INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 98/09889

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: 3
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although claim 3
is directed to a method of treatment of the human/animal
body, the search has been carried out and based on the alleged
effects of the compound/composition.
2. Claims Nos.: not applicable
because they relate to parts of the International Application that do not comply with the prescribed requirements to such
an extent that no meaningful International Search can be carried out, specifically:
see FURTHER INFORMATION sheet PCT/ISA/210
3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking(Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Claims Nos.: not applicable

In view of the extremely broad Markush claims, the search was executed with due regard to the PCT Search Guidelines (PCT/GL/2), C-III, paragraph 2.1, 2.3 read in conjunction with 3.7 and Rule 33.3 PCT, i.e. particular emphasis was put on the inventive concept, as illustrated by the examples and the compounds of claim 2.

The international search was, in so far as possible and reasonable, complete in that it covered the entire subject-matter to which the claims are directed.

(54) Title: THIADIAZOLYL AND OXADIAZOLYL PHENYL OXAZOLIDINONE ANTIBACTERIAL AGENTS

(57) Abstract

The present invention provides thiadiazolyl and oxadiazolyl phenyl oxazolidinone compounds of formula (I) wherein Q is thiadiazolyl or oxadiazolyl; wherein X¹ and X² are independently hydrogen, fluorine, or chlorine; and wherein R¹ is, for example, -COCH₃ or -COCH₂CH₃. These compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, including gram-positive and gram-negative aerobic bacteria.

THIADIAZOLYL AND OXADIAZOLYL PHENYL OXAZOLIDINONE
ANTIBACTERIAL AGENTS

BACKGROUND OF THE INVENTION

5 The subject invention discloses thiadiazolyl and oxadiazolyl phenyl oxazolidinone derivatives. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens, including gram-positive aerobic bacteria such as multiply-resistant staphylococci, streptococci and enterococci, as well as anaerobic organisms such as *Bacteroides spp.*, and acid-fast organisms such as *Mycobacterium*

10 *tuberculosis*.

Piperazine-containing oxazolidinones are disclosed in International Publication No. WO93/23384, November 25, 1987 (PCT/US93/03570). International Publication No. WO95/14684, June 1, 1995 (PCT/US94/10582) discloses esters of the oxazolidinone, piperazine ring structures disclosed in the above PCT application.

15 International Publication No. WO95/07271, March 16, 1995 (PCT/US94/08904) discloses oxazolidinones although containing morpholine and thiomorpholine instead of the subject piperazine.

Other earlier publications in the area of oxazolidinones are US Patent Nos. 4,801,600; 4,921,869; EPA 0352781 (January 31, 1989); and EPA 0316594 (May 24, 20 1989) all assigned to E.I. DuPont De Nemours and Company, which are cited here to exemplify the state of the art.

INFORMATION DISCLOSURE

International Publication No. WO 93/09103, published 13 May 1993, and corresponding US Patent No. 5,565,571, disclose substituted aryl- and heteroarylphenyl-oxazolidinones useful as antibacterial agents. Among the heteroaryl groups disclosed are groups such as imidazolyl, pyrazolyl, thiazolyl, isothiazolyl, oxazolyl, isoxazolyl and triazolyl.

International Publication No. WO96/23788, published 8 August 1996, discloses nitrogen-containing heteroaromatic ring substituted phenoxyazolidinone antimicrobials. 30 This 5-member nitrogen-containing hetero-aromatic ring has from 1 to 4 nitrogen atoms and is attached to the phenoxyazolidinone through one of the nitrogen atoms.

US Patent Nos. 4,948,801; 5,043,443; 5,130,316; and 5,254,577 aminomethoxyoxazolidinyl aryl-substituted benzene derivatives useful as antibacterial

agents. Among the aromatic groups disclosed are groups such as diazinyl, triazinyl, thiazolyl, oxazolyl and unsubstituted 1,2,3-thiadiazol-4-yl. These compounds do not have flanking halogens on the benzene ring.

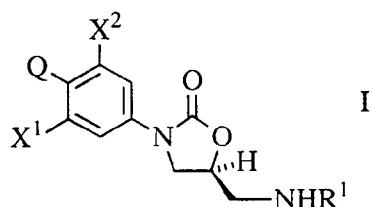

International Publication No. WO97/30981, published 28 August 1997, discloses 5 azolyl piperazinyl phenyl oxazolidinone antibacterials. Among the five-membered ring heterocycles (i.e., azolyl rings) disclosed are groups such as thiadiazolyl, oxadiazolyl, thiazolyl, benzothiazolyl, thiatriazolyl, imidazolyl, benzimidazolyl, triazolyl, tetrazolyl, pyrazolinyl, pyrazolyl, indazolyl, benzoisothiazolyl, isoxazolyl and benisoxazolyl. In all cases, the piperazine nitrogen atom is attached at the carbon atom of the carbon-nitrogen 10 double bond of the heterocyclic ring.

In another aspect, the subject invention is directed toward a method for treating microbial infections in patients by administering to a patient in need thereof an effective amount of a compound of Formula I as described above. The compound may be administered in a pharmaceutical composition either orally, parenterally, transdermally, or topically. Preferably, the compound is administered in an amount of from about 0.1 to about 100 mg/kg of body weight/day, more preferably, from about 3.0 to about 50 mg/kg of body weight/day. Some of the compounds of the present invention, especially the 10 1,3,4-thiadiazol-2-yl-containing compounds, are also surprisingly effective antibacterial agents against fastidious gram-negative bacteria/organisms. The activity of several 15 compounds of the present invention against a gram-negative bacterial strain is given in Table 2.

The compounds of the present invention are named according to the IUPAC or 20 CAS nomenclature system.

The carbon atoms content of various hydrocarbon-containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety; i.e., the prefix Ci-Cj indicates a moiety of the integer "I" to the integer "j" carbon atoms, inclusive. Thus, for example, C₁-C₃ alkyl refers to alkyl of one to three carbon 25 atoms, inclusive, or ethyl, ethyl, propyl, and isopropyl.

Examples of alkyl of one to nine carbon atoms, inclusive, are methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, and nonyl, and all isomeric forms thereof, straight and branched.

Examples of alkenyl of one to five carbon atoms, inclusive, are ethenyl, propenyl, 30 butenyl, pentenyl, and all isomeric forms thereof.

DETAILED DESCRIPTION OF THE INVENTION

The X¹ and X² groups may be independently either hydrogen atoms or the defined halogen atoms in a variety of substitution patterns. The X¹ and X² substituents are preferably one fluorine and one H.

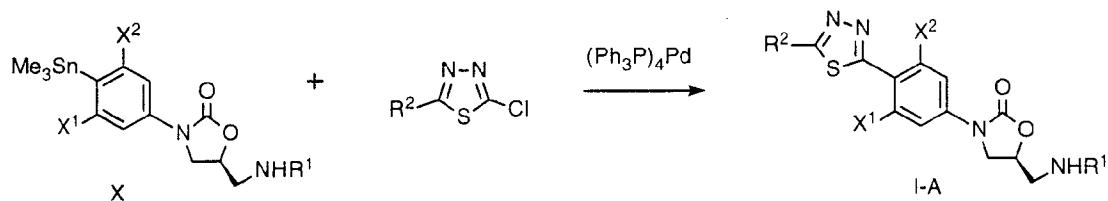

5 The preferred absolute configuration at C-5 of the oxazolidinone ring of compounds claimed in this invention is as represented in the structure of Formula I. This configuration is called (S) under the Cahn-Ingold-Prelog nomenclature system. It is this (S)-enantiomer which is antibacterially active. The racemic mixture is useful in the same way and for the same purpose as the pure (S)-enantiomer; the difference is that twice as
10 much racemic material must be used to produce the same antibacterial effect. It will be apparent to one skilled in the art that selected azolyl ring systems may have additional chiral centers present to give diastereomers. These diastereomers, in racemic and enantiomerically enriched forms, are also within the scope of the compounds of Formula I.

15 As is apparent to those of ordinary skill in the art, the compounds of the present invention can exist in several tautomeric forms, and all such tautomeric forms are included within the scope of the present invention. For instance, in the compound of Example 29 below, the 4,5-dihydro-5-oxo-1,3,4-thiadiazol-2-yl group, can exist as the 5-hydroxy-1,3,4-thiadiazol-2-yl group and both such tautomers are included within the
20 scope of the present invention.

Methods for preparing the oxazolidinones of Formula I are depicted in the following pages. It will be apparent to those skilled in the art that the described synthetic procedures are merely representative in nature and that alternative procedures are feasible and may be preferred in some cases.

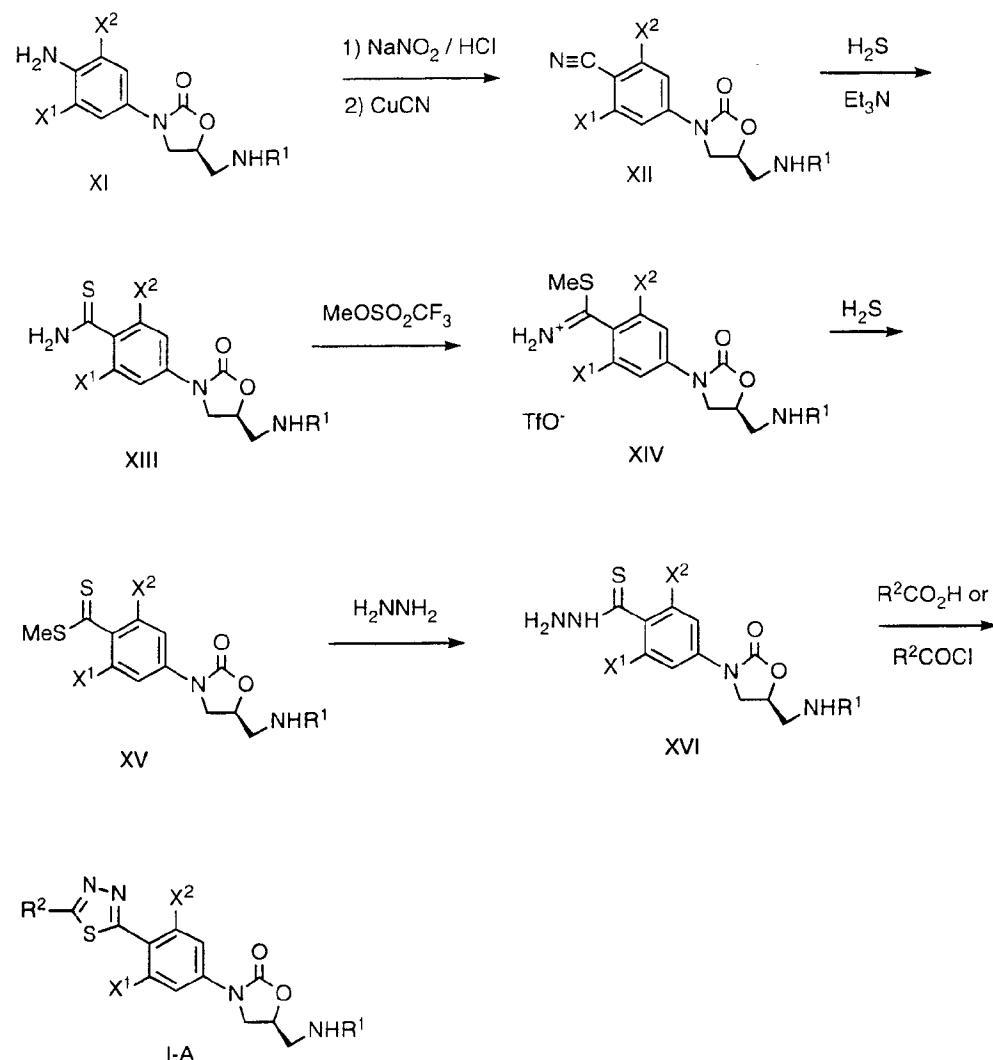

25 1,3,4-Thiadiazoles (I-A) of the present invention (formula I wherein Q is moiety II) are made by the reaction of the trimethylstannylphenyl oxazolidinone, X, with 2-chloro-1,3,4-thiadiazoles as shown in Scheme I-A below. Oxazolidinone X is prepared as described in US Patent No. 5,565,571 (Preparation 19). The required 2-chloro-1,3,4-thiadiazoles are well known in the chemical literature and many methods exist for their
30 preparation.

Scheme I-A

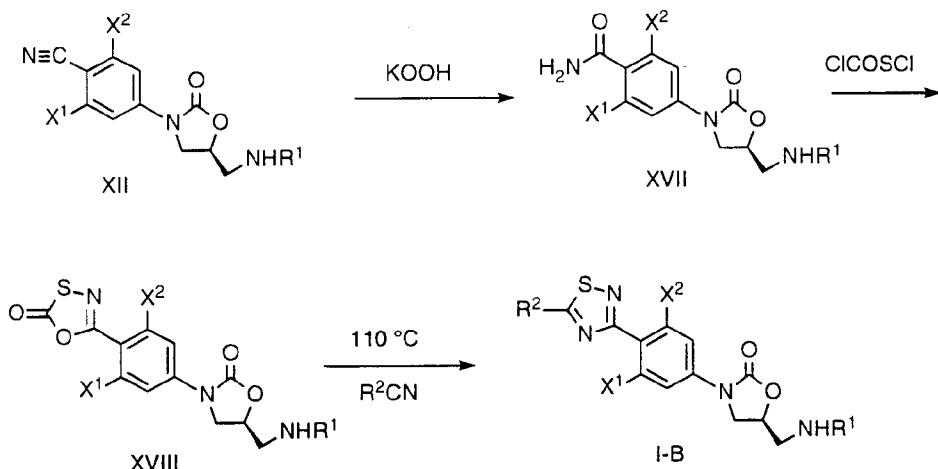

- 5 Alternatively, oxazolidinones I-A are preferably made by the sequence of steps shown in Scheme 1 below. Diazotization of aniline XI (prepared as described in International Publication No. WO 96/23788, published 8 August 1996, on page 33, lines 13-20) and reaction of the diazonium salt with cuprous cyanide gives the nitrile, XII. This nitrile is converted to the thioamide XIII by reaction with hydrogen sulfide.
- 10 Methylation of the thioamide is carried out by reaction with methyl triflate to produce the isothioamide XIV. Reaction of XIV with hydrogen sulfide gives the dithiobenzoate ester, XV. Addition of hydrazine to XV produces the thiobenzhydrazide XVI. Reaction of XVI with various carboxylic acids or acid chlorides affords the thiadiazoles I-A.

Scheme 1

1,2,4-Thiadiazoles (I-B) of the present invention (formula I wherein Q is moiety III) are made by the reaction sequence shown in Scheme 2 below. Hydrolysis of the nitrile XII to the amide XVII is accomplished with potassium hydroperoxide. Reaction of XVII with chlorocarbonylsulfenylchloride produces the oxathiazolone, XVIII. Pyrolysis of XVIII in the presence of various nitriles leads to oxazolidinones I-B.

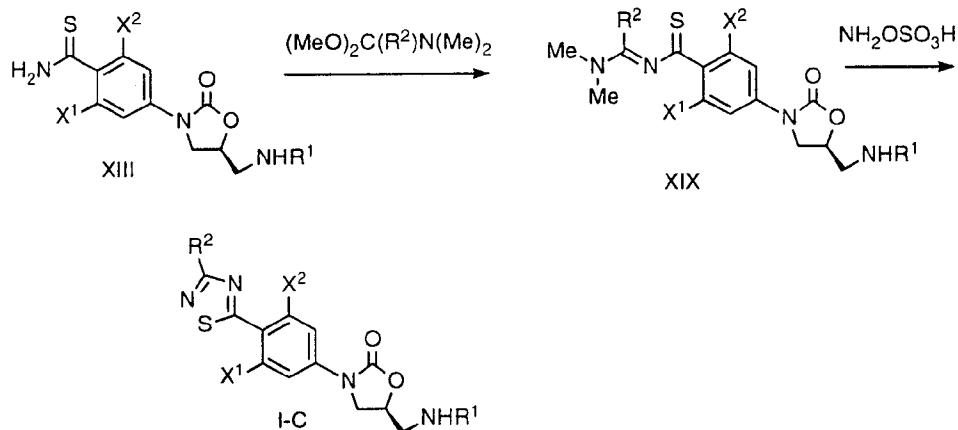

Scheme 2

1,2,4-Thiadiazoles (I-C) of the present invention (formula I wherein Q is moiety IV) are made by procedures outlined by Y. Lin (*J. Org. Chem.* 1980, 45, 3750-3753) as shown in

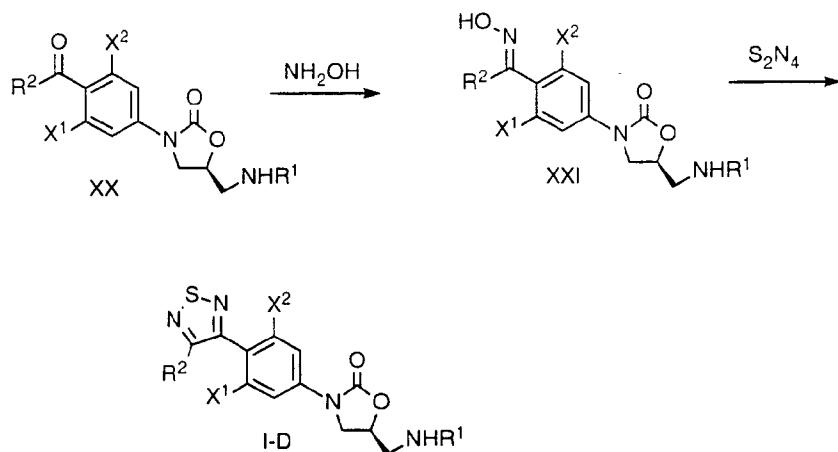

- 5 Scheme 3 below. Thus, reaction of the thiobenzamide XIII with a dimethoxyalkylamine leads to the amidine, XIX. Treatment of this amidine with hydroxylamine sulfonic acid produces the oxazolidinone I-C.

Scheme 3

- 10 1,2,5-Thiadiazoles (I-D) of the present invention (formula I wherein Q is moiety V) are made by procedures outlined by J. Cho (*J. Chem. Soc. Perkin Trans. I*, 1993, 2345-2350). As shown in Scheme 4 below, reaction of the appropriate aryl ketone XX with hydroxylamine gives the oxime XXI. Treatment of XXI with S_2N_4 produces oxazolidinone I-D. The required ketones are prepared by procedures disclosed by C-H. 15 Park (*J. Med. Chem.* 1992, 35, 1156-1165).

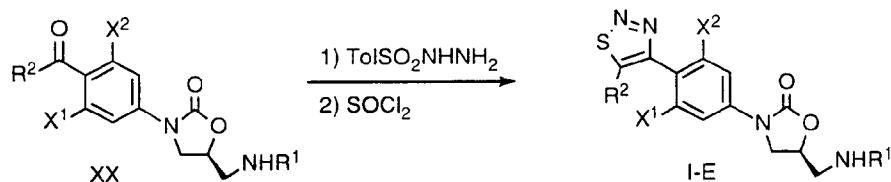

Scheme 4

1,2,3-Thiadiazoles (I-E) of the present invention (formula I wherein Q is moiety VI) are made from the appropriate ketone XX by procedures outlined by E. Thomas (*J. Med.*

5 *Chem.* 1985, 28, 2345-2350) and shown below in Scheme 5.

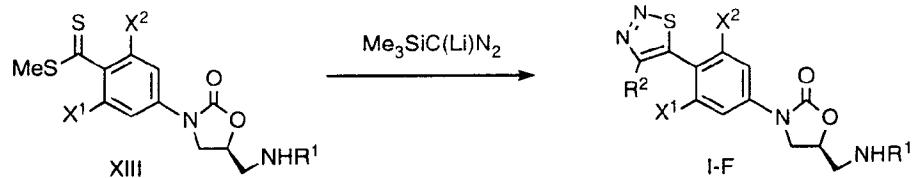

Scheme 5

1,2,3-Thiadiazoles (I-F) of the present invention (formula I wherein Q is moiety VII) are made from the dithiobenzoate XIII according to the method of T. Aoyama (*Heterocycles*,

10 1986, 24, 589-592), as shown in Scheme 6 below.

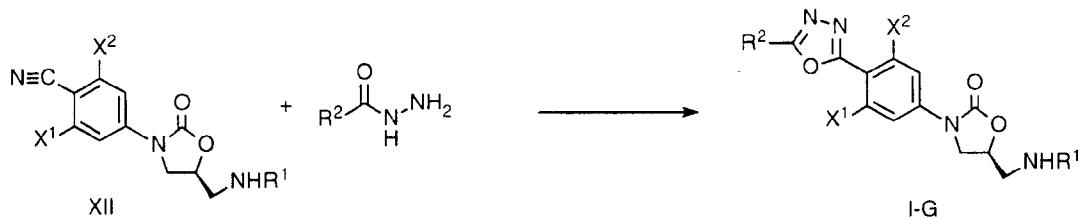

Scheme 6

1,3,4-oxadiazoles (I-G) of the present invention (formula I wherein Q is moiety VIII) are made from the nitrile XII using the appropriate acylhydrazide, following the procedures

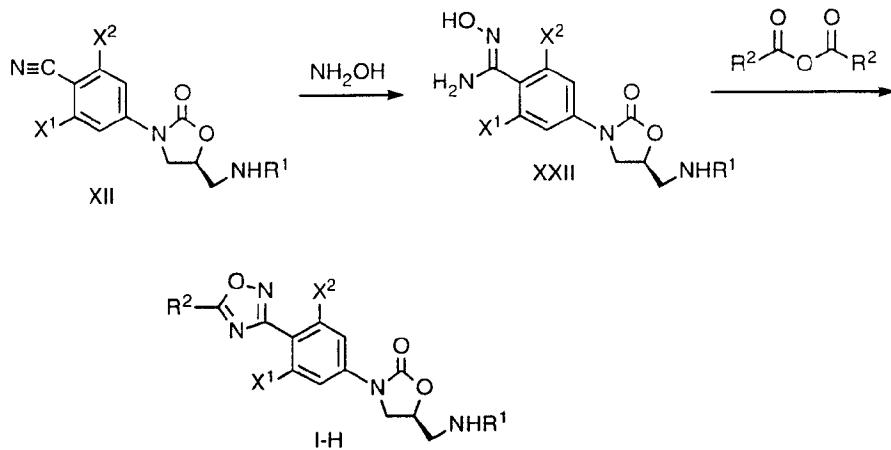

15 reported by R. L. Harris (*Aust.J.Chem.* 1977, 30, 2225-2240) as shown below in Scheme 7.

Scheme 7

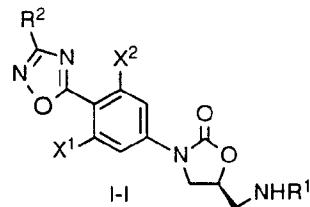

1,2,4-Oxadiazoles (I-H) of the present invention (formula I wherein Q is moiety IX) are
5 made from the nitrile XII by conversion to the hydroxyamidine XXII and then cyclization
with the appropriate anhydride, as shown in Scheme 8 below.

Scheme 8

The 1,2,4-Oxadiazoles (I-I) of the present invention (formula I wherein Q is
10 moiety IX-A) are made as additional products from the reaction shown in Scheme 3.

The preparation of oxazolidinones having a thiocabonyl functionality is disclosed
in US Patent Application, Serial No. 60/048,342, filed 30 May 1997, which is hereby
15 incorporated by reference herein.

The compounds of Formula I are useful for treatment of microbial infections in
humans and other warm blooded animals, under both parenteral, topical, transdermal,
and oral administration.

The pharmaceutical compositions of this invention are prepared by combining the compounds of Formula I of this invention with a solid or liquid pharmaceutically acceptable carrier and, optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Solid form compositions 5 include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low 10 melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene glycol systems, optionally containing suitable conventional coloring agents, flavoring agents, stabilizers and thickening agents.

15 Preferably, the pharmaceutical composition is provided employing conventional techniques in unit dosage form containing effective or appropriate amounts of the active component, that is, the compound of Formula I according to this invention.

The quantity of active component, that is the compound of Formula I according to this invention, in the pharmaceutical composition and unit dosage form thereof may be 20 varied or adjusted widely depending upon the particular application, the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combatting, bacterial infections in warm-blooded animals, the compounds or pharmaceutical compositions thereof will be 25 administered orally, parenterally, transdermally, or topically at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the animal undergoing treatment which will be antibacterially effective. The therapeutic uses of these compounds include their use in treating ocular infections and other ophthalmic uses. Generally, such antibacterially effective amount of dosage of active component will 30 be in the range of about 0.1 to about 100, more preferably about 3.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage

administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses
5 for administration, e.g., two to four times per day.

The compounds of Formula I according to this invention are administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound according to
10 Formula I as a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a buffer to provide a suitably buffered isotonic solution, for example, having a pH of about 3-7. Suitable buffering agents include, for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few
15 representative buffering agents. The compound according to Formula I generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml of solution. The resulting liquid pharmaceutical composition will be administered so as to obtain the above-mentioned antibacterially effective amount of dosage. The compounds of Formula
20 I according to this invention, due to their aqueous solubility, are advantageously administered orally in solid and liquid dosage forms.

The oxazolidinone antibacterial agents of this invention have useful activity against a variety of microorganisms. The *in vitro* activity of compounds of this invention can be assessed by standard testing procedures such as the determination of minimum
25 inhibitory concentration (MIC) by agar dilution as described in "Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically" (MFT) published Jan. 1983 by the National Committee for Clinical Laboratory Standards, 771 East Lancaster Avenue, Villanova, Pennsylvania 19084, USA. The activity of selected compounds of this invention against *Staphylococcus aureus* and *Streptococcus pneumoniae* are shown in Table 1.

DESCRIPTION OF THE PREFERRED EMBODIMENTS

Example 1. (*S*)-*N*-[[3-[4-(5-Cyano-1,3,4-thiadiazol-2-yl)-3-fluorophenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide (I-A, X¹ = F, X² = H, R¹ = CH₃CO, R² = CN). Refer to Scheme 1-A.

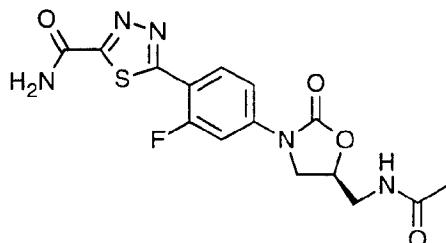

5

A mixture of the oxazolidinone X, prepared as described in US 5,565,571 (Preparation 19) (208.1 mg), 2-chloro-5-cyano-1,3,4-thiadiazole (72.9 mg), tris(dibenzylideneacetone)dipalladium(0) (9.1 mg) and triphenylarsine (12.2 mg) in 1-methyl-2-pyrrolidinone (3 mL) is evacuated and flushed with N₂ three times. The dark reaction mixture is stirred under N₂ for 6 days. The reaction mixture is partitioned between water (20 mL) and ethyl acetate (30 mL) and the phases are separated. The aqueous phase is extracted with ethyl acetate (2 x 25 mL). The combined organics are washed with water (20 mL), brine (20 mL), dried (MgSO₄), filtered and concentrated. The dark residue is purified by flash chromatography using 5% methanol in ethyl acetate as the eluent to afford 25.2 mg of the desired thiadiazole.

Physical characteristics are as follows: mp 210-211 °C. ¹H NMR (DMSO) δ 8.39, 8.24, 7.78, 7.60, 4.78, 4.19, 3.81, 3.43, 1.81; Anal. Found: C, 48.67; H, 3.57; N, 18.86; S, 8.33.

Example 2. (*S*)-5-[4-[(Acetylamino)methyl]-2-oxo-3-oxazolidinyl]-2-fluorophenyl]-1,3,4-thiadiazole-2-carboxamide (I-A, X¹ = F, X² = H, R¹ = CH₃CO, R² = H₂NCO). Refer to Scheme 1.

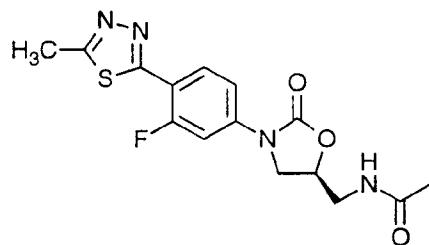

A solution of the title compound of Example 1 (58.6 mg) in 10:1 H₂SO₄ / H₂O (1 mL) is heated at 40 °C for 3.5 h. The cooled reaction mixture is treated with ice (15 mL)

and the mixture is adjusted to pH 7 with 50 % NaOH, resulting in formation of a solid precipitate. The reaction mixture is concentrated. The resulting solid is dissolved in methanol/chloroform, absorbed onto silica gel, and purified on 20 g of silica gel using 8% methanol in dichloromethane as the eluent to afford 37.1 mg of the title product as a tan 5 solid.

Physical characteristics are as follows: mp 243-244 °C (dec). ^1H NMR (DMSO) δ 8.62, 8.32, 8.25, 8.18, 7.76, 7.59, 4.76, 4.18, 3.80, 3.42, 1.81.

Example 3. (*S*)-*N*-[[3-[3-Fluoro-4-(5-methyl-1,3,4-thiadiazol-2-yl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide (I-A, $X^1 = F$, $X^2 = H$, $R^1 = \text{CH}_3\text{CO}$, $R^2 = 10 \text{ CH}_3$). Refer to Scheme 1.

Step 1. The aniline XI, prepared as described in International Publication No. WO 96/23788, published 8 August 1996 (5.2 g) is dissolved in 2 N HCl (23 mL) and cooled to 0 °C. Sodium nitrite (2.0 g) in water (12 mL) is added and the resulting yellow 15 solution is stirred at 0 °C for 30 min. Solid sodium bicarbonate is carefully added until the solution reaches pH 7. In a separate flask, copper (I) cyanide (2.3 g) and potassium cyanide (1.9 g) are suspended in water (19 mL) and ethyl acetate (38 mL) at 0 °C. The neutralized diazonium salt is added to this solution via cannula over 35 min. The resulting mixture is stirred at 0 °C for 30 min (during which time the mixture becomes 20 very dark in color) then at room temperature for 1 h. The dark heterogeneous reaction mixture is filtered through a pad of celite to remove copper salts. The filter cake is washed with ethyl acetate (2 x 50 mL) and water (1 x 50 mL). The phases of the filtrate are separated. The aqueous layer is extracted with ethyl acetate (100 mL). The combined organics are dried (MgSO_4), filtered and concentrated. The orange residue is dissolved in 25 30% acetone in dichloromethane and filtered through a short column of silica gel using 30 % acetone in dichloromethane as the eluent. The filtrate is concentrated to afford 3.4 g of desired nitrile XII as a yellow solid.

Physical characteristics are as follows: mp 173-174 °C. ¹H NMR (DMSO) δ 8.22, 7.92, 7.74, 7.52, 4.76, 4.14, 3.76, 3.40, 1.80; Anal. Found: C, 56.16; H, 4.34; N, 14.83.

Step 2. To a stirred solution of the nitrile XII (prepared in Step 1, 3.06 g) in 30 mL of DMF is added triethylamine (3.8 mL) at room temperature. The reaction is heated to 100 °C and H₂S is bubbled into the flask for 1 h. The reaction is then cooled to 60 °C over 30 min. A portion of the DMF (15 mL) is removed via bulb to bulb distillation. The reaction mixture is then poured onto 100 mL of ice and stirred until the ice melts. The mixture is filtered and the orange solid is dried overnight in a vacuum oven to afford 2.9 g of the thioamide XIII. An analytical sample of the thioamide is prepared by chromatography through a Biotage 40S column (1 % MeOH in CH₂Cl₂).

Physical characteristics are as follows: mp 116-119 °C ; ¹H NMR (DMSO) δ 10.1, 9.4, 8.23, 7.12, 7.46, 7.29, 4.7, 4.12, 3.73, 3.4045, 1.81. Anal. Found: C, 50.54; H, 4.70; N, 13.04; S, 9.60.

Step 3. To a stirred solution of the thioamide XIII (prepared in step 2, 1.05 g) in 1:1 THF/CH₂Cl₂ (37 mL) under N₂ is added methyl triflate (0.49 mL). The resulting orange solution is stirred at room temperature for 1 h, then pyridine (0.82 mL) is added. Hydrogen sulfide is bubbled through the reaction mixture for 1 h. The hydrogen sulfide is replaced with N₂ and nitrogen is bubbled through the reaction mixture for 30 min. The orange solution is concentrated. The resulting orange residue is dissolved in MeOH/CH₂Cl₂, absorbed onto silica, and purified using a Biotage 40 M column with a SIM using 2.5% MeOH in CH₂Cl₂ as the eluent to afford 640.2 mg of the methyl dithiobenzoate XV as an orange foam which is used immediately in the next reaction without further purification.

Physical characteristics are as follows: ¹H NMR (CDCl₃) 7.68, 7.47, 7.13, 6.81, 4.80, 4.04, 3.79, 3.64, 2.73, 2.00.

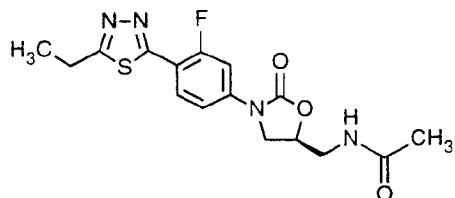

Step 4. To a stirred solution of the dithiobenzoate XV (prepared in step 3, 640.2 mg) in ethanol (18 mL) is added hydrazine monohydrate (0.33 mL). (The orange color of the dithiobenzoate dissipates within 5 min after addition of hydrazine). The reaction mixture is stirred at room temperature for 25 min, then concentrated. 15 Die minimalen Hemmkonzentrationen (MHK) wurden per Reihenverdünnungsverfahren auf Iso-Sensitest Agar (Oxoid) bestimmt. Für jede Prüfungssubstanz wurde eine Reihe von Agarplatten hergestellt, die bei jeweils doppelter Verdünnung abfallende Konzentration des Wirkstoffes enthielten. Die Agarplatten wurden mit einem Multipoint-Inokulator (Denley) beimpft. Zum Beimpfen wurden Übernachtkulturen der Erreger verwandt, die zuvor so verdünnt wurden, daß jeder Impfpunkt ca. 10⁴ koloniebildende Partikel enthielt. Die beimpften Agarplatten wurden bei 37°C bebrütet, und das Keimwachstum wurde nach ca. 20 Stunden abgelesen. Der MHK-Wert ($\mu\text{g}/\text{ml}$) gibt die niedrigste Wirkstoffkonzentration an, 20 bei der mit bloßem Auge kein Wachsum zu erkennen war.

Für schnellwachsende Mykobakterien wurde die MHK-Bestimmung in Anlehnung an die von Swenson beschriebene Methode der Bouillon Mikrodilution durchgeführt [vgl. J. M. Swenson, C. Thornberry, U.A. Silcox, Rapidly growing mycobacteria. Testing of susceptibility to 34 antimicrobial agents by broth microdilution. Antimicrobial Agents and Chemotherapy Vol. 22, 186-192 (1982)]. Abweichend davon war das mit 0,1Vol.-% Tween 80 versetzte Hirn-Herzextrakt Medium.

Die verwendeten Mykobakterienstämme wurden von der DSM (Dt. Sammlung von Mikroorganismen, Braunschweig) bezogen. Sie wurden in einer feuchten Kammer bei 37°C bebrütet.

Die MHK-Werte wurden nach 2-4 Tagen abgelesen, wenn die präparatfreien Kontrollen durch Wachstum trüb waren. Der MHK-Wert definiert sich als die niedrigste Präparatkonzentration, die makroskopisch sichtbares Wachstum völlig inhibiert.

Osmotisches Arzneimittelfreisetzungssystem

Die vorliegende Erfindung betrifft ein oral zu verabreichendes osmotisches Arznei-
5 mittelfreisetzungssystem, das aus einer Hülle und einem wirkstoffhaltigen Kern be-
steht, sowie ein Verfahren zu dessen Herstellung. Die Erfindung betrifft weiter ein
osmotisches Arzneimittelfreisetzungssystem zur Anwendung als Arzneimittel bei
Menschen oder Tieren sowie die Verwendung des osmotischen Arzneimittelfrei-
setzungssystems zur Herstellung eines Arzneimittels zur Behandlung und/oder
10 Prävention von Erkrankungen bei Menschen und Tieren.

Osmotische Arzneimittelfreisetzungssysteme sind grundsätzlich im Stand der Technik
bekannt. Dabei wird im allgemeinen ein osmotischer Druck als Energiequelle ausge-
nutzt, einen Arzneimittelwirkstoff mit kontrollierter Geschwindigkeit an das umgebe-
15 nende Medium abzugeben. Daher nennt man solche Systeme auch osmotische Pumpen.
Eine weitgehend vollständige Übersicht über die osmotischen Arzneimittelfrei-
setzungssysteme findet sich in Journal of Controlled Release 35 (1995) 1-21. Danach
unterscheidet man prinzipiell zwischen Mehrkammersystemen und Einkammer-
systemen. Das Einkammersystem besteht in seiner einfachsten Form aus einer kon-
20 ventionellen Tablette, die aus der Hülle einer semipermeablen Membran mit einer
Austrittsöffnung und einem Kern, in der der Wirkstoff in fester Form vorliegt, besteht.
Nach der oralen Verabreichung dringt Wasser durch die semipermeable Membran in
den Kern ein, der Wirkstoff löst sich auf und wird durch eine Austrittsöffnung
abgegeben (US-Patent No. 3.845.770). Dieses Prinzip eignet sich jedoch nur für sehr
25 gut wasserlösliche Wirkstoffe, da nur diese einen ausreichend hohen osmotischen
Druck erzeugen können. Speziell für schwerlösliche Wirkstoffe wurden daher soge-
nannte Doppelkammersysteme („Push-Pull“-Systeme) entwickelt (US-Patent Nr.
4.111.202, Europäische Patentanmeldung Nr. 52 917). Die Herstellung solcher Zwei-
kammersysteme ist jedoch technisch sehr aufwendig. Das Einkammersystem besitzt
30 daher einen prinzipiellen Vorteil gegenüber den Mehrkammersystemen. Um die Vor-
teile des Einkammersystems bei schwerlöslichen Arzneimitteln dennoch zu nutzen,
wurden zur Erzielung ausreichend hoher osmotischer Drücke im Innern der Tablette

- 2 -

Einkammersysteme vorgeschlagen, deren Kern aus dem Wirkstoff und bestimmten polymeren Quellmitteln besteht, die beim Hinzutreten von Wasser durch die äußere semipermeable Membran aufquellen und zusammen mit dem darin teilweise suspendierten Wirkstoff aus der Öffnung freigesetzt werden. Der Auswahl bestimmter polymerer Quellmittel kommt bei diesem System eine entscheidende Bedeutung zu, da wie in der EP-A-0 277 092 bereits beschrieben, bestimmte Quellmittel wie z.B. Polyvinylpyrrolidon, Polyethylenoxid oder Polymethacrylat einen so hohen Quelldruck erzeugen, daß es nach kurzer Zeit zu einer vollständigen Aufspaltung der semipermeablen Hüllmembran kommt und der Wirkstoff in kurzer Zeit freigesetzt wird, anstatt, wie gewünscht, verzögert bzw. kontrolliert freigesetzt zu werden. Die EP-A-0 277 092 trifft zur Lösung dieses Problems daher eine bestimmte Auswahl hydrophiler polymerer Quellmittel, nämlich eine Mischung aus einem Vinylpyrrolidon-Vinylacetat-Copolymer und einem Ethylenoxidhomopolymer.

Die WO 96/40080 beansprucht in generischer Form osmotische Einkammersysteme, die einen Kern aus einem pharmazeutischen Wirkstoff, einem wasserlöslichen osmotischen Mittel und einem wasserquellbaren Polymer umfassen. Wie jedoch bereits in der EP-A-0 277 092 dargelegt wird, sind nicht alle polymeren hydrophilen Quellmittel für diese Einkammersysteme geeignet, und eine sorgfältige Auswahl muß getroffen werden, um die gewünschte kontrollierte Freisetzung des Wirkstoffes aus dem Einkammersystem zu gewährleisten. In den konkreten Ausführungsformen der WO 96/40080 werden als wasserquellbare Polymere u.a. Polyethylenoxid und Cellulose bzw. deren Derivate verwendet.

Ein osmotisches Arzneimittelfreisetzungssystem mit kontrollierter, d.h. im allgemeinen mit verzögerter Freisetzung, das aus einem Einkammersystem besteht, sollte grundsätzlich eine möglichst vollständige Freisetzung des Wirkstoffes ermöglichen, ohne daß es während der Freisetzung zu einem Aufreißen der Austrittsöffnung und somit zu unkontrollierter Wirkstofffreisetzung kommt. Bei den Einkammersystemen besteht jedoch häufig das Problem, daß ein nicht unerheblicher Anteil des Wirkstoffs in der Tablette verbleibt, da der im Innern der Tablette erzeugte osmotische Druck nicht ausreicht, den Wirkstoff vollständig freizusetzen. So besitzen die oben beschriebenen

- 3 -

Systeme den Nachteil, daß sie den Wirkstoff nicht vollständig aus der Hüllmembran durch die Austrittsöffnung abgeben, so daß ein relativ hoher Anteil des Wirkstoffs nicht absorbiert wird und ungenutzt ausgeschieden wird. Wird jedoch auf der anderen Seite ein wasserquellbares Polymer verwendet, das einen sehr hohen osmotischen Druck erzeugt, kann dies zum Aufreißen oder gar zur vollständigen Sprengung der Tablette führen, so daß eine verzögerte, kontrollierte Freisetzung nicht erreicht wird.

Häufig weisen die osmotischen Arzneimittelfreisetzungssysteme des Stands der Technik auch das Problem auf, daß die unbeschichteten Tablettenkerne eine unge-
nugende mechanische Festigkeit aufweisen, was die nachfolgende Lackierung er-
schwert.

Grundsätzlich sollte ein osmotisches Arzneimittelfreisetzungssystem leicht herstellbar sein, aus preiswerten und pharmakologisch gut verträglichen Stoffen zusammenge-
setzt sein und es ermöglichen, ein günstiges Freisetzungsprofil des Wirkstoffs zu er-
reichen.

Es wurde nun überraschend gefunden, daß eine Kombination zweier bestimmter hydrophiler wasserquellbarer Polymere in bestimmten Gewichtsanteilen als Kernbe-
standteile besonders geeignet ist, die oben beschriebenen gewünschten Eigenschaften eines osmotischen Einkammer-Arzneimittelfreisetzungssystems, das einen pharmazeu-
tischen Wirkstoff, insbesondere ein Dihydropyridin umfaßt, zu erreichen. Die Erfinder der vorliegenden Erfindung fanden, daß die Kombination aus dem Heteropoly-
saccharid Xanthan und einem Vinylpyrrolidon-Vinylacetat-Copolymer als wasser-
quellbare Polymere in bestimmten Gewichtsmengen zu einer weitgehend vollständigen
Freisetzung eines Wirkstoffes aus der Hülle führt, ohne daß es dabei zu einem Auf-
reißen der Öffnung und unkontrollierter Wirkstofffreisetzung kommt.

Ohne an eine Theorie gebunden zu sein, wird angenommen, daß das Xanthan in Kom-
bination mit dem Vinylpyrrolidon-Vinylacetat-Copolymer insbesondere deshalb sehr
günstige Freisetzungseigenschaften bewirkt, da es strukturviskose Lösungen bildet,
deren Viskosität beim Fließen unter dem Einfluß zunehmender Schubspannung

- 4 -

abnimmt. Dies erlaubt offenbar eine besonders gleichförmige Freisetzung des Wirkstoffes aus der Austrittsöffnung, ohne daß es zum Einreißen der Membran kommt, und dabei wird der Wirkstoff über einen relativ langen Zeitraum gleichförmig und weitgehend vollständig freigesetzt.

5

Xanthan als wasserquellbares Polymer besitzt darüberhinaus gegenüber den in der EP-A-0 277 092 und der WO 96/40080 verwendeten Polyethylenoxiden den Vorteil der leichteren Handhabbarkeit, da es nicht den sogenannten TOMS-Effekt (Herabsetzung des Reibungswiderstands) aufweist. Ein weiterer Vorteil der Verwendung des
10 Xanthans gegenüber der Verwendung von Polyethylenoxiden als wasserquellbare Polymere besteht darin, daß Polyethylenoxide in der Regel nur mit organischen Lösungsmitteln feucht granuliert werden (s. z.B. Beispiele der EP-A-0 277 092), so daß die Herstellung unter Explosionsschutz erfolgen muß, oder es wird trocken
15 tablettiert (WO 96/40080), so daß die bekannten Nachteile der Trockentablettierung, wie schlechte Fließfähigkeit der Mischung der Kernbestandteile, Staubentwicklung sowie eine geringere Härte des Tablettenkerns auftreten.

Die vorliegende Erfindung überkommt die oben beschriebenen Probleme des Stands der Technik mit der Bereitstellung eines osmotischen Arzneimittelfreisetzungssystem,
20 daß besteht aus:

- einer Hülle aus einem wasserdurchlässigen, für die Komponenten des Kerns undurchlässigen Material, die mindestens eine Öffnung aufweist, und
- 25 einem Kern, enthaltend
 - 15 bis 35 Gew.-% eines pharmazeutischen Wirkstoffs
 - 20 bis 50 Gew.-% Xanthan
 - 30 10 bis 30 Gew.-% eines Vinylpyrrolidon-Vinylacetat-Copolymers,

wobei gegebenenfalls die Differenz zu 100 Gew.-% durch mindestens einen Bestandteil gebildet wird, der aus der Gruppe ausgewählt wird, die aus weiteren hydro-

30

- 5 -

philien quellbaren Polymeren, osmotisch aktiven Zusätzen und pharmazeutisch annehmbaren Zusatzstoffen besteht, die Gew.-%-Angaben auf das Gesamtgewicht der Kernbestandteile bezogen sind und die Summe der Kernbestandteile zu 100 % aufaddiert.

5

Die Hülle des osmotischen Arzneimittelfreisetzungssystems besteht aus einem wasser-durchlässigen, für die Komponenten des Kerns undurchlässigen Material. Solche Hüllmaterialien sind im Prinzip bekannt und beispielsweise beschrieben in der EP-A-0 277 092. Zur Herstellung der Hülle eignen sich z.B. die literaturbekannten polymeren Stoffe, die im Gastrointestinaltrakt nicht metabolisiert werden, d.h. unverändert ausgeschieden werden (s. US-Patente Nr. 3.916.899 und Nr. 3.977.404). Beispielsweise können acylierte Cellulosederivate (Celluloseester), die durch Acetylgruppen ein- bis dreifach oder durch Acetylgruppen ein- bis zweifach und einen weiteren von Acetyl verschiedenen Acylrest substituiert sind, verwendet werden, z.B. 10 Celluloseacetat, Cellulosetriacetat, Celluloseacetatethylcarbamat, Celluloseacetatphthalat, Celluloseacetatmethylcarbamat, Celluloseacetatsuccinat, Celluloseacetatdimethylaminoacetat, Celluloseacetatethylcarbonat, Celluloseacetat-chloracetat, Celluloseacetatethyloxalat, Celluloseacetat-methylsulfonat, Cellulose-acetatbutylsulfonat, Celluseacetatpropionat, Celluloseacetatdiethylaminoacetat, Celluloseacetatoctat, 15 Celluloseacetatlaurat, Celluloseacetat-p-toluolsulfonat, Celluloseacetatbutyrat und andere Celluloseacetatderivate sowie Agaracetat und Amyloseacetat. Als semipermeables Membranmaterial eignen sich auch Ethylcellulose und polymere Epoxide, Copolymere aus Alkylenoxid und Alkylglycidylethern, Polyglykole und Polymilchsäurederivate und weitere Derivate davon. Ferner können auch Mischungen von an 20 sich wasserunlöslichen Acrylaten (z.B. ein Copolymerisat von Acrylsäureethylester und Methacrylsäuremethylester) verwendet werden. Auf die Hülle kann bei Bedarf ein Lichtschutzlack aufgebracht werden. Geeignete Materialien für den Lichtschutzlack sind z.B. Polymere, wie Hydroxypropylcellulose, Hydroxypropylmethylcellulose, in Kombination mit geeigneten Weichmachern wie z.B. Polyethylenglykol und Pigmenten wie z.B. Titandioxid oder Eisenoxide.

- 6 -

Die Mengen und die verwendeten Bestandteile für die Herstellung der Hülle des osmotischen Arzneimittelfreisetzungssystems beeinflussen in bekannter Weise die Eintrittsgeschwindigkeit der gastrointestinalen Flüssigkeit. Grundsätzlich nimmt die Eintrittsgeschwindigkeit der gastrointestinalen Flüssigkeit mit zunehmender Lackmenge ab.

5

Die Hülle des osmotischen Arzneimittelfreisetzungssystems der vorliegenden Erfindung weist mindestens eine Öffnung bzw. Passage auf, durch die der Wirkstoff zusammen mit den weiteren Kernbestandteilen allmählich austritt. Die Öffnung wird durch Laserbohren, mechanisches Bohren oder z.B. Stanzen in die Hülle eingebracht. Es können ein oder mehrere Öffnungen in der Hülle vorhanden sein. Die Größe der Öffnung beträgt bevorzugt 0,2 bis 1,6 mm, besonders bevorzugt 0,4 bis 1,2 mm. Die Beschaffenheit und die Herstellverfahren der Öffnung sind an sich bekannt und beispielsweise beschrieben in den US-Patenten Nr. 4063064, 4088864 und 3916899 sowie in der EP-B-0277092.

10

15

Der Kern des osmotischen Arzneimittelfreisetzungssystems der vorliegenden Erfindung enthält, bzw. besteht im wesentlichen aus den folgenden Bestandteilen:

20

- 15 bis 35 Gew.-% eines pharmazeutischen Wirkstoffs
- 20 bis 50 Gew.-% Xanthan
- 10 bis 30 Gew.-% eines Vinylpyrrolidon-Vinylacetat-Copolymers,

25

wobei gegebenenfalls die Differenz zu 100 Gew.-% durch mindestens einen Bestandteil gebildet wird, der aus der Gruppe ausgewählt wird, die aus weiteren hydrophilen quellbaren Polymeren, osmotisch aktiven Zusätzen und pharmazeutisch annehmbaren Zusatzstoffen besteht, die Gew.-%-Angaben auf das Gesamtgewicht der Kernbestandteile bezogen sind und die Summe der Kernbestandteile zu 100% aufaddiert.

30

Bevorzugt besteht der Kern aus:

- 7 -

- 20 bis 30 Gew.-% eines pharmazeutischen Wirkstoffs
- 25 bis 40 Gew.-% Xanthan
- 10 bis 20 Gew.-% eines Vinylpyrrolidon-Vinylacetat-Copolymers,

5

wobei gegebenenfalls die Differenz zu 100 Gew.-% durch mindestens einen Bestandteil gebildet wird, der aus der Gruppe ausgewählt wird, die aus weiteren hydrophilen quellbaren Polymeren, osmotisch aktiven Zusätzen und pharmazeutisch annehmbaren Zusatzstoffen besteht, die Gew.-%-Angaben auf das Gesamtgewicht der Kernbestandteile bezogen sind und die Summe der Kernbestandteile zu 100% aufaddiert.

10

Weitere auf dem Gebiet der osmotischen Arzneimittelfreisetzungssysteme übliche Bestandteile können enthalten sein, solange ihre Anwesenheit, die Lösung der eingangs beschriebenen Aufgabenstellung nicht beeinträchtigt.

15

Bei den im Kern befindlichen pharmazeutischen Wirkstoffen handelt es sich vorzugsweise um schwerlösliche Wirkstoffe mit einer maximalen Löslichkeit von $\leq 1 \text{ g}$ in 1000 g Wasser, vor allem um solche, die auch noch im Dickdarm resorbiert werden, insbesondere um einen Wirkstoff der an sich bekannten Klasse der Dihydropyridine, wie sie zum Beispiel in der EP-A-0071819 beschrieben sind, z.B. Nifedipin und Nisoldipin. Sie wirken als Calciumantagonisten. Diese werden sowohl als Herzkreislaufmittel in der Indikation Bluthochdruck als auch in der Behandlung und Prävention ischämischer Gehirnerkrankungen eingesetzt.

20

25 Besonders bevorzugt wird Nifedipin verwendet.

30

Der Wirkstoff liegt im Kern des osmotischen Arzneimittelfreisetzungssystem der vorliegenden Erfindung in einer Menge von 15 bis 35 Gew.-%, bevorzugt 20 bis 30 Gew.-%, besonders bevorzugt 19 bis 23 Gew.-%, bezogen auf die Gesamtmenge der Kernbestandteile vor.

- 8 -

Das osmotische Arzneimittelfreisetzungssystem enthält als einen der wesentlichen Bestandteil des Kerns das hydrophile wasserquellbare Polymer Xanthan. Dabei handelt es sich um ein anionisches Heteropolysaccharid, das im Handel beispielsweise unter der Bezeichnung Rhodigel® (hergestellt durch Meyhall) erhältlich ist.

5

In einer bevorzugten Ausführungsform weist das Xanthan eine Partikelgröße von weniger als 800 µm auf. Eine Partikelgröße von mehr als 800 µm führt in einigen Fällen zu einem verschlechterten Freisetzungsverhalten. In einer besonders bevorzugten Ausführungsform beträgt die Partikelgröße des Xanthans weniger als 500 µm.

10

Das Xanthan liegt in einer Menge 20 bis 50 Gew.-%, bevorzugt 25 bis 40 Gew.-% besonders bevorzugt 28 bis 32 Gew.-%, bezogen auf die Gesamtmenge der Kernbestandteile vor.

15

Ein weiterer wesentlicher Bestandteil des Kerns des Arzneimittelfreisetzungssystems der vorliegenden Erfindung ist das Vinylpyrrolidon-Vinylacetat-Copolymer. Dieses Copolymer ist an sich bekannt und kann mit beliebigen Mischungsverhältnissen der Monomere hergestellt werden. Das bevorzugt verwendete kommerziell erhältliche Kollidon® VA64 (hergestellt durch BASF) ist z.B. ein 60:40- Copolymerisat. Es weist im allgemeinen einen Gewichtsmittelwert des Molekulargewichts Mw, bestimmt durch Lichtstreuungsmessungen, von etwa 45.000 bis etwa 70.000 auf. Die Menge des Vinylpyrrolidon-Vinylacetat-Copolymers im Kern des Arzneimittelfreisetzungssystems der vorliegenden Erfindung beträgt 10 bis 30 Gew.-%, bevorzugt 10 bis 20 Gew.-%, besonders bevorzugt 15 bis 20 Gew.-%, bezogen auf das Gesamtgewicht der Kernbestandteile. Daraus ergibt sich ein bevorzugtes Gewichtsverhältnis von Xanthan zum Vinylpyrrolidon-Vinylacetat-Copolymer von 5 : 1 bis 2 : 3.

20

25

Bevorzugt enthält das osmotische Arzneimittelfreisetzungssystem der vorliegenden Erfindung lediglich Xanthan und das Vinylpyrrolidon-Vinylacetat-Copolymer als wasserquellbare Polymere als Kernbestandteile.

30

In einer besonders bevorzugten Ausführungsform der Erfindung enthält das osmotische Arzneimittelfreisetzungssystem mindestens einen osmotisch aktiven Zusatz und/oder mindestens einen pharmazeutisch annehmbaren Zusatzstoff.

5 Dabei ist ein osmotisches Arzneimittelfreisetzungssystem bevorzugt, dessen Kern enthält:

- 20 bis 30 Gew.-% eines pharmazeutischen Wirkstoffs
- 25 bis 40 Gew.-% Xanthan
- 10 - 10 bis 20 Gew.-% eines Vinylpyrrolidon-Vinylacetat-Copolymers,
- 10 bis 30 Gew.-% einer osmotisch aktiven Substanz,
- 8 bis 20 Gew.-% mindestens eines pharmazeutisch annehmbaren Zusatzstoffes,

wobei die Gew.-%-Angaben auf das Gesamtgewicht der Kernbestandteile bezogen
15 sind und die Summe der Kernbestandteile zu 100% aufaddiert.

Obwohl es bevorzugt ist, daß das osmotische Arzneimittelfreisetzungssystem der vorliegenden Erfindung lediglich Xanthan und das Vinylpyrrolidon-Vinylacetat-Copolymer als wasserquellbare Polymere als Kernbestandteile enthält, können bei Bedarf
20 weitere zusätzliche hydrophile quellbare Polymere im Kern enthalten sein, die z.B. ausgewählt werden aus Hydroxypropylcellulose, Hydroxypropyl-methylcellulose, Natriumcarboxymethylcellulose, Polyacrylsäuren bzw. deren Salze.

Die gegebenenfalls im Kern vorhandenen weiteren hydrophilen quellbaren Polymere
25 liegen im Arzneimittelfreisetzungssystem der vorliegenden Erfindung in einer Menge vor, bei der die Lösung der eingangs beschriebenen Aufgabenstellung nicht beeinträchtigt ist.

Diese hydrophilen wasserquellbaren Polymere, die in der vorliegenden Erfindung verwendet werden, umfassen jedoch kein Polyethylenoxid (Polyethylenglykol), d.h. der Kern der Arzneimittelfreizusammensetzung der vorliegenden Erfindung ist frei von
30 Polyethylenoxidzusätzen.

Die wahlweise im Kern des Arzneimittelfreisetzungssystems der vorliegenden Erfindung enthaltenen osmotisch aktiven Zusätze sind im Prinzip nicht beschränkt, und alle wasserlöslichen Stoffe, deren Verwendung in der Pharmazie unbedenklich ist, wie z.B. die in Pharmakopöen oder in „Hager“ und „Remington Pharmaceutical Science“ erwähnten wasserlöslichen Hilfsstoffe können verwendet werden. Insbesondere können wasserlösliche Salze von anorganischen oder organischen Säuren oder nicht-ionische organische Stoffe mit großer Wasserlöslichkeit wie z.B. Kohlehydrate, insbesondere Zucker, oder Aminosäuren verwendet werden. Zum Beispiel können die 5 osmotisch aktiven Zusätze ausgewählt werden aus anorganischen Salzen wie Chloriden, Sulfaten, Carbonaten und Bicarbonaten von Alkali- oder Erdalkalimetallen, wie Lithium, Natrium, Kalium, Magnesium, Calcium sowie Phosphate, Hydrogen- oder Dihydrogenphosphate, Acetate, Succinate, Benzoate, Citrate oder Ascorbate 10 davon. Des weiteren können Pentosen, wie Arabinose, Ribose oder Xylose, Hexosen, wie Glucose, Fructose, Galactose oder Mannose, Disaccharide wie Sucrose, Maltose 15 oder Lactose oder Trisaccharide wie Raffinose verwendet werden. Zu den wasserlöslichen Aminosäuren zählen Glycin, Leucin, Alanin oder Methionin. Besonders bevorzugt wird Natriumchlorid verwendet. Diese osmotisch aktiven Zusätze sind bevorzugt in einer Menge von 10 bis 30 Gew.-%, besonders bevorzugt 15 bis 20 Gew.-%, bezogen auf die Gesamtmenge der kernbildenden Bestandteile enthalten.

Desweiteren kann der Kern des osmotischen Arzneimittelfreisetzungssystems der vorliegenden Erfindung einen oder mehrere pharmazeutisch annehmbare Zusatzstoffe enthalten, die ausgewählt werden aus: Pufferstoffen, wie z.B. Natriumbicarbonat, 25 Sprengmitteln, wie z.B. Natriumcarboxymethylstärke, Gleitmitteln, wie z.B. Magnesiumstearat, Tablettierhilfsmitteln, Schutzkolloiden, wie z.B. in der EP-B-0277092, S. 5, Z. 10-25 beschrieben, Weichmachern, wie z.B. in der EP-B-0277092, S. 5, Z. 29-32 beschrieben, Tensiden, wie z.B. in der EP-B-0277092, S. 5, Z. 33-44 beschrieben, Trägermaterialien, wie z.B. in der EP-B-0277092, S. 5, Z. 45-47 beschrieben.

- 11 -

In einer ganz besonders bevorzugten Ausführungsform der vorliegenden Erfindung umfaßt der Kern:

- 19 bis 23 Gew.-% eines pharmazeutischen Wirkstoffs
- 5 - 28 bis 32 Gew.-% Xanthan
- 15 bis 20 Gew.-% eines Vinylpyrrolidon-Vinylacetat-Copolymers,
- 15 bis 20 Gew.-% Natriumchlorid
- 5 bis 7 Gew.-% Natriumbicarbonat
- 6 bis 9 Gew.-% Natriumcarboxymethylstärke
- 10 - <1 Gew.-% Magnesiumstearat

wobei die Gew.-%-Angaben auf das Gesamtgewicht der Kernbestandteile bezogen sind und die Summe der Kernbestandteile zu 100% aufaddiert.

15 Das osmotische Arzneimittelfreisetzungssystems der vorliegenden Erfindung kann in verschiedenen Formen wie z.B. in der EP-B-0277092, S. 6, Z. 7-14 beschrieben vorliegen. Bevorzugt liegt es in Tablettenform vor.

20 Die Erfindung betrifft auch ein Verfahren zur Herstellung des erfindungsgemäßen osmotischen Arzneimittelfreisetzungssystems, bei dem die Bestandteile des Kerns miteinander vermischt werden, gegebenenfalls feucht oder trocken granuliert werden, tablettiert werden und der so entstandene Kern mit der Hülle beschichtet wird. Die Feuchtgranulation bewirkt häufig eine bessere Benetzbarkeit der Bestandteile des Tablettenkerns, wodurch die eintretende Gastrointestinalflüssigkeit den Kern besser durchdringt, was vielfach zu einer rascheren und vollständigeren Freisetzung des 25 Wirkstoffs führt, so daß die Feuchtgranulation bevorzugt ist.

30 Das erfindungsgemäße osmotische Arzneimittelfreisetzungssystem wird zur Behandlung und/oder Prävention von Erkrankungen von Menschen und Tieren, wie z.B. bei Kreislauferkrankungen, Infektionen, Entzündungen, Schmerzzuständen, Asthma, Cancer, Malaria, Thrombosen, Diabetes, Herzrhythmusstörungen, Hypoglycaemien, Mycosen, Depressionen, Störungen des Salz- und Flüssigkeitshaushaltes, Stoff-

- 12 -

wechselstörungen wie z.B. Störungen des Fettstoffwechsels, koronaren Herzerkrankungen, Bluthochdruck, cerebralen Leistungsstörungen und zur Therapie neurologischer Defizite insbesondere nach Subarachnoidalblutung verwendet. Besonders bevorzugt werden die osmotischen Arzneimittelfreisetzungssysteme der vorliegenden
5 Erfindung zur Behandlung von Bluthochdruck und koronaren Herzerkrankungen verwendet.

Nifedipin, Polyox WSR 303, Polyox WSR N80, Natriumcarboxymethylstärke, Lactose und Magnesiumstearat wurden gemischt. Die Mischung wurde anschließend tablettiert. Die entstandenen Tablettenkerne waren sehr weich und ließen sich nur schlecht weiterverarbeiten. Die Tablettenkerne wurden mit einem die Bestandteile der osmotischen Membran enthaltenden organischen Lack beschichtet. Die beschichteten Tabletten wurden anschließend getrocknet. Die entstandenen Tabletten besaßen einen Durchmesser von 9 mm. Anschließend wurde eine Öffnung von ca. 800 µm im Durchmesser bei jeder Tablette mit einem Handbohrer angebracht. Die in Figur 1 der WO-96/40080 gezeigten Freisetzungsmengen des Beispiels 1 der WO-96/40080 wurden unter den unten angegebenen Testbedingungen nicht gefunden.

Die in den Beispielen und Vergleichsbeispielen hergestellten osmotischen Arzneimittelfreisetzungssysteme wurden auf ihr Freisetzungsverhalten in der „Apparatur 2“ der USP XXIII (The United States Pharmacopeia USP XXIII 1995, Seite 1791 bis 1792) gemäß der Rührflügelmethode untersucht. Dazu wurde die Wirkstofffreisetzung in einer gängigen Freisetzungssapparatur der Firma ERWEKA bestimmt. Die Tabletten wurden in Puffer pH=6,8 (10%ig) nach Deutschem Arzneibuch 9. Ausgabe mit Tensidzusatz bei 37°C und 100 Upm inkubiert. Innerhalb von 24 Stunden setzten die Tabletten den Wirkstoff gemäß Tabelle frei. Die Freisetzungsmengen in der Tabelle sind als prozentualer Anteil der freigesetzten Wirkstoffmenge, bezogen auf die gesamte ursprüngliche Wirkstoffmenge im Kern angegeben.

5

Die Ergebnisse zeigen, daß das erfindungsgemäße osmotische Arzneimittelfreisetzungssystem den Wirkstoff im relevanten Zeitintervall - je nach angestrebter Freisetzungsraten - nahezu vollständig freisetzt, wohingegen die osmotischen Arzneimittelfreisetzungssysteme aus dem Stand der Technik den Wirkstoff am Ende der Freisetzung nur unvollständig freisetzen. Dabei ist davon auszugehen, daß nach einem Zeitraum von 24 Stunden eine Freisetzung an absorptionsrelevanten Stellen des Gastrointestinaltrakts nicht mehr stattfindet und die osmotischen Arzneimittelfreisetzungssysteme das Plateau ihrer Freisetzung erreicht haben. Die erfindungsgemäßen Beispiele 1 und 2 einerseits und 3 und 4 andererseits verdeutlichen den Einfluß der Feuchtgranulation im Unterschied zur Trockengranulation. Wie oben dargelegt, bewirkt die Feuchtgranulation häufig eine bessere Benetzbarkeit der Bestandteile des Tablettenkerns, wodurch die eintretende Gastrointestinalflüssigkeit den Kern besser durchdringt, was zu einer rascheren und vollständigeren Freisetzung des Wirkstoffs führt. Die Feuchtgranulation ist daher bevorzugt. Der Einsatz der Feuchtgranulation wird durch die Verwendung der speziellen wasserquellbaren Polymere in dem erfindungsgemäßen osmotischen Arzneimittelfreisetzungssystem, welche im Gegensatz zu den im Stand der Technik verwendeten Polyethylenoxiden keiner organischen Lösungsmittel bedürfen, praktisch erst ermöglicht. Der Vergleich zwischen den erfindungsgemäßen Beispielen 1 und 2 bzw. 3 und 4 zeigt, daß eine höhere Hüllackauftragsmenge am Anfang der Freisetzung zu einer gewissen Verzögerung (Lag-Zeit) führt, und die Freisetzungsraten aufgrund der

- 22 -

geringeren Eintrittsgeschwindigkeit der Gastrointestinalflüssigkeit verlangsamt wird. Über einen längeren Zeitraum werden jedoch weitgehend unabhängig von der Lackauftragsmenge etwa gleich hohe Freisetzungsmengen in den erfindungsgemäßen Beispielen erzielt.

5

Der Vergleich zwischen Beispiel 2 der Erfindung und Vergleichsbeispiel 1 zeigt, daß das erfindungsgemäße osmotische Arzneimittelfreisetzungssystem bei etwa gleicher Lackauftragsmenge und Lackzusammensetzung sowie vergleichbarem Herstellungsverfahren (Trockengranulation bzw. Direkttablettierung) eine deutlich höhere Endfreisetzung 10 bei annähernd gleichen Anfangsfreisetzungsraten aufweist. Dies bedeutet, daß das erfindungsgemäße osmotische Arzneimittelfreisetzungssystem auch zu einem späteren Zeitpunkt noch mit einer relativ hohen Freisetzungsrate den Wirkstoff freisetzt, wenn die Freisetzung des Wirkstoffs des osmotischen Arzneimittelfreisetzungssystems des Vergleichsbeispiels praktisch bereits zum Erliegen gekommen ist. Das bedeutet, daß ein großer 15 Anteil des Wirkstoffs des Vergleichsbeispiels in der Tablette verbleibt und somit ungenutzt ausgeschieden wird. Auch bei Vergleichsbeispiel 2 wird eine niedrige Freisetzungsrate in einem späteren Zeitpunkt der Freisetzung beobachtet.

DETAILED DESCRIPTION OF THE INVENTION

The compounds of Formula I as structurally disclosed above are useful antimicrobials. Typically, as further explained below, the compounds can be administered as antibacterial agents in a dosage range of from about 0.1 to 100 mg/kg or preferably from about 3.0 to about 50 mg/kg of body weight per day.

In the structural formula shown above the carbon content of various hydrocarbon containing moieties is indicated by a prefix designating the minimum and maximum number of carbon atoms in the moiety, i.e., the prefix C_i-C_j defines the number of carbon atoms present from the integer "i" to the integer "j" inclusive.

The term " C_{1-6} alkyl" used herein refers to an alkyl group having one to six carbon atoms such as, for example, methyl, ethyl, propyl, butyl, pentyl, hexyl and isomeric forms thereof; preferably methyl, ethyl, propyl and isomeric forms thereof.

The term " C_{2-6} alkenyl" refers to at least one double bound alkenyl group having two to six carbon atoms such as, for example, vinyl, 1-propenyl, 2-propenyl, 2-methyl-1-propenyl, 1-but enyl, 2-but enyl, 1-pentenyl, 2-pentenyl, 1-hexenyl and isomeric forms thereof, preferably an alkenyl group having 2 to 6 carbon atoms, and more preferably an alkenyl group having 2 to 4 carbon atoms.

The term " C_{2-7} alkynyl" refers to at least one triple bond alkynyl group having two to seven carbon atoms such as, for example, ethynyl, propynyl, butynyl, pentynyl, hexynyl, heptynyl and their isomeric forms thereof.

The term " C_{1-6} alkylamino" refers to an alkyl group having one to six carbon atoms attached to an amino moiety.

The term " C_{1-6} dialkylamino" refers to two alkyl groups having one to six carbon atoms attached to an amino moiety.

The term " C_{1-4} alkoxy" refers to an alkyl group having one to four carbon atoms attached an oxygen atom of hydroxyl group such as, for example, methoxy, ethoxy,

propoxy, butoxy and isomeric forms thereof, preferably an alkoxy group having 1 to 2 carbon atoms.

The term "C₁₋₆ alkylthio" refers to an alkyl group having one to six carbon atoms attached a thio moiety such as, for example, methythio, ethylthio, propylthio and isomeric forms thereof, preferably an alkylthio group having 1 to 2 carbon atoms.

The term "C₃₋₆ cycloalkyl" refers to three to six carbon atoms forming cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl and isomeric forms thereof.

The term "aryl" refers to an phenyl moiety optionally substituted with one or two F, Cl, Br, -CF₃, -CN, -C₁₋₃ alkoxy, or -C₁₋₃ alkylthio;

The term "Het" refers to a 5- or 6-membered heteroaromatic moiety having one to three atoms selected from the group consisting of O, N or S atoms such as, for example, furan, thiophene, pyrrole, pyrazole, triazoles, oxazole, thiazole, isothiazole, oxadiazoles, oxathiazole, pyridine, pyridazine, pyrimidine, pyrazine, piperazine and triazines all of which can optionally be substituted with one substituent selected from the group consisting of F, Cl, C₁₋₃ alkoxy, C₁₋₃ alkylthio or CN.

The compounds of the present invention can be converted to their salts according to conventional methods.

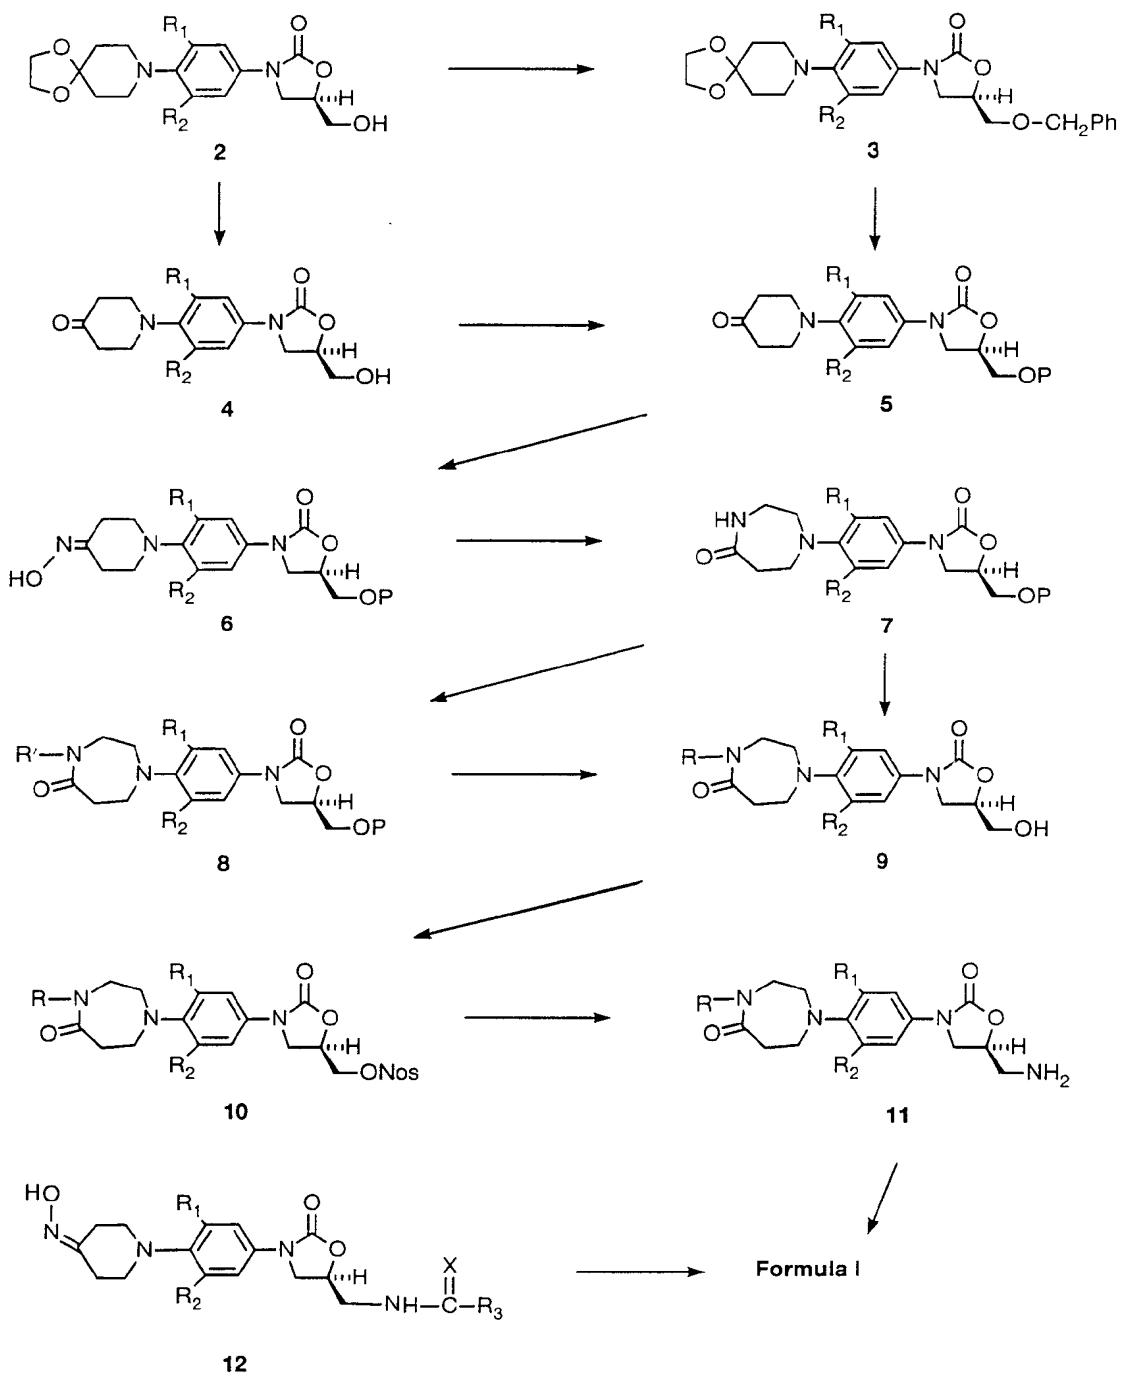

Pharmaceutically acceptable salts means acid addition salts useful for administering the compounds of this invention and these include hydrochloride, hydrobromide, sulfate, phosphate, acetate, propionate, lactate, mesylate, maleate, succinate, tartrate, citrate, 2-hydroxyethyl sulfonate, fumarate and the like when a basic group is present. These salts may be in hydrated form. Some of the compounds of this invention may form metal salts such as sodium, potassium, calcium and magnesium salts and these are embraced by the term "pharmaceutically acceptable salts".

Due to the configuration at C-5 of the oxazolidinone ring of compounds as represented in the structure of Formula I the compounds of this invention may exist in geometric, optical and other isomeric forms and this invention embraces any of these isomers. The racemic mixture and enantiomers are all believed to be useful as an antibacterial. Regardless, the preferred absolute configuration at C-5 of the oxazolidinone ring of compounds is as represented in the structure of Formula I. This absolute configuration is called (S) under the Cahn-Ingold-Prelog nomenclature system. It is believed that a majority of the pharmacological activity resides in this (S)-enantiomer to produce the antibacterial effect.

Compounds of Formula I can be prepared as shown in Scheme I where P represents an alcohol protecting group such as benzyl or *tert*-butyldimethylsilyl. Structure **2** of this scheme are prepared according to the methods outlined in Example 1, Step 1 and 2. In Scheme I, the alcohols of **2** are protected as benzyl ethers. In a suitable procedure for this reaction, a solution of the alcohol **2** in a solvent such as Et₂O or THF is allowed to react first with sodium hydride at 0-25 °C and then with benzyl bromide and tetrabutylammonium iodide at 0-25 °C to give structure **3**. The ethylene ketal of **3** can then be removed with an acidic catalyst such as *p*-toluenesulfonic acid in acetone (as described in Example 1, Step 2) to give structure **5** where P is benzyl. Alternatively the ketal of **2** can be removed, the resulting structure **4** is allowed to react with *tert*-butyldimethylsilyl chloride and imidazole in DMF or *tert*-butyldimethylsilyl chloride and triethyl amine in methylene chloride to give structure **5** where the alcohol protecting group (P) is *tert*-butyldimethylsilyl. Ketone **5** is then allowed to react with hydroxylamine hydrochloride and sodium acetate in methanol-methylene chloride to give oxime **6** (see Example 1, Step 3). The Beckmann rearrangement of structure **6** is carried out with *p*-toluenesulfonyl chloride and sodium carbonate in aqueous acetone at 20-40 °C to give structure **7**. For compounds of Formula I where R is not hydrogen, compounds **7** can be alkylated with R'Y where Y is Br, I, CH₃SO₃ or *p*-CH₃PhSO₃ and R' is an appropriate alkyl substituent. In one method for this alkylation compounds of structure **7** are allowed to react with sodium hydride and R'Y in a solvent such as DMF at 0-25 °C to give **8**. Alternatively, structure **7** can react with R'Y, potassium hydroxide and tetrabutylammonium bromide in THF or acetonitrile at 20-50 °C to give **8**. Deprotection of the alcohols **7** or **8** provide structure **9**. When P is a benzyl ether, this can be accomplished by hydrogenolysis with hydrogen and a palladium catalyst in ethanol or with ammonium formate and a palladium catalyst in methanol at 10-30 °C. The *tert*-butyldimethylsilyl protecting group can be removed under acidic conditions or with fluoride ion. This deprotection can be carried out, for example, with trifluoroacetic acid in methylene chloride at 25 °C or with tetrabutylammonium fluoride in THF at 25 °C to give alcohol **9**. Transformation of the alcohol **9** to the amine **11** can be carried out as described in Example 1, Step 1. Alternatively, the reaction of **9** with *m*-nitrobenzenesulfonyl chloride and triethylamine in methylene chloride at 5-25 °C will give the *m*-nitrobenzenesulfonate **10** which will react with ammonium hydroxide in THF or acetonitrile -isopropanol at 30-60 °C to give the amine **11**. The reaction of compound

11 with acyl halides, anhydrides, isocyanates, isothiocyanates or dithioesters provides compounds of Formula I.

Compounds of Formula I where R is hydrogen and X is oxygen are conveniently prepared by allowing compounds **12** to react with p-toluenesulfonyl chloride and sodium 5 carbonate in aqueous acetone at 20-40 °C (see Example 1, Step 4).

Scheme I

The compounds of the invention are useful for the treatment of microbial infections in humans and other warm blooded animals by either parenteral, oral, or topical administration.

The term "treatment" as used herein means partial or total lessening of symptoms of a disease which a patient suffers from; the term "prevention" as used herein means partial or total avoidance of symptoms of a disease in a patient who, according to a doctor's diagnosis, may suffer from the disease or a related state unless the preventive measure is taken.

The pharmaceutical compositions of this invention may be prepared by combining the compounds of Formula I of this invention with a solid or liquid pharmaceutically acceptable carrier and, optionally, with pharmaceutically acceptable adjuvants and excipients employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules, capsules and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene glycol systems, optionally containing conventional coloring agents, flavoring agents, stabilizers and thickening agents.

Preferably, the pharmaceutical composition is made by employing conventional techniques in unit dosage form containing effective amounts of the active component, that is, the compound of Formula I according to this invention.

The quantity of active component, that is the compound of Formula I, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application method, the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combatting bacterial infections in humans and other animals that have been diagnosed with bacterial infections, the compounds or pharmaceutical compositions thereof will be administered orally, parenterally and/or

topically at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the animal undergoing treatment which will be antibacterially effective. Generally, such antibacterially effective amount of dosage of active component will be in the range of about 0.1 to about 100 mg/kg, more preferably about 3.0 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of Formula I are administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration.

15 Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound according to Formula I as a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, for example, water-for-injection and a suitably buffered isotonic solution, for example, having a pH of about 3.5-6. Suitable buffering agents include, for example,

20 trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine, to name a few. The compound according to Formula I generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml. The resulting liquid pharmaceutical composition will be administered so as to obtain the

25 above-mentioned antibacterially effective amount of dosage. The compounds of Formula I according to this invention are advantageously administered orally in solid and liquid dosage forms.

As a topical treatment, an effective amount of a compound of Formula I is admixed in a pharmaceutically acceptable gel or cream vehicle that can be applied to the patient's skin at the area of treatment. Preparation of such creams and gels is well known in the art and can include penetration enhancers.

as multiply-resistant *staphylococci* and *streptococci*, gram negative organisms such as *H. influenzae* and *M. catarrhalis* as well as anaerobic organisms such as *bacteroides* and *clostridia* species, and acid-resistant organisms such as *Mycobacterium tuberculosis* and *Mycobacterium avium*.

5 In order to more fully illustrate the nature of the invention and the manner of practice the same, the following experimental examples are presented, but they should not be taken as limitations.

EXAMPLE 1 Preparation of (S)-N-[[3-[3-fluoro-4-(1,2,3,4,6,7-hexahydro-5-oxo-1,4-diazepin-1-yl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide.

10

Step 1: Preparation of (S)-N-[3-(3-fluoro-4-piperidin-1-yl-phenyl)-2-oxo-oxazolidin-5-ylmethyl)-acetamide :

15

Diisopropylethylamine (15.7 ml) and 3,4-difluoronitrobenzene (5.0 ml) are added successively to an ethyl acetate solution (70 ml) of piperidine (5.77 g) and the mixture is stirred at room temperature for 2 days. Water is added to the reaction solution and the separating ethyl acetate layer are washed with water and brine, dried over anhydrous sodium sulfate. The solvent is evaporated to afford a nitro compound (10.1 g) in a yield of 100%. Palladium on carbon (10%, 1.0 g) is added to an ethyl acetate solution (101 ml) of the nitro compound (10.1 g) and the mixture is stirred at room temperature for 4 hours under hydrogen atmosphere. The palladium on carbon is filtered off and the filtrate is concentrated under vacuum to yield an amine (8.75 g, 100%). Sodium hydrogencarbonate (5.0 g) and benzyloxycarbonyl chloride (8.4 ml) are added successively to a tetrahydrofuran (THF) solution (100 ml) of the amine (8.75 g), and the mixture is stirred at room temperature for 14 hours. Water is added to the reaction solution and the separating THF layer is washed with water and brine, dried over anhydrous sodium sulfate. The solvent is evaporated and the residue is purified by silica gel column chromatography (solvent: ethyl acetate/hexane/chloroform = 1/6/4) to afford a benzyl carbamate (14.5 g) in a yield of 98%. Butyl lithium (1.6 M hexane solution: 5.2

ml) is added to a THF solution (24 ml) of the benzyl carbamate (2.75 g) at -78 C and the mixture is stirred for 5 min. At the same temperature, (R)-(-)-glycidyl butyrate (1.25 ml) is added to the stirred solution and the mixture is stirred for 14 hours while the temperature is raised slowly to room temperature. Water is added to the reaction solution and the separating THF layer is washed with water and brine, dried over anhydrous sodium sulfate. The solvent is evaporated and the residue is purified by silica gel column chromatography (solvent: ethyl acetate/hexane = 3/1) to afford an alcohol (2.20 g) in a yield of 89%. Tosyl chloride (2.85 g) is added to a pyridine solution (8 ml) of the alcohol (2.20 g) and the mixture is stirred at room temperature for 6 h. Water (32 ml) is added to the reaction solution and the mixture is stirred for 1 hour. The resulting precipitate is collected by filtration and washed with water, followed by drying under vacuum at room temperature to afford a tosylate (3.28 g) in a yield of 98%. Sodium azide (3.80 g) is added to a dimethylformamide (DMF) solution (23 ml) of the tosylate (3.28 g) at room temperature and the mixture is stirred at 65 C for 5.5 hours. After the reaction mixture is cooled to room temperature, water is added and the mixture is extracted with ethyl acetate; the organic layer is concentrated under vacuum. The resulting residue is dissolved in ethyl acetate and washed with water and brine, dried over anhydrous sodium sulfate. The solvent is evaporated and the residue is purified by silica gel column chromatography (solvent: ethyl acetate/hexane = 1/1) to afford an azide (2.20 g) in a yield of 94%. Acetic anhydride (0.65 ml) and pyridine (1.0 ml) are added to an ethyl acetate solution (19 ml) of the azide (2.20 g) at room temperature; after addition of palladium on carbon (10%, 0.22 g), the mixture is stirred at room temperature for 6 hours under 1 atm hydrogen atmosphere. The palladium on carbon is filtered off and the filtrate is washed with water and brine, dried over anhydrous sodium sulfate. The solvent is evaporated and the residue is purified by silica gel column chromatography (solvent: acetone/hexane = 1/1) to afford the title compound.

Step 2: Preparation of (S)-N-{3-[3-fluoro-4-(4-oxo-piperidin-1-yl)-phenyl]-2-oxo-oxazolidin-5-ylmethyl}-acetamide.

Using a commercially available 1,4-dioxo-8-aza-spiro[4.5]decane, (S)-N-{3-[4-(1,4-dioxa-8-aza-spiro[4.5]dec-8-yl)-3-fluoro-phenyl]-2-oxo-oxazolidin-5-ylmethyl}-acetamide is synthesized by the same method as in Step 1. To an acetone solution (70 ml) of this compound (3.79 g), water (20 ml) and p-toluenesulfonic acid monohydrate (3.66 g) are added successively and the mixture is heated under reflux for 3 hours. After

the reaction mixture is cooled to room temperature, acetone is distilled off and the aqueous layer is neutralized with triethylamine. The solution is extracted with methylene chloride and the organic layer is washed with brine, dried over anhydrous sodium sulfate. The solvent is evaporated and the residue is purified by silica gel column chromatography (solvent: chloroform/methanol = 50/1 - 25/1) to afford the title compound .

- 5 Step 3: Preparation of (S)-N-{3-[3-fluoro-4-(4-hydroxyimino-piperidin-1-yl)-phenyl]-2-oxo oxazolidin-5-ylmethyl}-acetamide.

Sodium acetate (517 mg) and hydroxylamine hydrochloride (219 mg) are successively added to a methanol-methylene chloride solution (10-10 ml) of 1.00 g of the product of Step 2, and the mixture is stirred at room temperature for 2 days. The solvent is evaporated and the residue is dissolved in methanol, followed by addition of a silica gel (8 g). Methanol is evaporated and the residue is purified by silica gel column chromatography (solvent: chloroform/methanol = 50/1 - 25/1) to afford the title compound.

- 10 15 Step 4: Preparation of (S)-N-[[3-[3-Fluoro-4-(1,2,3,4,6,7-hexahydro-5-oxo-1,4-diazepin-1-yl)phenyl]-2-oxo-5-oxazolidinyl]methyl]acetamide.

A stirred mixture of the compound of product of Step 3 (0.200 g, 0.549 mmol) in acetone (5.3 mL), under nitrogen, is treated first with 5% aqueous sodium carbonate (5.3 mL) and then, dropwise during 3 minutes with a solution of *p*-toluenesulfonyl chloride (0.16 g, 0.82 mmol) in acetone (2.7 mL). Initially this mixture is a two phase solution; however, after about 25 minutes a precipitate began to form. It is kept at ambient temperature (23 °C) for 4 hours and filtered. The filtrate is concentrated under reduced pressure to remove acetone and the aqueous residue is extracted with CH₂Cl₂. The extract is dried (MgSO₄) and concentrated to give a small amount of crude product. Most of the product is in the aqueous layer which is concentrated in vacuo. The residue is combined with the crude product from the CH₂Cl₂ extract and chromatographed on silica gel with mixtures of MeOH-NH₄OH-CH₂Cl₂ that continued 3-5% MeOH and 0.3-0.5% NH₄OH. The product is crystallized from MeOH-EtOAc to give the title compound. mp 140-146 °C;

A stirred solution of 10.6 g (0.03 mol) of (S)-[3-[4-(1,4-dioxo-8-azaspiro[4.5]dec-8-yl)-3-fluorophenyl]-2-oxo-5-oxazolidinyl]methanol, the intermediate of formula 2 (Scheme 1) for the preparation of (S)-N-{3-[3-fluoro-4-(4-oxopiperidin-1-yl)phenyl]-2-oxooxazolidin-5-ylmethyl}-acetamide (Example 1, Step 2), in acetone (230 mL) is treated with water (65 mL) and *p*-toluenesulfonic acid monohydrate (11.4 g, 0.06 mol), refluxed under nitrogen for 5 hours and kept at ambient temperature (24 °C) for 18 hours. It is then concentrated in vacuo to remove acetone. The aqueous residue is neutralized with sodium bicarbonate and extracted with ethyl acetate; the extract is washed with saturated sodium bicarbonate, water and dilute sodium chloride, dried (Na₂SO₄) and concentrated to give the ketone, a compound of formula 4 (Scheme 1). A stirred solution of the ketone and triethylamine (12.5 mL, 0.09 mol) in methylene chloride (100 mL) is treated with *tert*-butyldimethylsilyl chloride (6.03 g, 0.04 mol) and kept under nitrogen at ambient temperature for 23 hours. Additional *tert*-butyldimethylsilyl chloride (3.0 g) is added and the mixture is kept at ambient temperature for an additional 20 hours. Additional triethylamine (3.0 mL) and *tert*-butyldimethylsilyl chloride (3.0 g) are again added and the mixture is kept at ambient temperature for 4 days, diluted with methylene chloride, washed with water and dilute sodium chloride, dried (Na₂SO₄) and concentrated. Chromatography of the residue on silica gel with mixtures of acetone-

heptane that contained 20-30% acetone gave 7.72 g of the *tert*-butyldimethylsilyl (TBDMS) ether, a compound of formula 5 (Scheme 1) where P is TBDMS. A stirred solution of the TBDMS ether (7.27 g, 17.2 mmol) in methanol (150 mL) is treated dropwise with a solution of hydroxylamine hydrochloride (1.44 g, 0.021 mol) and sodium acetate (1.72 g, 0.021 mol) in water (15 mL) and kept at ambient temperature for 20 hours. The mixture is concentrated under reduced pressure. A solution of the residue, a white solid, in methylene chloride is washed with water and dilute sodium chloride, dried (Na_2SO_4) and concentrated to give 7.25 g of the oxime, a compound of formula 6 (Scheme 1). The mixture is kept at ambient temperature for 18 hours and then concentrated under reduced pressure. A solution of the residue in methylene chloride is washed with water and dilute sodium chloride, dried (Na_2SO_4) and concentrated. Chromatography of the residue on silica gel with 3% methanol - 0.3% ammonium hydroxide-methylene chloride gave 5.98 g of the titled compound.

EXAMPLE 5 MIC Test Method

The *in vitro* MICs of test compounds are determined by a standard agar dilution method. A stock drug solution of each analog is prepared in the preferred solvent, usually DMSO:H₂O (1:3). Serial 2-fold dilutions of each sample are made using 1.0 ml aliquots of sterile distilled water. To each 1.0 ml aliquot of drug is added 9 ml of molten Mueller Hinton agar medium. The drug-supplemented agar is mixed, poured into 15 x 100 mm petri dishes, and allowed to solidify and dry prior to inoculation.

Vials of each of the test organisms are maintained frozen in the vapor phase of a liquid nitrogen freezer. Test cultures are grown overnight at 35 C on the medium appropriate for the organism. Colonies are harvested with a sterile swab, and cell suspensions are prepared in Trypticase Soy broth (TSB) to equal the turbidity of a 0.5 McFarland standard. A 1:20 dilution of each suspension is made in TSB. The plates containing the drug supplemented agar are inoculated with a 0.001 ml drop of the cell suspension using a Steers replicator, yielding approximately 10⁴ to 10⁵ cells per spot. The plates are incubated overnight at 35 C.

Following incubation the Minimum Inhibitory Concentration (MIC µg/ml), the lowest concentration of drug that inhibits visible growth of the organism, is read and recorded. The data is shown in Table I.

S-OXIDE AND S,S-DIOXIDE TETRAHYDROTHIOPYRAN
PHENYLOXAZOLIDINONES

FIELD OF THE INVENTION

5 The present invention relates to sulfur oxidized tetrahydrothiopyran N-phenyloxazolidinone compounds in which the phenyloxazolidinone moiety is linked with a thiopyran ring through a carbon-carbon bond. The invention also relates to a novel assay for determining the inhibitory activity of oxazolidinones to human monoamine oxidase.

10

BACKGROUND OF THE INVENTION

The oxazolidinone antibacterial agents are a novel synthetic class of antimicrobials with potent activity against a number of human and veterinary pathogens, including gram-positive aerobic bacteria such as multiply-resistant staphylococci and streptococci, gram-negative aerobic bacteria such as *H. influenzae* and *M. catarrhalis*, as well as anaerobic organisms such as bacteroides and clostridia species, acid-fast organisms such as *Mycobacterium tuberculosis* and *Mycobacterium avium*. It is also known that as a chemical compound class, oxazolidinones inhibit monoamine oxidase (MAO), the enzyme responsible for preventing acute blood pressure elevation by the endogenous and dietary amine, tyramine. Accordingly, there is a demand to discover oxazolidinone antibiotics which possess minimum MAO inhibitory activity to eliminate the related side effects from potential drug-drug interactions. There is also currently an interest in developing a high throughput screening assay to determine the MAO inhibitory activity of oxazolidinone antibiotics.

35

DETAILED DESCRIPTION OF THE INVENTION

The present invention provides sulfur oxidized tetrahydrothiopyran phenyloxazolidinone of formula I and formula II as defined above. The compounds are useful antimicrobial agents, effective against a number of human and veterinary pathogens as disclosed above. In particular, it has been discovered that, while 5 oxazolidinones as a chemical compound class are inhibitors of human monoamine oxidase A (MAO A) and monoamine oxidase B (MAO B), the compounds of the present invention have unexceptionally weak MAO inhibitory activity, which indicates that these compounds possess the capacity to minimize or eliminate potential drug-drug interactions since strong inhibition of monoamine oxidase can result in 10 altered clearance rates for other compounds normally metabolized by it, including several pharmaceuticals.

The present invention also provides a novel spectrophotometric assay for determining the ability of an oxazolidinone to inhibit human monoamine oxidases. MAO A and MAO B are membrane bound flavoproteins localized in the outer 15 mitochondrial membrane. The two enzymes prefer different substrate in catalyzing the oxidative deamination of biogenic and xenobiotic amines. Historically, MAO enzymes have been assayed by radioactive end point (discontinuous) methods using two different substrates. These methods have been criticized because as commonly practiced, they lack the proof of linearity of the reaction time course under 20 prevailing assay conditions. The use of these methods are also inadequate due to their cumbrous nature when screening a large number of compounds in a short period of time. The methods involve multiple processing steps including solvent extraction of reaction products. These steps lead to inaccuracies in the resulting data. See: Matthew J. Krueger, et al., "An Examination of the Reliability of the 25 Radiochemical Assay for Monoamine Oxidases A and B", *Analytical Biochemistry*, Vol. 214, pp. 116-123 (1993); Keith F. Tipton, et al., "Commentary - The Radiochemical Assay for Monoamine Oxidase Activity - Problems and Pitfalls", *Biochemical Pharmacology*, Vol. 46, No. 8, pp. 1311-1316 (1993).

We have now developed a continuous, visible, high throughput screening 30 spectrophotometric assay of MAO based on a colored product of oxidation of a chromogenic substrate, 1-methyl-4-(1-methyl-2-pyrrolyl)-1,2,3,6-tetrahydropyridine. The assay works equally well with MAO-A and MAO-B. It is sensitive, linear and tolerant of the low turbidity level introduced by the solubilized and partially purified 35 MAO A and MAO B. The reaction product is stable for many hours and the reaction rates for both enzymes are linear functions of time and enzyme concentration. The assay has been successfully adapted to a microtiterplate format, therefore, it can

provide information on thousands of tested oxazolidinone compounds in a short period of time. Even in the microtiterplate screening format, accurate information concerning the linearity of the reaction rate under prevailing assay conditions is obtained.

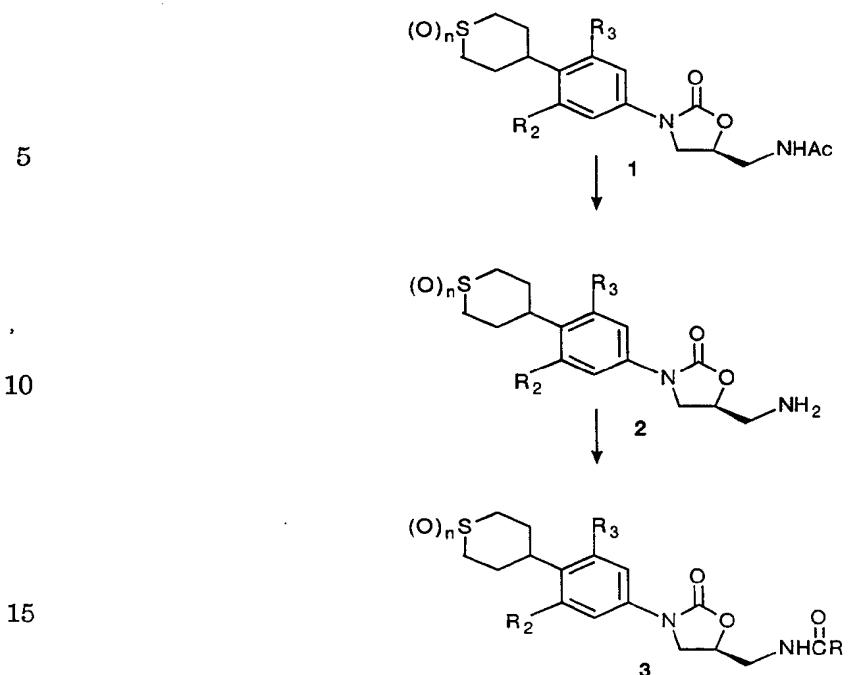

- 5 In addition, while evaluation of oxazolidinone compounds' MAO inhibitory activity is the most important utility of this assay, the present invention can be used to detect any inhibitor of MAO enzymes.

For the purpose of the present invention, the term "pharmaceutically acceptable salts" refers to salts useful for administering the compounds of this 10 invention and include hydrochloride, hydrobromide, hydroiodide, sulfate, phosphate, acetate, propionate, lactate, mesylate, maleate, malate, succinate, tartrate, citrate, 2-hydroxyethyl sulfonate, fumarate and the like. These salts may be in hydrated form.

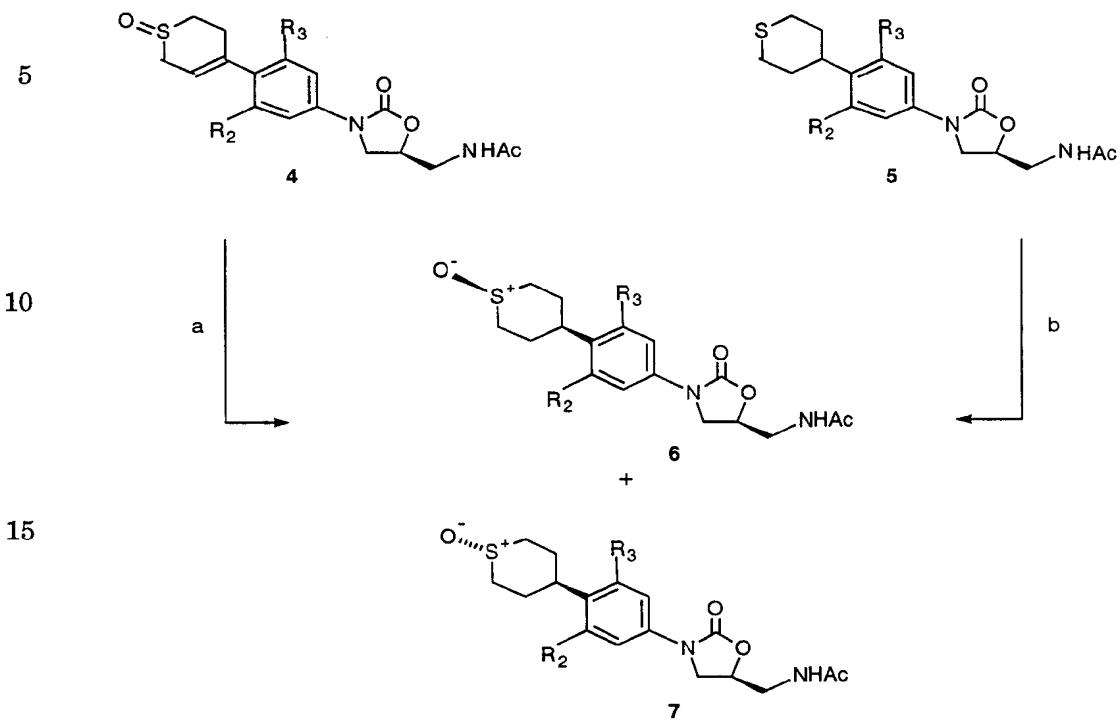

Compounds of the present invention may be prepared in accordance to 15 Schemes I and II following methodology known to those skilled in the art. Briefly, as shown in Scheme I, hydrolysis of the N-acetyl oxazolidinone **1** with hydroxylamine hydrochloride, for instance, provides the amine **2**. Treatment of structure **2** with an acid chloride or anhydride in the presence of a base affords N-acyl oxazolidinone **3**, wherein n is 1 or 2, and R is R₁ or R₄ as defined above. 20 Structure **1** in which n is 2 can be obtained according to the procedures disclosed in International Publication No. WO 97/09328; structure **1** in which n is 1 can be prepared as shown in Scheme II.

Compound **4** in Scheme II, which can be obtained according to the procedures disclosed in International Publication No. WO 97/09328, may be reduced to the 25 corresponding cis- and trans-sulfoxides **6** and **7** by catalytic hydrogenation in the presence of an appropriate catalyst and a suitable solvent, as depicted in route a. Alternatively, sulfide **5**, which may be isolated as a by-product in the reduction shown in route a or synthesized by the reduction of **6** or **7** with a sulfonic acid-sodium iodide system, can be oxidized with an appropriate oxidizing agent such 30 NaIO₄ or meta-chloroperoxybenzoic acid in an appropriate solvent to provide **6** and **7**, as depicted in route b of Scheme II. The isomeric mixture of **6** and **7** can be separated by chromatography.

SCHEME I

SCHEME II

These compounds are useful for the treatment of microbial infections, including ophthalmologic infections, in humans and other warm blooded animals, under both parental and oral administration.

The pharmaceutical compositions of this invention may be prepared by combining the compounds of Formulas I and II of this invention with a solid or liquid pharmaceutically acceptable carrier and, optionally, with pharmaceutically acceptable adjuvants and excipient employing standard and conventional techniques. Solid form compositions include powders, tablets, dispersible granules, capsules, cachets and suppositories. A solid carrier can be at least one substance which may also function as a diluent, flavoring agent, solubilizer, lubricant, suspending agent, binder, tablet disintegrating agent, and encapsulating agent. Inert solid carriers include magnesium carbonate, magnesium stearate, talc, sugar, lactose, pectin, dextrin, starch, gelatin, cellulosic materials, low melting wax, cocoa butter, and the like. Liquid form compositions include solutions, suspensions and emulsions. For example, there may be provided solutions of the compounds of this invention dissolved in water and water-propylene glycol and water-polyethylene glycol

systems, optionally containing suitable conventional coloring agents, flavoring agents, stabilizers and thickening agents.

Preferably, the pharmaceutical composition is provided employing conventional techniques in unit dosage form containing effective or appropriate amounts of the active component, that is, the compounds of formula I or II according to this invention.

The quantity of active component, that is the compound of formula I or II according to this invention, in the pharmaceutical composition and unit dosage form thereof may be varied or adjusted widely depending upon the particular application, 10 the potency of the particular compound and the desired concentration. Generally, the quantity of active component will range between 0.5% to 90% by weight of the composition.

In therapeutic use for treating, or combatting, bacterial infections in warm-blooded animals, the compounds or pharmaceutical compositions thereof will be 15 administered orally, topically, transdermally, and/or parenterally at a dosage to obtain and maintain a concentration, that is, an amount, or blood-level of active component in the animal undergoing treatment which will be antibacterially effective. Generally, such antibacterially effective amount of dosage of active component will be in the range of about 0.1 to about 100, more preferably about 3.0 20 to about 50 mg/kg of body weight/day. It is to be understood that the dosages may vary depending upon the requirements of the patient, the severity of the bacterial infection being treated, and the particular compound being used. Also, it is to be understood that the initial dosage administered may be increased beyond the above upper level in order to rapidly achieve the desired blood-level or the initial dosage 25 may be smaller than the optimum and the daily dosage may be progressively increased during the course of treatment depending on the particular situation. If desired, the daily dose may also be divided into multiple doses for administration, e.g., two to four times per day.

The compounds of formulas I and II according to this invention are 30 administered parenterally, i.e., by injection, for example, by intravenous injection or by other parenteral routes of administration. Pharmaceutical compositions for parenteral administration will generally contain a pharmaceutically acceptable amount of the compound according to formula I or II as a soluble salt (acid addition salt or base salt) dissolved in a pharmaceutically acceptable liquid carrier such as, 35 for example, water-for-injection and a buffer to provide a suitably buffered isotonic solution, for example, having a pH of about 3.5-6. Suitable buffering agents include,

for example, trisodium orthophosphate, sodium bicarbonate, sodium citrate, N-methylglucamine, L(+)-lysine and L(+)-arginine to name but a few representative buffering agents. The compounds according to formula I or II generally will be dissolved in the carrier in an amount sufficient to provide a pharmaceutically acceptable injectable concentration in the range of about 1 mg/ml to about 400 mg/ml of solution. The resulting liquid pharmaceutical composition will be administered so as to obtain the above-mentioned antibacterially effective amount of dosage. The compounds of formulas I and II according to this invention are advantageously administered orally in solid and liquid dosage forms.

The oxazolidinone antibacterial agents of this invention have useful activity against a variety of organisms. The in vitro activity of compounds of this invention can be assessed by standard testing procedures such as the determination of minimum inhibitory concentration (MIC) by agar dilution as described in "Approved Standard. Methods for Dilution Antimicrobial Susceptibility Tests for Bacteria That Grow Aerobically", 3rd. ed., published 1993 by the National Committee for Clinical Laboratory Standards, Villanova, Pennsylvania, USA. The activity of compounds of this invention against *Staphylococcus aureus* and *H. influenzae* is shown in Table 1.

The continuous spectrophotometric assay for measuring MAO activity is based on a colored oxidation product of the chromogenic substrate, 1-methyl-4-(1-methyl-2-pyrrolyl)-1,2,3,6-tetrahydropyridine, by MAO enzymes. The product is stable for many days at room temperature. The conversion of the substrate to the oxidation product is followed continuously from the moment of mixing of the MAO enzyme with the substrate and the initial reaction rate curve is directly observed. The bright yellow-green oxidation product has a peak absorption at 421 nm with a broad band that can be measured between 390 nm to 440 nm. Thus, the assay can be performed on the least sophisticated spectrophotometric equipment. The substrate itself is colorless; and does not spontaneously convert to product under conditions of the assay; thus, there is no interfering background rate.

The assay is sensitive, which allows accurate rate measurements at very low levels of change in the substrate concentration (<1%). The sensitivity of the assay permits measurements to be made on very low concentrations of the MAO enzymes, whether pure or in tissue homogenates. The assay is not susceptible to background interference from biologically derived materials all of which absorb between 210-350 nm.

The assay shows a linear reaction rate over a wide range of MAO enzymes, of the substrate, and of oxazolidinones concentrations and over a considerable portion

of the progress curve at any substrate or enzyme concentration. For example, the assay shows a linear reaction rate at final oxazolidinone's concentration from about 1 mM to about 1 nM; at any concentration of the enzymes which is sufficient to produce an absorbance change of 0.0005-0.05/minute at 421 nm; and at the 5 substrate's concentration from about 10 µM to about 10 mM. The reaction rate is also linear over long time intervals (up to 90 minutes) even at low enzyme concentrations. These properties permit a highly accurate rate determination as a function of substrate concentration, enzyme concentration or oxazolidinone inhibitor concentration.

10 The assay may be carried out in a buffer solution which does not adversely affect the reaction and provides a pH value at a range from about 7.0 to 7.5. The preferred buffer solution is sodium phosphate. The preferred pH value for assay is about 7.3. Further, the assay is preferably conducted at a temperature from about 25 °C to about 40 °C. The most preferred assay temperature is about 37 °C.

15 The chromogenic substrate 1-methyl-4-(1-methyl-2-pyrryl)-1,2,3,6-tetrahydropyridine can be prepared as described in N. Castagnoli Jr. et al., *J. Med Chem.*, Vol. 39, pp. 4756-4761 (1996) and the references cited within. The substrate is prepared as a 10-15 mM stock solution in 50 mM sodium phosphate. The solution is kept on ice or frozen and are typically diluted 1/10-1/100 by 50 mM sodium 20 phosphate (pH = 7-7.5) at the time of assay.

Human placental MAO A is solubilized and purified as described in N. Castagnoli Jr. et al., *J. Med Chem.* Vol. 39, pp. 4756-4761 (1996) and J. I. Salach et al., *J. of Bio. Chem.*, Vol. 260, p. 13199 (1985). The human placental MAO A is obtained as a concentrated solution (5 nmols per ml). Bovine liver MAO B is 25 purified as described N. Castagnoli Jr. et al., *J. Med Chem.*, Vol. 39, pp. 4756-4761 (1996) and J. I. Salach et al., *Methods Enzymol.*, Vol. 142, pp 627-623 (1987). The bovine liver MAO B is obtained as a concentrated solution (8 nmols per ml). Working stocks of the enzyme solutions are made by 1/50 dilution of initial stocks 30 into 50 mM sodium phosphate and optionally 10% glycerol. The solutions are kept on ice until final dilution into the assay. Alternatively, the frozen MAO enzymes may be diluted 800-3200 fold into the 50 mM sodium phosphate buffer immediately before use. This method is useful when screening a large number of oxazolidinones.

Oxazolidinones are prepared in DMSO at a concentration of 50 mM. Serial dilutions of the 50 mM stock solution are made in DMSO to form additional stock 35 solutions ranging from 20 mM to 0.3125 mM. The stock solutions are then frozen until use. The stocks are diluted 1/100 into the final enzyme assay volume at the

time of assay.

Typically, the enzyme, along with an oxazolidinone inhibitor, are preincubated for approximately 15 minutes in the sodium phosphate buffer prior to assay. The reactions are started by addition of the substrate. Initial velocities are 5 generally collected over an interval of one to sixty minutes.

The assay functions well in the spectrophotometer cuvette for evaluating single oxazolidinone's MAO inhibitory activity. The assay has also been successfully adapted to operate in high throughput microtiterplate format (i.e., 96, 384 and 1536 well plate readers). Hundreds of assays can be run simultaneously. Assay volumes 10 are 250 μ L and the wells have an effective path length of 0.75 cm. Generally, the final composition of the assay in the microtiterplate comprises 0.05 mM sodium phosphate (pH = 7.3), oxazolidinone having concentration ranging up to 500 μ M, 1% DMSO, 80 μ M substrate (MAO A) or 200 μ M substrate (MAO B), and sufficient enzyme to produce an absorbance change from 0.0005 to 0.050 per minute at 421 15 nm. The reaction is run at 37 °C, and rapid temperature equilibration of the assay solution is achieved by preincubating the plate and stock solutions at about 37 °C. The reaction is followed by recording the increase in absorbance at 421 nm. The oxidation product has an extinction coefficient of 25,000 M⁻¹ cm⁻¹ at 420. See: N. Castagnoli Jr. et al., *J. Med Chem.*, Vol. 39, pp. 4756-4761 (1996). Initial rates are 20 determined by linear regression of the progress curves over an absorbance change of 0.06-0.12 at 421 nm. This range represents a substrate consumption of approximately 5% in the assay. The percentage inhibition of an oxazolidinone is determined from the following equation

25 % Inhibition = 100{1- [rate(I) - rate (negative control)]/
[rate (positive control) - rate (negative control)]}

In the above equation, the term "negative control" refers to a complete assay with 1% of DMSO but no MAO enzyme. The term "positive control" refers to a 30 complete assay with 1% of DMSO but no inhibitor. The term "rate (I)" refers to the reaction rate under a complete assay conditions. The term "rate (negative control)" refers to the reaction rate under the negative control condition. The term "rate (positive control)" refers to the reaction rate under positive control condition. In the case where a single oxazolidinone's MAO inhibitory activity is evaluated in the 35 microtiterplate screening format, two replicates of positive control assay and two replicates of negative control assay are run to produce averaged control rates. In

the case where microtiterplate format is used to derive an inhibitory constant (K_i) for an oxazolidinone inhibitor, each plate contains four to eight wells without inhibitor (positive control). These rates are averaged to produce the mean uninhibited control rate for the plate. Each inhibitor is tested at six to eight 5 concentrations. Inhibitory percentage at each concentration is established relative to the uninhibited control rate. Since oxazolidinones are competitive inhibitors of MAO enzymes, the dissociation constant K_i is calculated from the initial velocity data using the following equation:

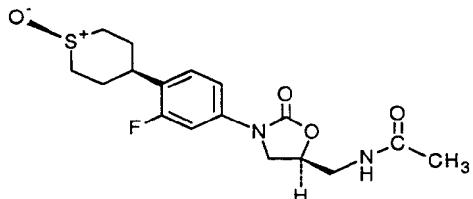

10 %Inhibition = $100[I]/([I] + K_i(1 + [S]/Km_{[s]})$

See I. H. Segel, *Enzyme Kinetics.*, Vol. 957, p.105, (1975). Wiley Interscience. NY, NY. In this equation, $[S]$ refers to the concentration of the chromogenic substrate; $[I]$ refers to the concentration of an oxazolidinone inhibitor; and $Km_{[s]}$ refers to the 15 dissociation constant of the substrate for the MAO enzyme. In practice, the data points from the inhibitor experiment are fit to the equation by non-linear least squares regression analysis. The K_i parameter and its standard error are estimated by the regression procedure. A low K_i value indicates that the tested inhibitor possesses a tight binding ability to MAO enzyme, thus, it is a strong MAO inhibitor.

EXAMPLE 10 Evaluation of Oxazolidinones' Inhibitory Activity to Human MAO-A

The solubilized and purified forms of human MAO-A and the substrate are obtained from Dr. Neal Castagnoli Jr's lab in Department of Chemistry, Virginia Technical University, Blacksburg, Virginia.

Preparation of buffer solutions: sodium phosphate was prepared as a 50 mM stock solution, pH = 7.3 at 37 °C. Preparation of the testing compounds: stock solutions (50 mM) of the test compounds were prepared in DMSO. Serial dilutions of

the 50 mM stocks were made in DMSO to form additional stock solutions ranging from 20 mM to 0.3125 mM. These stocks were then frozen until needed. The stocks were diluted 1/100 into the final enzyme assay volume at the time of assay. A 10 mM stock solution of the chromogenic substrate was prepared in the 50 mM phosphate buffer, aliquoted and then frozen until time of use.

Enzyme Assay- Initial velocity assays were run in a SPECTRAmax 250 microplate spectrophotometer (Molecular Devices Corp., Sunnyvale, CA.). The final composition of the assay solution comprises 0.05 M sodium phosphate (pH = 7.3), 80 μ M substrate, inhibitor concentrations ranging up to 500 μ M, 1% DMSO, and sufficient enzyme to produce an absorbance change at 421 nm of 0.0005-0.005/ minute. The reactions were run at 37 °C. The reaction was followed by recording the increase in absorbance at 421 nm. Inhibitors were pre-incubated with the MAO A in the reaction mixture for 15 minutes prior to starting the reaction. Ki values were determined from the initial velocity data using the above equation.

The results are also shown in Table 1.

sowie deren Salze.

Gegenstand der Erfindung sind auch die optisch aktiven Formen, die
15 Racemate, die Diastereomeren sowie die Hydrate und Solvate dieser
Verbindungen.

Der Erfindung lag die Aufgabe zugrunde, neue Verbindungen mit wertvol-
20 len Eigenschaften aufzufinden, insbesondere solche, die zur Herstellung
von Arzneimitteln verwendet werden können.

Es wurde gefunden, daß die Verbindungen der Formel I und ihre Salze bei
guter Verträglichkeit sehr wertvolle pharmakologische Eigenschaften besit-
25 zen. Insbesondere zeigen sie Faktor Xa inhibierende Eigenschaften und
können daher zur Bekämpfung und Verhütung von thromboembolischen
Erkrankungen wie Thrombose, myocardialem Infarkt, Arteriosklerose, Ent-
zündungen, Apoplexie, Angina pectoris, Restenose nach Angioplastie und
Claudicatio intermittens eingesetzt werden.

30

Aromatische Amidinderivate mit antithrombotischer Wirkung sind z.B. aus
der EP 0 540 051 B1 bekannt. Cyclische Guanidine zur Behandlung
thromboembolischer Erkrankungen sind z.B. in der WO 97/08165 be-
schrieben. Aromatische Heterocyclen mit Faktor Xa inhibitorischer Aktivität
35 sind z.B. aus der WO 96/10022 bekannt.

Der antithrombotische und antikoagulierende Effekt der erfindungsgemäßen Verbindungen wird auf die inhibierende Wirkung gegenüber der aktivierte Gerinnungsprotease, bekannt unter dem Namen Faktor Xa, oder auf die Hemmung anderer aktiverter Serinproteasen wie Faktor VIIa, Faktor IXa oder Thrombin zurückgeführt.

Faktor Xa ist eine der Proteasen, die in den komplexen Vorgang der Blutgerinnung involviert ist. Faktor Xa katalysiert die Umwandlung von Prothrombin in Thrombin. Thrombin spaltet Fibrinogen in Fibrinmonomere, die nach Quervernetzung elementar zur Thrombusbildung beitragen. Eine Aktivierung von Thrombin kann zum Auftreten von thromboembolischen Erkrankungen führen. Eine Hemmung von Thrombin kann jedoch die in die Thrombusbildung involvierte Fibrinbildung inhibieren.

Die Messung der Inhibierung von Thrombin kann z.B. nach der Methode von G. F. Cousins et al. in *Circulation* **1996**, 94, 1705-1712 erfolgen.

Eine Inhibierung des Faktors Xa kann somit verhindern, daß Thrombin gebildet wird.

Die erfindungsgemäßen Verbindungen der Formel I sowie ihre Salze greifen durch Inhibierung des Faktors Xa in den Blutgerinnungsprozeß ein und hemmen so die Entstehung von Thromben.

Die erfindungsgemäßen Verbindungen der Formel I können weiterhin Inhibitoren der Gerinnungsfaktoren Faktor VIIa, Faktor IXa und Thrombin der Blutgerinnungskaskade sein.

Die Inhibierung des Faktors Xa durch die erfindungsgemäßen Verbindungen und die Messung der antikoagulierenden und antithrombotischen Aktivität kann nach üblichen in vitro- oder in vivo-Methoden ermittelt werden. Ein geeignetes Verfahren wird z.B. von J. Hauptmann et al. in *Thrombosis and Haemostasis* 63, 220-223 (1990) beschrieben.

Die Messung der Inhibierung von Faktor Xa kann z.B. auch nach der Methode von T. Hara et al. in *Thromb. Haemostas.* 71, 314-319 (1994) erfolgen.

Der Gerinnungsfaktor VIIa initiiert nach Bindung an Tissue Faktor den extrinsischen Teil der Gerinnungskaskade und trägt zur Aktivierung des Faktors X zu Faktor Xa bei. Eine Inhibierung von Faktor VIIa verhindert somit die Entstehung des Faktors Xa und damit eine nachfolgende Thrombinbildung.

5 Die Inhibierung des Faktors VIIa durch die erfindungsgemäßen Verbindungen und die Messung der antikoagulierenden und antithrombotischen Aktivität kann nach üblichen in vitro- oder in vivo-Methoden ermittelt werden. Ein übliches Verfahren zur Messung der Inhibierung von Faktor VIIa wird z.B. von H. F. Ronning et al. in *Thrombosis Research* 1996, 84, 73-81 beschrieben.

10 15 Die Verbindungen der Formel I können als Arzneimittelwirkstoffe in der Human- und Veterinärmedizin eingesetzt werden, insbesondere zur Bekämpfung und Verhütung von thromboembolischen Erkrankungen wie Thrombose, myocardialem Infarkt, Arteriosklerose, Entzündungen, Apoplexie, Angina pectoris, Restenose nach Angioplastie und Claudicatio intermittens.

20 25 Gegenstand der Erfindung sind die Verbindungen der Formel I und ihre Salze sowie ein Verfahren zur Herstellung von Verbindungen der Formel I nach Anspruch 1 sowie ihrer Salze, dadurch gekennzeichnet, daß man

Die Verbindungen der Formel I und auch die Ausgangsstoffe zu ihrer Herstellung werden im übrigen nach an sich bekannten Methoden hergestellt, wie sie in der Literatur (z.B. in den Standardwerken wie Houben-Weyl, Methoden der organischen Chemie, Georg-Thieme-Verlag, Stuttgart) be-

schrieben sind, und zwar unter Reaktionsbedingungen, die für die genannten Umsetzungen bekannt und geeignet sind. Dabei kann man auch von an sich bekannten, hier nicht näher erwähnten Varianten Gebrauch machen.

5

Die Ausgangsstoffe können, falls erwünscht, auch *in situ* gebildet werden, so daß man sie aus dem Reaktionsgemisch nicht isoliert, sondern sofort weiter zu den Verbindungen der Formel I umsetzt.

10

Verbindungen der Formel I können vorzugsweise erhalten werden, indem man Verbindungen der Formel I aus einem ihrer funktionellen Derivate durch Behandeln mit einem solvolysierenden oder hydrogenolysierenden Mittel in Freiheit setzt.

15

Bevorzugte Ausgangsstoffe für die Solvolyse bzw. Hydrogenolyse sind solche, die sonst der Formel I entsprechen, aber anstelle einer oder mehrerer freier Amino- und/oder Hydroxygruppen entsprechende geschützte Amino- und/oder Hydroxygruppen enthalten, vorzugsweise solche, die anstelle eines H-Atoms, das mit einem N-Atom verbunden ist, eine Aminoschutzgruppe tragen, insbesondere solche, die anstelle einer HN-Gruppe

20

eine R'-N-Gruppe tragen, worin R' eine Aminoschutzgruppe bedeutet, und/oder solche, die anstelle des H-Atoms einer Hydroxygruppe eine Hydroxyschutzgruppe tragen, z.B. solche, die der Formel I entsprechen, jedoch anstelle einer Gruppe -COOH eine Gruppe -COOR" tragen, worin R" eine Hydroxyschutzgruppe bedeutet.

25

Bevorzugte Ausgangsstoffe sind auch die Oxadiazolderivate, die in die entsprechenden Amidinoverbindungen überführt werden können.

30

Die Einführung der Oxadiazolgruppe gelingt z.B. durch Umsetzung der Cyanverbindungen mit Hydroxylamin und Reaktion mit Phosgen, Dialkylcarbonat, Chlorameisensäureester, N,N'-Carbonyldiimidazol oder Acetanhydrid.

35

Es können auch mehrere - gleiche oder verschiedene - geschützte Amino- und/oder Hydroxygruppen im Molekül des Ausgangsstoffes vorhanden

sein. Falls die vorhandenen Schutzgruppen voneinander verschieden sind, können sie in vielen Fällen selektiv abgespalten werden.

Der Ausdruck "Aminoschutzgruppe" ist allgemein bekannt und bezieht sich 5 auf Gruppen, die geeignet sind, eine Aminogruppe vor chemischen Umsetzungen zu schützen (zu blockieren), die aber leicht entfernt sind, nachdem die gewünschte chemische Reaktion an anderen Stellen des Moleküls durchgeführt worden ist. Typisch für solche Gruppen sind insbesondere unsubstituierte oder substituierte Acyl-, Aryl-, Aralkoxymethyl- 10 oder Aralkylgruppen. Da die Aminoschutzgruppen nach der gewünschten Reaktion (oder Reaktionsfolge) entfernt werden, ist ihre Art und Größe im übrigen nicht kritisch; bevorzugt werden jedoch solche mit 1-20, insbesondere 1-8 C-Atomen. Der Ausdruck "Acylgruppe" ist im Zusammenhang mit dem vorliegenden Verfahren in weitestem Sinne aufzufassen. Er um- 15 schließt von aliphatischen, araliphatischen, aromatischen oder heterocyclischen Carbonsäuren oder Sulfonsäuren abgeleitete Acylgruppen sowie insbesondere Alkoxy carbonyl-, Aryloxy carbonyl- und vor allem Aral- 20 koxy carbonylgruppen. Beispiele für derartige Acylgruppen sind Alkanoyl wie Acetyl, Propionyl, Butyryl; Aralkanoyl wie Phenylacetyl; Aroyl wie Ben- 25 zoyl oder Toluyl; Aryloxyalkanoyl wie POA; Alkoxy carbonyl wie Methoxy carbonyl, Ethoxy carbonyl, 2,2,2-Trichlorethoxy carbonyl, BOC (tert.-Butyl oxy carbonyl), 2-Iodethoxy carbonyl; Aralkyloxy carbonyl wie CBZ ("Carbo-benzoxy"), 4-Methoxybenzyloxy carbonyl, FMOC; Arylsulfonyl wie Mtr. Bevorzugte Aminoschutzgruppen sind BOC und Mtr, ferner CBZ, Fmoc, Ben- 25 zyl und Acetyl.

Der Ausdruck "Hydroxyschutzgruppe" ist ebenfalls allgemein bekannt und bezieht sich auf Gruppen, die geeignet sind, eine Hydroxygruppe vor chemischen Umsetzungen zu schützen, die aber leicht entfernt sind, 30 nachdem die gewünschte chemische Reaktion an anderen Stellen des Moleküls durchgeführt worden ist. Typisch für solche Gruppen sind die oben genannten unsubstituierten oder substituierten Aryl-, Aralkyl- oder Acylgruppen, ferner auch Alkylgruppen. Die Natur und Größe der Hydroxyschutzgruppen ist nicht kritisch, da sie nach der gewünschten chemischen 35 Reaktion oder Reaktionsfolge wieder entfernt werden; bevorzugt sind Gruppen mit 1-20, insbesondere 1-10 C-Atomen. Beispiele für Hydroxy-

schutzgruppen sind u.a. Benzyl, p-Nitrobenzoyl, p-Toluolsulfonyl, tert.-Butyl und Acetyl, wobei Benzyl und tert.-Butyl besonders bevorzugt sind.

Das In-Freiheit-Setzen der Verbindungen der Formel I aus ihren funktionellen Derivaten gelingt - je nach der benutzten Schutzgruppe - z. B. mit starken Säuren, zweckmäßig mit TFA oder Perchlorsäure, aber auch mit anderen starken anorganischen Säuren wie Salzsäure oder Schwefelsäure, starken organischen Carbonsäuren wie Trichloressigsäure oder Sulfonsäuren wie Benzol- oder p-Toluolsulfinsäure. Die Anwesenheit eines zusätzlichen inerten Lösungsmittels ist möglich, aber nicht immer erforderlich. Als inerte Lösungsmittel eignen sich vorzugsweise organische, beispielsweise Carbonsäuren wie Essigsäure, Ether wie Tetrahydrofuran oder Dioxan, Amide wie DMF, halogenierte Kohlenwasserstoffe wie Dichlormethan, ferner auch Alkohole wie Methanol, Ethanol oder Isopropanol, sowie Wasser. Ferner kommen Gemische der vorgenannten Lösungsmittel in Frage. TFA wird vorzugsweise im Überschuß ohne Zusatz eines weiteren Lösungsmittels verwendet, Perchlorsäure in Form eines Gemisches aus Essigsäure und 70 %iger Perchlorsäure im Verhältnis 9:1. Die Reaktionstemperaturen für die Spaltung liegen zweckmäßig zwischen etwa 0 und etwa 50°, vorzugsweise arbeitet man zwischen 15 und 30° (Raumtemperatur).

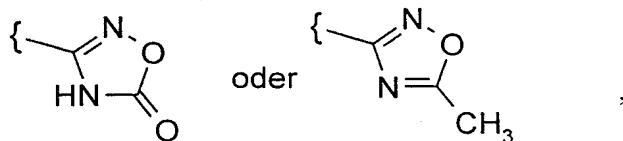

Die Gruppen BOC, OBut und Mtr können z. B. bevorzugt mit TFA in Dichlormethan oder mit etwa 3 bis 5n HCl in Dioxan bei 15-30° abgespalten werden, die Fmoc-Gruppe mit einer etwa 5- bis 50 %igen Lösung von Dimethylamin, Diethylamin oder Piperidin in DMF bei 15-30°.

Hydrogenolytisch entfernbare Schutzgruppen (z. B. CBZ, Benzyl oder die Freisetzung der Amidinogruppe aus ihrem Oxadiazolderivat) können z. B. durch Behandeln mit Wasserstoff in Gegenwart eines Katalysators (z. B. eines Edelmetallkatalysators wie Palladium, zweckmäßig auf einem Träger wie Kohle) abgespalten werden. Als Lösungsmittel eignen sich dabei die oben angegebenen, insbesondere z. B. Alkohole wie Methanol oder Ethanol oder Amide wie DMF. Die Hydrogenolyse wird in der Regel bei Temperaturen zwischen etwa 0 und 100° und Drucken zwischen etwa 1 und 200 bar, bevorzugt bei 20-30° und 1-10 bar durchgeführt. Eine Hydrogenolyse der CBZ-Gruppe gelingt z. B. gut an 5 bis 10 %igem Pd/C in Methanol

oder mit Ammoniumformiat (anstelle von Wasserstoff) an Pd/C in Methanol/DMF bei 20-30°.

In den Verbindungen der Formel III bedeutet L vorzugsweise Cl, Br, I oder
eine reaktionsfähig abgewandelte OH-Gruppe wie z.B. ein aktivierter
Ester, ein Imidazolid oder Alkylsulfonyloxy mit 1-6 C-Atomen (bevorzugt
Methylsulfonyloxy) oder Arylsulfonyloxy mit 6-10 C-Atomen (bevorzugt
Phenyl- oder p-Tolylsulfonyloxy).

30

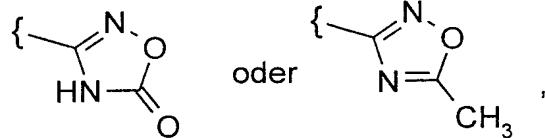

Die Umsetzung erfolgt in der Regel in einem inerten Lösungsmittel, in Ge-
genwart eines säurebindenden Mittels vorzugsweise eines Alkali- oder Er-
dalkalimetall-hydroxids, -carbonats oder -bicarbonats oder eines anderen
Salzes einer schwachen Säure der Alkali- oder Erdalkalimetalle, vorzugs-
weise des Kaliums, Natriums, Calciums oder Cäsiums. Auch der Zusatz
einer organischen Base wie Triethylamin, Dimethylanilin, Pyridin oder
Chinolin oder eines Überschusses der Aminkomponente der Formel II
bzw. des Alkylierungsderivates der Formel III kann günstig sein. Die Reak-

tionszeit liegt je nach den angewendeten Bedingungen zwischen einigen Minuten und 14 Tagen, die Reaktionstemperatur zwischen etwa 0° und 150°, normalerweise zwischen 20° und 130°.

- 5 Als inerte Lösungsmittel eignen sich z.B. Kohlenwasserstoffe wie Hexan, Petrolether, Benzol, Toluol oder Xylol; chlorierte Kohlenwasserstoffe wie Trichlorethylen, 1,2-Dichlorethan, Tetrachlorkohlenstoff, Chloroform oder Dichlormethan; Alkohole wie Methanol, Ethanol, Isopropanol, n-Propanol, n-Butanol oder tert.-Butanol; Ether wie Diethylether, Diisopropylether, 10 Tetrahydrofuran (THF) oder Dioxan; Glykolether wie Ethylenglykolmono-methyl- oder -monoethylether (Methylglykol oder Ethylglykol), Ethylen-glykoldimethylether (Diglyme); Ketone wie Aceton oder Butanon; Amide wie Acetamid, Dimethylacetamid, N-Methylpyrrolidon (NMP) oder Dime-thylformamid (DMF); Nitrile wie Acetonitril; Sulfoxide wie Dimethylsulfoxid (DMSO); Schwefelkohlenstoff; Carbonsäuren wie Ameisensäure oder Essigsäure; Nitroverbindungen wie Nitromethan oder Nitrobenzol; Ester wie Ethylacetat oder Gemische der genannten Lösungsmittel.

$N[C(R^5)_2]_m-COOR^5$ bedeutet, mit Verbindungen der Formel VIII erfolgt vorzugsweise in einem inerten Lösungsmittel und bei Temperaturen wie oben angegeben.

- 5 Verbindungen der Formel I, worin
X NH und
R³ H bedeutet,
und R¹, R², R⁴, Y und W die in Anspruch 1 angegebenen Bedeutungen haben,
- 10 Können aus ihren Oxazolidinonderivaten durch Behandeln mit einem solvolysierenden oder hydrogenolysierenden Mittel in Freiheit gesetzt werden.
Dies geschieht unter Bedingungen wie unter "Schutzgruppenabspaltung" beschrieben.
- 15 Verbindungen der Formel I, worin R¹ -C(=NH)-NH₂ bedeutet, können ferner aus der entsprechenden Cyanverbindung erhalten werden.
Die Umwandlung einer Cyangruppe in eine Amidinogruppe erfolgt durch Umsetzung mit z.B. Hydroxylamin und anschließender Reduktion des N-Hydroxyamidins mit Wasserstoff in Anwesenheit eines Katalysators wie
- 20 z.B. Pd/C.
Zur Herstellung eines Amidins der Formel I (R¹ = -C(=NH)-NH₂) kann man an ein Nitril der Formel I (R¹ = CN) auch Ammoniak anlagern. Die Anlagerung erfolgt bevorzugt mehrstufig, indem man in an sich bekannter Weise
a) das Nitril mit H₂S in ein Thioamid umwandelt, das mit einem Alkylierungsmittel, z.B. CH₃I, in den entsprechenden S-Alkyl-imidothioester übergeführt wird, welcher seinerseits mit NH₃ zum Amidin reagiert, b) das Nitril mit einem Alkohol, z.B. Ethanol in Gegenwart von HCl in den entsprechenden Imidoester umwandelt und diesen mit Ammoniak behandelt, oder
c) das Nitril mit Lithium-bis-(trimethylsilyl)-amid umsetzt und das Produkt
- 25 anschließend hydrolysiert.
- 30 Es ist ferner möglich, eine Verbindung der Formel I in eine andere Verbindung der Formel I umzuwandeln, indem man einen oder mehrere Rest(e) Y, R¹, R², R³ und/oder R⁴ in einen oder mehrere Rest(e) Y, R¹, R², R³ und/oder R⁴ umwandelt, z.B. indem man eine Aminogruppe acyliert oder Nitrogruppen (beispielsweise durch Hydrierung an Raney-Nickel oder

Pd-Kohle in einem inerten Lösungsmittel wie Methanol oder Ethanol) zu Aminogruppen reduziert.

Ester können z.B. mit Essigsäure oder mit NaOH oder KOH in Wasser,

5 Wasser-THF oder Wasser-Dioxan bei Temperaturen zwischen 0 und 100° verseift werden.

Ferner kann man freie Aminogruppen in üblicher Weise mit einem Säurechlorid oder -anhydrid acylieren oder mit einem unsubstituierten oder

10 substituierten Alkylhalogenid alkylieren, zweckmäßig in einem inerten Lösungsmittel wie Dichlormethan oder THF und /oder in Gegenwart einer Base wie Triethylamin oder Pyridin bei Temperaturen zwischen -60 und +30°.

15 Eine Base der Formel I kann mit einer Säure in das zugehörige Säure-additionssalz übergeführt werden, beispielsweise durch Umsetzung äquivalenter Mengen der Base und der Säure in einem inerten Lösungsmittel wie Ethanol und anschließendes Eindampfen. Für diese Umsetzung kommen insbesondere Säuren in Frage, die physiologisch unbedenkliche Salze liefern. So können anorganische Säuren verwendet werden, z.B.

20 Schwefelsäure, Salpetersäure, Halogenwasserstoffsäuren wie Chlorwasserstoffsäure oder Bromwasserstoffsäure, Phosphorsäuren wie Orthophosphorsäure, Sulfaminsäure, ferner organische Säuren, insbesondere aliphatische, alicyclische, araliphatische, aromatische oder heterocyclische

25 ein- oder mehrbasige Carbon-, Sulfon- oder Schwefelsäuren, z.B. Ameisensäure, Essigsäure, Propionsäure, Pivalinsäure, Diethylessigsäure, Malonsäure, Bernsteinsäure, Pimelinsäure, Fumarsäure, Maleinsäure, Milchsäure, Weinsäure, Äpfelsäure, Citronensäure, Gluconsäure, Ascorbinsäure, Nicotinsäure, Isonicotinsäure, Methan- oder Ethansulfonsäure,

30 Ethandisulfonsäure, 2-Hydroxyethansulfonsäure, Benzolsulfonsäure, p-Toluolsulfonsäure, Naphthalin-mono- und -disulfonsäuren, Laurylschwefelsäure. Salze mit physiologisch nicht unbedenklichen Säuren, z.B. Pikrate, können zur Isolierung und /oder Aufreinigung der Verbindungen der Formel I verwendet werden.

Andererseits können Verbindungen der Formel I mit Basen (z.B. Natrium- oder Kaliumhydroxid oder -carbonat) in die entsprechenden Metall-, insbesondere Alkalimetall- oder Erdalkalimetall-, oder in die entsprechenden Ammoniumsalze umgewandelt werden.

- 5 Auch physiologisch unbedenkliche organische Basen, wie z.B. Ethanolamin können verwendet werden.

Erfindungsgemäße Verbindungen der Formel I können aufgrund ihrer Molekülstruktur chiral sein und können dementsprechend in verschiedenen 10 enantiomeren Formen auftreten. Sie können daher in racemischer oder in optisch aktiver Form vorliegen.

Da sich die pharmazeutische Wirksamkeit der Racemate bzw. der Stereoisomeren der erfundungsgemäßen Verbindungen unterscheiden kann, 15 kann es wünschenswert sein, die Enantiomere zu verwenden. In diesen Fällen kann das Endprodukt oder aber bereits die Zwischenprodukte in enantiomere Verbindungen, durch dem Fachmann bekannte chemische oder physikalische Maßnahmen, aufgetrennt oder bereits als solche bei der Synthese eingesetzt werden.

20 Im Falle racemischer Amine werden aus dem Gemisch durch Umsetzung mit einem optisch aktiven Trennmittel Diastereomere gebildet. Als Trennmittel eignen sich z.B. optisch aktiven Säuren, wie die R- und S-Formen von Weinsäure, Diacetylweinsäure, Dibenzoylweinsäure, Mandelsäure, Äpfelsäure, Milchsäure, geeignet N-geschützte Aminosäuren (z.B. N- 25 Benzoylprolin oder N-Benzolsulfonylprolin) oder die verschiedenen optisch aktiven Camphersulfonsäuren. Vorteilhaft ist auch eine chromatographische Enantiomerentrennung mit Hilfe eines optisch aktiven Trennmittels (z.B. Dinitrobenzoylphenylglycin, Cellulosetriacetat oder andere Derivate von Kohlenhydraten oder auf Kieselgel fixierte chiral derivatisierte 30 Methacrylatpolymere). Als Laufmittel eignen sich hierfür wäßrige oder alkoholische Lösungsmittelgemische wie z.B. Hexan/Isopropanol/ Acetonitril z.B. im Verhältnis 82:15:3.

Gegenstand der Erfindung ist ferner die Verwendung der Verbindungen 35 der Formel I und/oder ihrer physiologisch unbedenklichen Salze zur Herstellung pharmazeutischer Zubereitungen, insbesondere auf nicht-chem-

ischem Wege. Hierbei können sie zusammen mit mindestens einem festen, flüssigen und/oder halbfüssigen Träger- oder Hilfsstoff und gegebenenfalls in Kombination mit einem oder mehreren weiteren Wirkstoffen in eine geeignete Dosierungsform gebracht werden.

5

Gegenstand der Erfindung sind ferner pharmazeutische Zubereitungen, enthaltend mindestens eine Verbindung der Formel I und/oder eines ihrer physiologisch unbedenklichen Salze.

10

Diese Zubereitungen können als Arzneimittel in der Human- oder Veterinärmedizin verwendet werden. Als Trägerstoffe kommen organische oder anorganische Substanzen in Frage, die sich für die enterale (z.B. orale), parenterale oder topische Applikation eignen und mit den neuen Verbindungen nicht reagieren, beispielsweise Wasser, pflanzliche Öle, Benzyl-

15

alkohole, Alkylenglykole, Polyethylenglykole, Glycerintriacetat, Gelatine, Kohlehydrate wie Lactose oder Stärke, Magnesiumstearat, Talk, Vaseline. Zur oralen Anwendung dienen insbesondere Tabletten, Pillen, Dragees, Kapseln, Pulver, Granulate, Sirupe, Säfte oder Tropfen, zur rektalen Anwendung Suppositorien, zur parenteralen Anwendung Lösungen, vorzugs-

20

weise ölige oder wässrige Lösungen, ferner Suspensionen, Emulsionen oder Implantate, für die topische Anwendung Salben, Cremes oder Puder. Die neuen Verbindungen können auch lyophilisiert und die erhaltenen Lyophilisate z.B. zur Herstellung von Injektionspräparaten verwendet werden.

25

Die angegebenen Zubereitungen können sterilisiert sein und/oder Hilfsstoffe wie Gleit-, Konservierungs-, Stabilisierungs- und/oder Netzmittel, Emulgatoren, Salze zur Beeinflussung des osmotischen Druckes, Puffersubstanzen, Farb-, Geschmacks- und /oder mehrere weitere Wirkstoffe enthalten, z.B. ein oder mehrere Vitamine.

30

Die Verbindungen der Formel I und ihre physiologisch unbedenklichen Salze können bei der Bekämpfung und Verhütung von thromboembolischen Erkrankungen wie Thrombose, myocardialem Infarkt, Arteriosklerose, Entzündungen, Apoplexie, Angina pectoris, Restenose nach Angioplastie und Claudicatio intermittens verwendet werden.

35

Dabei werden die erfindungsgemäßen Substanzen in der Regel vorzugsweise in Dosierungen zwischen etwa 1 und 500 mg, insbesondere zwischen 5 und 100 mg pro Dosierungseinheit verabreicht. Die tägliche Dosierung liegt vorzugsweise zwischen etwa 0,02 und 10 mg/kg Körpergewicht. Die spezielle Dosis für jeden Patienten hängt jedoch von den verschiedenen Faktoren ab, beispielsweise von der Wirksamkeit der eingesetzten speziellen Verbindung, vom Alter, Körpergewicht, allgemeinen Gesundheitszustand, Geschlecht, von der Kost, vom Verabreichungszeitpunkt und -weg, von der Ausscheidungsgeschwindigkeit, Arzneistoffkombination und Schwere der jeweiligen Erkrankung, welcher die Therapie gilt.

Die orale Applikation ist bevorzugt.

Vor- und nachstehend sind alle Temperaturen in °C angegeben. In den nachfolgenden Beispielen bedeutet "übliche Aufarbeitung": Man gibt, falls erforderlich, Wasser hinzu, stellt, falls erforderlich, je nach Konstitution des Endprodukts auf pH-Werte zwischen 2 und 10 ein, extrahiert mit Ethylacetat oder Dichlormethan, trennt ab, trocknet die organische Phase über Natriumsulfat, dampft ein und reinigt durch Chromatographie an Kieselgel und /oder durch Kristallisation. Eine Lösung von 0,39 g N-Methyl-N-oxiranylmethyl-4-(5-methyl-[1,2,4]oxadiazol-3-yl)-anilin und 30 ml Methylamin (33 %ig in Ethanol) in 10 ml Ethanol wird 15 Stunden bei 65° gerührt. Nach üblicher Aufarbeitung erhält man 0,44 g 1-Methylamino-3-{methyl-[4-(5-methyl-[1,2,4]oxadiazol-3-yl)-phenyl]-amino}-propan-2-ol ("BC").

10 100 mg "BC" und 87 mg 4-Isopropylphenylsulfonylchlorid werden zusammen mit 300 mg polymerem DMAP (1,6 mmol Dimethylaminopyridin /g

15 Harz) in 5 ml Dichlormethan 16 Stunden bei Raumtemperatur gerührt. Das Harz wird abfiltriert und das Filtrat wie üblich aufgearbeitet. Man erhält 109 mg N-(2-Hydroxy-3-{methyl-[4-(5-methyl-[1,2,4]oxadiazol-3-yl)-phenyl]-amino}-propyl)-4-isopropyl-N-methyl-benzolsulfonamid.

Durch Hydrierung analog Beispiel 2 erhält man daraus die Verbindung

20 4-({2-Hydroxy-3-[(4-isopropyl-benzolsulfonyl)-N-methyl-amino]-propyl}-N-methyl-amino)-benzamidin, Acetat, FAB 419

30 Analog erhält man durch Umsetzung von "BC" mit 2-Naphthylsulfonylchlorid und anschließender Hydrierung die Verbindung

4-({2-Hydroxy-3-[(naphth-2-ylsulfonyl)-N-methyl-amino]-propyl}-N-methyl-amino)-benzamidin, Diacetat, FAB 427.

(54) MEDICINAL COMPOSITIONS

(57) A pharmaceutical composition comprising as its active ingredients one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and one or more insulin resistance improving agents exhibits excellent arteriosclerotic progress inhibitory effects, and is useful as a drug, particularly as a drug for the prevention or treatment of arteriosclerosis.

Description

[Technical Field of the Invention]

5 [0001] The present invention relates to a pharmaceutical composition comprising as its active ingredients one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and one or more insulin resistance improving agents (particularly a pharmaceutical composition for prevention or treatment of arteriosclerosis), the use of one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and one or more insulin resistance improving
 10 agents for preparing a pharmaceutical composition (particularly a composition for prevention or treatment of arteriosclerosis), and a method which comprises administering in combination effective amounts of one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and one or more insulin resistance improving agents to warm-blooded animals for preventing or treating diseases (particularly arteriosclerosis).

15 [Background of the Invention]

20 [0002] The occurrence of arteriosclerosis is increasing with the adoption of Western-style diet and the growth of the aged population. This disease is the main cause of such disorders as myocardial infarction, cerebral infarction and cerebral apoplexy, and there is a need for its effective prevention and treatment. Examples of risk factors which cause arteriosclerosis include hyperlipidemia (particularly hypercholesterolemia), hypertension and saccharometabolism disorders based on insulin resistance. In addition, there are many cases in which these risk factors occur in the form of complications (Syndrome X), and are considered to be mutually interrelated [Diabetes, 37, 1595-1607 (1988)].

25 [0003] Efforts have been made for the purpose of preventing and treating arteriosclerosis by suppression of various risk factors such as hyperlipidemia, hypertension and insulin resistance. Although HMG-CoA reductase inhibitors like pravastatin improve hyperlipidemia, their inhibitory activity on arteriosclerosis in a case of administration alone is not enough [Biochim. Biophys. Acta, 960, 294-302 (1988)]. In addition, even insulin resistance improving agents like troglitazone do not exhibit sufficient arteriosclerosis inhibitory activity in a case of administration alone (Japanese Patent Application (Kokai) No. Hei 7-41423).

30 [0004] On the other hand, among drugs for the treatment of hypertension, it has been reported that arteriosclerotic lesions are suppressed when angiotensin converting enzyme (ACE) inhibitors that inhibit the renin-angiotensin system [Hypertension, 15, 327-331 (1990)] or angiotensin II receptor antagonists [Jpn. Circ. J., 60 (Suppl. I), 332 (1996)] are administered to animals having normal blood pressure and hypercholesterolemia. Angiotensin II not only exhibits vasoconstrictive activity, but also activity that stimulates the production of growth factors such as PDGF [Hypertension, 13, 35 706-711 (1989)] and activity that stimulates migration of neutrophils and macrophages [Eur. Heart J., 11, 100-107 (1990)]. Although the mechanism in which renin-angiotensin system inhibitors suppress arteriosclerosis is not clear at the present time, there is a possibility that the mechanism for suppressing arteriosclerosis may be a function at the site of the lesion which is different from their blood pressure lowering action. However, since inhibitors of renin-angiotensin system are unable to lower serum lipids [J. Cardiovasc. Pharmacol., 15, S65-S72 (1990)], their administration alone
 40 has limitations on the treatment of arteriosclerosis.

[0005] In addition, although troglitazone, glibenclamide and captopril are administered concomitantly to diabetes patients, there is no suggestion indicated whatsoever relating to the prevention and treatment of arteriosclerosis [J. Clinical Therapeutic & Medicines, 9 (Supp. 3), 39-60 (1993)].

45 [Disclosure of the Invention]

[0006] As a result of earnestly conducting various research in consideration of the importance of the prevention and treatment of arteriosclerosis, the inventors of the present invention found a method to solve the above-mentioned problems involved in the prior art and to obtain a preventive and/or therapeutic effect on arteriosclerosis by using the combination of one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and of one or more of insulin resistance improving agents.

15 [Effect of the Invention]

[0038] A drug comprising one or more drugs selected from the group consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and one or more insulin resistance improving agents, which are the active ingredients of the pharmaceutical composition of the present invention (particularly a composition for prevention or treatment of arteriosclerosis), has excellent inhibitory action on atherosclerosis and excellent inhibitory action against onset of xanthochromia occurring in limb joints, and low toxicity. Consequently, it is useful as a drug for the prevention and treatment (particularly for treatment) of arteriosclerosis or xanthochromia.

[0039] According to the present invention, drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors and insulin resistance improving agents exhibit excellent effects by using two of these agents in combination as compared with being used alone. In addition, these effects can be achieved without requiring that both types of agents be present in the body simultaneously.

[0040] Namely, such effects can be obtained even if both types of agents do not simultaneously have certain concentrations in the blood. According to hypothesis, if two types of agents used in the present invention are both incorporated *in vivo* and reach the receptors, they have the effect of turning on a switch *in vivo*. Thus, even if it appears that such effects are not demonstrated at their blood concentrations in course of time after their administration, the switch is actually still on, thereby allowing demonstration of preventive or therapeutic effects on arterial sclerosis possessed by the one type of substance. When the other type of agent is administered in this state, in addition to the preventive or therapeutic effects on arterial sclerosis possessed by that agent, the effects of the drug initially administered are combined to obtain excellent effects. Naturally, since it is convenient clinically to administer two types of agents simultaneously, drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors and an insulin resistance improving agent can be administered in the form of a combination drug. In cases where it is undesirable to physically mix both agents simultaneously in consideration of pharmaceutical formulation technology, each individual agent may be administered simultaneously. In addition, as was stated above, since excellent effects are demonstrated even if the two types of agents are not administered simultaneously, each individual agent can also be administered at a suitable interval in succession. The maximum administration interval of the two types of agents to demonstrate the excellent effects brought about by said two types of agents can be determined by clinical or animal studies.

[Industrial Applicability]

[0041] The administration route of the drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and of the insulin resistance improving agents used in the present invention is typically the oral administration route. Thus, the two types of agents can either be prepared in the form of two separate administrations or in the form of a single administration by physically mixing the two types of agents. The administration form can be, for example, a powder, granules, tablet or capsule and the like, and can be prepared by using conventional pharmaceutical formulation techniques.

[0042] The dose and administration ratio of the drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and of the insulin resistance improving agents used in the present invention can be changed over a wide range according to various conditions such as the individual activity of each agent, the patient's symptoms, age and body weight, and the like. For example, in the case of insulin resistance improving agents, since the *in vivo* activities of troglitazone and BRL-49653 by using a diabetic animal model are different, the dose of these two agents may be different by a factor of ten or more. In addition, for both agents consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and insulin resistance improving agents, their doses in the case used for prevention or treatment of arteriosclerosis in the present invention can be lower than their dose for use

as hypotensive agents and diabetes therapeutic agents respectively, which are their well-known applications. In addition, their doses can be made even lower due to the excellent effects resulting from combined use of both types of agents. For example, in the case of using CS-866 and troglitazone for the object of the present invention, their doses are lower than the approximately 5 to 100 mg and approximately 10 to 2000 mg, respectively, which are the doses for adults (mg/day) for use as a hypotensive agent and diabetes therapeutic agent in their well-known applications, being able to be approximately 1 to 80 mg and approximately 1 to 1000 mg, respectively.

[0043] As has been described above, the doses of the drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors and of the insulin resistance improving agents can be varied over a wide range, in general, and their doses for adults (mg/day) are approximately 0.5 to 100 mg and approximately 0.05 to 1,500 mg, respectively.

[0044] The ratio of the doses of these two types of agents can also be varied over a wide range, in general, and the dose ratio of the drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors to the insulin resistance improving agents can be, in terms of weight ratio, within the range from 1:200 to 200:1.

[0045] In the present invention, the drugs consisting of angiotensin II receptor antagonists and angiotensin converting enzyme inhibitors, and the insulin resistance improving agents are administered at the respective doses described above once a day or divided among several times per day, and may be administered simultaneously or separately at respectively different times.

1
SUBSTITUTED OXOAZAHETEROCYCLYL FACTOR Xa INHIBITORS

FIELD OF THE INVENTION

5 This invention is directed to oxoazaheterocycyl compounds which inhibit factor Xa, to pharmaceutical compositions comprising these compounds, to intermediates useful for preparing these compounds and to a method of inhibiting factor Xa.

BACKGROUND OF THE INVENTION

10 Factor Xa and Factor Xa assembled in the prothrombinase complex (Factor Xa, Factor Va, calcium and phospholipid) activates prothrombin to generate thrombin. Factor Xa is strategically located at the intersection of extrinsic and intrinsic pathways of the blood coagulation system. Thus, an inhibitor of Factor Xa inhibits the formation of thrombin and therefore is useful for preventing or treating 15 disorders related to blood coagulation in mammals.

Anticoagulant therapy is indicated for the treatment and prophylaxis of a variety of thrombotic conditions of both the venous and arterial vasculature. In the arterial system, abnormal thrombus formation is primarily associated with arteries of the coronary, cerebral and peripheral vasculature. The diseases associated with thrombotic occlusion of these vessels principally include acute myocardial infarction (AMI), unstable angina, thromboembolism, acute vessel closure associated with thrombolytic therapy and percutaneous transluminal coronary angioplasty (PTCA), transient ischemic attacks, stroke, intermittent claudication and bypass grafting of the coronary (CABG) or peripheral arteries. Chronic anticoagulant therapy may also be beneficial in preventing the vessel luminal narrowing (restenosis) that often occurs following PTCA and CABG, and in the maintenance of vascular access patency in long-term hemodialysis patients. With respect to the venous vasculature, pathologic thrombus formation frequently occurs in the veins of the lower extremities following abdominal, knee and hip surgery (deep vein thrombosis, DVT). DVT further predisposes the patient to a higher risk of pulmonary thromboembolism. A systemic, disseminated intravascular coagulopathy (DIC) commonly occurs in both vascular systems during septic shock, certain viral infections and cancer. This condition is characterized by a rapid consumption of coagulation factors and their plasma inhibitors resulting in the formation of life-threatening clots throughout the microvasculature of several organ systems.

In addition to their use in anticoagulant therapy, Factor Xa inhibitors are useful in the treatment or prevention of other diseases in which the generation of thrombin has been implicated as playing a physiologic role. For example, thrombin has been proposed to contribute to the morbidity and mortality of such chronic and degenerative diseases as arthritis, cancer, atherosclerosis and Alzheimer's disease by

2

virtue of its ability to regulate many different cell types through specific cleavage and activation of a cell surface thrombin receptor, mitogenic effects, diverse cellular functions such as cell proliferation, for example, abnormal proliferation of vascular cells resulting in restenosis or angiogenesis, release of PDGF and DNA syntheses. Inhibition of Factor Xa will effectively block thrombin generation and therefore neutralize any physiologic effects of thrombin on various cell types.

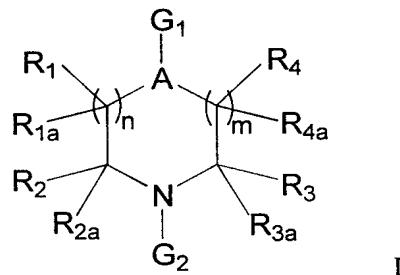

The representative indications discussed above include some, but not all, of the possible clinical situations amenable to treatment with a Factor Xa inhibitor.

Oxoazaheterocyclyl Factor Xa inhibitors are disclosed in International Patent Numbers PCT/US98/07158, published Oct. 22, 1998; PCT/US98/07159, published Oct. 22, 1998; PCT/US98/07160, published Oct. 22, 1998; PCT/US98/07161, published Oct. 22, 1998; and PCT/US96/09290, published Dec. 19, 1996. Oxoazaheterocyclyl fibrinogen antagonists are disclosed in International Patent Application Number PCT/US92/09467, published May 13, 1993.

The use of N-protecting groups is well known in the art for protecting groups against undesirable reactions during a synthetic procedure and many such protecting groups are known, Cf, for example, T.H. Greene and P.G.M. Wuts, Protective Groups in Organic Synthesis, 2nd edition, John Wiley & Sons, New York (1991), incorporated herein by reference. Preferred N-protecting groups are 20 acyl, including formyl, acetyl, chloroacetyl, trichloroacetyl, o-nitrophenylacetyl, o-nitrophenoxyacetyl, trifluoroacetyl, acetoacetyl, 4-chlorobutyryl, isobutyryl, o-nitrocinnamoyl, picolinoyl, acylisothiocyanate, aminocaproyl, benzoyl and the like, and acyloxy including methoxycarbonyl, 9-fluorenylmethoxycarbonyl, 2,2,2-trifluoroethoxycarbonyl, 2-trimethylsilylethoxycarbonyl, vinyloxycarbonyl, allyloxycarbonyl, t-butyloxycarbonyl (BOC), 1,1-dimethylpropynloxycarbonyl, 25 benzyloxycarbonyl (CBZ), p-nitrophenylsulfinyl, p-nitrobenzyloxycarbonyl, 2,4-dichlorobenzyloxycarbonyl, allyloxycarbonyl (Alloc), and the like.

"Oxo" means a carbonyl ($>C=O$) group.

30 "Compounds of the invention", and equivalent expressions, are meant to embrace compounds of general formula (I) as hereinbefore described, which expression includes the prodrugs, the pharmaceutically acceptable salts, and the solvates, e.g. hydrates, where the context so permits. It is understood that the activity of individual compounds of formula (I) will vary depending on the individual compound and assay employed. Compounds of the invention as used herein includes all compounds of formula (I) having an in-vitro activity of greater than 10% at 3.9 μ M in the Factor Xa in vitro enzyme assay described herein. Similarly, reference to intermediates, whether or not they themselves are

16

claimed, is meant to embrace their salts, and solvates, where the context so permits. For the sake of clarity, particular instances when the context so permits are sometimes indicated in the text, but these instances are purely illustrative and it is not intended to exclude other instances when the context so permits.

5 "Prodrug" means a form of the compound of formula I which may or may not itself be biologically active but which may be converted, for example by metabolic, solvolytic, or other physiological means, to a biologically active chemical entity, and is suitable for administration to a patient without undue toxicity, irritation, allergic response, and the like, and effective for their intended use, including ketal, ester and zwitterionic forms. A prodrug is transformed in vivo to yield the parent 10 compound of the above formula, for example by hydrolysis in blood. A thorough discussion is provided in T. Higuchi and V. Stella, Pro-drugs as Novel Delivery Systems, Vol. 14 of the A. C. S. Symposium Series, and in Edward B. Roche, ed., Bioreversible Carriers in Drug Design, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

15 "Solvate" means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. "Solvate" encompasses both solution-phase and isolable solvates. Representative solvates include ethanolates, methanolates, and the like. "Hydrate" is a solvate wherein the solvent molecule(s) is/are H₂O.

20 Where the compound of this invention is substituted with a basic moiety, acid addition salts may be formed. The acids which can be used to prepare the acid addition salts include preferably those which produce, when combined with the free base, pharmaceutically acceptable salts, that is, salts whose anions are non-toxic to the patient in pharmaceutical doses of the salts, so that the beneficial effects inherent in the free base are not vitiated by side effects ascribable to the anions. Although pharmaceutically 25 acceptable salts of said basic compounds are preferred, all acid addition salts are useful as sources of the free base form even if the particular salt, per se, is desired only as an intermediate product as, for example, when the salt is formed only for purposes of purification, and identification, or when it is used as intermediate in preparing a pharmaceutically acceptable salt by ion exchange procedures.

30 Pharmaceutically acceptable salts within the scope of the invention are those derived from the following acids: mineral acids such as hydrochloric acid, sulfuric acid, phosphoric acid and sulfamic acid; and organic acids such as acetic acid, citric acid, lactic acid, tartaric acid, malonic acid, methanesulfonic acid, ethanesulfonic acid, benzenesulfonic acid, p-toluenesulfonic acid, cyclohexylsulfamic acid, quinic acid, and the like. The corresponding acid addition salts comprise the following: hydrohalides, e.g. hydrochloride and hydrobromide, sulfate, phosphate, nitrate, sulfamate, acetate, citrate, lactate, tartarate, 35 malonate, oxalate, salicylate, propionate, succinate, fumarate, maleate,

methylene-bis- β -hydroxynaphthoates, gentisates, mesylates, isethionates and di-p-toluoyltartratesmethanesulfonate, ethanesulfonate, benzenesulfonate, p-toluenesulfonate, cyclohexylsulfamate and quinate, respectively.

Acid addition salts of the compounds of this invention are prepared by reaction of the free base with the appropriate acid by the application or adaptation of known methods. For example, the acid addition salts of the compounds of this invention are prepared either by dissolving the free base in aqueous or aqueous-alcohol solution or other suitable solvents containing the appropriate acid and isolating the salt by evaporating the solution, or by reacting the free base and acid in an organic solvent, in which case the salt separates directly or can be obtained by concentration of the solution.

The acid addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be regenerated from their acid addition salts by treatment with an alkali, e.g. aqueous sodium bicarbonate solution or aqueous ammonia solution.

Where the compound of the invention is substituted with an acidic moiety, base addition salts may be formed. The bases which can be used to prepare the base addition salts include preferably those which produce, when combined with the free acid, pharmaceutically acceptable salts, that is, salts whose cations are non-toxic to the animal organism in pharmaceutical doses of the salts, so that the beneficial effects inherent in the free acid are not vitiated by side effects ascribable to the cations.

Pharmaceutically acceptable salts, including for example alkali and alkaline earth metal salts, within the scope of the invention are those derived from the following bases: sodium hydride, sodium hydroxide, potassium hydroxide, calcium hydroxide, aluminum hydroxide, lithium hydroxide, magnesium hydroxide, zinc hydroxide, ammonia, trimethylammonia, triethylammonia, ethylenediamine, n-methylglucamine, lysine, arginine, ornithine, choline, N,N'-dibenzylethylenediamine, chloroprocaine, diethanolamine, procaine, n-benzylphenethylamine, diethylamine, piperazine, tris(hydroxymethyl)aminomethane, tetramethylammonium hydroxide, and the like.

Metal salts of compounds of the present invention may be obtained by contacting a hydride, hydroxide, carbonate or similar reactive compound of the chosen metal in an aqueous or organic solvent with the free acid form of the compound. The aqueous solvent employed may be water or it may be a mixture of water with an organic solvent, preferably an alcohol such as methanol or ethanol, a ketone such as acetone, an aliphatic ether such as tetrahydrofuran, or an ester such as ethyl acetate. Such reactions are normally conducted at ambient temperature but they may, if desired, be conducted with heating.

Amine salts of compounds of the present invention may be obtained by contacting an amine in an aqueous or organic solvent with the free acid form of the compound. Suitable aqueous solvents include water and mixtures of water with alcohols such as methanol or ethanol, ethers such as

tetrahydrofuran, nitriles such as acetonitrile, or ketones such as acetone. Amino acid salts may be similarly prepared.

The base addition salts of the compounds of this invention can be regenerated from the salts by the application or adaptation of known methods. For example, parent compounds of the invention can be
5 regenerated from their base addition salts by treatment with an acid, e.g. hydrochloric acid.

As well as being useful in themselves as active compounds, salts of compounds of the invention are useful for the purposes of purification of the compounds, for example by exploitation of the solubility differences between the salts and the parent compounds, side products and/or starting materials by techniques well known to those skilled in the art.

10 Compounds of this invention may exhibit stereoisomerism by virtue of the presence of one or more asymmetric or chiral centers in the compounds. The present invention contemplates the various stereoisomers and mixtures thereof. Desired enantiomers are obtained by chiral synthesis from commercially available chiral starting materials by methods well known in the art, or may be obtained from mixtures of the enantiomers by resolution using known techniques.

15 Compounds of this invention may also exhibit geometrical isomerism. Geometrical isomers include the cis and trans forms of compounds of the invention having alkenyl or alkenylenyl moieties. The present invention comprises the individual geometrical isomers and stereoisomers and mixtures thereof.
