

DECLARATION OF JON MEARS

I, Jon Mears, declare as follows:

1. I am a staff member of the Milton S. Eisenhower Library, which is located at Johns Hopkins University. I have personal knowledge of the facts listed below.

2. The Milton S. Eisenhower Library is open to the public. Any member of the public may enter the Milton S. Eisenhower Library and view the periodicals in the library's collection.

3. The document attached as Exhibit A is a scan of a portion of a periodical that I located in the Milson S. Eisenhower Library's collection of periodicals. Specifically, Exhibit A shows the article titled "Communication Protocols for Embedded Systems" as in appears in the November 1994 issue of *Embedded Systems Programming*. This is volume 7, issue 11 of this publication.

4. The stamp on the back cover of the November 1994 issue of *Embedded Systems Programming* reads "OCT 28 1994." It is the regular practice of the Milton S. Eisenhower Library to stamp periodicals with the date the periodical is added to the library's catalog. Once a periodical is in the library's catalog, it is made available in the library for viewing by any visitor of the library.

I declare under penalty of perjury that the foregoing is true and correct.

Dated: March 11, 2014

Communication Protocols for Embedded Systems

There's more to connecting multiple CPUs than just stringing wires or cable. Your choice of network protocol, in particular, will determine system performance.

he past few years have seen a growing trend to dramatically increase the embedded electronics content of automobiles, elevators, building climate control systems, jet aircraft engines, and other traditionally electro-mechanically controlled systems. In many large systems, this increasing electronics content is accompanied by a proliferation of subsystems with separate CPUs.

The increase in the number of processors in a system is often driven by computation and I/O growth. In some development environments, the increase may also be driven by a need to ease system integration burdens among multiple design groups or to provide system flexibility through "smart sensors" and "smart actuators." Whatever the reasons, once there is more than one CPU in a system, there must be some means of communication to coordinate action.

While some high-end embedded systems communicate over a VME backplane or similar arrangement, the embedded systems we're working on use physically distributed CPUs involving some sort of local area network (LAN), also called a multiplexed network or a communication bus. At the heart of the LAN is the media access protocol, which picks the next

Exhibit 1218 05/12

DOCKE

transmitter for access to the shared work medium, typically a wire, fibe, or RF frequency.

In this article, we will discuss the special considerations for network real-time embedded systems, and look at several media access protocol in demonstrate fundamentally different ways of accessing the shared mediand The protocols are: connection-onma protocols, polling, time division multiple access (TDMA), token ring, token bus, binary countdown, carrier sense multiple access with collision detex tion (CSMA/CD), and carrier sense multiple access with collision avoid ance (CSMA/CA). For each of these we will evaluate the strength and weaknesses against special consider tions. A protocol tradeoff chart will enable you to select a protocol to ft your needs. While no protocol is refect for all purposes, a variation CSMA/CA offers the most versal for many embedded systems.1

SPECIAL CONSIDERATIONS

I n practice, we have found to embedded real-time network require high efficiency, determine istic latency, operational robustor configuration flexibility, and low conper node.

Because cost limits the network bandwidth available to many areka-

DOCKET A L A R M

Explore Litigation Insights

Docket Alarm provides insights to develop a more informed litigation strategy and the peace of mind of knowing you're on top of things.

Real-Time Litigation Alerts

Keep your litigation team up-to-date with **real-time alerts** and advanced team management tools built for the enterprise, all while greatly reducing PACER spend.

Our comprehensive service means we can handle Federal, State, and Administrative courts across the country.

Advanced Docket Research

With over 230 million records, Docket Alarm's cloud-native docket research platform finds what other services can't. Coverage includes Federal, State, plus PTAB, TTAB, ITC and NLRB decisions, all in one place.

Identify arguments that have been successful in the past with full text, pinpoint searching. Link to case law cited within any court document via Fastcase.

Analytics At Your Fingertips

Learn what happened the last time a particular judge, opposing counsel or company faced cases similar to yours.

Advanced out-of-the-box PTAB and TTAB analytics are always at your fingertips.

API

Docket Alarm offers a powerful API (application programming interface) to developers that want to integrate case filings into their apps.

LAW FIRMS

Build custom dashboards for your attorneys and clients with live data direct from the court.

Automate many repetitive legal tasks like conflict checks, document management, and marketing.

FINANCIAL INSTITUTIONS

Litigation and bankruptcy checks for companies and debtors.

E-DISCOVERY AND LEGAL VENDORS

Sync your system to PACER to automate legal marketing.
