

IN THE UNITED STATES PATENT AND TRADEMARK OFFICE

In re Application for:

Burke et al.

Application No.: Not yet assigned

Filed: February 8, 2012

For: SYSTEM FOR REGULATING  
ACCESS TO AND  
DISTRIBUTING CONTENT IN A  
NETWORK

Examiner: TBD

Art Unit: TBD

Mail Stop Amendment  
Commissioner for Patents  
PO Box 1450  
Alexandria, VA 22313-1450

**PRELIMINARY AMENDMENT**

Please enter this amendment before considering the captioned application.

**Amendments to Specification** begin on page **2** of this paper.

**Amendments to Claims** begin on page **3** of this paper.

**Remarks/Arguments** begin on page **11** of this paper.

## **AMENDMENTS TO THE SPECIFICATION**

Please add this paragraph starting on page 2, before the paragraph entitled "Technical Field".

This application is a continuation of U.S. Patent Application 10/989,023, filed November 16, 2004 and entitled "SYSTEM FOR REGULATING ACCESS TO AND DISTRIBUTING CONTENT IN A NETWORK," which claims the benefit of U.S. Provisional Application No. 60/523,057 filed November 18, 2003, U.S. Provisional Application No. 60/538,370 filed January 22, 2004, and U.S. Provisional Application No. 60/563,064 filed April 16, 2004, the entire content and disclosures of which are hereby incorporated in their entirety.

## AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

### LISTING OF THE CLAIMS:

1. (Original) A system for regulating access to a network, the system comprising:
  - a controller node coupled to the network, the controller node comprising:
    - a first processor for generating controller instructions, and
    - a first network interface for transmitting the controller instructions over the network; and
  - a plurality of gateway units, the gateway units comprising:
    - a user interface receiving user-entered network access requests;
    - a second network interface coupled to the network and receiving the controller instructions from the network; and
    - a second processor, the second processor selectively transmitting at least some of the network access requests over the service provider network in accordance with the controller instructions, and transferring received content data responsive to the transmitted network access requests over the service provider network via the second network interface.
2. (Original) The system of claim 1 wherein:

the gateway units further comprise a storage device for storing instructions;

the gateway units further comprise an identifier uniquely associating the gateway units with a user; and the storage device is operable to store user-specific information.

3. (Original) The system of claim 1, wherein:

the gateway units comprise a user interface receiving requests to transmit data;

and

the gateway units comprise a second processor inspecting the data to selectively transfer the data in accordance with the controller instructions.

4. (Original) The system of claim 1, wherein:

the gateway units comprise a user interface receiving requests

to receive data; and

the gateway units comprise a second processor inspecting the data to selectively transfer the data in accordance with the controller instructions.

5. (Original) The system of claim 1, wherein the first processor generates the controller instructions automatically.

6. (Original) The system of claim 1, wherein the first processor generates the controller instructions in response to an operator-entered request.

7. (Original) The system of claim 1, wherein the controller nodes comprise a first processor generating the controller instructions by operator-controlled network crawling.

8. (Original) The system of claim 1, wherein the controller nodes comprise a first processor generating the controller instructions to deny user access to a first group of network servers.

9. (Original) The system of claim 8, wherein the gateway units comprise a second processor to generate a notification to a controller node if a network access request designates a network server of the first group of network servers.

10. (Original) The system of claim 8, wherein the gateway units comprise a second processor configured to:

detect a network access request designating a network server a first group of network servers; and

re-direct the access request to a second group of network servers in accordance with the controller instructions.

11. (Original) The system of claim 1, wherein:

the controller nodes comprise a first processor generating the controller instructions, the controller instructions including a file identifier; and

the system comprises a plurality of gateway units associated with a user file system, the gateway units comprising a second processor to detect a file in a user file system corresponding to the file identifier.

12. (Original) The system of claim 11, wherein the gateway units are operable between an active state and an inactive state.

13. (Original) The system of claim 12, wherein the second processors notify a controller node if the associated gateway unit enters an inactive state.

14. (Original) The system of claim 12, wherein the second processors delete the detected files from a user file system in accordance with the controller instructions.

15. (Original) The system of claim 14, wherein the second processors delete the detected files from a user file system during the inactive state.

# Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

## Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

## Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

## Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

## API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

## LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

## FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

## E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
