222 pages (May 2013)

Certain commercial entities, equipment, or materials may be identified in this document in order to describe an experimental procedure or concept adequately. Such identification is not intended to imply recommendation or endorsement by NIST, nor is it intended to imply that the entities, materials, or equipment are necessarily the best available for the purpose.

There may be references in this publication to other publications currently under development by NIST in accordance with its assigned statutory responsibilities. The information in this publication, including concepts and methodologies, may be used by Federal agencies even before the completion of such companion publications. Thus, until each publication is completed, current requirements, guidelines, and procedures, where they exist, remain operative. For planning and transition purposes, Federal agencies may wish to closely follow the development of these new publications by NIST.

Organizations are encouraged to review all draft publications during public comment periods and provide feedback to NIST. All NIST Computer Security Division publications, other than the ones noted above, are available at <http://csrc.nist.gov/publications>.

Cryptographic Alarm –	Circuit or device that detects failures or aberrations in the logic or operation of crypto-equipment. Crypto-alarm may inhibit transmission or may provide a visible and/or audible alarm. SOURCE: CNSSI-4009
Cryptographic Algorithm –	A well-defined computational procedure that takes variable inputs, including a cryptographic key, and produces an output. SOURCE: SP 800-21; CNSSI-4009
Cryptographic Ancillary Equipment –	Equipment designed specifically to facilitate efficient or reliable operation of cryptographic equipment, without performing cryptographic functions itself. SOURCE: CNSSI-4009
Cryptographic Binding –	Associating two or more related elements of information using cryptographic techniques. SOURCE: CNSSI-4009
Cryptographic Boundary –	An explicitly defined continuous perimeter that establishes the physical bounds of a cryptographic module and contains all the hardware, software, and/or firmware components of a cryptographic module. SOURCE: FIPS 140-2
Cryptographic Component –	Hardware or firmware embodiment of the cryptographic logic. A cryptographic component may be a modular assembly, a printed wiring assembly, a microcircuit, or a combination of these items. SOURCE: CNSSI-4009
Cryptographic Equipment –	Equipment that embodies a cryptographic logic. SOURCE: CNSSI-4009
Cryptographic Hash Function –	A function that maps a bit string of arbitrary length to a fixed length bit string. Approved hash functions satisfy the following properties: 1) (One-way) It is computationally infeasible to find any input which maps to any pre-specified output, and 2) (Collision resistant) It is computationally infeasible to find any two distinct inputs that map to the same output. SOURCE: SP 800-21
Cryptographic Ignition Key (CIK) –	Device or electronic key used to unlock the secure mode of crypto-equipment. SOURCE: CNSSI-4009
