further embodiments, the authentication process employs one or more authentication protocols such as public-key cryptography, key exchange protocols, protocols employing one-way functions, and the like that are well known by those of ordinary skill in the art. In other embodiments, however, the authentication may require an exchange of information between the converter device 102 and any of the system interface 106, the network 114, the USR 118 and another database 112. A challenge-response protocol may also be employed alternatively or in combination with any of the preceding authentication approaches.

At Stage 270, the completion of the transaction may be involve any of a wide variety of acts including: authorizing a withdrawal of money from a user's account, permitting the user access to a secure area, permitting a user to view medical information concerning themselves or a third party, or permitting the user to access other confidential information.

5           In addition, in some embodiments, the process 260 includes Stage 274 where following authentication the converter device 102 receives information associated with the user. The information may, for example, be necessary for the completion of the transaction. For example, where the system 100 is employed in conjunction with a check-authorization process, the converter device 102 may receive an indication that the user has sufficient funds to cover  
10 the amount of the check that is presented at a point of sale. Alternatively, or in addition, the information may include indicia related to the authorized holder of the user device 104, such as a picture ID. The process 260 is completed at Stage 272 – END.

          An embodiment, of the converter device 302 is illustrated in FIGS. 30A through 30D. As illustrated in the front view of FIG. 30A, in one embodiment, the converter device 302  
15 includes a housing 380, a substrate 332, and a magnetic stripe 334. In one embodiment, the housing 380 is manufactured from a rigid material, for example, metal or plastic and the converter device 302 is designed to be a hand-held device. FIG. 30B illustrates a side view perspective of an embodiment of the converter device 302, showing an indicating light 348 (e.g., an LED). As described in greater detail above, the indicating light 348 can include a  
20 single indicating light or a plurality of indicating lights.

          FIGS. 30A-30D illustrate an embodiment where the substrate extends substantially perpendicular from a side of the housing 380, however, the specific angle at which the substrate extends from the housing may vary so long as the housing does not interfere with the insertion of the substrate into, for example, the magnetic card reader 152.

25           FIG. 30D illustrates a top view of an embodiment of the converter device 302 which includes a display screen (e.g., an LCD display screen) that may provide the user interface 342 or a portion of the user interface of the converter device 302. In one embodiment, the user interface 342 includes a display screen that displays either a black and white or a color image of the individual to whom the user device 104 was issued. It should be recognized that the  
30 display screen may provide a wide range of functionality, for example, the display screen may

display a variety of data received by the converter device 302 including data represented in alpha numeric format.

The magnetic stripe 334 may be a programmable magnetic stripe such that the converter device 302 provides a magnetic stripe emulator. In one embodiment, as has been  
5 described herein, the converter device 302 receives a wireless signal from a user device 104 and provides a time varying signal which emulates data provided by a magnetic-stripe card to a magnetic card reader in response to receiving the information from the wireless signal. In a further embodiment, the information is provided to the magnetic card reader by inserting the magnetic stripe 334 into the magnetic card reader.

10 The various embodiments of a system and method for converting a wireless transaction device to a magnetic stripe emulator device may include any of the following or any combination of the following: a converter device with a processor communicatively coupled to a wireless signal receiver and to a magnetic stripe emulator. The converter device may optionally include an LED. Further the processor may be configured for any combination of  
15 the following: control of the LED to indicate that the device is properly aligned with the magnetic card reader, control of the LED to indicate that the device has received authorization for a transaction, and where the converter device includes a power supply, a processor configured to control the LED to indicate that the device has power.

In one embodiment, the information received from the wireless signal by the converter  
20 device may include any of a name, a card number, user identification, a device code, amount of credit available, and an expiration date of the card for a transaction.

Further, in various embodiments, the converter device may include an output device that can provide information to a network or to a networked device. In various embodiments, the output device can be configured as a wireless transmitter device, such as an optical  
25 transmitter device.

In various embodiments the wireless transmitter device where the wireless transmitter may generally be configured as an RF transmitter device, and in particular, as a Bluetooth transmitter device.

In addition, in various embodiments, the processor can be configured in combination  
30 with the output device to provide any of an encrypted output signal, a time-varying encrypted output signal, and in particular, a time-varying public and private key output signal.

In further embodiments, the converter device may include an output device configured as a data port via which the converter device can provide data to a network or a networked device and to receive data from the network or a networked device.

5 In one embodiment, the converter device may also include an LCD screen for displaying at least some of the data received by the converter device, and a processor configured in combination with the LCD device to display indicia corresponding to the authorization of a transaction, and in particular, indicia that includes picture information of the cardholder.

10 In addition to the above described features, the various embodiments of a system and method for converting a wireless transaction device to a magnetic stripe emulator device may include any combination of the following or any combination of the following and the above listed features: the converter device can be configured to communicate with the magnetic card reader via the data port; the wireless receiver and/or processor is configured to decrypt an encrypted wireless signal; the converter device is configured to decrypt a time-varying  
15 encrypted wireless signal; the converter device configured to decrypt time-varying public and private key information contained within the wireless signal; the converter device includes a user interface communicatively coupled to the processor; the converter device processor is configured to determine whether the user is authorized to provide the information contained within the wireless signal from data provided through the user interface.

20 In addition, the following further additional features may be combined alone or in combination with the preceding: the data contained within the wireless signal received by the converter device may include any combination of the following: user I.D. information, biometric information of the user, secret information, (for example, a PIN, a password, or a passcode of the user), or information about an uncounterfeitable token of the user.

25 In various embodiments, the converter device may include a substrate housing the magnetic stripe emulator, and the substrate may include a programmable magnetic stripe.

In various embodiments, the system employed with the converter device may also include a system interface coupled to a network where the system interface includes a magnetic stripe reading device configured to read a time-varying signal. In a further embodiments, the  
30 system interface may be configured to transmit data received from the wireless transaction device to a networked credit card authentication entity also coupled to the network. The

system may also include any of a keyboard, a printer, an (LCD) display, and an audio signal transducer.

Although the preceding description is primarily directed to an embodiment of the user device 104 that does not include a magnetic stripe, it should be recognized that some  
5 embodiments of the user device 104 may include a magnetic stripe. In these various embodiments, the converter device 102 may be employed to convert information coded on the magnetic stripe for transmission via another mode of information transmission.

As described above, various embodiments allow a user to employ a mobile phone or other device as a token to assist the user in securely accomplishing a variety of operations.  
10 Some embodiments also allow the user to employ the token in combination with a USR system to increase the utility of the token and the functionality and security of the various operations. That is, the token may be employed to assist the user in conducting operations that access data concerning commercial transactions (for example, retail purchases), finance and banking operations, medical records and medical information systems, physical security and access  
15 control, and identification and authentication of the parties involved in any of the preceding, etc.

Referring now to FIG. 31, a system 350 is illustrated for use in facilitating financial transactions in accordance with some embodiments. As used herein with reference to Fig. 31, the term “financial transaction” can include any of sales transactions including transactions  
20 conducted on-line or at a point of sale using credit or debit accounts, banking transactions, purchases or sales of investments and financial instruments or generally the transfer of funds from a first account to a second account. The system includes a user device 352, a point-of-sale (“POS”) device 354 and a universal secure registry 356 which can communicate with one another wirelessly, and/or over a network 357.

25 According to one embodiment, the user device 352 includes a display 362, a user interface 364, a communication link 366 and a biometric sensor 367. In various embodiments, the user device 352 may be any of a mobile phone, a personnel digital assistant or other handheld device.

In various embodiments, the communication link 366 may include any of a receiver and  
30 a transmitter suitable for wireless communication such as via RF and/or optical signals. Accordingly, in some embodiments, the communication link 366 includes an antenna and/or an

optical signal source such as a LED alone or in combination with an optical receiver. In accordance with one embodiment, the user device 352 can employ an optical signal in the infrared spectrum. In various embodiments, the user device 352 can be configured to communicate by any form of a wireless signal such as a Bluetooth signal, WiFi, near field  
5 communication, ultra-wideband communication, RF signals and electromagnetic signals in general.

In some embodiments, the biometric sensor 367 may be employed to receive and process biometric inputs such as any of or any combination of a fingerprint, a speech/voice input, an iris scan, a retina scan, a facial scan, a written input, the user's fingerprint and DNA.  
10 In a further embodiment, the biometric sensor can be employed to process a written input that includes a signature.

In addition, various embodiments of the user device 352 may be in the form of a smart card or other type of credit card as described previously. Further, in some embodiments, the user device 352 may include an embodiment of the first wireless device 2110 illustrated in  
15 FIG. 21. Accordingly, in various embodiments, the user device 352 can include all or some of the features and functionality found in the first wireless device 2110. That is, the user device 352 can include features that may not be illustrated in FIG. 31, for example, a microprocessor, memory, a power source, etc. In yet another embodiment, the first wireless device 2110 can be employed to conduct transactions in accordance with the embodiment illustrated in FIG. 31  
20 and described below.

In general, the POS device 354 may be any type of POS device as known to those of ordinary skill in the art. In accordance with some embodiments, the POS device 354 includes a display 368, a user interface 370 and a communication link 372. Further, in some  
25 embodiments, the user device may include an embodiment of the second wireless device 2112 illustrated in FIG. 21. Accordingly, in various embodiments, the POS device 354 can include all or some of the features and functionality found in the second wireless device 2112. That is, the POS device 354 can include features that may not be illustrated in FIG. 31, for example, a microprocessor, memory, a power source, a biometric sensor, etc. In yet another embodiment, the second wireless device 2112 can be employed to conduct transactions in accordance with  
30 the embodiment illustrated in FIG. 31 and described below. Further, it should be apparent to those of skill in the art that the POS device may be a handheld device or a larger "countertop"

device. It should also be apparent to those of skill in the art that the POS device may communicate wirelessly with the network or may be coupled to the network 357 via a hardwired connection.

In accordance with one embodiment, the network 357 includes a plurality of networks that may allow communication between any of the user device 352, the POS device 354 and the USR 356 over any communication medium including wired networks (including fiber optic networks) or wireless networks. Further, the network may include one or more of either or both of local area networks and wide area networks including the Internet. In general, the network 357 can be employed for communication between the user device 352 and the USR 356, communication between the user device 352 and the POS device 354, communication between the POS device 354 and the USR 356, and communication between the user device 352 and the USR 356 via the POS device 354. According to the illustrated embodiment, the system 350 may also include a network 374 that allows communication between the user device 352 and the POS device 354 but does not provide communication with the USR. A wireless personal area network such as Bluetooth provides one example, while a local WiFi network, near field communication and ultra-wideband communication provide further examples of various embodiments of the network 374. As should be apparent to those of ordinary skill in the art, however, the network 357 may include any of the preceding in accordance with some embodiments.

Further, in accordance with some embodiments, the user device 352 may wirelessly communicate with a converter device, for example, the converter device 102 described with reference to FIG. 28. According to this embodiment, the converter device is used to communicate with the POS device 354, for example, where the POS includes a mag-stripe reader.

According to one embodiment, the USR 356 includes a secure database that stores account information for a plurality of users 358. In a further embodiment, the USR 356 retains records concerning one or more accounts 360 for each of the plurality users so that in effect the USR 356 in the system creates a secure wallet that allows a user of the device 352 to select a particular account from among a plurality of accounts associated with the user for use in a selected transaction. The type of account can vary in accordance with various embodiments. In accordance with one embodiment, the accounts 360 are credit card accounts, for example,

any of those serviced by VISA, MasterCard, Discover and American Express. Alternatively or in combination with the preceding, the accounts 360 may be debit accounts associated with the various bank accounts held by the user 358.

In accordance with various embodiments, the user device 352 includes software that  
5 allows the user device 352 to operate in combination with the USR 356. In accordance with one embodiment, the user device 352 can initially be provided with the software or it can be retrofitted by downloading software for operation with the USR via the network 357. In one embodiment, the software is loaded via a cellular network. In another embodiment, the software is loaded via any wireless network such as a WiFi network. In a further embodiment,  
10 the software is included in a Subscriber Identity Module (“SIM”) that can be removably installed in the user device 352. In yet another embodiment, the software is loaded over a hardwired communication link between the user device 352 and an access point to the network 357. Accordingly, various embodiments can allow a user to download the software for operation with the USR (including the initial receipt of the software, later updates, security  
15 patches, etc.).

In general and in accordance with one embodiment, the system 350 allows each user to employ their respective user device 352 to purchase goods or services at a wide variety of points-of-sale, and further, to make such purchases from one or more accounts selected from a plurality of accounts 360. Accordingly, the system 350 allows users to employ a mobile phone  
20 as an “electronic wallet” to select, at the point-of-sale, a particular account from among a plurality of available accounts, for example, a plurality of credit card accounts. Further, in some embodiments, the system 350 allows users to employ the approach for purchases that are made using the Internet. As mentioned above, the system 350 can also be employed in other forms of financial transactions including banking transactions and investment transactions.

In accordance with some embodiments, the user device 352 is activated for a  
25 transaction when the user satisfactorily completes an authentication process with the device. In some embodiments, the entry of a PIN number known to the user is employed to activate the device. In some embodiments, the software included in the user device 352 and employed in conducting transactions using the system 350 remains inoperative until the entry of the correct  
30 PIN. In a further embodiment, the data (for example, contact lists and associated information) stored in the user device 352 is unavailable or unintelligible until the entry of the correct PIN.

In accordance with one embodiment, the data in the user device 352 is stored following a mathematical operation that acts to modify the data such that it is unintelligible. In this example, the user device 352 employs the PIN supplied by the user to reverse the mathematical operation, for example, by performing an exclusive or operation (“XOR”) on the data using the PIN to render the data legible. In other words, this embodiment provides a secure embodiment of the user device that is useless in the hands of a user without knowledge of the PIN information, as without the entry of the PIN, the data stored on the device is useless.

In a further embodiment, the above approach is used to disable the software employed by the user device 352. That is, a mathematical operation is performed on software stored in the user device 352 with the PIN. Once the mathematical operation is performed the modified software is unusable and the software remains inoperative until the PIN is supplied by the user. Here too, an XOR operation may be employed to recover the software, which allows the software to operate.

In accordance with one embodiment, the preceding approaches provide an increased level of security because the theft of the user device 352 (for example, the mobile phone) is not enough for the thief to employ the user device 352. Instead, a third party in possession of the user device 352 cannot employ the device to conduct a transaction without knowledge of the PIN.

Some embodiments can employ a multi-factor authentication process before allowing a user to employ the user device 352 to conduct a transaction. That is, the system 350 can authenticate a user based on something the user knows, something the user is, and something that the user has. According to one embodiment, the user device 352 is included in the last element of the three factors. For example, many electronic devices, including mobile phones, include an electronic serial number. Thus, in one embodiment, the user is authenticated and allowed to conduct a transaction with the USR 356 by providing something the user knows (for example, a PIN), something the user is (for example, a biometric measurement as detected by the biometric sensor 367) and something the user possesses (for example, the mobile phone as evidenced by the correct electronic serial number). In accordance with this embodiment, the PIN, the biometric information and the electronic serial number are communicated to the USR 356 where the user is authenticated. In various embodiments, the multiple pieces of data can be combined (for example, cryptographically combined through known encryption techniques)

before being communicated. The transaction and/or access to the user's account info are permitted when an authentication is successful. Conversely, a transaction can be denied/refused where the authentication is unsuccessful, for example, where one or more of the PIN, the biometric information and the electronic serial number are incorrect.

5           According further embodiments, the multi-factor authentication process can also employ the identification of the account selected by the user for the current transaction. That is, the system 350 can authenticate the user based on a combination of two or more of something the user knows, something the user is, something that the user has and an account selected by the user for the current transaction (i.e., the transaction for which the authentication  
10 is being completed). For example, in one embodiment, encrypted authentication information is generated from a non-predictable value generated by the user device 352, identifying information for the selected user account 360, and at least one of the biometric information and secret information the user knows (for example, a PIN). According to one embodiment, the authentication information (for example, encrypted authentication information) is  
15 communicated to the secure registry for authentication and approval of the requested account access and/or financial transaction. In a further embodiment, one or more aspects of the authentication and approval are completed at the POS, for example, using the POS device 354, while in another embodiment, the POS provides a conduit or communication path from the user device 352 to the secure registry 356.

20           According to another embodiment, the user device 352 is secured such that authentication information cannot be generated by the user device 352 prior to an authentication of the user based on the biometric input provided to the user device 352. In one embodiment, the user device 352 performs the authentication. In another embodiment, the POS device 354 authenticates the biometric information provided by the user. In yet another  
25 embodiment, the biometric information is authenticated by the secure registry 356.

          According to one embodiment, any two of the PIN, the biometric information, the electronic serial number, a discrete code associated with the device and the identifying information concerning the selected account are employed to generate a seed from which further authentication information is generated, for example, to generate a seed from which a  
30 non-predictable value can be generated by the user device 352. For example, in one embodiment, the seed is employed in an algorithm that also employs a temporal value to

generate the authentication information. In one embodiment, the seed and the further authentication information are generated at the user device 352 and are provided to either or both of the second device 354 and the USR 356. Either or both of the second device and the USR can use the authentication information to authenticate or validate the identity of the user of the device 352, as has been described herein. In accordance with another embodiment, all four of the PIN, the biometric information, the electronic serial number and the identifying information concerning the selected account are employed to generate the seed. In one embodiment, the discrete code that is associated with the device is also used in combination with each of the preceding to generate the seed.

10 In some embodiments, the discrete code that is associated with the device is provided in lieu of the electronic serial number while in other embodiments the unique code is employed with the electronic serial number to generate the seed. In one embodiment, the discrete code is unique to the user device 352. In accordance with one embodiment, the discrete code is inaccessible to an individual in possession of the device. Further, the discrete code may be maintained by the user device 352 such that any indication that the security of the device is compromised results in the discrete code being set to a default value (for example, zero) which effectively prevents valid authentication information from being generated by the user device 352. As just one example, the preceding security measure can be taken when the device receive an indication that it is being used under duress.

20 In another embodiment, a challenge/response protocol is employed, for example, where the USR 356 communicates a challenge to the user device 352 and access to the USR is only granted where the user's response is correct. In accordance with one embodiment, a correct response is generated using any of the PIN, the biometric information and the electronic serial number in combination with the information provided as the challenge. As has been discussed herein, the challenge/response protocol can be invisible and seamless to the user of the device 352, since other than the user providing any of PIN and/or biometric information, the communication protocol of the challenge/response protocol can be done in the background without active participation from the user.

30 According to some embodiments, the validation of the biometric information provided by the user can be performed on a character by character basis. For example, where the biometric information includes a spoken word or phrase, each spoken character (whether alpha

or numeric) can be individually evaluated to determine whether it was provided by a user authorized to employ the user device 352. In various embodiments, the authentication of the biometric occurs at the user device 352, at the POS device 354, at the USR 356 or at a combination of the preceding.

5           In accordance with some embodiments, the security of the system may be further increased where the system 350 allows for one or more approaches to limit the use of the user device 352. For example, according to one embodiment, the system allows a user to establish limitations on the use of the user device 352. For example, a user may establish an active period or periods as the only period(s) that the user device 352 can be used in combination  
10 with the USR 356. Accordingly, the active period may include a temporal element. For example, the active period may be so many consecutive hours or days beginning from the start of the activation period, a fixed period of time during every day, certain days of the week, etc. As should be apparent to those of skill in the art, in one embodiment, operation of the user device 352 may be completely disabled outside of the designated active period(s). In the  
15 embodiment illustrated in FIG. 31 where the system 350 is employed for financial transactions including credit card purchases, the user may limit the use of the user device 352 to conduct such transactions to a maximum amount of a single transaction, a maximum cumulative amount of all transactions, a maximum quantity of transactions and/or a predetermined monetary amount. According to some embodiments, each of the preceding can be employed  
20 alone or in combination with a temporal element such that, for example, the maximums are determined for an active period of time having a known length. Further, the values may be set by the user, or for example, by an issuer of the user device 352. Alternatively, the maximum values may be provided by an issuer of one or more of the plurality of user accounts 360.

As a further security enhancement, the user device 352 can be configured to cease  
25 operating when an unauthorized use of the device is detected. The unauthorized use may be detected where the user 352 provides an indication that the device is being used under duress as described above. In one embodiment, a transaction in which a user signals the use under duress proceeds but the user device 352 becomes inoperative for one or more subsequent transactions. In a further embodiment, the system 350 communicates information concerning  
30 the situation to local law enforcement, for example, the location of the user device and the identity and/or appearance of the user. According to one embodiment, a constant is added to

the value of the PIN when the user device 352 is being used under duress. For example, the user can enter a value which corresponds to the PIN plus one.

In some embodiments, the USR 356 provides consolidated security for the plurality of user accounts associated with a plurality of individual service companies (i.e., VISA  
5 MasterCard, etc.) who employ USR. In some embodiments, this avoids the need for the individual service companies to separately monitor the security of transactions for each of their respective accounts even where the service companies are not be affiliated with one another.

In a further embodiment, the user device 352 may destroy data/information present in the user device based on the occurrence of an event or multiple events. In one embodiment,  
10 this action is the result of evidence of tampering with the user device 352, for example, the repeated entry of an incorrect PIN. In another embodiment, the user device 352 destroys sensitive information (or a subset of information included in the user device 352) following the passage of a predetermined period of time of, for example, inactivity. It is also to be appreciated that, in an embodiment, the underlying data and/or software need not be destroyed  
15 in the above events, but instead there may be a lockout period as a result of the above events for which the device is rendered unusable. This lockout period may be extended and/or increased for repeated events discussed above.

It is to be appreciated, as has been discussed herein, that according to some embodiments, biometric information of a user of the first device or authentication of biometric  
20 information of the user of the first device can be provided to the second device 354 for any of the purposes described herein in any of the following ways: at least in part from the first device 352, at least in part from the USR 356, and at least in part from reading the biometric data stored on the second device.

In accordance with one embodiment where wireless communication is employed to  
25 communicate information between the user device 352 and the POS device 354 (for example, communication via Bluetooth protocol), the POS device may receive signals from a plurality of user devices 352 in the vicinity of the POS device 354. Accordingly, the POS device 354 may be employed to select from a plurality of users to conduct a transaction. For example, where an image of each of the users in the vicinity is displayed at the POS device 354, the individual  
30 operating the POS device 354 may select the user (and associated accounts) by selecting the photo of the user who is employing the user device 352 for the current transaction.

It is to be appreciated, as has been discussed herein, that according to some embodiments the system 350 including the USR 356 is used to provide authorization for an occurrence of an event, such as a credit or debit transaction, without providing secure information such as the credit or debit card number. In particular, for such embodiments, the USR either by itself or in combination with credit or banking authority, authenticates the user of the first device and the selected account information and either provides a one time code for authorizing the transaction or a denial to the second device, which can be displayed on the second device to indicate the approval or denial of the transaction to the POS operator. It also to be appreciated that the system can also be employed, for example, for internet purchase through a web site where the USR can alone or in combination approves or denies the transaction and provides the approval or denial to the operator of the web site, for example, where the user of the first device 352 either manually logs into a web site and provides account information, or where the user of the first device communicates via the first device 352 and the token provided by the first device with the web site. It is also to be appreciated that the code or information displayed at the second device 354 can enable many forms of a transaction not just limited to a credit or debit transaction. It can include approval for enablement of any of the events that have been described herein. In addition, the code or information can, for example, provide authorization or security that funds exist in the account to cover a check written by the user of the first device, in effect providing a code that turns the personal check into a certified check, without the need for the user of the first device having to obtain a bank check.

In various embodiments of the preceding system, the system 350 can be employed as a peer to peer network. For example, the first device and the second device are configured as peer to peer devices, in combination with the USR 356 or in some embodiments without the needs for information in the USR 356, as has been discussed herein, to authenticate and/or validate an identity of a user of the first device to the second device and in addition to authenticate and/or validate an identity of a user of the second device to the first device, to allow an occurrence of an event, such as a credit or debit transaction, access to a secure location, passport identification information and the like.

Although the above-described system 350 employs the USR 356 to facilitate the preceding operations, the above approach may be employed with alternative systems that include a secure database with the user's account information. Further, although the preceding

description concerning FIG. 31 primarily discusses sales transactions, the system 350 may be employed in a variety of fields to allow only authorized access by authenticated users to secure data, for example, as illustrated in FIG. 4, and the like as has been described herein.

Further, the user device can in some embodiments be used to authenticate identity in a variety of applications. That is, an authentication code can be generated by the user device 352 as described above where the authentication code is used to determine whether the user is authorized to take one or more actions. According to one embodiment, the authentication code is provided to a security system to determine whether the user is permitted to access a physical facility, for example, to determine whether the user is permitted to access a residence or a place of business. In a further embodiment, the user device 352 wirelessly communicates an authentication code to a home security system as part of an access request. The authentication code generated by the user device 352 can be used in a similar manner to determine whether an individual can access a computer network, for example, log in. According to additional embodiments, such an authentication code can also be used to provide positive identification of an individual in possession of the user device 352 in the manner of a passport, driver's license or other form of identification issued by the government or another third party such as an employer.

In one embodiment, a user device is configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction. In one embodiment, the user device includes a biometric sensor configured to receive a biometric input provided by the user, a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts. In a further embodiment, the user device includes a communication link configured to communicate with a secure registry, and a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface, and the communication link. According to one embodiment, the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry. According to another embodiment, the secret information includes the identifying information.

In a further embodiment, the communication link wirelessly transmits the encrypted authentication information to a point-of-sale (POS) device, and the POS device is configured to transmit at least a portion of the encrypted authentication information to the secure registry. Further, the POS device can include a magnetic stripe reader.

5           In yet another embodiment, the communication link wirelessly transmits the encrypted authentication information to a converter device configured to generate an emulated magnetic stripe output for use with the POS device.

          In still another embodiment, the user device includes a memory coupled to the processor where the memory stores information employed by the device to authenticate the biometric received by the biometric sensor. In one embodiment, the device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the device.

          According to a further embodiment, the secret information known to the user includes a PIN, and the authentication of the secret information and the biometric input activate the device for the financial transaction. In one embodiment, the user device includes a memory coupled to the processor and the data stored in the memory is unavailable to an individual in possession of the device until the device is activated. According to his embodiment, the data can be subject to a mathematical operation that acts to modify the data such that it is unintelligible until the device is activated.

20           In accordance with some embodiments, a method of generating authentication information includes acts of authenticating an identity of a user to a device based on at least one of biometric data received by the device from the user and secret information known to the user and provided to the device. The method can also include the generation of a non-predictable value with the device. The method can further include acts of receiving identifying information from the user concerning a selected one of a plurality of user accounts and generating encrypted authentication information from the non-predictable value, the identifying information, and at least one of the biometric data and the secret information. In a further embodiment, the device can generate encrypted authentication information from each of the non-predictable value, the biometric data, the secret information, and the identifying information.

In accordance with another embodiment, the method includes an act of de-activating the device without generating the encrypted authentication information if the identity of the user is not successfully authenticated to the device. Embodiments may also include an act of generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry.

According to a still further embodiment, a method of controlling access to a plurality of accounts is provided where the method includes acts of generating, with a device, encrypted authentication information from a non-predictable value generated by the device, identifying information concerning an account selected by a user of the device from among a plurality of accounts associated with the user, and at least one of a biometric of the user received by the device and secret information provided to the device by the user, communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry, authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated, and denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

According to a further embodiment, the method includes an act of authenticating an identity of the user by validating the biometric with one of the device and the secure registry. In some embodiments, the biometric can be validated on a character-by-character basis.

According to yet another embodiment, the method includes an act of transmitting image data from the secure registry to the POS device along with an authorization authorizing the POS device to initiate the financial transaction provided that the image data when processed at the POS device authenticates an identity of the user. In a further embodiment, the method also includes an act of authenticating the identity of the user at the POS device by any of displaying an image of the user at the POS device for visual confirmation by an operator of the POS device and processing biometric data provided by the image data. The operator may be a store clerk, bank clerk, security personnel or an individual in any other capacity in which they are tasked with a responsibility to verify an identity of an individual in possession of the user device.

In accordance with one embodiment, the secure registry includes a database containing information concerning a plurality of accounts associated with a different one of a plurality of users, respectively. Further, the plurality of accounts can include accounts associated with a plurality of different financial service providers. According to some embodiments, the method  
5 can include an act of transmitting information including at least a portion of the encrypted authentication information to the secure registry from the POS device.

Having thus described several aspects of at least one embodiment of this invention, it is to be appreciated various alterations, modifications, and improvements will readily occur to those skilled in the art. Such alterations, modifications, and improvements are intended to be  
10 part of this disclosure, and are intended to be within the spirit and scope of the invention. Accordingly, the foregoing description and drawings are by way of example only.

What is claimed is:

CLAIMS

1. A device configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction, comprising:
- 5 a biometric sensor configured to receive a biometric input provided by the user;
- a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts;
- 10 a communication link configured to communicate with a secure registry; and
- a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface and the communication link, the processor configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information
- 15 concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry.
2. The device of claim 1, wherein the communication link is configured to wirelessly transmit the encrypted authentication information to a point-of-sale (POS) device,
- 20 and wherein the POS device is configured to transmit at least a portion of the encrypted authentication information to the secure registry.
3. The device of claim 2, wherein the POS device includes a magnetic stripe reader, and wherein the communication link is configured to wirelessly transmit the
- 25 encrypted authentication information to a converter device configured to generate an emulated magnetic stripe output for use with the POS device.
4. The device of claim 2, wherein the processor is configured to generate the encrypted authentication information from each of the non-predictable value, the identifying
- 30 information, the information concerning the biometric input and the secret information.

5. The device of claim 1, wherein the biometric received by the biometric sensor is communicated to the secure registry for authentication prior to generation of the encrypted authentication information.

5 6. The device of claim 1, wherein the secret information includes the identifying information.

7. The device of claim 1, further comprising a memory coupled to the processor, wherein the memory stores information employed by the device to authenticate the biometric received by the biometric sensor.

8. The device of claim 7, wherein the device does not permit the entry of the user input if the biometric input received by the biometric sensor is determined to not belong to an authorized user of the device.

15 9. The device of claim 8, wherein the secret information known to the user includes a PIN, and wherein the authentication of the secret information and the biometric input activate the device for the financial transaction.

20 10. The device of claim 9, further comprising a memory coupled to the processor, wherein data stored in the memory is unavailable to an individual in possession of the device until the device is activated.

11. The device of claim 10, wherein the data is subject to a mathematical operation that acts to modify the data such that it is unintelligible until the device is activated.

12. The device of claim 9, further comprising a memory coupled to the processor and configured to store an electronic serial number of the device, wherein the processor is configured to generate a seed using at least two of the electronic serial number, a discrete code associated with the device, the PIN and the biometric input to generate the encrypted

authentication information, and wherein the seed is employed by the processor to generate the non-predictable value.

13. The device of claim 1, wherein the biometric sensor is configured to receive  
5 and process at least one of a fingerprint, a speech/voice input, an iris scan, a retina scan, a facial scan, a fingerprint, written information and a DNA input.

14. The device of claim 1, further comprising a handheld device including each of  
the biometric sensor, the user interface, the communication link and the processor.

10

15. A method of generating authentication information comprising acts of:  
authenticating an identity of a user to a device based on at least one of biometric data  
received by the device from the user and secret information known to the user and provided  
to the device;  
15 generating a non-predictable value with the device;  
receiving identifying information from the user concerning a selected one of a  
plurality of user accounts; and  
generating encrypted authentication information from the non-predictable value, the  
identifying information, and at least one of the biometric data and the secret information.

20

16. The method of claim 15, further comprising an act of generating encrypted  
authentication information from each of the non-predictable value, the biometric data, the  
secret information, and the identifying information.

17. The method of claim 15, further comprising an act of de-activating the device  
25 without generating the encrypted authentication information if the identity of the user is not  
successfully authenticated to the device.

18. The method of claim 15, further comprising an act of generating a seed from  
30 which the authentication information is generated by employing at least two of the biometric  
data, the secret information known to the user, and an electronic serial number of the device.

19. The method of claim 15, further comprising an act of generating encrypted authentication information in a manner that allows the identification of the user and the selected one of the plurality of user accounts by a secure registry.

5

20. A method of controlling access to a plurality of accounts, the method comprising acts of:

generating, with a device, encrypted authentication information from a non-predictable value generated by the device, identifying information concerning an account selected by a user of the device from among a plurality of accounts associated with the user, and at least one of a biometric of the user received by the device and secret information provided to the device by the user;

communicating the encrypted authentication information from the device to a secure registry via a point-of-sale (POS) device to authenticate or not authenticate the device with the secure registry;

authorizing the POS device to initiate a financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is successfully authenticated; and

denying the POS device from initiation of the financial transaction involving a transfer of funds to or from the account selected by the user when the encrypted authentication information is not successfully authenticated.

## ABSTRACT

In one embodiment, a user device is configured to allow a user to select any one of a plurality of accounts associated with the user to employ in a financial transaction. In one embodiment, the user device includes a biometric sensor configured to receive a biometric input provided by the user, a user interface configured to receive a user input including secret information known to the user and identifying information concerning an account selected by the user from the plurality of accounts. In a further embodiment, the user device includes a communication link configured to communicate with a secure registry, and a processor coupled to the biometric sensor to receive information concerning the biometric input, the user interface, and the communication link. According to one embodiment, the processor is configured to generate a non-predictable value and to generate encrypted authentication information from the non-predictable value, the identifying information, and at least one of the information concerning the biometric input and the secret information, and to communicate the encrypted authentication information via the communication link to the secure registry.

FIG. 31

Under the Paperwork Reduction Act of 1995, no persons are required to respond to a collection of information unless it contains a valid OMB control number.

<b>Application Data Sheet 37 CFR 1.76</b>		Attorney Docket Number	W0537-701320
		Application Number	
Title of Invention	UNIVERSAL SECURE REGISTRY		
The application data sheet is part of the provisional or nonprovisional application for which it is being submitted. The following form contains the bibliographic data arranged in a format specified by the United States Patent and Trademark Office as outlined in 37 CFR 1.76. This document may be completed electronically and submitted to the Office in electronic format using the Electronic Filing System (EFS) or the document may be printed and included in a paper filed application.			

**Secrecy Order 37 CFR 5.2**

Portions or all of the application associated with this Application Data Sheet may fall under a Secrecy Order pursuant to 37 CFR 5.2 (Paper filers only. Applications that fall under Secrecy Order may not be filed electronically.)

**Applicant Information:**

Applicant 1					Remove
Applicant Authority		<input checked="" type="radio"/> Inventor		<input type="radio"/> Legal Representative under 35 U.S.C. 117	<input type="radio"/> Party of Interest under 35 U.S.C. 118

This collection of information is required by 37 CFR 1.76. The information is required to obtain or retain a benefit by the public which is to file (and by the USPTO to process) an application. Confidentiality is governed by 35 U.S.C. 122 and 37 CFR 1.14. This collection is estimated to take 23 minutes to complete, including gathering, preparing, and submitting the completed application data sheet form to the USPTO. Time will vary depending upon the individual case. Any comments on the amount of time you require to complete this form and/or suggestions for reducing this burden, should be sent to the Chief Information Officer, U.S. Patent and Trademark Office, U.S. Department of Commerce, P.O. Box 1450, Alexandria, VA 22313-1450. DO NOT SEND FEES OR COMPLETED FORMS TO THIS ADDRESS. **SEND TO: Commissioner for Patents, P.O. Box 1450, Alexandria, VA 22313-1450.**

## Privacy Act Statement

The Privacy Act of 1974 (P.L. 93-579) requires that you be given certain information in connection with your submission of the attached form related to a patent application or patent. Accordingly, pursuant to the requirements of the Act, please be advised that: (1) the general authority for the collection of this information is 35 U.S.C. 2(b)(2); (2) furnishing of the information solicited is voluntary; and (3) the principal purpose for which the information is used by the U.S. Patent and Trademark Office is to process and/or examine your submission related to a patent application or patent. If you do not furnish the requested information, the U.S. Patent and Trademark Office may not be able to process and/or examine your submission, which may result in termination of proceedings or abandonment of the application or expiration of the patent.

The information provided by you in this form will be subject to the following routine uses:

1. The information on this form will be treated confidentially to the extent allowed under the Freedom of Information Act (5 U.S.C. 552) and the Privacy Act (5 U.S.C. 552a). Records from this system of records may be disclosed to the Department of Justice to determine whether the Freedom of Information Act requires disclosure of these records.
2. A record from this system of records may be disclosed, as a routine use, in the course of presenting evidence to a court, magistrate, or administrative tribunal, including disclosures to opposing counsel in the course of settlement negotiations.
3. A record in this system of records may be disclosed, as a routine use, to a Member of Congress submitting a request involving an individual, to whom the record pertains, when the individual has requested assistance from the Member with respect to the subject matter of the record.
4. A record in this system of records may be disclosed, as a routine use, to a contractor of the Agency having need for the information in order to perform a contract. Recipients of information shall be required to comply with the requirements of the Privacy Act of 1974, as amended, pursuant to 5 U.S.C. 552a(m).
5. A record related to an International Application filed under the Patent Cooperation Treaty in this system of records may be disclosed, as a routine use, to the International Bureau of the World Intellectual Property Organization, pursuant to the Patent Cooperation Treaty.
6. A record in this system of records may be disclosed, as a routine use, to another federal agency for purposes of National Security review (35 U.S.C. 181) and for review pursuant to the Atomic Energy Act (42 U.S.C. 218(c)).
7. A record from this system of records may be disclosed, as a routine use, to the Administrator, General Services, or his/her designee, during an inspection of records conducted by GSA as part of that agency's responsibility to recommend improvements in records management practices and programs, under authority of 44 U.S.C. 2904 and 2906. Such disclosure shall be made in accordance with the GSA regulations governing inspection of records for this purpose, and any other relevant (i.e., GSA or Commerce) directive. Such disclosure shall not be used to make determinations about individuals.
8. A record from this system of records may be disclosed, as a routine use, to the public after either publication of the application pursuant to 35 U.S.C. 122(b) or issuance of a patent pursuant to 35 U.S.C. 151. Further, a record may be disclosed, subject to the limitations of 37 CFR 1.14, as a routine use, to the public if the record was filed in an application which became abandoned or in which the proceedings were terminated and which application is referenced by either a published application, an application open to public inspections or an issued patent.
9. A record from this system of records may be disclosed, as a routine use, to a Federal, State, or local law enforcement agency, if the USPTO becomes aware of a violation or potential violation of law or regulation.

**DECLARATION FOR PATENT APPLICATION**

As a below named inventor, I hereby declare that:

My residence, post office address and citizenship are as stated below next to my name.

I believe I am the original, first and sole inventor (if only one name is listed below) or an original, first and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the application entitled

**UNIVERSAL SECURE REGISTRY**

the specification of which is attached hereto unless the following is checked:

was filed on \_\_\_\_\_, as Application No. \_\_\_\_\_, bearing attorney docket No. \_\_\_\_\_, and was amended on \_\_\_\_\_ (if applicable).

I hereby state that I have reviewed and understand the contents of the above identified application, including the claims, and amended by any amendment referred to above.

I acknowledge the duty to disclose information which is known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, §1.56.

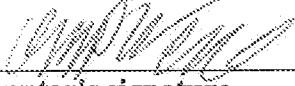

I hereby claim foreign priority benefits under Title 35, United States Code, §119(a)-(d) or §365(b) of any foreign application(s) for patent or inventor's certificate, or §365(a) of any PCT International application designating at least one country other than the United States listed below and have also identified below any foreign application for patent or inventor's certificate or PCT International application having a filing date before that of the application on which priority is claimed:

Prior Foreign or PCT International Application(s) and any priority claims under 35 U.S.C. §119(a)-(d) and §365(a),(b):

			Priority Claimed
