Inside USB Transfers

To design and program a USB device, you need to know a certain amount about the inner workings of the interface. This is true even though the hardware and system software handle many of the details automatically.

This and the next three chapters are a tutorial on how USB transfers data. This chapter has essentials that apply to all transfers. The following chapters cover the four transfer types supported by USB, the enumeration process, and the standard requests used in control transfers.

You don't need to know every bit of this information to get a project up and running, but I've found that understanding something about how the transfers work helps in deciding which transfer types to use, in writing the firmware for the controller chip, and in tracking down the inevitable bugs that show up when you try out your circuits and code.

The USB interface is complicated, and much of what you need to know is interwoven with everything else. This makes it hard to know where to start. In general, I begin with the big picture and work down to the details. Unavoidably, some of the things I refer to aren't explained in detail until

later. And some things are repeated because they're important and relevant in more than one place.

The information in these chapters is dense. If you don't have a background in USB, you won't absorb it all in one reading. You should, however, get a feel for how USB works, and will know where to look later when you need to check the details.

The ultimate authority on the USB interface is the specification published by its sponsoring members. The specification document, titled not surprisingly, *Universal Serial Bus Specification*, is available on the USB Implementers Forum's website (www.usb.org). However, by design, the specification omits information and tips that are unique to any operating system or controller chip. This type of information is essential when you're designing a product for the real world, so I've included it.

Transfer Basics

You can divide USB communications into two categories, depending on whether they're used in configuring and setting up the device or in the applications that carry out the device's purpose. In configuration communications, the host learns about the device and prepares it for exchanging data. Most of these communications take place when the host enumerates the device on power up or attachment. Application communications occur when the host exchanges data for use with applications. These are the communications that perform the functions the device is designed for. For example, for a keyboard, the application communications are the sending of keypress data to the host to tell an application to display a character.

Configuration Communications

During enumeration, the device's firmware responds to a series of standard requests from the host. The device must identify each request, return requested information, and take other actions specified by the requests.

On PCs, Windows performs the enumeration, so there's no user programming involved. However, to complete the enumeration, Windows must

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
