Subject: Re: Hi from Corephotonics

Eran,

Thanks for responding to me so quickly. Since we already have an NDA, perhaps we could have a brief discussion tomorrow morning. I am involved in the definition of our raw video transport and image processing architecture for future products, and I want to understand what the implications of using a solution like yours would be. I am specifically interested in understanding the sensor synchronization, MIPI signaling and image processing requirements. Appreciating that the image processing includes much of your IP, I am only looking for a breakdown of the high-level flow. For example image registration in GPU followed by color reproduction in hardware ISP, etc.

Would tomorrow at 8:30 am PDT / 18:30 pm Israel be too late (for 30 minutes)? You can call me at + [REDACTED], or send me a number to dial.

Sincerely,

[REDACTED]

Hello [REDACTED]

Gal and I have met you during our time at Tessera.

We are glad to conference with you regarding Corephotonics' dual aperture camera technology. In fact Apple and Corephotonics executed a mutual NDA in February 2012 that is in effect.

Regarding IP, under our NDA, let me indicate that our telephoto lens knowledge achieves in fact a high focal length but with an irregularly short TTL.

In addition there is a 3rd category of IP relating to architecture – pending patents relating to various optimizations to a dual sensor system solution.

We would be glad to conference during AM time PDT which is 10 hours later in Tel Aviv.

Best Regards

Eran Jonathan Kali
